The "Kulm" patent fireproof partition slabs—a speciality of this firm—are exhibited at this stand in illustration of their application to ordinary constructive work. In composition they differ somewhat materially from the many varieties of partition slabs on the market in that instead of being of plaster, they are of pumice concrete and Portland cement. To their concrete nature may be attributed their heat-resisting power, which has been proved to be considerable as a result of severe tests by the British Fire Prevention Committee. They afford good fixing for woodwork, which can be nailed directly to them without the necessity for plugging, and their surface provides an efficient key for plaster or cement finish. The illustration shows their adaptability to stanchion casing, which is one of the uses for which they are particularly suitable. They have been employed to a considerable extent in the external work of bungalows, etc., where rigidity and rapidity of construction are necessary.

The following is a list of buildings (with their architects) in which "Kulm" slabs have been adopted: Gloucester House Flats, Piccadilly, W., Collcutt and Hamp; Harcourt House Flats, Cavendish Square, W., Gilbert and Constanduros; Thorney Court Flats, Palace Gate, W., Millard and Pryce; Portland Court, Great Portland Street, W., Durward Brown; British Medical Association's new premises, Strand, W.C., H. Percy Adams; Hamburg-American Line Offices, Cockspur Street, S.W., Stock and Page; extensive premises at Bristol for the Imperial Tobacco Co., Ltd., F. W. Wills, Bristol; Anglo-American Bank and Offices, Old Broad Street, E.C., and King's House, King Street, E.C., M. E. Collins; large block of shops and offices, 417-422, Strand, W.C., G. R. Crickmay and Sons; etc. etc.

JOHN DAYMOND AND SON, EDWARD STREET, WESTMINSTER, LONDON, S.W. STAND 139. ROW H.

It will interest architects to see at close quarters the full-size models from which the capitals on the main facades of the new Local Government Offices in Whitehall were executed. These, and models for carved capitals at the Tate Gallery extension are exhibited at this stand.

Messrs. Daymond also show specimens of hard wood carving and joinery, including portions of an organ case, a font, etc.

Modelling in "Stuc" for interior and exterior work forms another feature at this stand, where practical demonstrations will be given by one of the firm's craftsmen, who will be at work during the exhibition on some panels illustrating Æsop's fables.

Examples of fibrous plaster ceiling enrichments, models of groined ceilings, scale models of details of buildings, and one of H.M. Dockyard, Bermuda, illustrate the varied character of this firm's work.

The following is a list of buildings (with their architects) in which Messrs. Daymond have executed carving:—Local Government Board Offices, Westminster, and Land Registry Offices, Lincoln's Inn, Sir Henry Tanner; Croydon, Brompton, and other County Courts, Inland Revenue Offices, and Post Offices, H.M. Office of Works; Christ's Hospital, Horsham, and Royal Naval College, Dartmouth, Sir Aston Webb and E. Ingress Bell; Society for Propagation of the Gospel Offices, Sir Wm. Emerson; Tate Gallery Extension Mansions, Hamilton Place, and Piccadilly, R.C. Church, Farm Street, W. H. Romaine-Walker and Besant; St. Mary, Moorfields, Eldon Street, E.C., Geo. Sherrin; St. John's Hospital, Leicester Square, W.C., Treadwell and Martin; Tonbridge School, W. Campbell Jones; St. Bartholomew's Hospital, E. B. I'Anson; "Hatchford," Weybridge, C. Harrison Townsend; etc., etc.

THE EXPANDED METAL CO., LTD., YORK MANSIONS, YORK STREET, WESTMINSTER. STAND 76. ROW E.

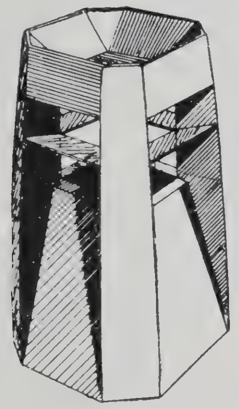
The Expanded Metal Co. have a most interesting exhibition of the very various uses to which their well-known speciality is applicable. It is, of course, most extensively used—(1) as lathing for plaster, and (2) as reinforcement for concrete.

Examples are shown of its employment in the construction of fire-resisting flooring, roofing, and walling; in plaster partitions, steelwork encasing, etc.; and in the building of expanded steel-concrete retaining walls, sewers, conduits, etc.

Examples of expanded metal "made-up" goods, such as workmen's lockers, builders' screens and riddles, workshop divisions, fencing, etc.

The following are some of the most recent works for which it has been employed:—British Museum Extension (J. J. Burnet, R.S.A.); new Admiralty Block (Sir Aston Webb, R.A.); Royal College of Science, Dublin (Sir Aston Webb and T. Manley Deane); Victoria and Albert Museum (Sir Aston Webb); Dane's Castle Reservoir, Exeter (Thomas Moulding, city engineer); Cambridge County Girls' Schools (H. H. Dunn); Grain Silos, Belfast (Spencer and Co., Melksham, engineers); Loch Leven Water Power Conduit (Meik and Meik, engineers); Teignmouth Sea Defence Works (C. F. Gettings, Council engineer); Bristol Head Post Office (H.M. Office of Works); Law Courts Extensions (H.M. Office of Works); Duveen Wing, Tate Gallery (H.M. Office of Work); Thorverton bridge, Devonshire (S. Ingram, county surveyor); Lincoln reservoir (Neil McK. Barron, waterworks engineer); Newport Technical Schools (C. F. Ward, city architect); Edinburgh Corporations slaughter-houses, Gorgie (George Morham, engineer).

MARK FAWCETT AND CO., 50, QUEEN ANNE'S GATE, WESTMINSTER, LONDON, S.W. STAND 146. WALL SPACE.



PERSPECTIVE SKETCH

Messrs. Fawcett and Co., whose pioneer work in connection with fireproof floor construction is well known, have quite recently introduced their "Mon'lithcrete" steel girders, for use in conjunction with concrete. A slab of flooring made on this principle is exhibited at this stand, and the peculiarities of the joist will be seen to consist in the perforation of the web with quadrilateral holes, which are so cut that the remainder of the web forms a series of tension bars inclined at 45 deg. with the flange. It is demonstrable that joists cut in this way, when embedded in concrete, develop more than twice the strength of ordinary joists of equal weight.

Another of this firm's specialities is the "Edwardian" chimney pot, which, apart from its efficacy in the case of smoky chimneys, may fairly claim to be the only patent pot on the market with any pretension to architectural form.

Messrs. Fawcett and Co. have carried out flooring contracts at the following:—St. Bartholomew's Hospital (new out-patients' block); St. Bartholomew's Hospital (new pathological block); Messrs. Dewar's new premises, Haymarket, S.W.; the General Steam Navigation Co.'s new offices, Byward Street, E.C.; Mr. Lingard's extension of premises, Baldwin Lane, Bradford; new Council Schools, Chopwell, Co. Durham; new Nugget Polish factory, Vauxhall, S.E.; St. Paul's Schools, Ball's Pond, N.; 47, Queen Elizabeth Street, S.E.; Mr. Ellis's new shops, Burton-on-Trent; new Grammar School, Melton Mowbray; Chelmsford Infirmary; Girls' School, Exeter; Windsor Castle additions; Hackney Infirmary, block D; Royal Boscombe and West Hants. Hospital, Boscombe; Royal Portsmouth Hospital; County School for Girls, Bangor; Workmen's Hall, Ebbw Vale.

GRANITE SILICON PLASTER CO., LTD., 34, 36, KING'S ROAD, ST. PANCRAS, N.W. STAND 25. ROW B.

Granite plaster is described as an artificial stone composition, which may be used advantageously in substitution for the ordinary lime-and-hair plaster for covering ceilings, walls, etc. It is manufactured in the form of a fine powdered material, and is put up in handy sacks. It is applied to lathwork, brick, stone, etc., in the usual way, and is exceedingly easy to work. It dries quickly, and its exceeding hardness and density render it a good non-conductor of temperature, and impervious to disease germs. Its strength and tenacity, which increase with time, render it a support instead of a dead weight.

Two very interesting features of the exhibit, to which special attention is drawn, are (1) four handsome columns and a panelled ceiling formed of the firm's Cromoleth plaster, and a 2in. solid partition composed of granite plaster on an expanded metal core stiffened with iron rods.

The list of important buildings in which granite plaster has been used fills a pamphlet. Following are a very few of the more recent works for which it has been specified by the architects, whose names appear in parentheses:—New market buildings, Gainsborough (borough surveyor); new premises, Oxford Street (Messrs. Gilbert and Constanduros); artisans' dwellings, Brantome Place (Messrs. Joseph, Son and Smithem); Imperial Tobacco Co., Drury Lane (Messrs. Spalding and Spalding and G. C. Lambert); Church Hall, Leith (J. W. Johnston); mansion, Welbury (R. Lofthouse and Son, Middlesbrough); Pathological block, St. Bartholomew's, London (I'Anson and Son); Naval Hospital, Shotley Point (the Admiralty); Naval Cadets' Hospital, Osborne (the Admiralty); convalescent home, Hitchin (C. Rees); Royal Victoria Hospital, Bournemouth (W. A. Pite); Isolation Hospital, Stone (Chapman and Snape); new Poor House Hospital, Seafield, Leith (J. W. Johnston); King's College Hospital, Camberwell (W. A. Pite).

THE GYPSUM MINES, LTD., MOUNTFIELD, ROBERTSBRIDGE, SUSSEX. 276, 277 WALL SPACE (ANNEXE

Sirapite Plaster, which, in various forms, constitutes the exhibit of this firm, is manufactured from gypsum, and is a cement plaster of somewhat similar nature to Keene's cement. It is not a "retarded" plaster of the plaster-of-Paris type, but is a thoroughly burned cement. It was first made by the Subwealden Gypsum Co., at Mountfield, Sussex, in 1891. To the end of last month more than 254,000 tons of Sirapite had been sold; and the material has been used on buildings of almost every description, from the humblest to the highest. It is quick-setting, of great strength and adhesiveness, and is entirely free from glue or other elements of putrefaction. Only two coats are required, and these may be applied with great expedition, the first coat soon becoming sufficiently firm to receive the second or finishing coat. On a plain surface, one ton of coarse Sirapite mixed with three times its bulk of sand, will cover 300 yards super ⅜in. thick, and one ton of finish used neat will cover 350 yards super ⅛in. thick. For walls, Sirapite plaster used half-and-half with common lime plaster, and for ceilings half-and-half with common lime and hair plaster, will give satisfactory results; the advantage of gauging with Sirapite being that a large quantity may be safely mixed at one time.

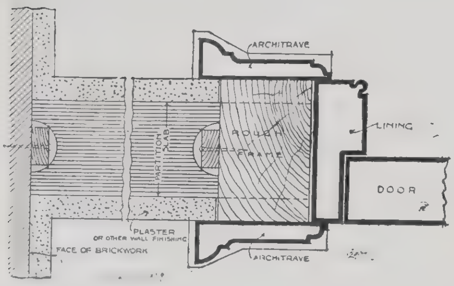
In the very long list of buildings upon which Sirapite has been used, the following are included: Royal Naval Hospitals at Plymouth, Haulbowline, Malta, Portland, Great Yarmouth, and elsewhere; Government buildings at Westminster, Aldershot, Gibraltar, Jamaica, and many other places; hospitals and infirmaries, such as Guy's, Charing Cross, the London University College Hospital, Royal National Orthapœdic, the Miller Hospital at Greenwich, the new infirmary at Penzance, the National Sanatorium at Beneden, King Edward VII. Sanatorium at Midhurst, etc.; innumerable churches, chapels, colleges, and schools; at the Savoy, Granville (Bexhill), Royal Victoria (St. Leonards), Metropole (Folkestone), the Waldorf, Piccadilly, and many other hotels; and on very many public buildings, banks, offices, etc., as Croydon Muncipal Buildings, Colchester Town Hall, the Baltic, Electra House, Salisbury House (Finsbury), Finsbury Pavement House, the National Bank of Scotland, in Nicholas Lane, E.C., etc.

GARDEL, LTD., 133b, COLDHARBOUR LANE, CAMBERWELL, S.E. STAND 274. ROW P.

"Del" Partition blocks of various thicknesses are exhibited at this stand in the form of a complete room, where they are shown unfixed, fixed, and fixed and set. The partitions are variously finished with different kinds of setting coats, and display the equally adhesive qualities of the smooth-faced blocks and those with a keyed surface. These blocks consist of plaster, breeze, and a special composition, and it is claimed for them that they are fire-resisting, sound-proof, strong, and vermin-proof.

Like many other makes of partition blocks, the "Del" can be cut for openings and pipe chasings, where required, without impairing their stability. They are made in a stock size of 29ins. by 15ins., and of thicknesses from 2 to 3½ins., and the company will erect the partitions in their entirety or supply the blocks only.

FREDERICK JONES AND CO., KENTISH TOWN, N.W.; BURTON-ON-TRENT; MANCHESTER; AND MIDDLESBROUGH. STAND 98. ROW F.

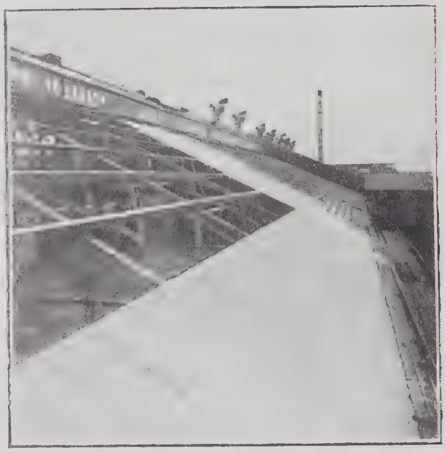


An interesting exhibit of this firm's patent Hercules fireproof partitions, in gypsum-concrete, and in Portland concrete, shows the various qualities in different stages of erection and completion.

The fibrous plaster slabs shown are employed for lining the ceilings of schools, warehouses, motor garages, and similar buildings. It is pointed out that the use of smooth-faced slabs is more economical than that of ordinary lath and plastering, and that fibrous slabs, hand-made and with canvas foundation, are crack-proof and fire-resisting. They are supplied in sheets of various sizes amounting to about a yard super.

The Pioneer silicate cotton or slag-wool, introduced by this firm about thirty years ago, is of approved value as a sound-resisting fire-proofing felt and pugging. As raw material, it is supplied in bags, and it is also manufactured in the form of slabs and felt for application to various surfaces for the purposes of insulation of various kinds.

J. A. KING AND CO., BRIDGE HOUSE, 181, QUEEN VICTORIA STREET, LONDON, E.C. STAND 71. ROW D.



Messrs. King and Co. are the patentees and manufacturers of the well-known "Mack" fireproofing goods, and at this stand are to be seen numerous specialities of this description. There are "Mack" Plaster Partitions, with slabs keyed for plastering, and others smooth-faced, requiring none; "Mack" ceiling slabs; "Mack" fireproof pugging slabs and blocks, from 1in. to 6in. thick; and the 5in. "Mack" fireproof pugging blocks, specially designed for fire-proofing projecting shop fronts. "Mack" slab construction for floors is also shown, where the slabs rest on the lower flanges of the steel joists. "Mack" slabs may be used for fire-resisting roof construction, as may be seen from the specimen exhibited. Several fine examples of old and decayed stone work, parts of which have been restored and treated according to the process adopted by the Stone Preservation Co., will be exhibited on this stand. Architects, builders, and others interested in the subject of cleaning and preserving stone buildings, would do well to closely scrutinize these exhibits.

Among other things being shown are "Mack" fireproof lathing for encasing columns; a patent cement for restoring stonework; a patent fluid for preserving stonework; and the "King" fireproof pumice-concrete partition.

The following is a list of buildings (with their architects) in which the "Mack" specialities have been used: The Guildhall, London, Sidney Perks, City Surveyor; the Victoria and Albert Museum, Kensington, Sir Aston Webb, R.A.; Christ's Hospital, Horsham, Sir Aston Webb, R.A., and E. Ingress Bell; Bank Buildings, Princess Street, E.C., Sir Arthur Blomfield and Sons; Mappin and Webb's new premises, Oxford Street, London, W., John Belcher, R.A.; D. H. Evans and Co.'s extensions, Oxford Street, London, W., J. Murray; Union of London and Smith's Bank, Lombard Street, E.C., Dunn and Watson; Union of London and Smith's Bank, Cornhill, London, E.C., W. Campbell Jones; L. C. and M. Banks, branches in London and Provinces, T. B. Whinney; Women's Hospital, Waterloo Road, London, S.E., Waring and Nicholson; Hammersmith Workhouse and Infirmary, Shepherd's Bush, London, W., Giles, Gough and Trollope; Municipal Dwellings, Croydon, and Croydon Mental Hospital, Warlingham, G. F. Carter, Borough Engineer, Croydon; London Hospital, London, E., Rowland Plumbe; Guy's Hospital, London, S.E., Wood and Ainslie; Salvation Army Shelters, Devonport, etc., Oswald Archer; University College, Gower Street, London, Professor F. M. Simpson; Town Hall and Law Courts, Russell and Cooper; etc., etc.

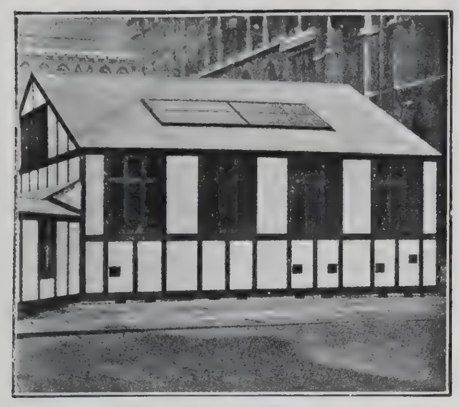
THE LEWIS CONSTRUCTION CO., LTD., JUPP ROAD, STRATFORD, E. STAND 56. ROW G.

This system of reinforced concrete construction depends for its distinctive character almost entirely upon the dovetail corrugated steel sheeting which is employed. This is formed out of thin steel plates of various gauges, so bent as to form dovetails on either side, and was originally employed in the construction of partitions only. Now, however, its application has become very general, and the system is adaptable to the construction of walls, beams, columns, floors, and even window frames, etc. In conjunction with channel and T irons, and round steel bars, the dovetail sheeting forms a very efficient system—combining great strength with a relatively small use of concrete. The reinforced concrete sashes and frames are constructed of granite concrete reinforced with light round rods, and in the case of reinforced doors they are made of dovetail sheeting, special section channel iron, and round steel rods.

Architects should make a point of studying the structure erected at this stand, in which the application of this system of construction is clearly demonstrated.

The following is a list of buildings (with their architects) in which the Lewis Construction Co.'s system has been adopted: Devonshire House, Piccadilly, Stephen Box, A.R.I.B.A.; New University, Cardiff, W. D. Caroe, A.R.I.B.A.; Walthamstow Education Committee, H. Prosser, M.S.A.; Mizen Head Bridge, Ireland, M. Noel Ridley, A.M.I.C.E.; London and County Bank, Walton, W.A., Burr; Desiccated Grain Co. Factory, Rotherhithe, Wreford and Wright; extension to Town Hall, Leyton, Newman and Jacques, A.R.I.B.A.; etc., etc.

MACHIN AND KOENIG, 17 AND 18, ROSCOE STREET, E.C., AND G. R. SPEAKER AND CO., 29, MINCING LANE, E.C. STAND 9. ROW A.



This exhibit consists of a "half-timbered" pavilion, shewing the application of Speaker's "Eternit" asbestos slabs for exterior and interior walls and ceilings, and Speaker's "Eternit" roofing tiles (in various colours and patterns) for the roof.

Compo-board, in its application to ceilings and interior walls, both plain and papered, is also shown.

Among various specialities may be noticed veneered panels mounted on asbestos slabs, laminated wood panels (up to 48ins. by 48ins. 3-16in. and ¼in. thickness, "Superior" panels in waterproof birch and alder, and Speaker's "Eternit" fireproof door.

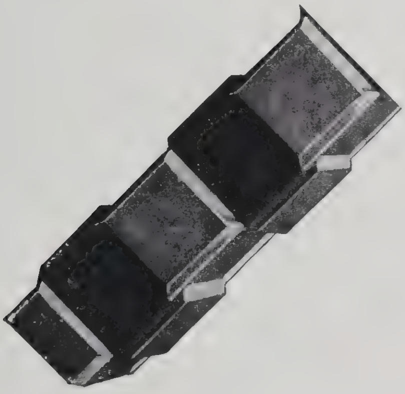
Speaker's "Eternit" has been known in Great Britain for the last six or seven years. Its insulating qualities are of the first order, and the weight of a finished roof done in "Eternit" is about one-fifth of the weight of a natural slate roof. The material is known not only to all the Government departments which do building, but also to the various County Councils, including the London County Council.

The tensile strength of "Eternit" tiles is 5,781lbs. per square inch, its crushing force being 8,281lbs. per square inch. The lightness of the material is a valuable consideration, and while the initial cost is practically the same as that of best Welsh slates, "Eternit" roofs require no upkeep, for in ratio with their age the roofs increase in strength.

For panels, ceilings, and walls, "Eternit" is supplied in sheets 8ft. by 4ft. These sheets are light, of immense mechanical strength, are easily erected, and constitute an excellent and economical wall lining.

Many important Government contracts have been carried with Speaker's "Eternit" roofing tiles in Jamaica and Gibraltar, Sheerness, Chatham, Devonport, York, Salisbury Plain, as well as in Ireland and Scotland.

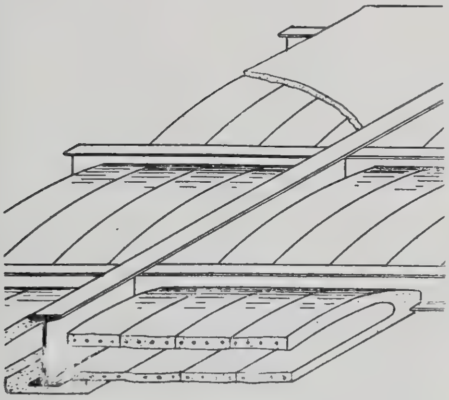
THE PATENT INDENTED STEEL BAR CO., LTD., QUEEN ANNE'S CHAMBERS, LONDON, S.W. STAND 24. ROW B.



The great variety in the design and type of bars for reinforcing concrete is the natural outcome of a system of construction which, however widely it has been adopted for many classes of work, is still in its infancy; in fact, it can only be in this direction that ultimate experiments and improvements will eventually lead to the discovery or invention of a type of reinforcement which shall be capable of giving the best general results under all conditions and circumstances. The patent indented bar here exhibited is of square section, and is "indented" or depressed at regular intervals in its length on each of its faces. It is made of rolled steel in the following sizes, viz.:—¼in., ⅓in., ½in., ⅝in., ¾in., ⅞in., 1in., and 1¼in. square.

The following are some of the recent buildings for which this reinforcement has been supplied:—Selfridge Stores, R. Frank Atkinson, F.R.I.B.A., architect; Medway Conservancy Offices, Rochester; coal bunkers for Borough Electrical Engineer, Croydon; Montgomery's Bakery, Govan; Schools, Bromley, Kent, for Kent Education Committee; South Darley Waterworks Extensions; Water Tower, Gosnall, Staffs.; reservoir covers, Whitehaven Waterworks; Main Drainage Works, Glasgow; strong room, Belfast; Sea Defence Works, Teignmouth, C. F. Gettings, engineer; Register House, Edinburgh; Bank Buildings, Jamaica; Galleries, Hull Cattle Market, for City Engineer; brewery floors, Messrs. Bass and Co., Burton-on-Trent; warehouse, Bombay; etc., etc.

D. G. SOMERVILLE AND CO., 116, VICTORIA STREET, LONDON, S.W. STAND 141. ROW H.



Messrs. Somerville and Co. exhibit a model of the building erected for the National Telephone Co. at Paddington, from the designs of Mr. Leonard Stokes, F.R.I.B.A., in which building the steel and concrete construction was carried out by this firm.

Full-size specimen sections of hollow reinforced fireproof floors and roofs are also shown, together with reinforced concrete piles, columns, and beams.

In regard to the floors, two types are exhibited. Type "A" consists of hollow reinforced concrete tubes, supported between steel joists, with the usual concrete filling in to form the floor surface. This system requires no centreing.

Type "B" has rectangular hollow tiles of fireclay or cement, with steel reinforcing bars (embedded in strong concrete) between them. The bars are turned up at the ends where necessary, to resist shearing stresses. Unless the span is considerable, the tiles merely require a screeding layer as a preparation for finished floor.

The following is a list of buildings (with their architects), where Messrs. Somerville's floors have been used:—Paddington, Brixton, Hammersmith, and Deptford Telephone Exchanges: Chelsea Town Hall; Mansion House, Inholmes; Leonard Stokes, F.R.I.B.A. Jewish Girls' Home, Walworth; St. Giles' Mission Hall, Kingsway; Messrs. Rumplemeyer's new premises; covering to District Railway; and Norwich Insurance Offices, Piccadilly; Messrs. Runtz and Ford. Virginia Sanatorium, Cardiff University Settlement, and Church, Edinburgh; W. R. Schultz. Hendon Electricity Works; W. Curtis-Green. Flats, James Street, and mansion, Englefield Green; Forsyth and Maule; Messrs. Sanderson's premises, L. A. Hayes, A.R.I.B.A.; etc., etc.

THE SAXON PORTLAND CEMENT CO., LTD., CAMBRIDGE. STAND 187. ROW K (ANNEXE).

NORTHFIELD RESERVOIR, BIRMINGHAM.

The vital part played by Portland cement in reinforced concrete construction gives this company's exhibit more than ordinary interest. Since the invention of Portland cement in 1756 great improvements have been made in the process of manufacture, with the result that of late years its tensile strength has greatly increased.

The raw material from which this company makes its cement is a "chalk-marl," consisting of a combined chalk and clay deposit, containing from 15 to 25 per cent. of clayey matter, and about 79 per cent. of carbonate of lime. After mixing, the damp material is dried on rotary drums, and then ground in the mills till it is so fine that no residue remains on a sieve having 5,800 meshes per square inch. Tensile strain—600lbs. per square inch in seven days.

The following are some of the contracts on which the cement has been used:—Admiralty, War Office, H.M. Office of Works, General Post Office, London County Council, and the following other public works:—Derwent Valley Water Board Contract, Birmingham, Tame and Rea District Drainage Board, Manchester Corporation Moss Side Baths and Conveniences, Manchester Midland Hotel, Manchester Hippodrome, Manchester Opera House, Manchester Blackley Infirmary, Stockport Hayfield Reservoirs (20,000 ton contract), Stockport Town Hall; Stockport Pipe Track (New Mills to Hayfield), Withington Workhouse extensions and drainage, Manchester Stock Exchange additions, Widnes gasholder tank, Lancashire County Council bridges, Radcliffe Paper Mills, Hyde gasholder tank, Leeds police station; Oxford library, Lincoln College; Hertford Christ's Hospital, St. Thomas' Hospital, Boston Harbour Trust, Ipswich Electric Power Station, etc.

SIDEOLITH, 19, TEMPLE STREET, BIRMINGHAM. STAND 115. ROW G.

The Sideolith system of reinforced concrete construction, which is applicable to every variety of work of this description, including lintels, beams, columns, foundations, flooring, and roofing, is represented by a specimen of hollow block flooring, and a series of the "skeletons" employed for reinforcement.

As will be seen from the accompanying illustration, the reinforcement is produced from single bars of steel of varying thicknesses, split and expanded into girder-like form, the parts being apportioned and adjusted to take the tensional and shearing strains without waste or danger of displacement. The completed structure is very light, yet with great bearing capacity.

The firm point out that, in brick and stone buildings, individual features, such as lintels, beams, columns, floorings, roofings, etc., can with great advantage be constructed of reinforced concrete which in many positions is much more desirable than wood, for which in many cases, considering its superior durability and strength, its non-inflammability, its non-liability to attacks by insects, it is in the long run a really economical substitute. The proprietors of Sideolith hold that the safest form of reinforced concrete flooring is constructed on the same principle as wood-joisted flooring, namely, with joists at moderate distances apart (say, about 3ft. centre to centre), and thin slabbing, instead of using larger beams at greater distances with thicker floor slabbing.

The following are a few of the works at which Sideolith has been used (the names of the architects are enclosed in parentheses):—Grand Theatre, Oldham (Thomas Taylor); Convent of Mercy, Oldham (Thomas Taylor); extensions, General Hospital, Birmingham (Henman and Cooper); Messrs. Jarrett and Rainsford's new premises, Birmingham (Henman and Cooper), etc., etc.

JAMES H. TOZER AND SON, LTD., YORK MANSION, YORK STREET, WESTMINSTER. STAND 28. ROW B.

Messrs. Tozer's exhibit is designed to illustrate the various methods of using their "Lock-woven" mesh reinforcement as applied to walls, floors, roofs, sewers, and similar works.

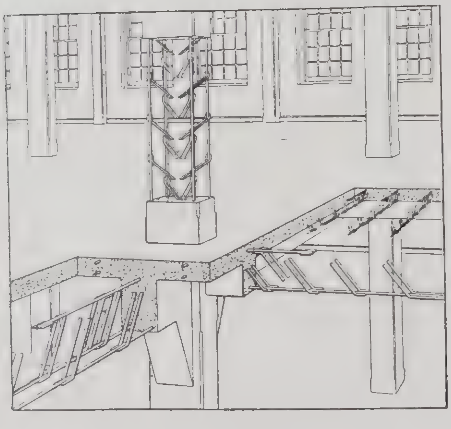
A concrete structure consisting of columns on pedestals, with entablature over, shows the adaptability of the "Lock-woven" mesh reinforcement under everyday circumstances.

Its application to sewer construction is demonstrated by a short section of an egg-shape sewer (of 5ft. by 3ft. 4ins. internal dimensions), and there is by the side of this exhibit a portion of a 5ft. 6ins. high retaining wall similarly reinforced.

Floor and roof construction are also shown. In the latter the mesh is employed in continuous lengths in a very efficient manner. Concrete fencing posts, fire-resisting partitions, etc., further illustrate the general constructional uses of this mesh.

In the suspended floor and roof on exhibition, in the latter the application of the continuous lengths of lock-woven mesh is demonstrated. The mesh in the roof slab is brought down at the end of the roof, and is joined up to the floor below, a smaller mesh being wired to the heavier concrete mesh and then plastered to form a solid partition. The heavy concrete mesh dispenses with any necessity for rods or other fixings for the lighter plastering mesh.

THE TRUSSED CONCRETE STEEL CO., LTD., CAXTON HOUSE, WESTMINSTER, S.W. STAND 80. ROW E.



This company exhibit a number of models illustrating the manner in which the Kahn trussed bar is used in their system of concrete reinforcement. This is particularly well demonstrated in one showing a reinforced concrete beam, which enables the visitor to see for himself how completely the concrete packs itself round the diagonals of the trussed bar at their junctions with the main bar.

The model reinforced concrete lintol which is shown, is an interesting one, and architects and contractors should inspect it, as it appears to offer a useful suggestion for economical and rapid lintol construction.

Of more general interest, perhaps, is the machine used by the company in the manufacture of their patent bar. Machinery in motion always attracts, and this will prove no exception. Pieces of the bar will be presented as souvenirs, to those who care to apply for them.

The following is a list of works in course of construction on the Kahn system. The name of the architect or engineer is given in parentheses:—Wesleyan Methodist Hall (Lanchester and Rickards); Y.M.C.A., Manchester (Woodhouse, Corbett and Dean); York Towers, North Eastern Railway (W. J. Cudworth); Loch Long Jetty (Admiralty); Exeter Reservoirs (T. Moulding); Southampton Schools (J. A. Crowther); Cheetham's Mills; Brighouse Mills (Sharp and Waller); Bridges, Chingford reservoir (Metropolitan Water Board); Bridges and Stands, York Race Course (Walter H. Brierley); Football Stand Twickenham (J. E. Profit); Football Stand, Bradford; Scottish Union Offices, Leeds (Perkin and Bulmer); Motherwell Reservoir (J. McMillan); extension to Kodak Works, Harrow (S. V. Haus); Pickelden Bridge (H. P. Maybury); etc., etc.

UNITED KINGDOM FIREPROOFING CO., LTD., 47, VICTORIA STREET, LONDON, S.W. STAND 90. ROW F.

At this stand are to be seen a variety of floor sections illustrating the several systems of fireproof construction advocated by the company. It will be seen that each is based on the ferro-concrete principle, and embodies methods of application suitable for specific cases. For instance, system No. 1 consists of hollow concrete tubes, about 3ft. wide, supported on ferro-concrete beams, covered with a layer of concrete of sufficient depth to take up all compressional stresses. The beams, which may be either cast beforehand, or "in situ," are made up to 30ft. in length. Such a floor as this is recommended for use in hospitals, schools, and other buildings where level ceilings and sound-proof floors are essential.

System No. 2 is composed entirely of hollow concrete beams (cast before fixing) with dovetail joints between them, which are grouted in after erection. This type of floor is very rapidly constructed, and may be finished and be ready for use in less time than is usually allowed to elapse before the temporary boarding of an ordinary concrete floor can be removed.

System No. 3 has terra-cotta lintels resting on the splayed flanges of reinforced concrete beams, and on account of its lightness and soundproof qualities, is especially adapted for dwelling houses and private residences where light loads only obtain.

System No. 4 has been designed for use where very deep girders are employed, and where the ceilings must at the same time be level. In this system terra-cotta cover plates (cambered) and ceiling plates of similar material, span the openings between the reinforced concrete beams, which are specially haunched to receive them.

The remaining systems bear a more or less close resemblance to those described, and embody modifications of detail rather than of principle.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

THE WOULDHAM CEMENT CO., LTD., 35, GREAT ST. HELENS, LONDON, E.C. STAND BAY 9a, GALLERY P. 374.

This firm are exhibiting samples of their finished products, "Red Cross" brand Portland cement, and "Reinforcrete," a cement specially prepared for use in ferro-concrete structures.

The whole of the firm's cement is guaranteed as more than fulfilling every requirement of the British Standard Specification, as revised June, 1907.

They also exhibit various models made from their cements, and samples of raw materials, including chalk, clay, coke, coal, etc. Also samples of the cement in a partly manufactured state in the form of slurry and clinker.

Having their own cooperages, the firm make a feature of supplying casks of specially good make, such as are in every way admirably adapted for export shipments. Leakage from the casks is practically impossible, owing to all the joints, both of bodies and of ends, being tongued and grooved.

A few of the works upon which this Portland cement has been used during recent years are as follows:—Admiralty Harbour Works, Dover and Malta; New Ross and Waterford Railway; Surrey Commercial Docks; London County Council; Plymouth main drainage; Dublin main drainage; Seaham Harbour; Great Northern and City Railway; Mersey Docks and Harbour; East London Waterworks; Catford-Plumstead main drainage; Hull Joint Docks; Great Western Railway; Isna Barrage, Egypt; Egyptian State Railways; Nile Bridges, Egypt; Constantinople Docks and Government Buildings; Southern Nigeria Railway; Cartagena Waterworks; Dorado Railway extension, Panama Canal; Bolivar Railway; Colombian National Railway; Bolivian Railways; Vera Cruz and Coatzacoalcos Harbours; Rio de Janeiro Improvement Works; Para Port Works; Argentine North-Eastern Railway; Central Argentine Railway, etc., etc.

"THE BUILDERS' JOURNAL" STAND MARKED THUS +

Section V.—WOODWORK.

The following firms are noticed under this section, and their stands are blacked in, with numbers in white:—

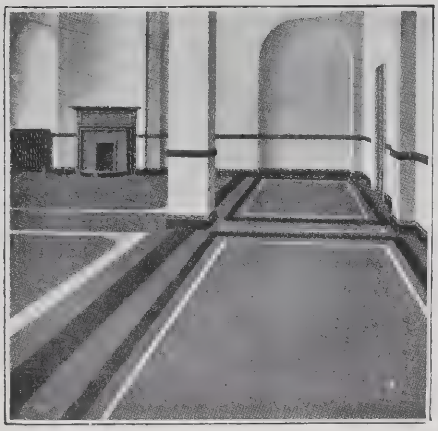
57	D	British Doloment Co., Ltd., (The), p. 376.
46	C	Bath Cabinet Makers' Co., Ltd., p. 376.
86	E	Cleaver, H. C., Ltd., p. 376.
280	Wall Space Annexe	Ebner, Jos. F., p. 376.
122	G	Elliott, Samuel, and Son, Ltd., Reading, p. 377.
55	C	Elliott's Moulding and Joinery Co., Ltd., Newbury, p. 377.
65	D	"Excellence" Wood Block Flooring Co., (The), p. 377.
67	D	Gilmour Door Co., Ltd., (The), p. 377.
61	D	Goodwin, H. C., and Son, p. 378.
83, 84	E	Höfler, Ltd., p. 378.
163	Wall Space	Ingram, Perkins, and Co., p. 378.
89	F	Pemberton, Arber and Carey, p. 379.
13	A	Shannon, Ltd., (The), p. 379.
60	D	Venesta, Ltd., p. 379.
53	C	Van Kannel Revolving Door Co., Ltd., p. 379.
77	E	White, John P., p. 380.
88	E	"Young" Firm, (The), (E. C. Young), p. 380.

REFERENCES.

The following firms are noticed in other sections, but are showing exhibits connected with this one. Their stands are indicated by hatching:—

104	F	Art Pavements and Decorations, Ltd. (The), (Wood Block Parquet and Armadek Floors), p. 358.
139	H	Daymond, John and Son, (Wood Carving), p. 370.
9	A	Machin and Koenig, p. 373.

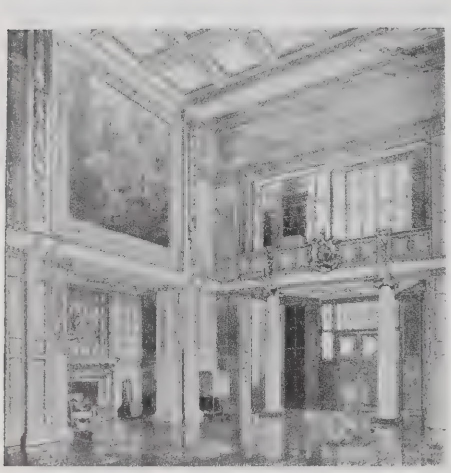
THE BRITISH DOLOMENT CO., LTD., CAXTON HOUSE, WESTMINSTER, LONDON, S.W. STAND 57. ROW D.



This well-known flooring material is laid ⅞in. thick, in a double layer, and is guaranteed not to crack or bulge. It is elastic, non-absorbent, non-inflammable, and jointless, and is specially adapted for hospitals, schools, and public buildings. Doloment is applied to walls as well as floors, and can be finished in many colours and designs in imitation of granite, mosaic, or marble. The company points out that to ensure a perfect result it is absolutely necessary that the foundation of the floor should be dry, solid, and free from lime. It need not necessarily be smooth, but it must be level. On account of its elasticity it does not crack, even if the foundation should settle. In addition to the above properties, it is without odour, and will not burn. As a flooring for hospitals, laboratories, etc., its imperviousness to wet, and the ease with which it can be kept clean it is particularly suitable, and during the two years it has been on the market has been largely used in buildings of these descriptions.

The following list includes public bodies using the British Doloment Company's patent flooring and buildings in which it has been used:—H.M. Office of Works, the War Office, the Admiralty, Royal Arsenal, H.M. Prisons Commissioners, Metropolitan Asylums Board, the London County Council, City of London Union Infirmary, Royal Infirmary, Manchester, St. Mary's Hospital, Manchester; Royal Ophthalmic, London; Royal Infirmary, Dundee; Royal Southern, Liverpool; Royal Bucks General Hospital, Westmoreland County Asylum, Church House Schools, Windsor; St. Jude's Hall, Stratford; Maldon Grammar School, King's College, Strand; Ley's Schools, Cambridge; Wolverhampton Grammar School, Prices Schools, Fareham; etc., etc.

THE BATH CABINET MAKERS' CO., LTD., TIVERTON, BATH; AND 18, BERNERS ST., W. STAND 46. ROW C.



What may be called architectural furniture is represented by the exhibits of this firm, whose staff includes not only skilled designers of furniture, but also trained architects.

Representative examples of the firm's work include a portion of an oak-panelled room in the Elizabethan style, with carved tracery frieze, and also a Georgian inglenook with panelled walls and ceiling, and with china cupboards built into walls at the sides of the fireplace. There are also examples of Charles II., Queen Anne, and Chippendale chairs, tables, etc.

Among the works that have been executed by this firm the following may be mentioned:—The entire furnishing, decoration, and joinery, for Sir George White's house, "Cotham House," Bristol (Messrs. Oatley, F.R.I.B.A., and Lawrence, A.R.I.B.A., architects), contains fine Georgian work, and Grinlin Gibbons' carvings. The Bristol Stock Exchange complete (H. Williams, M.S.M., architect); fine Elizabethan panelled rooms and inglenook, etc., for Mr. E. A Trapnell, at Clevedon Hall (W. H. Watkins, A.R.I.B.A., architect); the Strand Palace Hotel, for J. Lyons and Co., Ltd., complete furnishing (W. H. Ancell, A.R.I.B.A., architect); Council chamber and committee room for March County Hall (Herbert J. Green, A.R.I.B.A., architect); wood carving for Churchill Cottage Homes (Messrs. Silcock and Reay, F.R.I.B.A., architects); board-room, etc., Cosham Memorial Hospital, Kingswood (F. B. Bond, F.R.I.B.A., architect); dining hall, Lisvane Manor (Herbert Davis Richter, architect and artist); shop-fitting and showcases at Selfridge's, Oxford Street; billiard room in oak for Littlejohn Philips, Esq., Box, Wilts (H. Davis Richter, architect); shopfitting for James Colmer, Ltd., Bath, and for Waymark and Company, Tunbridge Wells, pine panelled hall in New York (H. Davis Richter, architect); banqueting hall at the Park Hotel, Cardiff (H. Davis Richter, architect); offices for Sir George White and Co., Clare Street, Bristol, in Spanish mahogany (Oatley and Lawrence, architects); etc., etc.

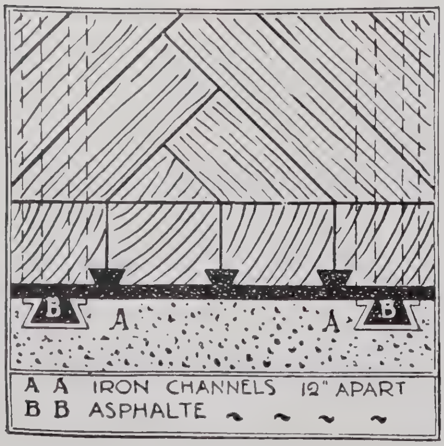
H. C. CLEAVER, LTD., 35, BERNERS STREET, LONDON, W. STAND 86. ROW E.

"Tudoresk" patent oak panelling for walls is the principal feature of this exhibit, and may be brought to the notice of architects as a new method of construction. In this patent the panelling is built up section by section (as it is fixed) on a system of interlocking grooves and tenons. Each separate piece is secretly nailed, and by this means no nail or screw heads appear on the surface.

The exhibit includes chimney-piece treatments, solid oak panelled front and interior doors, parquet flooring, and the patent Tudor letter filing cabinet. This possesses some novel features, and the trays can be converted by a simple arrangement into ordinary drawers or a fully-equipped card index.

The following is a list of buildings where "Tudoresk" has been specified and fixed:—New School at Folkestone, J. Dixon Butler, F.R.I.B.A.; house at Northolt, J. Dixon Butler, F.R.I.B.A.; house in Kensington, J. Dixon Butler, F.R.I.B.A.; Queen Elizabeth's Grammar School, Blackburn, Herbert Stones, bungalow at Broadstairs, John Murray, F.R.I.B.A.; house at Ormesby, Jas. Forbes; Alexandra Hotel, Saltburn, Jas. Forbes; house at Middlesbrough, Jas. Forbes; house at Saltburn, Jas. Forbes; house at Mansfield, Vallance and Westwick; Swan Hotel, Mansfield, Vallance and Westwick; Foxcote Manor, Buckingham, T. H. Bishop, A.R.I.B.A.; house at Ealing, Brown and Barrow; house near Cheltenham, Chatters and Smithson; house at Oxshott, Niven and Wigglesworth; house at Billingshurst, Peach and Ramsey; flats in Portland Place, H. J. Colebrook; house in Prince of Wales' Terrace, L. J. Williams, A.R.I.B.A.; etc., etc.

JOS. F. EBNER, STEWART STREET, CUBITT TOWN, LONDON, E. STAND 280 WALL SPACE (ANNEXE).



One of the principal features at this stand is a collection of samples of the Jointless Composition Flooring known as "Ebnerite." This material is not intended as a substitute for this firm's Parquet Flooring or Marble Terrazzo Pavings, but rather for such situations as would not be suitable or possible for either of them.

"Ebnerite" is composed of wood fibre, fine mineral powder, and a cementing liquid. It is laid with a trowel, in a plastic state, and becomes hard in about 35 hours. The finish can be either rough, polished, oiled, or bees-waxed like a Parquet floor. It can be laid on concrete, stone, or wooden subfloor, new or old, even if much worn. In appearance it is not unlike linoleum, and as it is silent and resiliant to walk on, is warm to the feet, non-slipping, and cleanly. It may be recommended for all classes of buildings. The following is a list of buildings (with their architects) in which this firm's specialities have been used:—Queenstown Cathedral, Ashlin and Doolin; Shire Hall, Norwich, E. J. Tench; Milton Asylum, Portsmouth, Rake and Cogswell; 49-50, New Bond Street, London, W., Walter Cave; several schools for Education Committee, Manchester; and Education Committee of Norfolk; New Theatre, Cork, Arthur Hill; Queen's Hospital, Birmingham, E. Harper and Brother; London Joint Stock Bank, Kingsway, R. Creese, Harrison and Son; King Edward VII. School, Southampton, Mitchell, Son, and Gutteridge; Welbeck House, Wigmore Street, Bockmer and Gibbs; Debenham and Freebody's premises, Wigmore Street, W. Wallace and J. S. Gibson; Thorney Court, London, W., Millard and Pryce; several generating stations, London County Council; Queen Margaret's School, Scarborough, F. A. Tugwell; etc., etc.

ELLIOTT'S MOULDING AND JOINERY CO., LTD., ALBERT WORKS, NEWBURY. STAND 55. ROW C

This stand, of somewhat ambitious design, consists of four built-up yellow pine Ionic columns with carved capitals, and moulded entablature over, finished in white enamel, and all of high-class workmanship. Conspicuous among the specimens exhibited is an oak screen for Isfield Church, near Bexhill-on-Sea, made from the designs of Mr. John Rawlinson, A.R.I.B.A. This is a very delicate piece of tracery work, and contains some good carving. An example of classic work is shown in the polished mahogany entrance doors, which are of fine figure and of substantial make. These doors are surrounded by a frame, with pilasters attached, surmounted by a carved overdoor.

Messrs. Elliott are showing an improved kind of revolving door (Buckingham's Patent) which should be particularly noted. The rest of the exhibit comprises a very complete collection of mouldings made in various kinds of hard and soft woods, and a deal door and overdoor.

The following is a list of buildings (with their architects) in which Messrs. Elliott's joinery has been used:—St. Etheldreda's Church, Ely Place, and Watford Holy Rood Church, the late J. F. Bentley; Wycliffe Hall, Oxford, W. Wallace; Holy Trinity Church, Tooting, Leonard A. S. Stokes; Church House, Gt. Smith Street, Westminster, Sir Arthur Blomfield and Sons; Welbeck Palace Hotel and Flats, Boehmer and Gibbs; Navarino Mansions, Dalston Lane, Joseph and Smithem; Llanelly Parish Church, E. M. Bruce Vaughan; Mansion, Pwllheli, N. Wales; West Ham Board of Guardians' Offices, J. W. Dunsford, M.S.A.; Ordnance Survey Office, Southampton; Capital and Counties Bank Head Office, Threadneedle Street, G. H. Hunt; Capital and Counties Bank, 335, High Holborn, Paul Waterhouse; etc., etc.

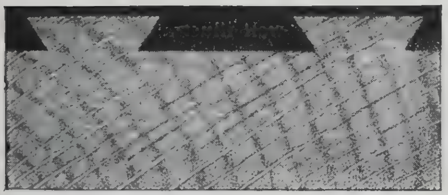
SAMUEL ELLIOTT AND SONS, LTD., CAVERSHAM, READING. STAND 122. ROW G.

The exhibition of work that has been actually commissioned undoubtedly lends an added zest to the inspection of the object, and Messrs. Samuel Elliott and Sons provide us with this agreeable sensation. They show, for instance, an oak ingle that has been executed for a contract in the West of England, and also a special Spanish mahogany door destined for Gaddesdon Place (the late Cole A. Adams, F.R.I.B.A., architect). The firm show also many and various other specimens of joinery work which has won for them many medals and diplomas in the past. They have also on view a large display of their mouldings of registered designs, of which more than 1,600 sections are shown in their catalogue; and they have added an interesting selection of examples of square and round turning.

A leaflet which they are circulating illustrates some specimens of ecclesiastical carving that have been executed by this firm, the examples including a lectern executed for Mr. S. S. Stallwood, architect; details of a screen executed under Mr. F. B. Wade, architect, for the Roman Catholic Church at Caversham, and of another screen made to the design of Mr. B. Ingelow, architect, for Sherborne Abbey; and the panelling, doors, and bookcases to a corridor library, more than 300ft. long, in Westminster Cathedral.

The claim—we forget for the moment who had the happy inspiration to advance it—that "there is something noble in woodwork," involuntarily arises in the memory as one gazes at the many dignified and stately examples of wood-carving here shown. The firm, we understand, are particularly expert in the production of Gothic-style carving for ecclesiastical uses, as, indeed, the specimens of their work that are shown at this Exhibition sufficiently attest.

THE "EXCELLENCE" WOOD-BLOCK FLOORING CO. WORKS, PROSPECT SAW MILLS, LEEDS. LONDON OFFICES 11, QUEEN VICTORIA STREET, E.C. STAND 65. ROW D.



At this stand the chief exhibit consists of a display of samples of wood blocks and panels illustrating "Nicholson's" patent "dovetailed" system of wood block flooring. These are in various woods. This company's flooring blocks have a particularly effectual key, consisting of dovetail grooves on their undersides. The blocks are dipped in hot mastic in the usual way and laid on a perfectly smooth cement screeding. They are made of 1in., 1¼in., 1½in., and 2in. thicknesses, by 9in., 12in., 15in., and 18in. lengths, and are 3in. wide. Deal, pitch pine, and oak are the usual kinds supplied, but they may be had in any other suitable wood if required.

In addition to the above exhibit, the company has some good joiners' work on show, such as a walnut counter and some screen framing, etc., executed by Messrs. Wm. Nicholson and Son, Ltd., of Leeds.

The following is a list of buildings (with their architects) where "Excellence" wood block floors have been specified: Several schools, W. S. Braithwaite; several schools for the West Riding County Council, J. V. Edwards; new schools at Reddish, Stockport, Cheers and Smith; schools at Whitwell Bottom, Waterfoot, A. Brocklehurst; George Street School, Chester; Acton Schools, London, E. C. P. Monson; Middlesex County Council, G. H. Crothall; Merrywood Road Schools, Bristol, H. D. Bryan; schools at Newbridge Lane, Stockport, Cheers and Smith; schools at Greek Street, Stockport, Cheers and Smith; Love Street Schools, Chester; Gravesend Borough Council Schools, J. J. Robson; Wimbledon Education Council Schools, H. P. B. Downing; Rotherham Schools for Education Committee, Holdgate and Harrison; Uphall Road Schools, Ilford Education Committee, C. J. Dawson; etc., etc.

THE GILMOUR DOOR CO., LTD., 51, BERNERS STREET, LONDON, W. STAND 67. ROW D.

The prinicpal exhibit of this company is their patent revolving door, which is quite new. In the construction of the wings an innovation has been introduced, in that the door is a "two-way" one, leaving ample room for each person. At a time of panic due to fire or other cause, a pair of doors dividing the wings open under pressure, the action being identical with that required by the London County Council for fire-door exits in public buildings. In addition to these features, the wings automatically swing back into the circular sides. The door now being shown is to be installed in the entrance of the new Strand Hotel.

The Gilmour hardwood veneered door and hospital door are built up with a core of Canadian yellow pine, and heavy steam-heated rollers are used for rolling on the glued veneer.

The Gilmour hardwood veneered door is built up on scientific principles so as to counteract any possible warping, twisting, splitting, shinking, or blistering. The hardwood facing is dried with steam-heated air, the steam being used to keep the pores of the wood open, and preventing the wood becoming brittle, and enabling same to be thoroughly and perfectly dried from the centre outwards. The facing in all cases is again tested by actually measuring a portion and placing same in 200 degrees of heat for a short time, and on being again measured, and found not to have shrunk, it is considered dry and ready for use. Heavy steam-heated rollers are used to roll on the hardwood face to core, so that the surplus glue is rolled out through the grooves, and only sufficient allowed to remain to bring wood and wood together and form a perfectly welded joint.

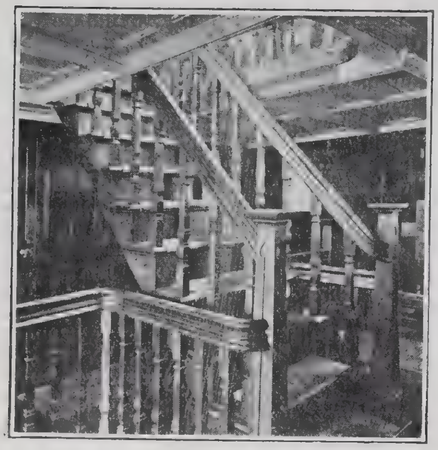
The hospital door is a separate patent, with an absolutely flush surface both sides. It is flat veneered. The core is built up entirely of ⅞-in. pieces of Canadian yellow pine (the most unwindable of softwoods) laid both vertically and horizontally, and always grain against grain throughout. The core is combined with oak dowels. Any hardwood is veneered thereon to order.

Each Gilmour hardwood veneered door is guaranteed against winding, warping, shrinking, shaking, or blistering, and, owing to its being veneered, only the primest stuff is used, and it shows that desirable figure which is often hidden up inside the solid door.

A list of a few of the public buildings to which during the past four years doors have been supplied can be obtained from the firm's stand.

The point on which particular emphasis is laid is that, as mentioned above, the Gilmour anti-cyclone door embodies a totally new method of treatment in the construction of the wings, as a two-way door, thus leaving plenty of room for each person, while for exit in case of fire a pair of doors dividing the wings open under pressure, as required by the London County Council.

H. C. GOODWIN AND SON, 16, CHARLES STREET, HATTON GARDEN, LONDON, E.C. STAND 61. ROW W



Messrs. Goodwin and Son have an extensive display of joinery executed at their works, including stock doors, mouldings, balusters, newels, etc. This firm has carried out some high-class work from architects' designs, and photographs of some of them are on view. An example of good finish is the staircase for the surveying yacht "Galatea," which is here illustrated.

The stock doors are slightly in advance of the usual type as regards design, but architects will expect a further improvement before they will specify them to any extent. This is a point which manufacturers will be wise to consider.

The many uses to which Compoboard can be put for interior work are demonstrated at this stand.

Joinery has been executed from the designs of the following architects:—J. Simpson, Buxton; Messrs. S. Harrison and Sons, Leicester; J. W. Start, Colchester; C. R. Ross, Long Eaton; H. Reed, Exeter; J. Newman, Sandown, I.W.; Messrs. Hooper and Nash, Gerrard's Cross; Messrs. White, Son and Pill, Barnet; F. Shaw, Drogheda; W. G. Lower, Guildford; W. C. Jackson, Chesterfield; J. W. Pate, Cambridge; Messrs. Caddy and Ball, Mackins Hey, Liverpool; Messrs. Friend and Lloyd, Aldershot; C. W. Calcott, London; T. Moody, London; T. M. Garrood, London. Messrs. Still, Wheat and Luker, London; A. Burr, London; C. Burton, London; Messrs. Crickmay and Sons, London; C. F. Doll, London; Messrs. Searle and Searle, London; C. W. Reeves, London; J. O. Kyn, Cairo; Drill Hall at Blackheath, architects, Messrs. T. Dinwiddy and Sons, London; Naval Establishment, Shotley Point, Ipswich, T. C. Agutter, civil engineer.

HÖFLER, LTD., 26a, SOHO SQUARE, LONDON, W. STANDS 83 AND 84. ROW E.

Messrs. Höfler exhibit some well executed metal and joinery work at their stands, in addition to their sheet lead damp-course. In regard to the metal work, special note should be made of a pair of wrought and polished iron gates, designed in accordance with the "Adam" tradition, and intended as a specimen of the standard of work and finish done at "The Chiswick Forge."

An ambitiously designed chimney piece (in the "Georgian" manner), which exhibits some very skilful craftsmanship in its execution, is also on show, as also are many examples of Austrian oak panelling and inexpensive Austrian oak chimney pieces, and a small staircase with wrought iron balustrading on one side and polished steel bronze on the other. It should be pointed out that this latter is meant as an illustration of the kind of work which the firm is capable of turning out.

On the same stand are also shown, in addition to samples of Austrian oak panelling, of joinery and carving, and of parqueterie, specimens of "Durato" asbestos flooring, which is jointless, fireproof, and damp-proof.

The following is a list of buildings (with their architects) for which this firm has executed work: New Midland Hotel, Manchester, Charles Trubshaw; Imperial Hotel, Russell Square, Chas. Fitzroy Doll; hall and staircase, house near Doncaster, Yorks., G. F. S. Streatfield; Cranston's Kenilworth Hotel, Geo. Waymouth; executive block, St. Thomas's Hospital, Percival Currey; Royal Hotel, Matlock Bath, F. W. Hodge; panelled rooms, near Hull, Runton and Barry; cedar wood room, Cornbury Park, John Belcher, R.A.; carved oak and gilt reredos, Farm Street Church and St. Michael's Church, Brighton, Romaine-Walker and Besant.

INGRAM, PERKINS AND CO., 37, BEECH STREET, BARBICAN, E.C. STAND 163. WALL SPACE.

Recent alarmist reports as to the probable ultimate exhaustion of the world's timber supply will probably serve, if one happens to think of them at the moment, to increase rather than to diminish interest in the exhibition of some of the most beautiful specimens of hard woods that the world can produce. Long may it be before such handsome specimens are jealously guarded in museums as relics of an extinct material.

This exhibit, though primarily interesting to those connected with the timber trade, should, on general grounds, prove equally so to architects, who, as a rule, are content to take a good deal of their knowledge of woods at second-hand. At this stand are to be seen fine selections of conveniently displayed hard and soft woods, comprising a large proportion of those more generally used for building purposes, with the exception of fancy woods. The peculiarities of growth, texture, and figure, and the wonderful contrasts which occur in different kinds of timber are particularly well illustrated in the series brought together by this firm.

Mahogany, teak, maple, American and English oak, stock joinery, compo-board, etc., etc., form the bulk of this exhibit, which has the additional interest of being that of a firm whose establishment dates back to 1797. Particulars of the buildings in which timber supplied by the firm are to be found are not easily procurable, as the business is a wholesale one, but it may be mentioned that Messrs. Ingram, Perkins and Co. enter into large contracts with H.M. Government, the London County Council, the Corporations of the Cities of London and Westminster, most of the Metropolitan Borough Councils, and a number of the County Councils and County Boroughs.

JAMES LATHAM, LTD., 124, CURTAIN ROAD, E.C. STAND 260. ROW R.

On this stand are shown samples of finely figured mahogany from Cuba, Tobasco, Honduras, Mexico, and other districts; oak from Austria, Russia, and America; walnut from America and Italy; satinwood from Ceylon; teak from India, Java, and Siam; Kauri pine from New Zealand; maple and pine from Canada; etc., etc.

The firm also handle large quantities of high-class home-grown timber, such as oak, walnut, beech, sycamore, and brown oak, etc., and of these they show some remarkably fine examples, which in view of the scheme of afforestation recently recommended to Parliament, should be particularly interesting. The sample of English oak is from a tree which, at a height of 6ft. from the ground, had a diameter of 4ft., and was from 250 to 300 years old. The walnut is about 150 years old, and the brown oak sample about 700 years old. Messrs. Latham inform us that they recently handled a parcel of this latter wood from trees which formed part of a well-known avenue in the Midlands, which is mentioned in Doomsday Book as being a well-grown plantation then, so the wood must have been at least 1,100 years old.

Mouldings, floorings, handrails, etc., in mahogany, oak, teak, and American whitewood form a strong feature of this exhibit. They are of good design and excellently machined.

A fine collection of hardwoods is exhibited in the representative samples of veneers, both sawn and knife-cut, which are shown. They illustrate many wonderful vagaries of nature. For interior decoration, these should be of especial interest to all engaged in the production of high-class joinery.

Among the most attractive features of the stand, are actual specimens growing in pots, of many of the woods used in the trade, such as oak, walnut, ash beech, maple, pine, and the rest.

PEMBERTON, ARBER AND CAREY, GRAY'S INN PASSAGE, BEDFORD ROW, LONDON, W.C. STAND 89. ROW F.

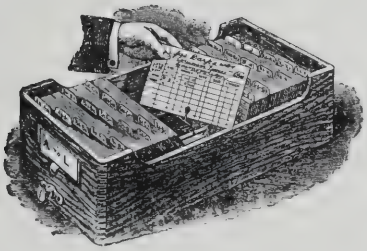
This exhibit is a very clever invention, and is shown by a full-size model of the "Sesame" door, which opens itself when a person steps on the mat in front of it, and closes itself after he has passed through the doorway. The mechanism controlling the movement of the door—which is double, and each leaf pivot balanced—is concealed beneath the floor, in a space which has to be 6ft. 6in. long by 8½in. deep. This, of course, presents no difficulty in a new building, but such a requirement might render inconvenient its adoption in many existing ones.

The invention is quite a new one, and since the success it attained in its early stages, has now been further improved. Architects will find this exhibit one of particular interest.

The following architects have specified "Sesame" doors:—Ambrose Poynter, Esq., F.R.I.B.A.; Lewis Solomon, Esq., F.R.I.B.A.; Messrs. Charles Heathcote and Sons, of Manchester; Messrs. Edward Boardman and Sons; and Messrs. Morgan and Buckingham, both of Norwich; F. Lindus Forge, Esq., 28, Martin's Lane, Cannon Street, E.C.

List of "Sesame" doors installed:—Messrs. Aspreys, silversmiths, etc., 165, New Bond Street, W.; Messrs. Story and Triggs, house furnishers, 152-156, Queen Victoria Street, E.C.; Messrs. A. W. Pettit, drapers, 192-195, High Street, Kensington, W.; Messrs. Marshall's School of Cookery, Mortimer Street, W.; Messrs. Boots, Ltd., cash chemists, King Street, Great Yarmouth; Messrs. Frank Bentall and Co., drapers, Kingston-on-Thames; Messrs. David Cohen and Co., merchants, 17, Tokenhouse Yard, E.C.; Messrs. The Comptoir Nationale Bank, bankers, Franco-British Exhibition; Messrs. Moon and Sons, pianoforte merchants, Plymouth; Messrs. Handleys, Ltd., drapers, Southsea; etc., etc.

THE SHANNON, LTD., ROPEMAKER STREET, LONDON, E.C. STAND 13. ROW A.



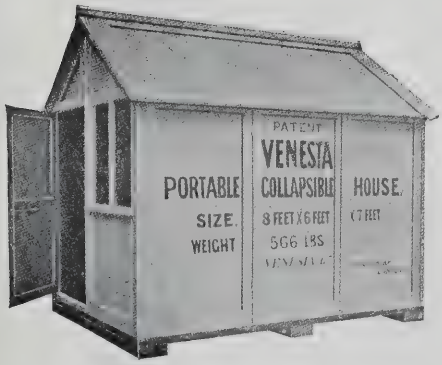
The employment of the shorthand clerk and the typist, while facilitating the transaction of business, has undoubtedly led to a vast increase in the accumulation of documents; and their disposal in convenient compass for ready reference, has been the particular study of this firm for many years.

At this stand may be seen specimens of every kind of office fitments made by the Shannon, Limited, which undertakes the complete equipment in this respect of business premises of all kinds. A special feature is the steel cabinet for the protection of valuable papers in offices.

The dominating principle of the Shannon system is the sectional idea, by which filing cabinets are made up of separate units, procured as present requirements necessitate, and added to when future needs have to be met.

The following is a list of some of the buildings in which their specialities have been supplied: Agricultural Bank of Egypt, Cairo; Anglo-Egyptian Bank, Ltd., London, Cairo, and several branches; Anglo-French Exploration Co., Salisbury House, E.C.; Hon. W. W. Astor, Victoria Embankment, S.W.; Barclay and Co., Great Yarmouth; Barry Dock Railway Co., Barry Docks; Barry, Head and Co., Cannon Street, E.C.; Battersea Borough Council; Ben Lassim and Co., Cairo; Berkleys, Ltd., Victoria Street (shop fittings); Birkbeck Bank, Chancery Lane, W.C.; British Westinghouse Co., Manchester; British Uralite Co., Hale End; Broadbent and Co., Huddersfield; Callender's Cable Co., Victoria Embankment, S.W.; Christie and Co., Ltd., Hoddesdon; City of London Contract Corporation; W. Clarke and Sons, Lincoln; Close Bros., Basildon House; etc., etc.

VENESTA, LTD., 20, EASTCHEAP, LONDON, E.C. STAND 60. ROW D.



This firm exhibit patent waterproof ply Venesta boards for door panels and decorative panelling. The system of construction —thin sheets of perfectly dry wood united with patent waterproof cement—prevents cracking or shrinking, and it is claimed that damp buildings do not injure them.

These boards can be supplied (from 3 to 7 ply) in sizes up to 5ft. by 15ft. without a joint, and ⅛in. to 1in. in thickness. They have been extensively used for tramcar roofs, sides, and seats, and also for cabin partitions on steamships.

Architects should note that this material can be obtained with a veneer of oak, mahogany, walnut, teak, or birch.

The large sizes and widths in which these boards can be made renders it possible to construct doors and panels in designs which are not practicable with timber of ordinary widths. It is obvious that a substantial saving in mouldings and in the labour of construction may be effected by the use of these large panels.

Another advantage is that the patent Venesta three-ply boards are ready for use immediately on delivery, so that they never assume the formidable character of capital lying idle in large stocks whilst wood is seasoning.

THE VAN KANNEL REVOLVING DOOR CO., LTD., 5, BEDFORD ROW, LONDON, W.C. STAND 53. ROW C.

The growing popularity of revolving doors for public and other buildings has made their further improvement inevitable. At this stand the Van Kannel Revolving Door Co. has on show one of an entirely new form, specially designed to ensure the safety of the public in the event of a panic occurring in a large building, and so constructed that sudden pressure on the part of a crowd rushing towards the exit will instantly and automatically cause it to collapse, no matter in what position the wings may be in at the time. These are made to fold neatly together like a fan, and segments of the circular casing can also be made to collapse outwards. From the collapsed position the whole door can be made to assume its original revolving position in a few seconds.

The following is a list of buildings (with their architects), where the Van Kannel doors have been installed: H.M. Office of Works (G.P.O. London); H.M. War Department (Royal Army Clothing Department, Pimlico); Victoria and Albert Museum, Sir Aston Webb, R.A.; Fownes Glove Factory, Gresham Street, E.C., Harvey Dyball; Brompton Oratory, South Kensington, S.W.; Ritz Hotel, Piccadilly, Mewes and Davis; Carlton Hotel, Haymarket, S.W.; Waldorf Hotel, Aldwych, W.C., A. Marshall Mackenzie and Son, A.R.S.A.; Standard Bank of South Africa, Clements Lane, E.C., Meakin and Archer; London Joint Stock Bank, Paddington, W., R. Creese Harrison; "Morning Post" Offices, Strand, W.C., Mewès and Davis; "Daily News" Offices, Bouverie Street, E.C.; White Star Line Offices, Cockspur Street, H. L. Tanner, jun.; the Cunard Line Offices, Liverpool; the Booth Line Offices, Liverpool, Willink and Thickness; the Mersey Dock and Harbour Board Offices, Liverpool; etc., etc.

JOHN P. WHITE, THE PYGHTLE WORKS, BEDFORD, AND 134, NEW BOND STREET, LONDON, W. STAND 77. ROW E.

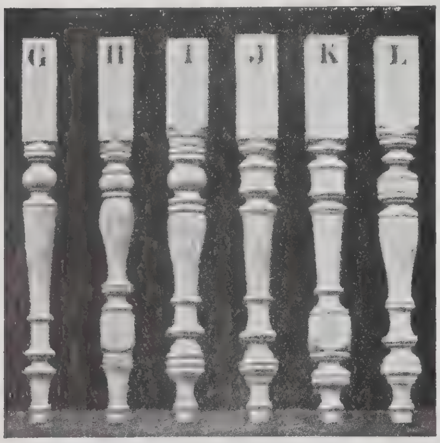
This is a very interesting exhibit, and shows in a varied and representative manner the general excellence of the work executed by this firm. Mr. White's entrance and wicket gates are well known to architects, who appreciate their simplicity and appropriateness of design. Quarter full-size models of these, complete in every essential detail, are on view. Examples of the several kinds of English oak, cut in various ways, and in different stages of seasoning, are also shown.

The attention of architects is drawn to the collection of "stock" hardwood doors, made of best Austrian wainscot in a very solid and substantial manner, and guaranteed not to shrink or warp.

Photographs and drawings of executed work. consisting of general joinery, panelling, staircases, etc., are hung on the stand, which itself is a specimen of treillage.

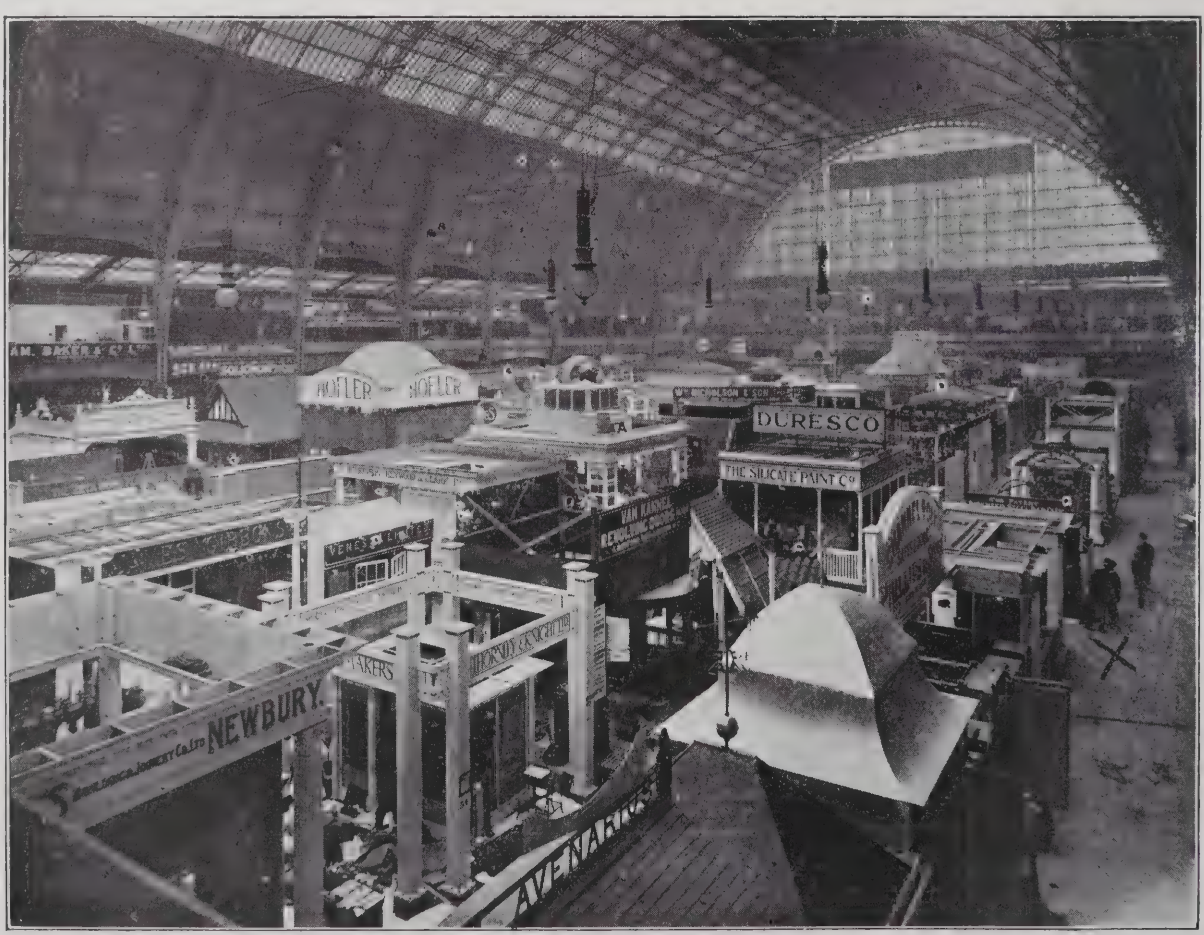
Contracts for woodwork have been carried out at the following buildings:—Ditton Place, Balcombe, Smith and Brewer, architects; Brockhampton Park, Gloucester, G. W. Atkinson, architect; Swinton Park, Yorkshire, Jas. Ledingham, architect; Cornbury Park, Oxon, John Belcher, architect; Stapleford Park, Leicester, C. E. Mallows, architect; Polesden Lacey, Dorking, Ambrose Poynter, architect; Blakesley Hall, Northants, Law and Harris, architects; Abbess Grange, Hants., Bannister, Fletcher and Sons, architects; Sutton Place, Guildford, Ambrose Poynter, architect; Hatley Park, Gamlingay, R. W. Schultz, architect; Stockport Town Hall, Sir A. Brumwell Thomas, architect; Sunderland and South Shields Water Co.'s offices, W. and R. Milburn, architects; Royal Victoria Infirmary, Newcastle-on-Tyne, Newcombe and Adams, architects; etc., etc.

THE "YOUNG" FIRM (E. C. YOUNG), VIRGINIA ROAD, BETHNAL GREEN, E. STAND 88. ROW E.



This exhibit consists of a model room panelled throughout with oak framing and 3-ply panelling, in which are shown samples of the many specialities manufactured by this firm, such as turnery of every description, stock mouldings, over-doors, etc. Letters, either of plain wood or gilded, ready for fixing, are also displayed in large variety. Contractors who use stock newels, balusters, handrails, over-doors, fretwork arches etc., will find them all here, of varied design. This firm is introducing especially cheap wood letters, either plain or gilt, ready for fixing. The illustration (here given) represents a few examples of the many specimens of turned work made by the firm, whose range of goods can only be briefly indicated in the limited space allotted for exhibitors' notices.

The really artistic architect is always a connoisseur of woodwork, for he realises very keenly that many of his best effects, both internal and exterior, depend largely upon the treatment of staircases, balconies, dadoes, and so forth, to say nothing of the "fitments, fixtures, and fittings." In every such item of woodwork about a house there is infinite scope for the exercise of taste and skill. Even the cupboards that the ladies so insistently and imperatively desire must nowadays display a considerable departure from mere and absolute plainness; and as for newels, the imagination of those whose pleasing task it is to "turn them to shapes" with a view to giving them "a local habitation" is apt to run riot.



GENERAL VIEW OF THE EXHIBITION FROM THE GALLERY, LOOKING TOWARDS ADDISON ROAD. *Photo: Topical.*

"The Builder's Journal" Stand is indicated by a cross.

THE ATMOSPHERIC STEAM HEATING CO., LTD. (1907), 52, GRAY'S INN ROAD, HOLBORN, W.C.

STANDS 211 AND 212. ROW N.

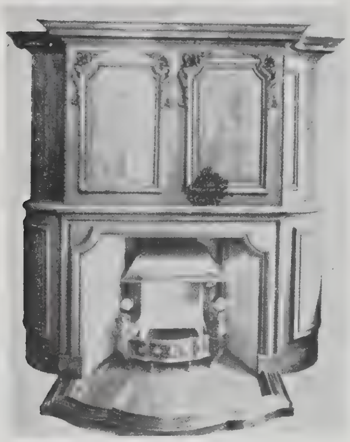
The atmospheric system of steam heating provides the means by which steam can be circulated without initial pressure, independently of the length of mains. The circulation is not forced, but induced, by partially exhausting by means of a vacuum pump, all mains, radiators, etc., in advance of admitting the steam. In this system the two troublesome obstructions to free circulation—namely, air-binding, and inefficient drainage of the water of condensation—are non-existent, the extraction of air and water being automatic and continuous; and, by the same process, water-hammer and the damage it produces by causing leaky joints, become impossible. Other advantages claimed are: thorough effectiveness of the radiating surfaces, reduction in sizes of mains, economy in fuel and maintenance, and control of the distribution and volume of the steam circulated. The system obviously admits of the utilisation of exhaust steam without back pressure on the engines, the exhaust steam flowing into the heating system more freely than into the atmosphere direct.

The "National" system of automatic temperature control, of which this firm are the sole licensees in Great Britain, includes a thermostat that is sensitive to a change of even one degree of temperature, and a motor that gives effect to any alteration that is felt by the thermostat; the motive power being air, for which the compressors are actuated by steam or hydraulic power. By this means the uniformity of temperature that is of vital importance in hospitals, for instance, is automatically kept constant.

The Webster "Star Vacuum" feed-water heater, purifier, filter, and receiver, and several other specialities that appeal to engineering interests, are also shown, as well as a boiler showing the arrangement adopted for the "Beck" rapid circulation hot-water system.

The Government and municipal buildings, hospitals, asylums, workhouses, and educational and business premises in which the atmospheric system of steam heating has been installed make a long list, from which a few selections only can be here given, namely: Imperial Institute (London University), Royal College of Science, and Victoria and Albert Museum, all at South Kensington; the Royal Courts of Justice; etc., etc.

BELL RANGE AND FOUNDRY CO., LTD., 70, MORTIMER STREET, LONDON, W., AND WEST BRIDGE WORKS, NORTHAMPTON. STAND 174. WALL SPACE.



This firm has placed its grates in appropriate "surrounds." There is a 12ft. inglenook, with marble surround to grate, and marble shelf, with a "Bell patent dog grate" in action. Another such grate is filled with a finely carved Elizabethan oak mantel. A Jacobean oak mantel enshrines a basket fire grate "in rough armour bright, and with marble panels." There are also some specially designed examples of white wood mantels, fitted with Bell basket fire grates.

Bell's patent dog grates are not to be confounded with the old-fashioned sort. The new grates are constructed to double the heating capacity with half the consumption of fuel, while the hearth is kept perpetually clean without any necessity for sweeping. The grates represent the best patterns of several different periods.

The Bell boiler for domestic hot water aims at supplying an almost unlimited quantity of water at merely nominal cost in fuel consumption.

The following is a list of a few of the buildings (with their architects) where this firm's goods are in use:—Bromham House, Bedford (G. P. Allen); Russley Park (R. T. Beckett); "Ashlawn," Rugby (J. D. Hoper); Belton Hall, Rutland (Talbot, Brown and Fisher); St. Wilfrid's, Portsmouth (J. T. Blackwell); Earl's Barton Grange (Talbot, Brown and Fisher); New Houses, Bournemouth (J. H. Brewerton, F.R.I.B.A.); Weston Favell House, Northampton (C. Dorman and Son); Patishall House (H. O. Tarbolton); Ber House, Norwish; Clapton Manor, Oundle (Gotch and Saunders); Hotel Cameron, Swansea (C. T. Ruthen); Northampton General Hospital (F. Dorman); Crawford Arms Hotel, Wolverton (C. V. Cable); Rushton Hall (Gotch and Saunders); Albany Hotel, Hastings; Savoy Hotel, London; Charlton House, Kent; Junior United Service Club, London; 15, Princes Gardens, S.W.; 48, Onslow Gardens, S.W.; etc., etc.

BENHAM AND SONS, LTD., 66, WIGMORE STREET, LONDON, W. STANDS 107 AND 108. ROW G.

Messrs. Benham and Sons, the well-known makers of cooking apparatus, kitchen ranges, hot-water boilers, and cylinders, etc., exhibit at this stand a selection from among their very numerous specialities, among which may be particularly noticed their coal-fired central hot-plate (10ft. long by 5ft. wide). This is constructed with a descending flue and a fire and two ovens on each side, making two fires and four ovens in all, and has heavy cast-iron top metal, and a guard rail on each side. Other improvements, such as the construction of the body and ovens in mild steel, are embodied in this apparatus, which will interest those whose business it is to advise on the cooking equipment of large institutions, hotels, etc.

The "Wigmore" kitchener is represented by one of 5ft. 6ins. in length, having tiled covings, and a roasting fire fitted with vertical bars, which are removable. It also has two large ventilated ovens for baking and roasting, and a hot closet overhead fitted with revolving doors.

The company also exhibits a 4ft. "Welbeck House" kitchener, similar in all respects to those supplied for all the flats at Welbeck House, Welbeck Street, W. The points to be noticed are the rising fire, fitted with movable bars, the open and close fire arrangement, the two ventilated ovens, and white tiled covings.

A very useful fitting for potatoes, puddings, fish, etc., is the three-compartment wet steam oven. Each compartment is fitted with perforated galvanised trays, and is capable of being worked independently. Special steam tight doors with screw-wheel fastenings are included.

The "Wigmore" independent hot-water system is also exhibited, and comprises a specially constructed wrought welded boiler, a galvanised steel circulating cylinder, with circulating pipes, safety valve, emptying cock, etc.

WILLIAM BOBY, SALISBURY HOUSE, LONDON, E.C. STAND 167. WALL SPACE.

This firm makes a speciality of water-softening appliances, of which type "K"—for domestic service—calls for particular note, as being the outcome of very wide experience in this class of machine.

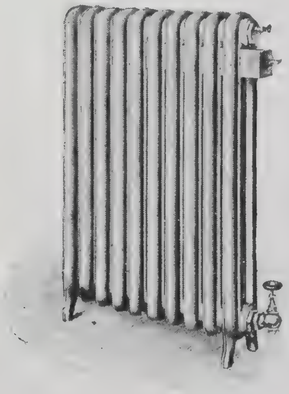
The softening material is a fine powder, which is deposited into a receptacle with a lid, and in the standard types of machines no attention is necessary for weeks at a time. If required, the time can be made to extend to a period of two months.

The "Simplex" water softener is capable of dealing with from 100 gallons per hour, upwards. In this appliance the mechanism is automatic, always in sight and above water, making inspection a simple matter.

As a remedy against the choking of hot-water pipes and apparatus in hard-water districts, these machines should prove of value.

The following is a list of some of the buildings at which these appliances have been fitted:—Dromoland Castle, Co. Clare, Ireland, for Lord Inchiquin; house at Kingswood, Surrey, Mr. Cowlishaw, architect; house near Newbury, Berks., Mr. Kirk, architect; the New Strand Hotel, London, Mr. Ancell, architect; the Savoy Hotel; University College Medical School, Gower Street, Mr. Waterhouse, architect; Isolation Hospital, Dartford, Kent; The Infirmary, City of London Union, Homerton; Lincoln County Asylum, Lincoln, W. Watkins and Sons, architects; The Devon and Exeter Hospital, Fulham Infirmary, Radcliffe Infirmary, Oxford; Northwood Sanatorium, Ivanhoe Hotel, London; business premises (Messrs. D. H. Evans and Sons), Oxford Street; Woolwich Arsenal; Chatham Dockyard; The Admiralty, Chatham Dockyard, 3 machines; the War Office, the Crown Agents for the Colonies; Dewrance and Co., London; Crown Laundry, Fulham; Achille Serre, Ltd., Hackney Wick, 2 machines; etc., etc.

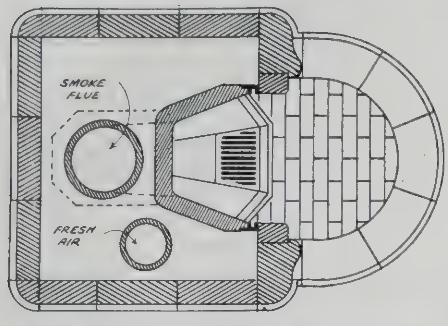
W. J. BURROUGHES AND SONS, 143, QUEEN VICTORIA STREET, LONDON, E.C. STAND 221. ROW O.



In the "Ideal" low-pressure hot-water system of heating, the boiler is made with the latest devices for self-regulation, and has a fuel capacity which enables it to run from ten to twelve hours without attention. The radiators, which constitute the sole exhibit of Messrs. Burroughes and Sons, are made in sections, and if found desirable at any time to alter their size, by reason of the enlargement of the room, one or more sections may be added. In the company's new patent radiator the vapourising pan is placed entirely on the inside of the radiator, and is consequently out of sight; but having no fixed parts it can be taken out like a table drawer, and on account of its close contact with the heated surface, the maximum amount of evaporation is obtained.

Messrs. Burroughes and Sons have executed contracts for the following:—Higher Broughton Synagogue, Manchester; Congregational Church, Chertsey; Schools, Heston and Isleworth U.D.C. Education Committee, Heston; Kent House College, Penge, S.E.; Kentish Town Parish Church; St. Andrew's Church, Fulham; St. Peter's Church, Tooting; St. Mary's Church, Bletchworth; Jewish Synagogues at Hampstead, Stoke Newington, New Cross, Brondesbury, and Finsbury Park; Neola Piano and Player Co., 94, Regent Street, W.; Bon., Ltd., Streatley House, Piccadilly, W.; Hanbury, Tomsett and Co. (Electric Press), Kensal Rise, N.W.; "Egypt House," 36, 37, and 38, New Broad Street, E.C.; Roneo, Ltd., 26, Holborn Viaduct, E.C.; Central London Throat and Ear Hospital, Gray's Inn Road, W.C.; Bryant and May, Ltd., Fairfield Works, Bow, E.; Council Buildings, Aldershot; Kodak, Ltd.; Read Bros., Ltd.; Raphael Tuck and Sons, Ltd., Moorfields, E.C.; Capital and Counties Bank, Tunbridge Wells; etc.

CANDY AND CO., LTD., 87, NEWMAN STREET, LONDON, W. STAND 99. ROW F AND STAND 178. WALL SPACE.



PLAN OF SINGLE CENTRAL WARD STOVE WITH DEVON No3 RAISED FIRE.

The most conspicuous exhibit at this stand is a new hospital stove, which Messrs. Candy and Co. are introducing for the first time. It has a good appearance, has been very carefully thought out, and possesses features which should commend themselves to those interested in hospital equipment. In order to obviate the taking down of the entire stove when the back requires to be renewed, there are two small pieces of faience in the front whose removal facilitates any repairing work. The blower, too, which is so important a part of a ward stove, works in two ratchets fixed between the fireback and the faience front. Another improvement consists in the substitution of a shaped piece of firebrick at the bend of the fire-back top, for the ordinary concrete finish, which is liable to work loose, and so become injured in sweeping the flue.

Among the firm's other interesting exhibits should be noted a new application of their well-known "Devon" fire to existing hearths.

The following are a few of the buildings (with their architects), in which Messrs. Candy's fires have been used:—Houses at Brancote Road, Oxton, Birkenhead, Herbert Story; houses at Heswall Hill, Cheshire, and new residences at Burrell Hill, Burrell Road, Prenton, Cheshire, A. W. Street; City Buildings, Liverpool, F. G. Fraser; new High Schools, Wallasey, Appleyard and Quiggin; new house, Brancote Road, Oxton, Birkenhead, E. C. Aldridge; Wallasey U.D.C., Public Offices, W. H. Travers; new offices, Seacombe, Cheshire, Harris and Hobson; Toxteth Technical Institute, for Liverpool Corporation; new residences at Upton, near Birkenhead, W. A. Thomas; public baths, Seacombe, Cheshire, W. H. Travers; house at Telegraph Road, Heswell, near Birkenhead, A. Gilbertston; Children's Home, Formby, J. J. Havelock Sutton; etc.

THE CARRON CO., CARRON WAREHOUSE, 15, UPPER THAMES STREET, LONDON, E.C. STAND 129. ROW H.

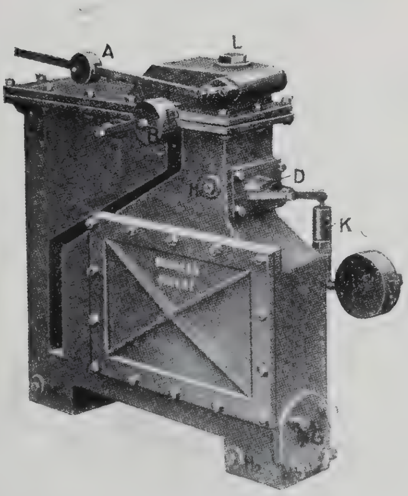
British ironworkers have always easily maintained supremacy over the workers in this material in all other countries, and there seems to be every probability that they will worthily maintain this honourable distinction until there is not left with us sufficient fuel to feed the forge withal. Perhaps it is not flattering our national pride overmuch to assume that in this superiority there is a certain consistency with the strength and determination of the national character. We delight in overcoming the stubbornness of an intractable material, and in shaping it to our will.

That strength and beauty may be happily combined is conclusively demonstrated in the exhibits at this stand. The firm justly claim that the firegrates they show will make a potent appeal to all who appreciate artistic and distinctive home decorations.

The designs represent about the best period that such work has known. They are of the eighteenth century, being taken from originals carved at Carron more than a century ago, and represent the work of two unassuming geniuses of this time, William and Henry Haworth, who were students at the Royal Academy during the presidency of Sir Joshua Reynolds. Their work clearly shows that they were true children of the times in which they lived, and that they were strongly influenced by the style of Flaxman, and by the dominating example of the Brothers Adam. The carvings, it is claimed, with perfect justice, are masterpieces of the carver's art, and recall the time when strict attention to detail, combined with ease and grace, was the aim of every artist and craftsman. These fireplaces have been, of course, reconstructed to suit present-day requirements, but in thus adapting them, great care has been taken to preserve the ornamental characteristics in their integrity; but the essential working parts are up to date.

A few baths are also shown.

RICHARD CRITTALL AND CO., 197, WARDOUR STREET, LONDON, W. STAND 252. ROW Q.



The problem of preserving an equable temperature within doors at the season when artificial heating is necessary not only for comfort, but for the preservation of health and even of life, is now mainly difficult by reason of the embarrassment of choice in the matter of heating installations.

This is a matter in which, during the past few years, rapid progress has been made, and the most recent modern developments are well represented at this stand.

The "Cable" system of heating is a low-pressure automatic self-regulating one, by which the water is forcibly circulated (at any desired temperature) without pumps and irrespective of levels. Pipes of large diameter are not required, as they are all of small bore (from ¼in. upwards). Neither is it necessary by this system to excavate for the boiler or form channels for the pipes. Further, wherever the boiler is situated the pipes can be fixed without regard to direction or level.

The pipes and radiators can be automatically heated to any temperature, which may be maintained without the dampers being touched; and, as it is impossible to exceed the desired temperature without altering the regulating lever, no boiling over can result, however hard the boiler is fired. The system may be worked with a boiler pressure as low as 3lbs. per square inch, or with exhaust steam only.

This system is applicable to existing buildings, as the whole apparatus can be installed without undue interference with the structure. The apparatus is shown in actual use at this stand.

The following heating installations have recently been carried out, or are now in course of construction:—Ritz Hotel (extension to heating); Cavalry Club, architects Mewès and Davis; Albemarle Club, architects, Smith and Brewer; District Railway Offices, St. James' Park Station, architect, H. A. Ford; 4, Crosby Square, Arthur Blomfield, M.A., F.R.I.B.A.

THE COALBROOKDALE CO., LTD., COALBROOKDALE, R.S.O., SHROPSHIRE. STAND 182. WALL SPACE.

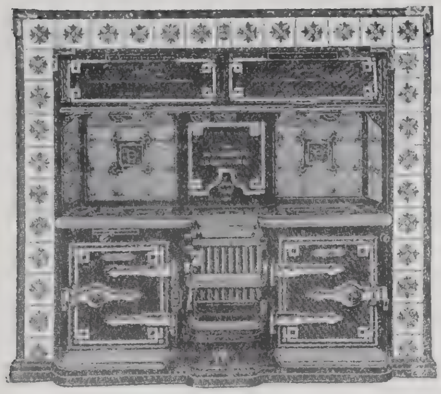
Particular attention is drawn to two specialities exhibited at this stand—the "Tilt" fire, and the "Thrift" range.

The former is so constructed that when first lighted it can be tilted bodily by means of a poker so that the bottom of the fire assumes a sloping position. This action causes the lower half of the back to incline backwards, leaving the upper half in its original position, where it acts as a blower. When the coals are incandescent, it is merely necessary to draw out the canopy and lower the fire again, to make it slow burning.

The "Thrift" portable range possesses novel features throughout its construction. These include a patent fire box, by means of which hot air is supplied to the fire at the back and sides, thus assisting combustion of fuel very materially.

Certain kinds of cheap coal—if any coal can ever be said to be cheap—we mean those classes of coal that are usually regarded as inferior, and are comparatively low in price, such as cobbles and nuts, would often be preferred for domestic consumption if only they were a little more tractable. When once they are fairly alight, they burn much brighter and better than many of the so-called superior coals, and give more heat and less soot; but the difficulty is to get them to start on their brilliant career. As this trouble occurs at exactly the time when it can be endured with least patience—in the morning, when every moment is precious—this consideration determines the choice in favour of a softer and sootier coal, which is a pity. We take it that by means of appliances such as those exhibited at this stand this preliminary objection is entirely overcome, and that therefore the "Tilt" fire and the "Thrift" range make equally for efficiency and economy.

THE EAGLE RANGE AND GAS STOVE CO., LTD., 127, REGENT STREET, LONDON, W.
STAND 179. WALL SPACE.



The "Premier" Gold Medal Eagle range, with tiled covings, patent hat closet canopy, and tiled mantel frame, has all its flues (including the boiler flue) enclosed; and hinged front bars afford convenient access to the boiler flue, or for clearing out the firebox, while the boiler itself can be easily removed from the front, without disturbing the range. There is an improved reversing damper for heating either the bottom or the top of the baking oven—or, if desired, the heat can be directed to both top and bottom simultaneously—and the improved movable bottom grate can be easily raised or lowered with one hand. The draught is indicated and regulated by means of a patent device, while the oven ventilation and the smoke-consuming and soot-eliminating fire-cheeks are of guaranteed efficiency. There is a separate boiler damper. All the wearing parts are interchangeable.

In the New Eagle portable range, the ovens, which are thoroughly ventilated, are exceptionally large for the size of range, and are fitted inside with a revolving meat-hanger. An air-chamber to the over door is formed by an inner sheet, to prevent rapid cooling when the outer door is opened. Bath boilers, with hot closets for worming plates and dishes, are provided with the ranges designated H.P., while those known as O.B. are fitted with low-pressure side boilers. The fire is easily altered from open to close, the bottom grate can be raised or lowered to any required position, and the damper and draught-regulating mechanism is self-indicating. The boilers are of improved construction.

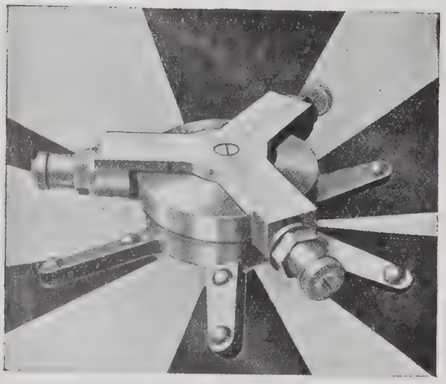
FENLON AND SON (INCORPORATING G. SHREWSBURY AND CO.), TUDOR STREET, LONDON, E.C.
STAND 183. ROW K.

Messrs. Fenlon and Son exhibit a large selection of their geysers, gas baths, gas boilers, etc., among which may be mentioned the following:—The "Tudor," "Fleet," "C.C. Fleet," "Mani-Supply," "Calda" and oil geysers; "City" cast-iron, "Ludgate" porcelain and "Plunge" tinned iron baths; "Excelsior" gas-heated baths; cork bath mats; registered asbestos gas fire burners; "C.C. Fleet" and "Triad" gas-heated circulating boilers for attachment to ordinary hot water pipes from kitchen range; "Unique" and "New Era" self-contained gas or oil-heated radiators with patent safety valves; "Temple" gas-heated hot water apparatus with copper boiler and cast-iron pipes for heating greenhouses, motor houses, etc.; "We-do-get-'ot" and "Ephaness" gas or oil-heated hot water apparatuses; "Reliance," "Nonpareil" and "Registered" gas boilers.

These specialities are the products of the two incorporated firms—Fenlon and Son, and G. Shrewsbury and Co.

It has been interesting to watch the growth of this firm during a series of years. Success has been achieved, we should suppose, mainly as a result of the thorough enthusiasm of the proprietors, who have always taken a keen practical and personal interest in all that pertains to their business, and who are never satisfied until they have succeeded in satisfying the customer. They have taken out many patents, especially for heating apparatus, and in each case the point in which improvement could be effected has become evident as the result of close observation, and one might almost say loving solicitude, Fenlons evidently desiring nothing so much as to render their apparatus as perfect in every respect as anxious study could make it. Hence the firm's "expansion by heat," so to speak, has been well earned.

THE GLOVER-LYON VENTILATION CO., LTD., CAXTON HOUSE, WESTMINSTER, LONDON, S.W.
STAND 208. ROW N.



This exhibit is one which architects should make a special point of inspecting, as practical demonstrations will be given in order to prove the correctness of the theories upon which this system of ventilation depends.

The company has erected a room fitted up with an apparatus which can be seen in action. This room will be filled with smoke, which will in the course of a few minutes be removed and replaced by fresh air introduced at a suitable temperature through numerous specially graduated apertures, without draught. The extraction is effected in a corresponding manner, and the result is that a slow sweep of air passes through the room from end to end or from side to side—as the necessities of the case may dictate. The friction drive, which has recently been introduced, gives greater control over the speed of the fan to which it is attached, and, moreover, enables a smaller motor to be used.

The practical demonstration of the efficiency of the system will doubtless attract a great deal of attention, and it will go much further towards convincing the sceptical than would the clearest and most eloquent exposition of theory; and it leaves no room for doubt as to the soundness of the theory, nor as to the effectiveness in parctice.

Among some of the buildings in which the Glover-Lyon system has been adopted are the following: The University of Cambridge; Farrow's Bank, London; the Royal Society of Medicine; the Bath Club, London; the University Club, Edinburgh, J. M. Dick Peddie, architect; Central Throat Hospital; Criterion Restaurant, London; Colston Hall, Bristol, Hall-Jones and Cummings, architects, etc.

HARTLEY AND SUGDEN, LTD., ATLAS WORKS, HALIFAX. STAND 123. ROW G.

At this stand Messrs. Hartley and Sugden exhibit a selection of their boilers, and attention may be drawn to the "Savile"—for domestic supply or heating apparatus—the "Hospital," the "Villa," "Manor," and "White Rose" boilers.

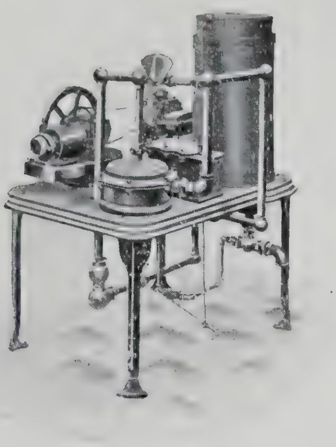
The Chatsworth boiler for heating greenhouses, and four different types of range boilers, are also shown.

The "Effective" and "Dromana" boilers (of wrought iron) for low-pressure steam heating, a series of plain and fluted radiators, are among other specialities made by this firm.

This exhibit comprises every form of boiler which can be required for heating apparatus of whatever pattern or design.

This firm has for many years enjoyed a high reputation for the manufacture of high-class boilers for every conceivable service in connection with heating apparatus. The boilers of this firm are built upon the sectional principle. One hardly looks for elegance in a boiler, efficiency being all that can be reasonably expected of it; and the ordinary ugly boiler is, as a rule, mercifully hidden from the common gaze. Messrs. Hartley and Sugden's boilers, however, are exceptionally handsome, and no special measures need be taken for their concealment. In fact, any one possessing one of these very presentable boilers would be glad to keep it well in sight. Its decidedly patrician appearance strongly recommends it for use—or, rather, explains its extensive adoption in country houses, and for the heating of conservatories and greenhouses.

THE "LOCO" VAPOUR GASLIGHT CO., LTD., 6, ST. ANNE'S PASSAGE, KING STREET, MANCHESTER. STAND 160. WALL SPACE.



At this stand is exhibited the company's "Loco" Air-Gas Machine, which generates the petrol vapour and admixes it with air in the proportions necessary for lighting, heating, and cooking. The problem of lighting country houses or any buildings which are situated at a great distance from a gas works has been in great part solved by the adoption of the petrol-vapour principle, which has much to recommend it, provided that the machine is a safe one. In the case of the "Loco" apparatus, the petrol is stored in a sealed tank outside the machine house, and automatically conveyed into the machine by a small pipe in minimum quantities, by which arrangement it will be seen the question of safety has been very carefully considered. The machine has no soldered joints or needle valve feed, and the petrol is supplied through a mercury regulator.

Orders for "Loco" gas installations have been received from the following :—Stonyhurst College, near Blackburn ; Lord N. C. Stuart, House of Falkland ; C. B. Haworth, Esq., Illawalla, Poulton-le-Fylde ; the Duke of Devonshire, Chatsworth (agent's house) ; J. Grimble Groves, Esq., J.P., Bank Hall ; Commander Hudson, R.N., Frogmore, Ross ; Disley Co-operative Society ; Crewdson Waterhouse, Esq., Prestbury ; Messrs. Fodens, Ltd., Sandbach ; William Challoner, Esq., Blackpool ; Tom Jackson, Esq., Risley Shooting Lodge ; C. B. Craven, Esq., "Westwood," Clayton Green ; Messrs. Bamber Bridge Spinning Co., Ltd. ; Messrs. Wm. Griffiths and Sons (Liverpool), Ltd. ; Pinxton Co-operative Society ; Henry Bratt, Esq., J.P., C.C., Hartford ; Messrs. Pilot Spinning Co., Ltd., Bury. These names, of course, represent only a small selection.

LONDON WARMING AND VENTILATING CO., LTD., 20, NEWMAN STREET, OXFORD STREET, LONDON, W. STAND 175. WALL SPACE.

The smoke nuisance problem would cause but little further trouble if anthracite were more generally used. In this respect it is almost an ideal fuel, and as a heat-giver it is unrivalled, provided you can only get it to burn. Unfortunately it is rather intractable, and is virtually impossible for the ordinary domestic grate. Here, however, we find special provision for the consumption of anthracite ; and the grates and stoves designed with that object in view and here exhibited will be sure to receive the earnest attention of those who are keenly interested in questions of smoke abatement and fuel economy ; but more especially by those architects who are called upon to design houses for districts, either at home or abroad, in which a plentiful supply of anthracite is available. But the goods here shown are not exclusively related to the consumption of anthracite.

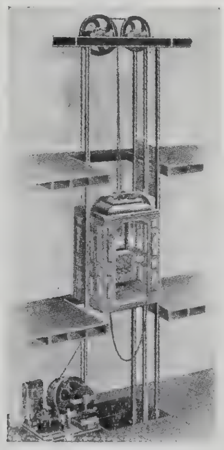
This firm makes a speciality of grates and stoves, chiefly for the consumption of anthracite or smokeless coal.

Attention is drawn to the "Florence" grate, in which a secondary flue (used in conjunction with the ordinary firebrick back) is introduced, which provides the necessary draught to ensure perfect combustion of anthracite. This flue is controlled by an adjustable canopy, which, when shut, seals the principal flue, and brings the secondary one into use. The patentees claim that when ordinary coal is being used the smoke is drawn through the fire to a point where the heat is practically incandescent, by which it is to a large extent consumed.

This stove gained the only medal awarded by "The Coal Smoke Abatement Society," after tests with bituminous or ordinary coal.

Another interesting exhibit is the "Salamandre" stove, similar to those used on board the "Discovery."

MEDWAY'S SAFETY LIFT CO., 10, BUSH LANE, CANNON STREET, LONDON, E.C. STAND 30. ROW B.



This exhibit consists of several examples of lift gear, the principal one being Medway's Electric Passenger Lift Gear, which is entirely self-contained and has a strong cast-iron bed-plate. The winding of the lift is accomplished by means of a spiral-cut drum, or a turned grooved wheel, according to the position of the gearing space. A special feature is the interlocking attachment, which prevents the opening of any gate or door unless the lift is at a standstill in front of it, and in addition does not allow of the lift being moved away from any floor unless all the gates or doors are shut.

The remaining exhibits include Medway's Push-Button Electric Lift, Medway's Silent Self-sustaining Dinner Lift (made in all sizes with single or double cages), and Medway's Patent Safety Gate Apparatus.

The following is a list of some of the customers for whom the company's lifts have been supplied : The Duke of Devonshire, Devonshire House, Piccadilly, W. ; Vickers, Sons, and Maxim, Barrow-in-Furness (2) ; the Royal Mail S.S. Co., Southampton ; the South Eastern and Chatham Railway, Herne Hill, S.E. ; the London County Council, Woolwich, S.E. (2) ; St. Thomas's Hospital, London (3) ; A. B. Markham, M.P., 48, Portland Place, W. ; the Gwalia Hotel, Upper Woburn Place, W.C. ; the Tavistock Hotel, Covent Garden, W.C. ; the General Motor Cab Co., Kennington, S.E. ; Wholesale Co-operative Society, Ltd., Northampton ; J. Sainsbury and Co., Blackfriars, S.E. (2) ; Barrett and Co., Wood Green, N. ; Clarke, Nicholls and Coombes, Hackney Wick, N.E. ; Maynards, Ltd. ; Tottenham, N. ; Batger and Co., Stepney, E. ; Eagle Confectionery Co., Bow, E. ; S. F. Edge, Ltd., 14, New Burlington Street, W. ; Rye and Eyre, 13, Golden Square, W.

It will of course, be understood that this list could be greatly extended.

MATTHEWS AND YATES, LTD., 84, GRAYS INN ROAD, W.C., AND SWINTON, MANCHESTER. STAND 162. WALL SPACE.

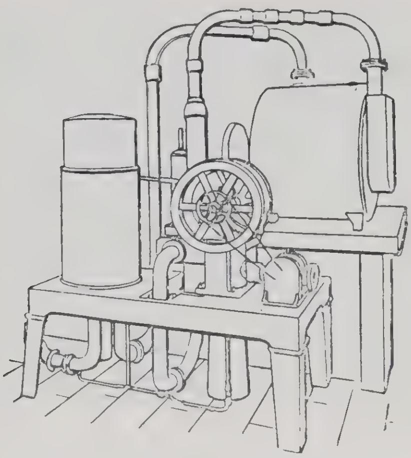
At this firm's stand the section most interesting to builders and those using wood-working machinery is probably the pneumatic collection of the refuse thrown off by the machines, and of this the firm have a small plant at work showing how the refuse is handled. The apparatus consists of a powerful suction fan, to which the machines are connected by means of galvanised iron piping. The fan sucks away the sawdust and chips, and discharges them into a dust separator, so that they are deposited in a heap, and the air passes away to atmosphere.

The firm also show their well-known cyclone fans for ventilating and plenum heating. These are made either belt-driven, steam-driven, or directly driven by electric motors on either continuous or alternating supplies. These fans are in use in most of the public buildings in London and in the Royal palaces.

Along with the fans are their cyclone steel plate blowers and exhausters, made in heavy and light patterns, the former for refuse collecting, induced draught dust collecting, forge blowing, mine ventilating, or any work requiring high pressure and long continuous running, and the latter for ventilating where large volumes of air are required at low pressure.

A few of the buildings in which the cyclone fans and blowers are installed are as follows :—Buckingham Palace, Windsor Castle, Houses of Parliament, Home Office, Somerset House, Royal Mint, Natural History Museum, National Portrait Gallery, Royal Courts of Justice, Custom House, National Physical Laboratory, Patent Office, Scotland House, Brompton new County Court, Westminster County Court, Tower of London, Board of Trade Offices, new War Office, etc., etc.

THE NON-EXPLOSIVE GAS CO., LTD., 85, LONDON WALL, LONDON, E.C. STAND 156. WALL SPACE.



Although the saturation of air with a definite proportion of petrol vapour has been known for fifty years to produce a cheap and efficient medium for lighting and heating, it is only during the last decade that the discovery has been applied to commercial purposes. The great difficulty hitherto found has been the production of a machine which shall be absolutely safe, and it is in this direction that the energies of inventors have been chiefly applied.

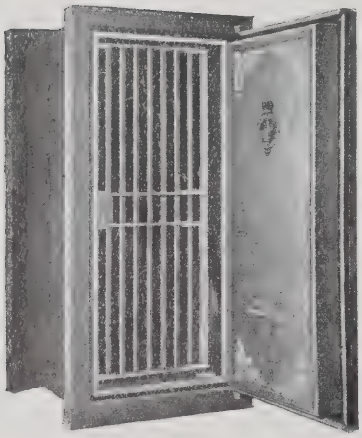
The machine which is manufactured by this company is worked by a hot-air motor and is drawn by a jet of gas placed underneath. The carburettor has no moving parts, and the correct proportioning of the vapour and air is secured by the supply of the latter being controlled by a meter.

Ordinary incandescent mantles (either upright or inverted) may be used with the gas, which gives a brilliant light entirely free from ultra violet rays, which are said to be harmful to the sight.

The firm can produce many references to installations of their system that have given every satisfaction.

Among recent installations laid down by the company are the following:—Perrystone Court, Ross, Herefordshire; Sion House, Chaddesley, Worcestershire; Tara Hall, Tara, Ireland; The Brambles, Iver Heath, Bucks; Earl Soham Grange, Suffolk; The View, Swanage, Dorset; Hyde End, Brimpton, Berks; London and South-Western Rly., Worplesdon Station; War Office, Newhaven Fort, Sussex; War Office, Riding School, Netheravon, Wilts; Rooksbury Mill, Andover; Millfields Works, Wolverhampton; Scunthorpe Works, near Doncaster; The Towers, Downe, near Orpington, Kent; British Medical School, Woodhouses, Ashton-under-Lyne; Bettyfold, Coniston.

PHILLIPS AND SON, SPEEDWELL WORKS, BIRMINGHAM. STAND NO. 22. ROW B.



The resource and ingenuity of the modern burglar have become so formidable since he has adopted scientific means of plying his trade that the makers of safes have been hard put to it to keep abreast of him. The problem has not proved insoluble, however, and at this stand are to be seen a number of strong-room doors and safes which are held by the makers to be not only burglar-proof, but fireproof. Practical tests have at least demonstrated the value of Messrs. Phillips and Son's safes in the latter respect, and as regards the former it is difficult to believe that any burglar could open such safes as are here shown, when it is remembered that the material is undrillable armour-plate, and the bolts are of the continuous "channel" type.

An especially interesting safe—the door of which is made of Naxian steel 2ins. thick—is on exhibition, designed expressly for the use of diamond merchants and those whose business involves very large risks. The patent "Channel" bolts encircle the door and frame, and are drawn inwards by turning the handle. This safe is protected against oxy-acetylene gas blowpipes.

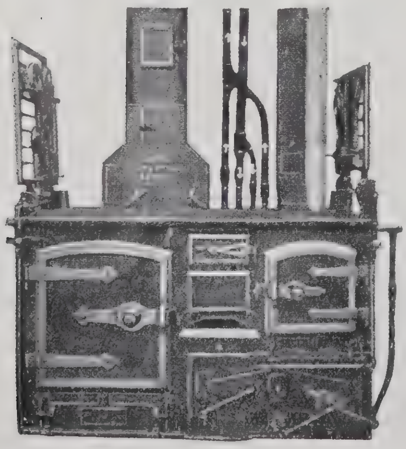
Amongst others the following well-known firms and corporate bodies are users of Phillips and Son's safes and strong rooms:—London City and Midland Bank (various branches); Hibernian Bank, Ltd. (various branches); York City and County Bank, Ltd.; H.M. Post Office; H.M. War Office; H.M. Admiralty; various district councils, local boards, county registrars, unions, and barracks; Marquess of Anglesea; Allsopps and Son, Ltd., Burton; Belfast and County Down Railway Co.; Belfast and Northern Counties Railway Co.; Belfast "Evening Telegraph"; Jas. Baldwin and Sons, Ltd., Birmingham; Baldwins, Ltd., Pontypool; Bank of Burmah, Rangoon; J. Barnsley and Son, Birmingham; etc., etc.

J. F. PHILLIPS AND SON, 21, OLD QUEEN STREET, WESTMINSTER, LONDON, S.W. STAND 205. ROW N.

It is broadly claimed for Barker's patent cable system of low pressure hot-water heating, which may be seen in full action at this stand, that it can overcome any obstacles, and maintain a good circulation of hot water at any temperature, in all circumstances, however disadvantageous, without requiring excavations, channelling or skilled attention, and often at a lower total cost than an ordinary system. It is automatic, and by its adoption hot water at any temperature can be freely circulated to radiators through very small pipes fixed without regard to direction or levels. The heating and circulating appatus required for this system, in addition to the boiler, is known as the "Thermo-Syphonizer," and is entirely enclosed and self-contained, and is fed by a single steam-pipe, conveying exhaust steam or other low-pressure steam at a pressure of 1½lbs. per square inch upwards, according to circumstances.

The following is a list of a few representative installations carried out in Barker's patent "Cable" system:—Cardiff Asylum, Newport Asylum, Bodmin Asylum, Newport Workhouse Infirmary; Padna Hospital, Italy; Rashleigh Sanatorium, Okehampton; Krugersdorp Town Hall (S. Africa); University of Leeds; University of Johannesburg; Standard Bank of S. Africa, Johannesburg; Banca d'Italia, Bologna, Italy; Newcastle Edinburgh Life Office; Cockerill Iron Works Offices, Belgium; M. Worth's shops, Rue de Paix, Paris; National Radiator Co.'s Works, Hull; Armley High Schools, Leeds; Barry Schools, Wales; Edinburgh Art Schools, Brighton Aquarium, Nottingham Hippodrome, The Agapemone, Bridgwater; Tain Church, Rusper Church, St. John's Church, Manchester; Worthing Chapel; Union Church, Brighton; Villa d'Este Hotel, Cernobbio, Como, Italy; residence of Mr. T. H. Brockbank, St. Bees, etc., etc.

THOMAS POTTERTON, CAVENDISH WORKS, BALHAM, LONDON, S.W. STAND 31. ROW B.

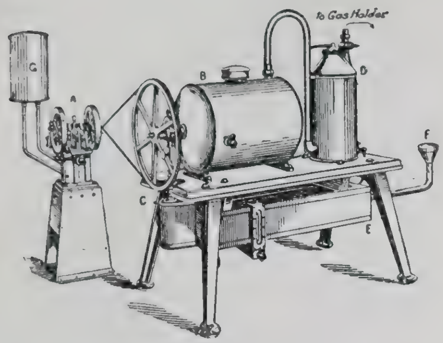


A comparatively new idea in ranges is exhibited at this stand, in the "Queen" combined gas and coal range. Since its first appearance at the Ideal Home Exhibition last October, the patentee has effected further improvements in it. Made in 3 sizes, this range has one oven and a hot closet, and oven cooking, hot-plate cooking, and water heating (for bath or sink supply), may be done with either coal or gas. An important innovation is the provision of the "Victor" gas boiler, which affords a supply of hot water when the coal fire is not in use. A feature which should be noted is that as hot water is withdrawn, the gas valve opens automatically, giving increased flames at the burner until the normal temperature of the water has been restored.

This exhibitor has for many years worked incessantly and successfully in the direction of improvement in stoves, flues, and heating apparatus, and his knowledge of the subject, derived from long and active practice, must indeed be extensive. It would almost seem as if there is something in the study of heating apparatus that tends to expand and develop latent genius; for certain it is that from the days of Count Rumford, and even earlier, an extraordinary amount of energy and talent has been devoted to this form of making "a happy fireside clime."

About Mr. Potterton's inventions there is always observable the evidence of a thoroughly practical acquaintance with the actual requirements of the case; and his exhibits this year—and, by the way, his is one of the stands that one always looks for at the building exhibition—are by no means an exception to this excellent rule. From the point of view of practicability, they will repay the closest scrutiny.

THE PRAED PATENT SAFETY GAS LIGHT CO., LTD., 20, VICTORIA STREET, LONDON, S.W. STAND 154, WALL SPACE.



The possibilities of petrol have doubtless many revelations in store for us. It is, indeed, rather surprising that so useful an agent should have been so long unexploited.

The Praed Safety Gas Plant generates gas from petrol vapour, which is combined with air. The percentage of petrol vapour is very small—about 1½ per cent., and it is to this fact that it owes its immunity from explosion. It is also non-poisonous, and may be inhaled without any risk.

The gas produces a blue flame of high temperature, and is successfully burned for illuminating purposes by means of mantle burners. It has many other uses, and can be employed for cooking, heating water, etc., but being non-explosive, it cannot be used for power. A small hot-air motor actuates an air-propeller and a pump, delivering respectively in the requisite proportions, air and petrol into the gas-producing chamber. Particular care has been taken in the design of the plant to prevent the leakage of petrol.

Plants have been erected for the North Staffordshire Railway, at Trentham Station, Ford Green Station, Sudbury Station, and Rochester Junction, carried out to the specification of the chief engineer of the railway company; installations at Pirbright Camp, for the officers' mess, wet canteen and dry canteen, carried out to the specification of the Canteen and Mess Co-operative Society; installation at Fort George, Nairnshire, carried out for the War Office.

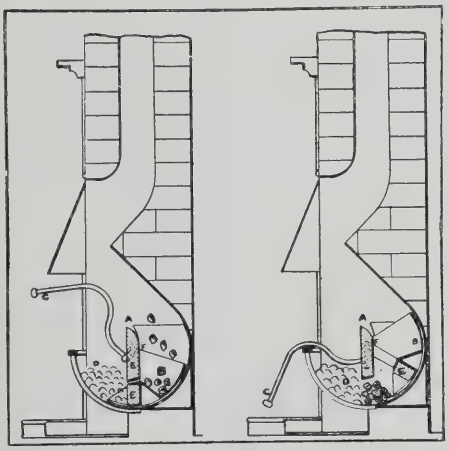
SMITH AND WELLSTOOD, LTD. 11, LUDGATE CIRCUS, LONDON, E.C. STANDS 170 & 171. WALL PACE.

An extensive assortment of interiors of "period" designs, some of which are exceedingly good, is the chief feature of this firm's exhibit. Messrs. Smith and Wellstood have recognised that architects will not specify grates of florid design, and that simplicity in combination with good taste, has become an essential condition to a ready sale. These interiors are in several instances made with side-wings or covings designed in harmony with the interiors, the intention being that tiled cheeks may thus be dispensed with.

The firm's goods are made with three finishes:—(a) Blacklead, (b) bright steel, and (c) electro-bronze. In the latter there are two varieties, one of which, antique electro-bronze, is similar in colour to an old penny. The "Wellstood" range, in which have been embodied some recent improvements, and a selection of newly-designed anthracite stoves are also exhibited.

The following is a list of some of the buildings (with their architects) in which "Wellstood" ranges and grates have been used:—Ritz Hotel, Mewès and Davis; Royal Liver Friendly Society, John Belcher; Edinburgh Life Assurance Co., Edinburgh, J. Dick Peddie; New Cookery Training College, Hampstead, Beazley and Burrows; Duke of York's Schools, Dover, Sir Henry Tanner; L. and S.W. Bank, Arthur C. Blomfield; Alliance Bank, Joseph and Smithem; official residence First Lord of the Admiralty (alterations), Sir Henry Tanner; new house, Norwich, P. Morley Horder; new house, Woolhampton, Mervyn Macartney; Henley Hall, Ludlow, Williams and Wratten; H.M.S. "Prince of Wales," The Admiralty; Prince Louis of Battenberg's room; Palace of the King of Siam, Palace of the Amir of Afghanistan, Palace of Seoul, Korea.

SMOKE CONSUMPTION, LTD. (COWPER-COLES PATENTS), 82, VICTORIA STREET, WESTMINSTER, LONDON, S.W. STAND 52. ROW C.



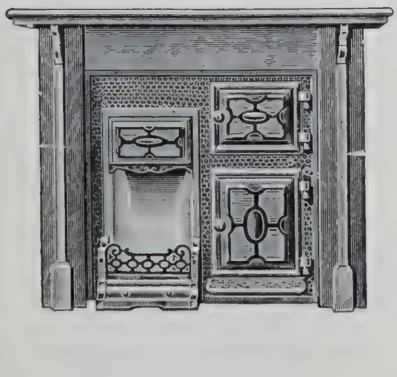
This company's principal exhibit is a model chimney fitted with caloriser patents, illustrating the apparatus which, when fitted to boilers and boiler flues, completely consumes the smoke. The model can be seen in operation by those interested in this subject, and there are also diagrams showing the application of the apparatus to Lancashire boilers.

Of greater interest to architects is a full-sized model of a domestic grate of the "underfeed" type. This is a very clever but simple invention, by which a hand lever controlling a pivot-hung coal tip causes the fuel to be shot into the bottom of the fire, through whose incandescence the newly-formed smoke must pass and so be consumed. This is an entirely new smoke-consuming grate, and is deserving of the serious attention of the profession. "Osbornite," a new smokeless fuel, and two patent ventilators, are also exhibited.

The war against smoke enlists the fullest sympathy of every architect, as well as of every hygienist; and the promoters of this Exhibition have always very properly laid the utmost stress on the necessity for smoke abatement.

Architects and other artists realise, of course, that smoke does more than make their work look grimy. There are those who affect the strange fallacy that St. Paul's Cathedral looks all the more characteristically London-like for its coating of soot; but the theory would hardly commend itself to Sir W. B. Richmond, who has done so much to beautify the interior of St. Paul's, and who would probably give much to see its exterior freed from its coating of soot, which, some say, is the Nemesis that has come to it as a reminder that it was built partly out of the proceeds of the coal dues. Sir William is, in fact, one of the most stalwart opponents of the smoke nuisance; and he would probably approve of this company's method of preventing that nuisance at its source.

THE STANDARD RANGE AND FOUNDRY CO., LTD., WATFORD, HERTS. STANDS 137 & 138. ROW H.



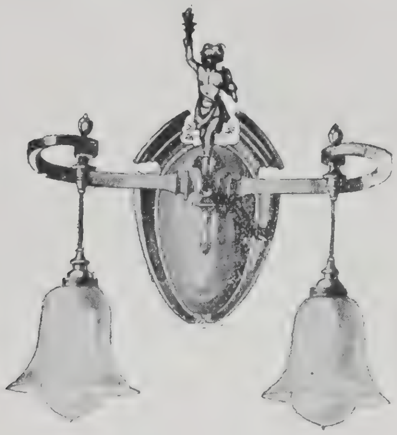
A stove which has no bars, needs no poker, and will burn any fuel without attention for hours at a time, should have a special interest for householders. The body of the fireplace is bowl-shaped in section, and at the bottom—in the centre—is a domical iron grating through which the ashes drop into a pan beneath. The sloping curved sides of the stove cause the coal to slip down towards the grating, thus making a compact fire to the last.

For hospitals and sick-rooms the "Burkone" fire—being self-stoking and consequently noiseless—should prove of particular value.

It can be fixed in place of stoves now obsolete, without material alteration to the hearth, and it has the further merit of standing on the floor level—thus obviating any excavation.

The following is a list of buildings (with their architects) where this Company's manufactures have been used:—Stanley Villas, Station Road, Amersham, O. Kennard, architect; Sandland Grove, Walton-on-Hill, H. J. Wise, A.R.I.B.A., architect; The Avenue, Tadworth, Surrey, Messrs. J. Hatchard-Smith and Sons, architects; new offices, Mansfield Colliery, Notts, F. Rowntree, architect; Royal Masonic Schools, Bushey, C. P. Ayres, architect; Cook's new offices, Strand, Messrs. Smee and Houchin, architects; Hertfordshire County Council schools, W. H. Syme, architect; Dickinson's Institute, Croxley Green, near Watford, C. P. Ayres, architect; new schools for the Corporation of Southend-on-Sea, T. H. Elford, architect; private houses, Newport, Mon., E. Maples-Linton, architect; new Council offices, Bushey, A. Durst, architect; new Manor House, Maesycrugiau, Carmarthenshire, Arnold Mitchell, architect; the Ecclesiastical Commissioners' Buildings, Millbank Street, Westminster, W. D. Caröe, architect; new Mansion, Bramley, Arnold Mitchell, architect, etc., etc.

C. J. THURSFIELD AND CO., 28, BERNERS STREET, LONDON, W. WORKS, BIRMINGHAM. STAND 173a, WALL SPACE



Electric light fittings of all kinds, the designs of which reveal a high standard of merit, are exhibited at this stand. They are supplied with various finishings, such as old brass, bronzed, gilt-colour, polished brass or antique copper, and can be had in iron (armour bright), and with an oxydised silver or silver armour finish. This firm also executes work in cast bronze.

A speciality, which will interest hospital architects, is a pendant for carrying the light in operating theatres. This is provided with a patent universal joint, which, while of simple construction, enables the light to be set at any required angle.

Some of the models exhibited are reproductions of old candelabra, etc.; others are frank translations of the details of the period, adapted to modern requirements.

The following are a few of the many recent public installations for which Messrs. Thursfield and Co.'s fittings have been selected:—Great Northern Hotel, Leeds; the Manchester and Counties Bank, Oldham; the Manchester and Counties Bank, Bolton; Albury Hall, W. J. Parker, architect, London; Carnegie Library, Wednesbury, S. T. Holliday, architect, Birmingham; Parish Church, Carlton, Glasgow; Royal National Orthopædic Hospital, London, Rowland G. Plumbe, architect; Grand Theatre, Oldham, Thos. Taylor, architect, Oldham; Bay Hotel, Falmouth; Parish Church, Stoke-on-Trent; Metropolitan Bank, Ltd., Swansea, F. Adams Smith, architect, London; St. Albans, Redland, Bristol, Messrs. Rodway (A.R.I.B.A.) and Dening, architects, Bristol; new Art Gallery and Museum, Bristol; Royal Barracks, Devonport; R.N. Barracks Church, Devonport; Imperial Hotel, Torquay; Mudies Library, London, etc., etc.

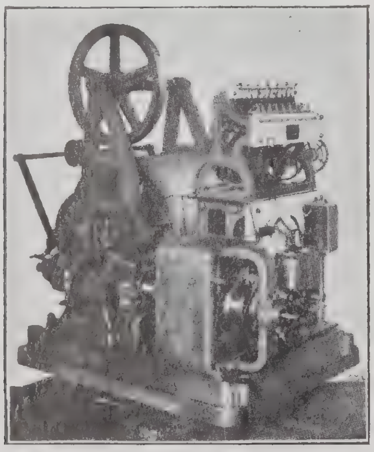
THE TEALE FIREPLACE CO., 38, COOKRIDGE STREET, LEEDS. STAND 173. WALL SPACE.

The barless type of fireplace—which has so largely come to the front of recent years—originated with this firm, which has been associated with the construction of fireplaces on scientific lines for over 35 years. At this stand may be seen representative types of this company's fireplaces, etc., designed to suit various requirements and embodying in their construction the most recent improvements. Among these may be noted the Patent Floor Protector, consisting of a sheet of iron which can be drawn out from under the hearth. This plate is attached to a tray, upon which rest two light ashpans, and the whole contrivance may be drawn out for the removal of ashes, without disturbing the fire. For use in sick rooms, this arrangement is of great value.

The firm also manufactures kitchen ranges, hospital ward stoves, etc., and undertakes hot-water heating.

The following is a list of hospitals where this company's ward stoves, etc., are in use: The London, Royal National Orthopædic, and Tottenham Hospitals, Rowland Plumbe; Lying-in Hospital, City Road, and Jewish Home for Incurables, M. E. Collins; Park Hospital, Lewisham, E. T. Hall; Rous Hospital, Newmarket, J. G. Oatley; Victoria Hospital for Children, Chelsea; Seamen's Hospital, Greenwich; the Royal London Ophthalmic, Middlesex, London Fever, Royal Free, and Evelina Hospitals; Royal Infirmary, Derby; Chelmsford and Essex Hospital, Chelmsford, etc., etc., Young and Hall.

THE TITAN LIFT AND ELECTRIC CO., 65, 67 AND 69, MOUNT PLEASANT, LONDON. W.C. STAND 271. ROW T

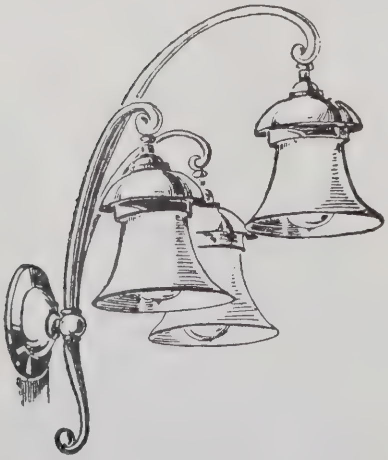


The lift as an institution has long been so thoroughly acclimatised in this country that it has now come to be regarded as absolutely indispensable to every establishment of any pretensions—not necessarily a passenger lift—though this kind has multiplied exceedingly within the past few years, its use on the tube railways having rendered it familiar. The Titan lifts—which are electrically driven—may be worked in various ways, such as the hand-rope and the switch systems; but in either of these an attendant is necessary.

Architects should therefore take particular note of the Titan push button system, by which this functionary is dispensed with. This type of lift is operated by means of a series of buttons—one for every landing, and when one of these is pressed the lift travels from whatever position it may be in, and finally stops opposite the door on the required level. After entering and pressing one of the buttons in the lift, it will move up or down to whatever level the button indicates. There are various safety devices in connection with the system by which it is impossible to open the landing doors until the cage is standing opposite to them, or start the cage unless all the doors are shut.

Titan lifts have been specified by the following architects: John Belcher, R.A.; Frank Verity, G. A. Lansdown, C. W. Stephens, Max. J. Zimmermann, Adams and Biggs, Worley and Armstrong, F. W. Foster, G. A. Sexton; and have been installed in the following buildings: Orb Factory, Luton; 44, Dover Street, W.; 25, Berkeley Square, W.; 7, Cleveland Road, S.W.; Elliot and Co., Bayswater; York Street, S.W.; 190, Brompton Road, S.W.; Blenheim Club, S.W.; General Motor Cab Co.; 9 and 10, Marble Arch, W.; 28, Margaret Street, W.

TREDEGAR AND CO., 56, VICTORIA STREET, WESTMINSTER. STAND 230. ROW O.



One of this firm's smaller electric lighting sets for country houses, guaranteed to light twenty-five lamps, each of 16-candle power, at 1d. per hour, is sure to be inspected with care and attention, since architects most certainly regard it as meeting a common requirement.

The engine for these lighting sets uses common petroleum for fuel, and sparking coil for ignition. It can be started by means of the blow-lamp supplied, or by using petrol for a few minutes when commencing the run.

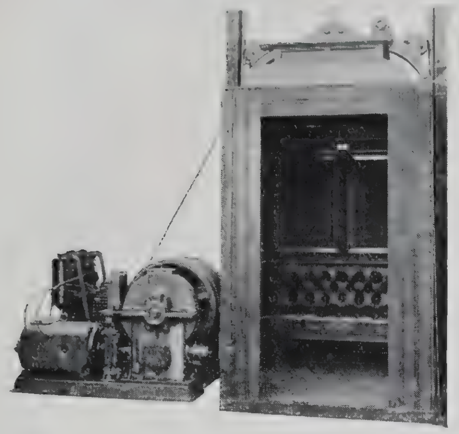
The dynamo is a well-built, simple machine, requiring a minimum of attention, and the switchboard is a model of convenience.

In another quarter, equal interest will be centred in the special builders' lighting set, for lighting buildings, and engineering works while in course of construction. It can be erected with the utmost expedition, and, by means of armoured wandering leads, the lights can be taken to any part of the building; the runs being extended to any length by simply plugging together the necessary pieces.

The firm undertake the lighting of works in progress, and they were responsible for the whole of the electric lighting and power during construction of the Baker Street and Waterloo Railway, the Piccadilly Hotel, and the Waterloo Station improvements.

Although stress is here laid on exhibits of special professional and trade interest, it must not be overlooked that Messrs. Tredegar do a large business in general electric work, and supply complete installations, from engine to lamp, and they exhibit a large number of high-class fittings of eminently artistic design, showing great catholicity of taste with respect to ideas, styles, and periods. They also specialise in wood fittings for electric light installations, and here again excellent taste and abundant variety are conspicuous.

R. WAYGOOD AND CO., LTD., FALMOUTH ROAD, LONDON, S.E. STAND 58. ROW D.



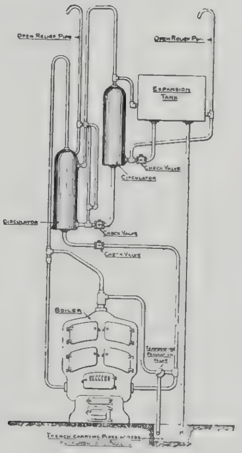
Messrs. Waygood and Co. exhibit—in addition to a number of working models—a full-size electric passenger lift travelling from the ground floor to the gallery. A feature to be noted is the enclosing of the gear in a cast-iron case, with the worm beneath the wheel, by which arrangement it is always running in oil. Another very important point is the easy access provided to the bearings, which enables repairs or adjustments to be effected without dismantling the gear.

It is difficult in a short notice such as this to describe in detail the many improvements and safety appliances which are embodied in this lift, but visitors will have every opportunity of satisfying themselves of its completeness in all respects by actual inspection.

The working models previously mentioned illustrate respectively Waygood's full automatic push button electric lift, a suspended hydraulic passenger lift, and the Waygood patent hydraulic luffing crane. There are also exhibits of electric rope grips, and samples of wrought-iron and wirework suitable for lift enclosures.

Waygood's lifts have been installed in the following buildings (architects' names are in parentheses):—War Office, Whitehall, New Local Government Board Offices, Whitehall, Admiralty buildings, S.W. (under the supervision of the chief engineer to H.M. Office of Works; Grand Trunk Railway Co. offices, Cockspur Street, W., premises for Pearson and Sons (Sir Aston Webb); St. Bartholomew's Hospital (I'Anson and Sons); Chartered Bank of India, Old Broad Street (Gordon and Gunton); new Sessions House, Newgate Street, E.C. (the late E. W. Mountford); new Strand Palace Hotel (C. Ancell); offices of Commissioners of Woods and Forests, Whitehall (J. Murray).

WERNER, PFLEIDERER AND PERKINS, LTD. STAND 255 AND 256. ROW R.



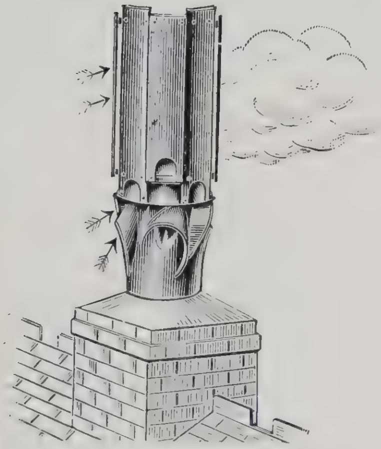
One delightful peculiarity of the common or garden flow and return system is that it takes a highly-trained expert to understand its interesting little divagations. Such an expert is not always available, and is usually very expensive. He gives his advice with the lordly air of a consulting physician, and the mechanics who are called in to carry it out succeed in nothing but in making the architect's hair turn grey. A system free from these disadvantages is here exhibited.

The system of low-pressure hot water heating adopted by this firm differs very materially from those generally employed. In ordinary installations the circulation is derived naturally from the difference in weight between two columns of water arranged respectively as "flow and return," and there are certain rigid requirements consequent upon their adoption (such, for instance, as the necessity for the boiler to be below the level of the heating pipes and radiators), which at times prove matters of difficulty.

This company has perfected a system—the "Pulsial"—by which the hot water is circulated compulsorily. The apparatus is noiseless and automatic in its working, and by its use the circulating pipes and radiators may be disposed at will, while perfect freedom as to the position and level of the boiler is allowed.

The following are some of the buildings in which the "Pulsial" system is installed:—Messrs. Wolfram (Tungsten), M.F. Lamps, Ltd., Hammersmith; Messrs. W. H. Smith and Sons, Kingsway, London, W.C.; Thorne Provided Schools, Yorks; Maldon Grammar School, Essex; Treeton Provided School, Yorks; Ben Rhydding School, Yorks; Glenelg, Peterborough; Paston Hall, Peterborough; Prince of Wales Hospital, Tottenham, etc., etc.

E. G. WRIGHT, GUILDFORD, SURREY, STAND 185. ROW K.



Mr. Wright, of Guildford, having been for nearly forty years a ventilating specialist and chimney expert, invented, as the outcome of his long and varied experience and observation, the "Twentieth Century Chimney Cowl." This device, which has no revolving parts, and is thereby the less likely to get out of order, is so contrived as to cause an updraught from every direction of the wind. This phenomenon we remember to have seen Mr. Wright demonstrate. Placing a piece of paper in the flue, he blew down the cowl, with the result that the paper flew, not downwards, as might have been expected, but upwards, as if in defiance of the laws of nature.

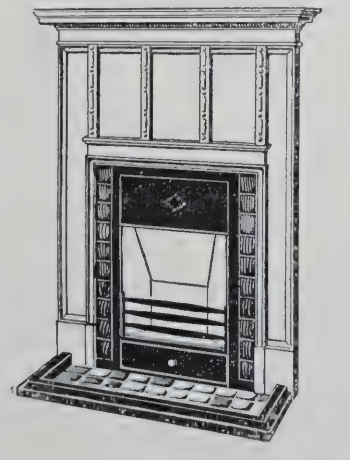
The cowl can be swept as easily as an ordinary chimney, and cannot interfere with the free movement of the sweep's brush. It is made of galvanised sheet steel, coated with iron paint. It is, therefore, very strong and durable; and as every part is riveted, it weathers bravely the highest winds.

The same exhibitor's "Excelsior" down-blow preventer chimney-pot is made either in buff or red stoneware or in galvanised sheet metal.

The patent "Twentieth Century King Ventilator," having an improved lifting draught at the base, is also on view, as well as a patent hot-air stove for laundry drying rooms and for heating greenhouses, schools, etc.

The cowls are in use on many Government and other important buildings, including the Arsenals and public buildings in Jersey and Guernsey, and on numerous barracks.

YATES, HAYWOOD AND CO., 15, BERNERS STREET, OXFORD STREET, LONDON, W. STAND 254. ROW Q



At this stand are exhibited some of the more representative of the company's manufactures, such as a kitchener, mantel registers, interiors, and wood mantels.

The kitchener is the firm's patent "Quadrant" lift fire pattern, which is self adjusting, and there is the additional advantage that there is no rack in the front to get out of order, as the quadrant on which the bottom moves is placed far enough away from the heat to prevent expansion of the movable parts.

The mantel registers are good examples of casting, and the designs are in keeping with the material.

In the section devoted to interiors are to be seen several fitted with improved low fires. A good point about these interiors is that the bricks may be removed from the front without disturbing the setting of the stove. Attention has also been given to the construction of the fireback, so that the excessive waste of fuel in the form of smoke may be prevented. The hoods are hand made, and are of brass or copper, in either adjustable or lift-off form.

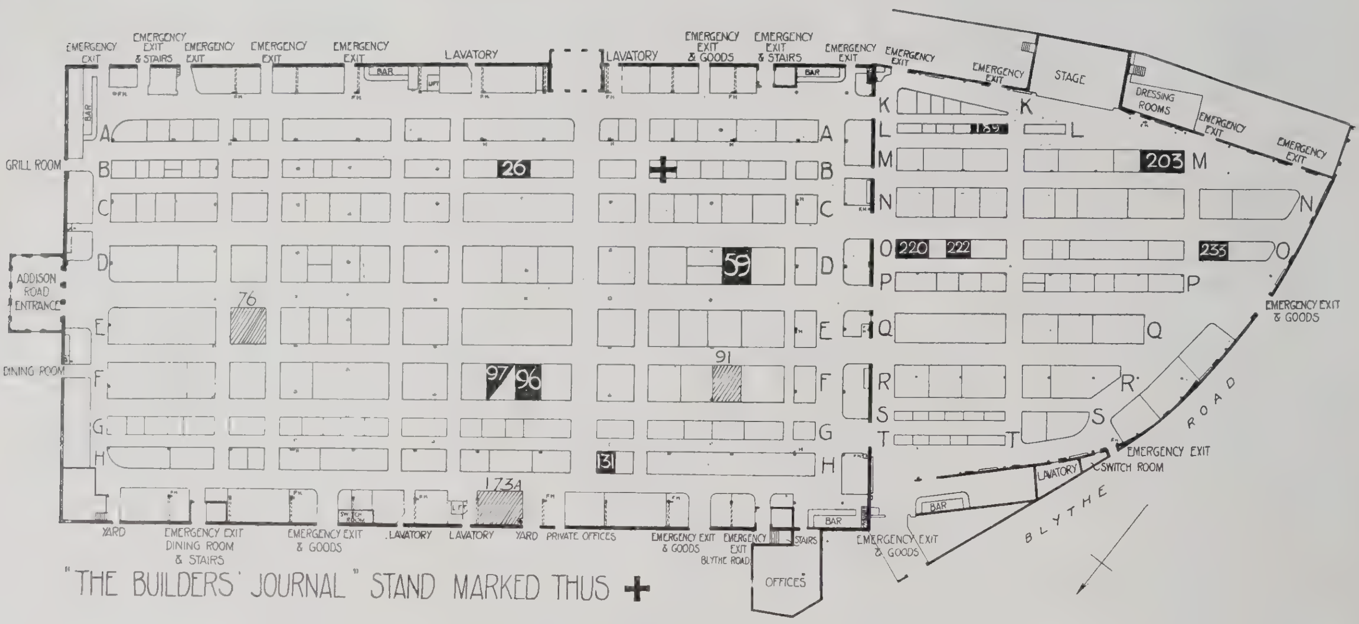
This company has on view several examples of wood mantelpieces in whose designs may be detected a distinct advance in the matter of refinement and seemliness. Marble and tiled surrounds in very good taste are shown in conjunction with them.

Messrs. Yates, Haywood and Co., are also manufacturers of tiled grilling stoves, suitable for hotel dining rooms and restaurants, and containing all the improvements which modern cookery demands, such as a hot closet fitted with folding doors, lift-out fire bars, bright grill, etc., etc.

Taken altogether, this stand may be described as one possessing many features of interest to architects, and time should be found for visiting it.

SECTION SEVEN.

Art Metal. Ironmongery. Leaded Lights. Stained Glass. Glazing.



"THE BUILDERS' JOURNAL" STAND MARKED THUS ✚

The following firms are noticed under this section, and their stands are blacked in, with numbers in white:—

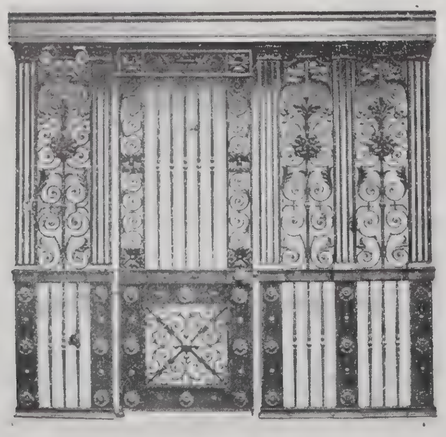
THE BIRMINGHAM GUILD OF HANDICRAFT, LTD., 45, GREAT CHARLES STREET, BIRMINGHAM. STAND 203. ROW M.



The Birmingham Guild of Handicraft shows some very high-class work at this stand, such as wrought-ironwork and cast-bronzework for architectural decoration, electric and gas fittings, door and cabinet furniture, grates, fire-dogs and gas stoves, and enamel work.

The attention of architects may be drawn to the forged iron and cast bronze screen here exhibited, of which the mouldings and leaf work are forged with mounts, capitals and entablature of cast bronze.

Among the specimens of enamel work should be noted the Guild's enamel letters for shop fascias and signs. These are particularly good and of pleasant form, while the enamel merges from peacock-blue—in the upper part—to green below. These colours are in themselves mottled, and thus produce an artistic effect. The letters are made with or without bronze margins.

The following is a list of buildings for which the Birmingham Guild has executed metal work: Messrs. Debenham and Freebody, Wigmore Street, J. S. Gibson, architect; No. 8, Addison Road, Halsey Ricardo, architect; Hamburg-America Line Offices, Cockspur Street, A. T. Bolton, architect; Ponsbourne Park, Hertford, P. K. Allen, architect; Axwell Park, Durham; house at Chertsey for Sir J. Brunner, R. P. Jones, architect; Madresfield Court, Malvern Link, for the Rt. Hon. Earl Beauchamp; Birmingham University, Sir Aston Webb, R.A., architect; Glasgow Liberal Club; Elder Library, Govan; Shire Hall, Aberdeen; Technical School, Warrington; Royal Mental Hospital, Croydon; City Asylum, Hollymoor, Birmingham; Scotsman Buildings, Edinburgh; Co-operative Buildings, Glasgow; Alexandra Hotel, Harrogate; Wellington Hotel, Harrogate, etc., etc.

CAMPBELL AND CHRISTMAS, WEST BROMPTON. STAND 220. ROW O.

The "storied windows, richly dight," are now less than ever confined to the "dim cathedral aisle." They, or some appropriate modification of them, are gladly adopted in the home, as well as in the public or semi-public building. Tinted and stained glass and leaded lights, by the associations, or in their own inherent quality, may create within an atmosphere of tranquillity, and without, as well as within, an appearance of sumptuousness; and these things are, when tastefully arranged, an inestimable boon in these utilitarian times. They make for joy.

This firm shows not only leaded lights, but also stained plate glass for roofs. Specimens of iron casements are also exhibited, and Opus sectile and mosaic work, as well as other forms of decoration, are also shown.

CHANCE BROTHERS AND CO., LIMITED., GLASS WORKS, NEAR BIRMINGHAM. STAND 26. ROW B.

The love of a glassy surface seems perennial and ineradicable, and at the present day the mosaics at St. Paul's and the scheme for the decoration of the Roman Catholic Cathedral at Westminster testify to the high regard in which vitreous ornamentation is held.

Even those who profess not to share in the popular admiration will come near conversion when they see the beautiful uses to which glassware can be turned by competent craftsmen like the present exhibitors.

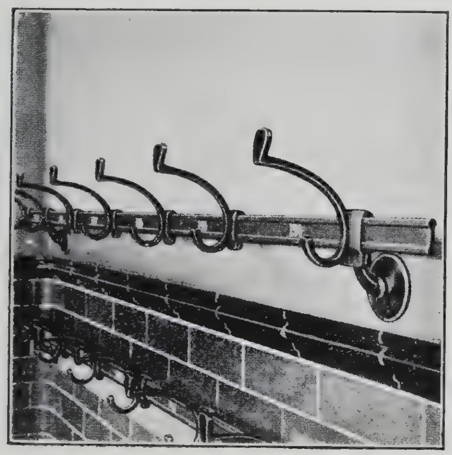
The panelled ends of the stand are formed of Venturene opal tiles in white and various tints, and in different sizes, with plain and with figured surfaces.

Dado wings to the stand are formed of the extra-thick opal tiles that are used as surface coverings in hospitals, subways, railway stations, engine-rooms, etc. Skirtings and dado mouldings give variety and finish.

Vitreous glass mosaic panels forming the name and address of the exhibitors indicate a particularly useful service that may be rendered with this material. Signs and fascias constructed of vitreous mosaics were never more popular than they are to-day, which is not surprising, considering the breadth and boldness of their appeal, which, withal, has in it a considerable touch of artistry.

The firm show many attractive samples of their tiles and mosaics, besides samples of various kinds of ornamental window glass.

JAMES GIBBONS, ST. JOHN'S WORKS, WOLVERHAMPTON; AND 9, SOUTHAMPTON ROW, HOLBORN, W.C. STAND 59. ROW D.



Conspicuous among the exhibits at this stand are Gibbons' patent adjustable cloakroom fittings, in which the "Gosforth" safety hook is attached to a bar rail, which advantageously supersedes the customary tube. The arrangement certainly scores in neatness and simplicity, while the hook gives the utmost assurance of safety—an inestimable quality where school children are concerned.

The door furniture that is represented in such great variety is designed on genuinely artistic lines, and covers a wide range of both taste and utility, including, one can well suppose, every article that can possibly be required for any kind of door.

Electric fittings are also shown in great variety; and here, again, the designs are conspicuously tasteful, especially with respect to the metal-work, in which the best models have been adopted or adapted to the up-to-date requirements of electric lighting.

A list of buildings, etc., recently fitted by Mr. James Gibbons, includes the following. The architects' names are given in parentheses:—The Royal London Friendly Society (John Belcher); Messrs. Mappin and Webb's premises (John Belcher); house in Belgrave Square (John Belcher); Belfast City Hall (Sir A. Brumwell Thomas); Woolwich Town Hall (Sir A. Brumwell Thomas); Stockport Town Hall (Sir A. Brumwell Thomas); London, Edinburgh, and Glasgow Assurance (Professor Pite); Audley House (Simpson and Ayrton); Albemarle Club (Smith and Brewer); Strand Palace Hotel (W. J. Ancell); Shanghai and Nangkin Railway (Chas. Barry); new infirmary, Wandsworth (J. S. Gibson); Hull Town Hall (Russell and Cooper); Ramsgate Hospital (Wood and Ainslie); Langham Hotel (J. MacVicar Anderson); etc., etc.

It will, of course, be understood that this list could easily be extended.

THE GUILD OF DECORATORS SYNDICATE, LTD., 29, NEWMAN STREET, OXFORD STREET, LONDON, W. STAND 233. ROW O.

The Guild of Decorators includes among its artists and craftsmen men who have distinguished themselves by the high quality of their executed work in the several branches of decorative art, and whether it be stained glass, metal work, furniture designing, sculpture, or mural painting, each secures due recognition for his work, instead of having his identity sunk, as is so often the case, in the name of a commercial firm.

At this stand may be seen some exceedingly good examples of metal work designed and carried out by the Guild, and a small room decorated in an adaptation of the Pompeian style, with painted pilasters and panels. This is intended as an illustration of carefully considered and tasteful methods of colour decoration as a substitute for the prevailing fashion of an "all white" finish.

The patent "Guildecor" hinge is very well except, perhaps, for its name. We grant that it is expressive enough; but does it not savour rather more of commerce than of art? That, after all, is not our concern; and this very mild, and, we trust, judicially stated, protest is the only criticism that we have to offer with respect to a thoroughly interesting series of exhibits, which reflect in a very striking manner the advance in taste and skill of which the mere existence of such institutions as this affords must be gratifying testimony.

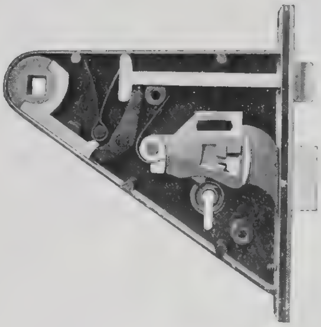
PANELS, LTD., DUKE STREET, BIRKENHEAD. STAND 189. ROW L.

An entirely new mechanically-produced repoussé is exhibited at this stand in the shape of a series of panels made by this firm. These are of varied size and design, and can be obtained in silver, copper, or brass. The manufacturers undertake to reproduce in metal any design by this process from the artist's original drawing.

Architects will probably prefer those examples whose designs are confined solely to Renaissance ornament. There are numerous other panels illustrating nautical subjects, etc., which have a more general interest, and will appeal to those outside the profession.

A set of panels in brass has recently been supplied to the builders of the SS. "Abangarez" for the firct-class smoke-room.

HENRY HOPE AND SONS, LTD., 55, LIONEL STREET, BIRMINGHAM. STAND 97. ROW F.

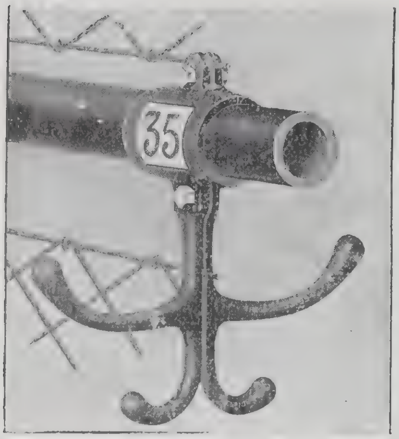


Messrs. Henry Hope and Sons show at this stand a very interesting selection of their metal casements and sashes, opening gear, leaded lights, bronze, brass, and iron hardware, cast leadwork and patent glass roofing. The casement sections range from those of the very highest grade to the simpler forms, suitable for cottage casements, and in all cases they display the same care as regards constructional detail.

Among the exhibits of bronze, brass, and iron hardware are some particularly well-designed knockers, door knobs, and finger plates, etc. Messrs. Hopes' patent glazing, which has steel bars sheathed in lead, possesses special features, and should be examined by architects. An improved mortise lock (822), which is shown with a variety of other types, is of such shape as requires less cutting of the lock-rail tenon in fixing. This is clear from the illustration given.

Among some of the buildings lately fitted with Hope's metal windows, etc., are the following, with names of their architects:—Ashton Memorial, Lancaster, John Belcher, R.A.; New Law Courts, Hull, S. B. Russell and T. E. Cooper; New Town Hall and Law Courts, Cardiff, H. V. Lanchester and E. A. Rickards; Eton Memorial, Windsor, L. K. Hall and S. K. Greenslade; Stockport Town Hall, Sir A. Brumwell Thomas; Birmingham University, Sir Aston Webb, R.A., and E. Ingress Bell; Gerrard Telephone Exchange, London, Leonard Stokes; Mappin and Webb, Ltd., Oxford Street, John Belcher, R.A.; Debenham and Freebody, Ltd., Wigmore Street, J. S. Gibson; Warehouse for Spalding and Hodge, Ltd., W. H. Harrison and Melville S. Ward; "Bystock," Devonshire, W. H. Ansell; New Berwick House, Wiltshire, Detmar Blow; etc., etc.

SHAW AND CARTER, EDGBASTON STREET, BIRMINGHAM. STAND 222. ROW O.



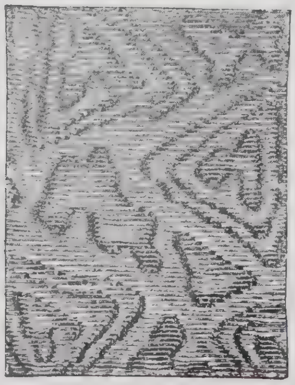
Recent lectures and discussions show that architects and builders are fully alive to the trend of the current movement with respect to the planning and equipment of schools. A new order of building is being evolved; and its plenishings are receiving increased attentions, down to the minutest detail.

There are several very useful articles displayed here, patented and manufactured by this firm. School architects will in particular be interested in the patent "Shawcar" hat and coat hooks, which combine several novel features. They are designed so that the numbers are not hidden when hats are hung on the hooks, and, moreover, the numbers are interchangeable, and can be made in any colour. The most conspicuous advantage presented by these hooks is that wiring or bolting of the panels is obviated, as the act of bolting the hooks to the tube rails secures the wire panels to the hooks, which are divided (or grooved) for the purpose.

The patent ball-bearing "Shawcar" Axle Pulley is another recently introduced improvement. It is suitable for any pattern of cord, cable, or chain, and is well worth examination.

The following is a list of buildings (with their architects) where Messrs. Shaw and Carter's fittings have been used:—Langho Epileptic Colony, Blackburn, Lancs, Giles, Gough and Trollope; Nurses' New Homes, etc., etc., Leicester, Everard, Son, and Pick; H.M. Police Station, Scotland Yard, Dixon Butler; Cheddleton Asylum, Leek, Staffs., Giles, Gough, and Trollope; Barming Asylum, Maidstone, J. W. Jennings; Poplar Cottage Homes, Shenfield, Essex, Holman and Goodrham; Leicester Workhouse and Infirmary, Giles, Gough, and Trollope; "Bournville Garden City," "Hampstead Garden Suburb"; etc., etc.

THE MAXIMUM LIGHT WINDOW GLASS CO., 28, VICTORIA STREET, WESTMINSTER, LONDON, S.W. STAND 131. ROW H.



The extensive loss of daylight in offices and basements having their outlook on narrow streets with tall buildings opposite, has in a large degree been reduced by the substitution of patent window glass for ordinary sheet or plate. At this stand can be seen the various specialities of the Maximum Light Window Glass Company, the most important of which—as a daylight recoverer—is the "Maximum Light" window glass. It is prismatic on one face, and has lenses on the other, and it is this combination which produces the remarkable effects known to result from its use. Its adoption by architects, in positions where the light is particularly bad, may be confidently recommended.

This firm also shows its "Cat's Eye" glass, and a novelty in figured glass—the "Max Silk" glass—which latter is here illustrated.

The following is a list of London buildings in which this glass has recently been used: H.M. War Office Department; Royal Arsenal, Woolwich; Wellington Barracks; New Westminster County Court, St. Martin's Lane; Hotel Cecil; 20, Essex Street, Strand; Sun Insurance Co., 40, Chancery Lane, W.C.; for H.M. Office of Works—Charles Street, S.W.; Mellier and Co., 26a, Albemarle Street, W.; Salubra Wall Covering Co., 103, Great Portland Street, W.; H.M. Office of Works, Tower of London; Bachelor's Club, Hamilton Place, W.; Glenburn Hotel, Great Russell Street; Harley House, Regent's Park; St. Mary's School, Putney; Thackeray Hotel, Great Russell Street; Capel House, New Broad Street, E.C.; Goldsmiths' College, Lewisham High Road, S.E.; Stockwell College, S.W.; Middle Temple Buildings; Mansion House Chambers; Messrs. Goldsmith and Silversmiths Co., Ltd.; etc., etc.

MESSRS. WENHAM AND WALTERS, LTD., PARAGON WORKS, VICARAGE ROAD, CROYDON. STAND 96. ROW F.

One of the principal features at this stand is an exhibit illustrating the application of "Fowler's" Patent Sliding Hinges to both wood and metal casements. By means of these hinges—which are provided with telescopic extensions fixed to the top and bottom rails of the casement—the latter may be bodily shifted laterally, in such a manner that it can be easily cleaned.

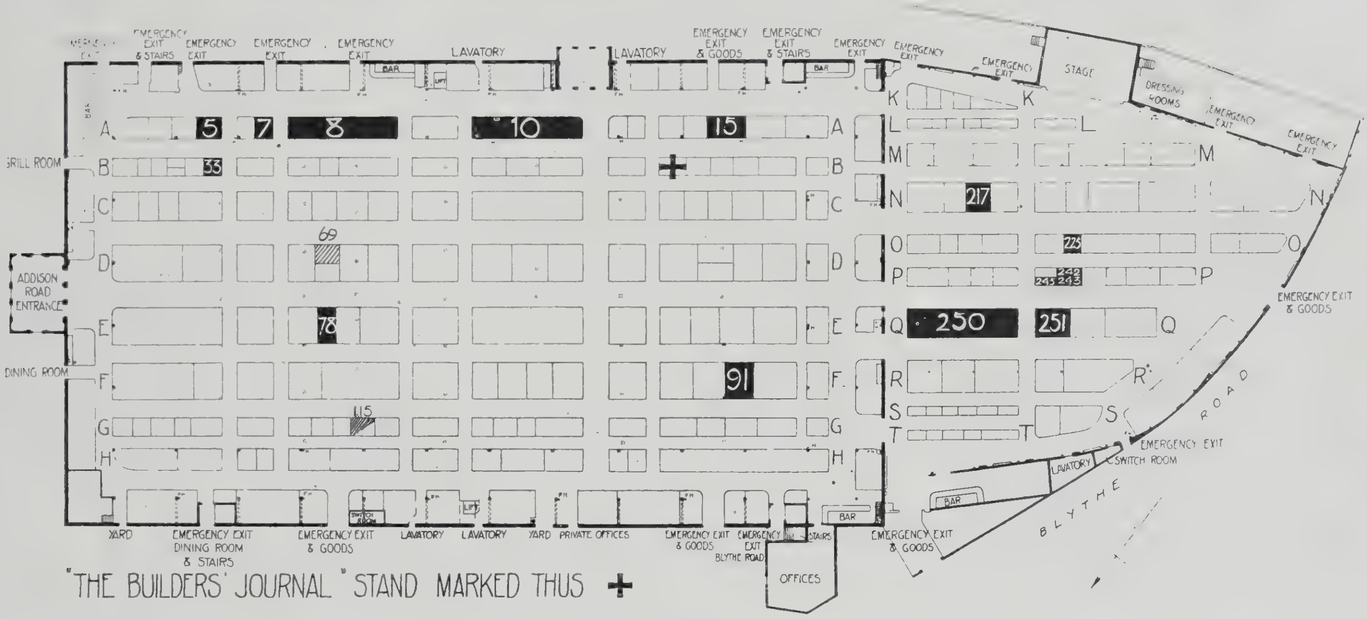
The firm is also showing specimens of forged welded casements, which are forged on the anvil in the old-fashioned manner. It should be mentioned that oxygen gas welding has so largely entered into the manufacture of casements in recent years that Messrs. Wenham and Waters desire, in reverting to the older method, to demonstrate its superiority over the newer.

Among other exhibits at this stand are various new sections of "Cottage" casements, samples of ventilating radiators, lead rainwater heads, etc., etc.

The following is a list of buildings (with their architects) for which this firm has supplied casements, lead glazing, etc.:—West Ham Hospital, British Medical Institute, Strand, W.C., King Edward VII. sanatorium, Midhurst (Adams and Holden); Carshalton public offices and fire station (F. Atkinson, F.R.I.B.A.); Bloemfontein Law Courts, South Africa (Baker and Massey); Epsom College (Chas. Barry, A.R.I.B.A.); "Ashgrove," Seven Oaks (F. S. Chesterton); Liscombe Park (Tom P. Clarkson); City of London Lying-in Hospital; Anglo-South American Bank (M. E. Collins, F.R.I.B.A.); Bradford Town Hall (F. E. P. Edwards, A.R.I.B.A.); house, Limpsfield, Surrey (Arthur Keen, F.R.I.B.A.); houses, Amersham and Chesham (Kemp and How); Polesden Lacey, near Dorking (Mewès and Davis), etc.

SECTION EIGHT.

Sanitation and Sanitary Fittings. Plumbing.



Section VIII.—SANITATION.

The following firms are noticed under this section and their stands are blacked in, with numbers in white :—

235	O	Auto-Controller and Switch Co., p. 393.
7	A	Cakebread, Robey and Co., p. 394.
8	A	Davis, Bennet and Co., p. 394.
250, 251	Q	Doulton and Co., Ltd., p. 394.
78	E	Jones, John, (Chelsea), Ltd., p. 394.
217	N	Knowles, John, and Co., p. 395.
91	F	Mellowes and Co., Ltd., p. 395.
245	P	Moule's Patent Earth Closet Co., Ltd., p. 395.
15	A	North British Plumbing Co., Ltd., (The), p. 395.
33	B	Patent Tip-up Bath Co., (The), p. 396.
10	A	Shanks, Ltd., p. 396.
5	A (Ground Floor, Bay 27, Gallery)	Webb Lamp Co., Ltd., (The), p. 396.
242, 243	P	Woodward, James, Ltd., p. 396.

The following firms are noticed under other sections, but are showing exhibits connected with this one. Their stands are indicated by hatching :—

69	D	Brook, F. H., ("Ideal" Screw-down tap), p. 358.
115	G	Sankey, J., and Sons, Ltd., ("Ephos" Sanitary Ware), p.365.

THE AUTO-CONTROLLER AND SWITCH CO., SIMPLEX WORKS, VIENNA ROAD, JAMAICA ROAD, BERMONDSEY, LONDON, S.E. STAND 325. ROW O.

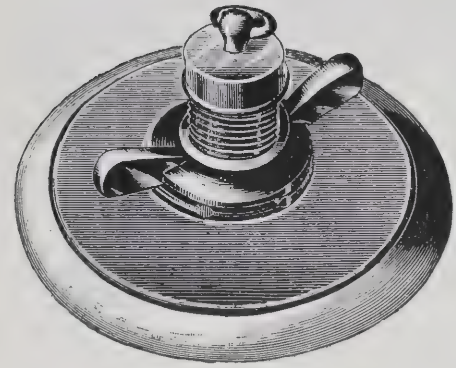
SOLDERING PASTE
FLUXITE
REGISTERED
FOR USE INSTEAD OF SPIRITS OR RESIN.
SUITABLE FOR ALL METALS, (EXCEPT ALUMINIUM) METALS OTHER THAN CAST IRON NEED NOT BE CLEANED DOES NOT CORRODE. CANT BE SPILT
THE MOST EFFECTIVE FLUX KNOWN.

"Fluxite" is of particular interest to plumbers, and is a paste which renders soldering an easy matter. It is claimed for it that the metals to be soldered by its aid (as a flux) need not be previously filed or cleaned, even if greasy, dirty, or covered with paint. This does not apply to iron, however. In the case of jointing leadwork, the solder may be dispensed with entirely, all that is necessary being a blow pipe.

Its uses and advantages are numerous, and its capabilities in a variety of directions are exemplified by the demonstrator, who gives practical illustrations for the information of visitors.

The following are a few of the users of "Fluxite": The Royal Arsenal; the Royal Engineers; the Indian Government; Cape Government Railways; London and North Western Railway; Great Eastern Railway; Great Northern and City Railway; London County Council Tramways; Blackpool Corporation Tramways; Burnley Corporation Tramways; Borough of Ilkeston Tramways; Lincoln Corporation; Coventry Corporation; Newport Corporation; Epsom District Council; Board of Education; Cambridge University; London County Asylums; Bowdens Patents Syndicate, Ltd.; Sun Electrical Co., Ltd.; Magnetos, Simms, Bosch, Ltd.; London Electric Wire Co., Ltd.; Tate and Co., Ltd.; Bruce, Peebles and Co., Ltd.; Barclay, Perkins and Co., Ltd.; Veritys, Ltd.; Whitehead Torpedo Works; Aerators, Ltd.; Stones, Wilkinson and Co., Ltd.; Telegraph Construction Co., Ltd.; Bolding and Sons, Ltd.; Empress of India Cotton Mills; Troupe, Curtis and Co., Ltd.; J. Stone and Co., Ltd.; Parsons Motor Co., Ltd.; Wm. McGeoch and Co., Ltd.; Dodd and Oulton, Ltd.; Lautaro Nitrate Co., Ltd.; Richard Pape, Ltd.; etc., etc.

CAKEBREAD, ROBEY AND CO: STOKE NEWINGTON, LONDON, N. STAND 7, ROW A.



Messrs. Cakebread, Robey and Co. exhibit a comprehensive selection of drain cleansing rods, drain tools, drain cleaners, smoke test machines, drain plugs, etc. The specialities of this firm's manufacture are their patent lockfast joints for drain rods, among which are the "Slide Bolt," "Simplex," "Clutch Bolt," "Swivel Collar," "Ball Clutch," and the "Ferret." The last mentioned is their well-known joint, which is extensively used in various departments of the Government, corporations, municipalities, urban district councils, at home and abroad, and also by the principal railway companies. A very large number have also been supplied to telephone and electrical companies for the laying of cables.

Another speciality is the "Standard" smoke test machine, made almost entirely of metal. This will charge 50ft. of 6in. drain per minute, and the pump will give a pressure of 15lbs. per square inch.

Messrs. Cakebread, Robey and Co. are contractors to the War Office, Post Office, Telegraph Department, L.C.C., Indian Government, G.N. Railway, G.W. Railway, L. and N.W. Railway, corporations of Cape Town, Leeds, Bradford, Doncaster, Cheltenham, Bournemouth, Rochester, Ipswich, Newport, Limerick, etc.; municipalities of Cawnpore, Naini-Tal, Allahabad; City of Rio de Janeiro; urban district councils, local boards, etc.; electrical engineering companies, builders, contractors, etc., etc.

DAVIS, BENNET AND CO., WESTMINSTER SANITARY WORKS, HORSEFERRY ROAD, LONDON, S.W. STAND 8. ROW A.

A large selection of sanitary goods of all kinds is exhibited at this stand, where a series of apartments fitted up to represent respectively four model bathrooms and a model kitchen, will enable architects to examine this firm's manufactures. The floors are jointless and watertight in each instance, and the fittings include every requisite which modern sanitary science has evolved.

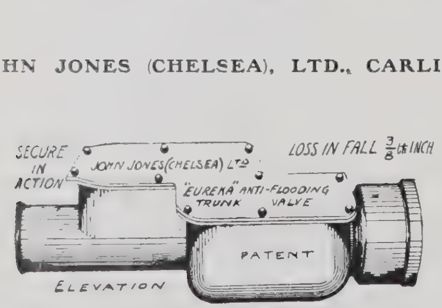
Attention may be called to the special lavatory for surgical use, with elbow-action, hot and cold supplies, knee-action waste, and a white enamelled cupboard over, fitted with glass shelves for instruments.

An interesting exhibit is the stack of soil pipe showing various connections with access door on each branch and bend.

The whole of the stand is lighted with a special system of incandescent gas.

The firm has carried out sanitary work for the following architects:—Sir William Emerson, Past Pres. R.I.B.A., Messrs. Gordon and Gunton, F.R.I.B.A., Messrs. Hesketh and Stokes, F.R.I.B.A., R. S. Ayling, Esq., F.R.I.B.A., Messrs. Ford, Son and Burrows, F.R.I.B.A., E. Keynes, Purchase, Esq., A.R.I.B.A., C. H. B. Quennell, Esq., A.R.I.B.A., M. E. Collins, Esq., F.R.I.B.A., Messrs. H. M. and W. Grellier, F.R.I.B.A., C. Stanley Peach, Esq., F.R.I.B.A., E. A. Minty, Esq., F.R.I.B.A., Messrs. F. and H. Francis, F.R.I.B.A., R. O. B. North, Esq., A.R.I.B.A., Messrs. Frank Matcham and Co., F.R.I.B.A., Stanley J. May, Esq., A.R.I.B.A., Messrs. Mallows and Grocock, F.R.I.B.A., Messrs. Gilbert and Constanduros, A.R.I.B.A., A. E. Jones, Esq., F.R.I.B.A., Lewen Sharp, Esq., A.R.I.B.A., T. E. Pryce, Esq., A.R.I.B.A., V. S. Dunkerley, Esq., F.R.I.B.A., Messrs. Mewès and Davis, A.R.I.B.A., E. Douglas Hoyland, Esq., A.R.I.B.A., C. W. Stephens, Esq., F.R.I.B.A., F. W. Stephenson, Esq., F.R.I.B.A., Messrs. Jarvis and Son, F.R.I.B.A., Messrs. Ernest George and Yeates, F.R.I.B.A.; etc., etc.

DOULTON AND CO., LTD., HIGH STREET, LAMBETH, LONDON, S.E. STANDS 250 AND 251. ROW Q.

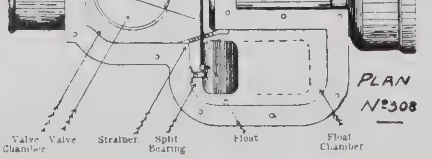


Several branches of manufacture are represented in this firm's exhibit, but it is mainly devoted to sanitary appliances, which are displayed in a series of rooms, where baths, closets, lavatories, etc., may be seen—ranging in price and quality, from such as are suitable for a cottage to those of the greatest luxury. A porcelain enamelled cast iron bath on wheels—designed so that the tub can be pivoted on the waste end—permits of more thorough cleansing of floor and walls than is otherwise possible.

The last room shows a collection of the most modern fittings used in the hydro-therapeutic treatment, where sudden changes in temperature are necessary.

Of special interest to architects is the exhibit of Carrara ceramic ware, an excellent building material, now much used for hotels, business premises, etc. Among these may be mentioned the Savoy Hotel extension, (Collcutt and Hamp, architects), the Corner House for Messrs. Lyons, the new Strand Palace Hotel, all in London. Messrs. Doulton are also showing numerous specimens of their art pottery Doulton ware in the shape of jugs, vases, bowls, etc., which are well worthy of attention.

JOHN JONES (CHELSEA), LTD., CARLISLE WORKS, CHURCH STREET, CHELSEA, LONDON, S.W. STAND 78. ROW E.



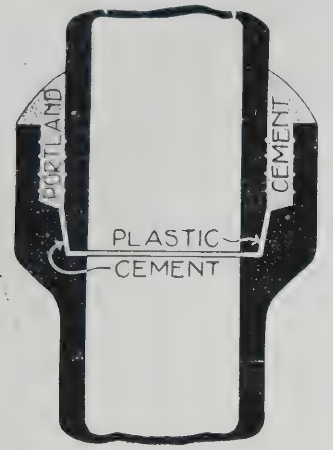
This firm exhibits a large selection of sanitary fittings and appliances of every description, among the latest being their Patent Anti-Flooding "Eureka" Trunk Valve, which is here illustrated. This invention provides for a valve which hangs in a chamber above the drain. On the flood water rising, the float in the adjoining chamber rises with it, and closes the valve. The Royal Sanitary Institute's bronze medal was awarded to the manufacturers of this valve in 1907. School, hospital, and laboratory fittings are well represented, and include many excellent types.

Surveyors will find the display of roadway and lamphole covers, sewer ventilating shafts, sewer ironwork, etc., of especial interest.

This firm also makes patent drain testing and clearing appliances, specimens of which are on exhibition.

The following is a list of buildings (with their architects) where this firm's drainage fittings have been supplied:—New War Office, Sir John Taylor, H.M. Office of Works; new Admiralty Buildings, Messrs. Leeming and Leeming; "Morning Post" Offices, Messrs. Mewès and Davis; Waldorf Hotel, Messrs. Marshall Mackenzie and Son; Tower of London (new drainage), H.M. Office of Works ; new British Embassy, Madrid, H.M. Office of Works; National Gallery (new drainage), H.M. Office of Works; new British Hospital, Constantinople, H. Percy Adams; New Military Barracks and Married Quarters. Tidworth, Salisbury Plain, Bulford, Borden Camp, Weedon; naval and military stations and hospitals at home and abroad for H.M. Government (Admiralty and War Departments); new South-Eastern Hospital, Messrs. T. W. Aldwinckle and Son, Gore Farm Hospital, Kent; Messrs. T. W. Aldwinckle and Son; Schools for London County Council; Schools for Messrs. Beazley and Burrows, A. H. Ryan Tenison, and R. L. Curtis and Sons; Schools in various parts of the United Kingdom for other architects; model dwellings for London County Council; etc., etc.

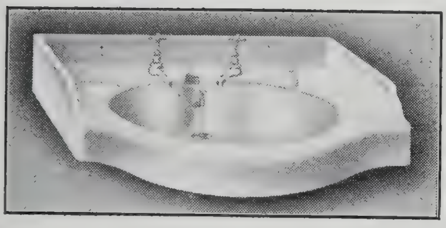
JOHN KNOWLES AND CO., LTD., 38, KING'S ROAD, ST. PANCRAS, LONDON, N.W. STAND 217. ROW N.



Knowles' "Free-Flow" stoneware drain pipe is the principal exhibit at this stand, and should be specially noted by architects and surveyors. It has unusual features, and differs materially from other patented joints. In the "Free-Flow," the spigot end is tapered, and is received by a corresponding splay formed on the inside of the socket, the two being jointed with plastic cement. The remaining part of the socket and the outer fillet are jointed in the ordinary manner with neat Portland cement, and the result is a cylindrical bore without lipping or overlapping. By this system the spigot end rests on the inner socket, and prevents any movement of the drain when the trench is being filled in; and the plastic cement jointing secures a close-fitting and water-tight joint, which is proof against the percolation of the Portland cement into the invert.

The following is a list of places (with architects' names) where "Free-Flow" pipes have been used:—London and South-Western Bank, Streatham; Wandsworth B.C.C.; Brockwell Hall, Herne Hill, Mr. Graham; Croydon Corporation, Norbury; Camberwell B.C.C., Herne Hill; Fitzroy Street, Tottenham Court Road; Hungerford Road, York Road; Medburn Street, Pancras Road; Church Road, Addlestone; Police Station (Canterbury Corporation), Mr. A. C. Turley; Isolation Hospital (Twickenham U.D.C.); Bromley Common, Mr. P. Coad; Station Road, Orpington, Mr. C. J. Barham; Oak Lodge, Chislehurst Common; South Hill, Bromley, Mr. P. Coad; Catherine Road, West Ham; High Street, Chingford; Hoe Street, Walthamstow; High Road, Chiswick; Tunis Road Hammersmith; Barnes District Council; Glaybury Road, W. Kensington; Ranleigh Gardens, Chiswick; St. Peter's Square, Hammersmith; Stowe Road, Shepherd's Bush, Messrs. Gale, Durlachen and Emmett; Auriel Road, W. Kensington; Acton Vale; New Infirmary, Lower Edmonton, Mr. Stewart Hill; etc., etc.

MELLOWES AND CO., LTD., SHEFFIELD. STAND 91. ROW F.

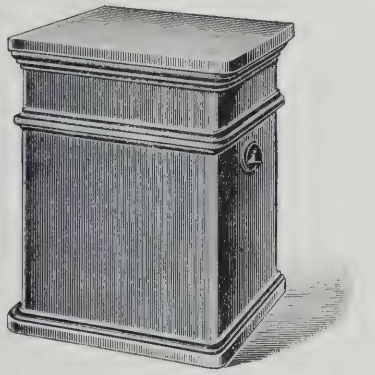


At this stand are exhibited several high-class sanitary fittings, such as a w.c. basin specially designed—without mouldings of any sort—to suit the requirements of architects. It is made by a new process, of highly finished earthenware, and has a very good appearance. The new model lavatory, also shown, is of similar make, plain, and with a large basin. There is a bath with a 4in. massive roll edge and a nickel-plated supply and waste, fitted independently. A similar bath to the last is provided with a hood, a nickel-plated needle and shower bath, and a plate-glass screen.

Attention is called to a series of samples of modern plumbing work showing special expansion joints in vertical lead waste pipes. This firm also makes the "Eclipse" Glazing Bar, consisting of a steel case encased in a lead sheath.

The following are some buildings, with their architects), in which this company's sanitary fittings have been used:—Ritz Hotel, London, Mewès and Davies; Waring and Gillows' premises, London, R. Frank Atkinson; Conkwell Grange, near Bath, E. Guy Dawber; Monsall Hospital, Manchester, H. Price, city architect; Townley Hospital, Bolton, J. Mawdsley; Orleans House, Liverpool, H. A. Matear; Mersey Docks Offices, Liverpool, Briggs, Wolstenholme, Hobbs, and Thornley; Underground Conveniences at Bury, Cleethorpes, Belfast, Sheffield, etc., etc.

MOULE'S PATENT EARTH CLOSET CO., LTD., 5a, GARRICK STREET, COVENT GARDEN, LONDON, W.C. STAND 245. ROW P.



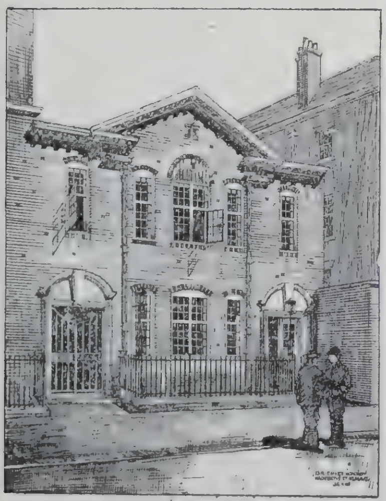
The utility of earth closets in places where flushing is impracticable is indisputable, and if the system is carried out with reasonable care by the users, it affords a wholly efficient means of sanitation. Of the many systems that have been adopted, none is better known throughout the civilised world than Moule's, which embodies a large number of ingenious patents, with the effect that the last degree of efficiency seems to have been reached, so that the earth closet is quite applicable to indoor use.

These well-known appliances have been recently further improved, and the new patent is applied to all the fittings sold by the company, which has also introduced two new patterns to the many now on the market.

The patent dry earth system has been in use for upwards of 40 years, and the general principles involved in its adoption do not require to be recapitulated to the present generation.

At this stand several types are exhibited, and are representative of the varying circumstances under which these closets have been found efficacious. The bedroom cabinet commode, for instance, is so designed as to effectually disguise its object, and is equally suitable for house boats, ocean steamers, or in any position where space is limited. This pattern is made in American whitewood, teak, or mahogany, and when closed is 1ft. 6ins. square, and 1ft. 11ins. in height.

THE NORTH BRITISH PLUMBING CO., LTD., 15, CARTERET STREET, QUEEN ANNE'S GATE, WESTMINSTER, LONDON, S.W. STAND 15. ROW A.



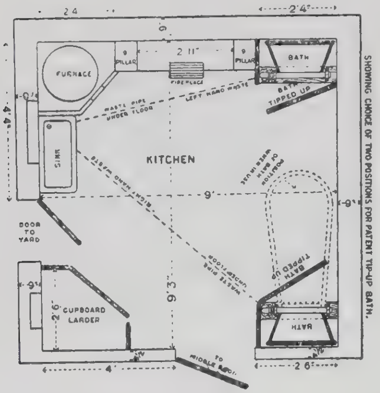
This exhibit includes a variety of interesting features, prominent among which is a working system of cast-iron drainage, with improved patterns of airtight inspection chambers, gulleys, etc., affording easy access, without risk of breaking the bolts.

Among novelties in plumbing should be noted the company's new system of jointing lead soil pipes by means of a cast-lead collar, thus doing away with the primitive and very ugly soldered joint.

The sanitary appliances for the house here shown are of a simple and efficient character. two kinds of flushing cisterns are exhibited, one worked with a "drip by drip" feed, and the other (electric, intended for use with pedestal closets) by pressing a button. The Mitchelite Petrol Air Gas Apparatus is worked by water pressure, and may be seen in operation. The Company's premises (here illustrated) were designed by Mr. W. W. Scott-Moncrieff.

The following is a list of sanitation works carried out by the North British Plumbing Co., Ltd.:—New Record Offices, Chancery Lane, W.C.; Boord's Brewery, Tooley Street; Brook's Club, St. James' Street; The Travellers' Club, Pall Mall; Overstrand Hall, Cromer. for Lord Hillingdon; the Liverpool and London and Globe Insurance Offices, Cornhill; the British Linen Bank, Threadneedle Street; Coutts' Bank, Strand; a House in Park Lane, W.; new offices, Kingsway, for W. Robinson; Oxhey Grange, Bushey, Herts; Chenies Street, Residential Chambers; the Institute of Mechanical Engineers, Storey's Gate; Clumber House, for the Duke of Newcastle; 19, Hyde Park Terrace, W.; 42. Brook Street, W.; Army and Navy Club, Pall Mall; the National Telephone Co.'s Offices, Victoria Embankment; the National Bank of Scotland, Nicholas Lane; the Guardian Assurance Co., Ltd., Lombard Street, E.C.; Lloyd's Bank, Cornhill; Holborn Restaurant; Quendon Hall, Newport, Essex; Park Hall, Towcester, Northants; the London, City and Midland Bank, Threadneedle Street; the Royal Dental Hospital, Great Portland Street, W.; etc., etc.

THE PATENT TIP-UP BATH CO. 31, BROAD STREET, BIRMINGHAM. STAND 33. ROW B.



Plan of Kitchen.

The economy of space resulting from the use of a bath which tips up on its end and stands (when not in use) in a cupboard of 1ft. 6in. projection only is very clearly demonstrated at this stand, where is exhibited a model of a workman's scullery, measuring 9ft. by 9ft. 3in., showing alternative positions for this description of bath.

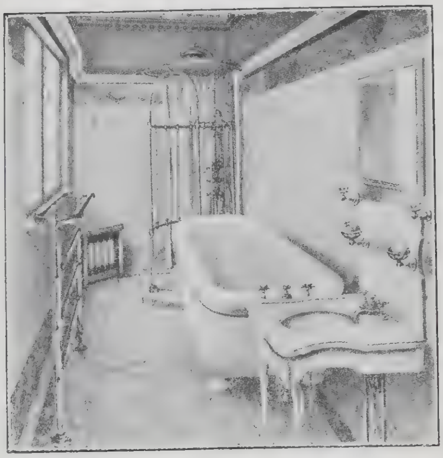
Architects who have been to Bournville Village and the many Garden City Estates in various parts of the country will remember seeing these baths.

Much ingenuity has been shown in the waste, which must take the discharged contents of a hinged bath, and yet be watertight in itself.

For use near the kitchen fire, in cottages or tenements where servants are not kept, these baths are especially valuable.

The following is a list of cottage estates and buildings (with the names of their architects) where "Tip-up" baths are in use:—The Bournville Village Trust, architect H. Tyler; The First Garden City Estate, Hitchin, architects H. Tyler and Messrs. Stanley Barrett and Driver; Model Cottage Exhibition, Newcastle-on-Tyne, architects, Messrs. White and Stephenson; Ideal Village, Bordesley Green; The Ideal Benefit Society, Birmingham; workmen's cottages for the Metropolitan Amalgamated Railway Carriage and Waggon Co., Ltd, Saltley, Birmingham, architect Chas. H Collett; Geo. Bell and Sons, Tottenham Hall, London, N., on private estate; etc., etc.

SHANKS AND CO., LTD. WORKS, BARRHEAD, SCOTLAND. LONDON OFFICES, 81, NEW BOND STREET, W. STAND 10. ROW A.



The exhibit at this stand is intended to illustrate more particularly Messrs. Shanks and Co.'s domestic sanitary appliances, as it is impossible in the limited space available, to represent the almost endless variety of fittings made by the company for schools, hospitals, prisons, asylums, steamships, etc.

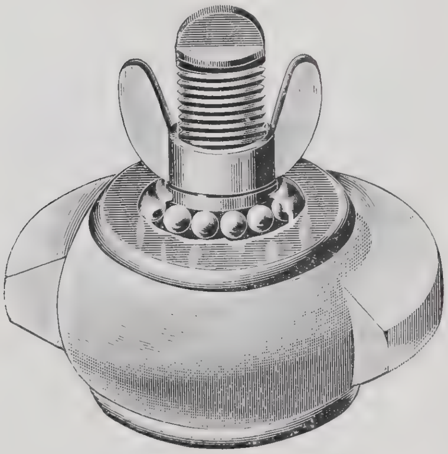
Architects should take note of the examples shown of the use of glass for canopies or enclosures in connection with spray baths, some of which have not been previously exhibited. In regard to the baths, attention is directed to specimens of cast-iron baths (porcelain enamelled, inside and outside), standing on marble sole plates, which represent the latest form of fitting.

An entirely new form of waste and overflow the "Eureka" is exhibited for the first time, and the attention of the profession is drawn to it. The lavatory basin, which is entirely free of metal parts, is formed with an overflow chamber at the back, communicating (by means of a discharge orifice at the bottom) with the basin. This chamber has a pull-up, hollow plug, and when the basin is full the overflow falls over a weir at the back, and is discharged through the plug into the trap and waste.

Among other interesting exhibits is a form of water closet (standing on a marble sole plate) operated by means of a pedal.

Shanks and Co., Ltd., have supplied sanitary appliances for the following buildings (names of architects in parentheses):—Waldorf Hotel, London (A. Marshall Mackenzie, F.R.I.B.A.); "Morning Post" offices, London (Mewès and Davis); Holborn Town Hall, London (Warwick and Hall); Cavalry Club, Piccadilly, London (Mewès and Davis); Edmonton Workhouse Infirmary, London (Stuart Hill); etc., etc.

THE WEBB LAMP CO., LTD., 11, POULTRY, AND 24, QUEEN VICTORIA STREET, LONDON, E.C. STAND 5. ROW A AND BAY 27 (GALLERY).



This firm exhibits a variety of specialities, among which are their patent sewer-ventilating lamps. These lamps have also been used to ventilate underground conveniences, and, according to locality, may be constructed to burn coal gas, petroleum, or kerosene.

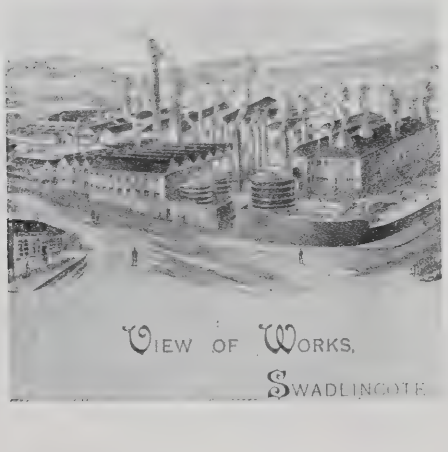
The anti-splash tap and hydrant combines several advantages, and can be quickly converted from an ordinary tap into a hydrant, by the use of interchangeable parts.

The "Kom" drain-testing plug, for testing drains by water, smoke, etc., can be used in all classes of drains, both in ware or iron, where it is desired to employ hydraulic pressure for cleansing purposes.

A novelty in burners is "Webb's self-intensifying gas burner," which is specially designed for the lighting of bridges, public streets, outside lamps, etc., where rough usage and vibration occur.

The patent galvo tap, and the galvo filter and water steriliser, as well as the patent silencer for w.c. cisterns, are exhibited at stand No. 5, Row A. At Bay No. 7 are shown the Webb system of sewer ventilation, consisting of apparatus for gas, as supplied for L.C.C. sewers; apparatus for the ventilation of underground conveniences, hospitals, etc.; apparatus to use petroleum, as supplied to the Corporations of Madras, Mysore, Bangalore, etc.; the Bolingbroke patent automatic non-return inlet ventilator, for sewage tanks, hospitals, etc.; Webb's patent "London" ventilator, as supplied to the London and other hospitals. Here, also, are Webb's patent sewer cleaner; the patent self-intensifying gas burner and incandescent burners for street lighting; special anemometers and high-pressure thermometers, the Kom drain-testing plug; and (exhibited for the first time) an automatic scrubber for washing oval or egg-shape sewers.

JAMES WOODWARD, LTD., SWADLINCOTE. LONDON OFFICE, 66, VICTORIA STREET, WESTMINSTER. STANDS 242 AND 243. ROW P.



Messrs. James Woodward's Anchor Works, Swadlincote, were started in 1790 for the manufacture of firebricks. In 1857 the works were extended for the production of stoneware pipes, and subsequently further extensions were made for the manufacture of glazed bricks and enamelled sinks and sanitary ware.

The exhibits show on what lines and to how great an extent the firm has developed. The glazed bricks are in an astonishing variety of agreeable colours, ranging from ivory white to chocolate and black, with a dozen intermediate tints. The patterns are even more numerous, and seem to anticipate every possible requirement of shape.

The vitrified brown glazed stoneware includes many varieties of pipes, large and small, simple and complex, junctions, tapers, elbows, syphons, traps, gullies, and air-bricks.

The firm's patent double-seal pipes, and the "Archer" improved patent jointed pipes, have been extensively adopted for the sanitary arrangements at many large hospitals and other public institutions; and kitchen sinks with special fittings, lavatories, and trough closets for public schools, etc., form a special interesting section of the firm's catalogue.

Special attention may be drawn to the high finish of Woodward's "Apex" salt-glazed bricks, chimney tops of many patterns, round, octagonal, square, and oblong, severely plain, or highly ornamented, offer wide scope for choice.

Messrs. Woodward's lavatories, urinals, pedestal closets, and sanitary ware in general, are of comprehensive variety in form, decoration, and purpose, and form a most interesting exhibition that in a manner is complete in itself, and is almost worth a special visit

SECTION NINE.

Paints. Enamels. Distempers. Stains. Wood Preservatives. Wall Papers. Damp Preventatives.

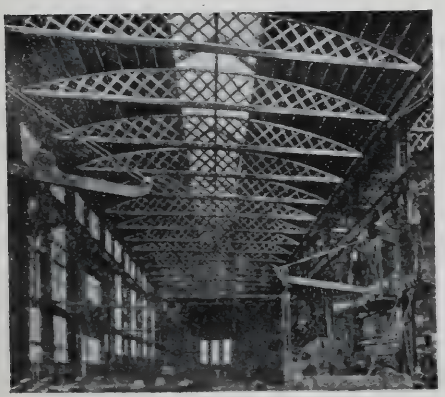
D. ANDERSON AND SON, LTD., LAGAN FELT WORKS, BELFAST, AND ROACH ROAD WORKS, OLD FORD, LONDON, E. STAND 29. ROW B.



This firm's exhibit takes the form of a rustic bungalow, in which three of their specialities are more particularly exemplified. These are the "A.W.P." washable water paint, Stoniflex roofing felt, and Sideroleum wood preservative. In regard to the latter, its pleasant nut-brown colour may be seen on the outer timbers, and its usefulness as a protection against decay, fungus, and insects has been proved by cooling-tower makers, builders, estate agents, etc.

Stoniflex roofing felt, made in three qualities, may be employed for general work as a permanent roof covering, and for lining and insulating buildings.

On the inside of the bungalow there are specimens of the "A.W.P." water paint, which is not a mere distemper made of whiting, size, and a little colour, but is a real paint with a fine opaque body, presenting a smooth egg-shell finish. It has the further merit of not rubbing off on to one's clothes, and when soiled or dirty can be washed. This is easily demonstrated, and may be proved to the satisfaction of visitors.

The firm show also their Siderosthen anti-corrosive paint for protecting every description of iron and steel work; Sideroleum wood preservative, which is nut-brown in colour, and is used by cooling tower makers, as well as by builders and estate agents; slag wool (silicate cotton), loose, and made up in various forms for insulating, deadening, fire-proofing, and similar purposes; felts for roofing, lining, damp-proofing, and for covering permanent and temporary buildings; the Stoniflex damp-course (in three qualities), which is made with refined Trinidad bitumen; and Anderson's wooden lattice and other roofs, water tanks, etc.

WALTER CARSON AND SONS, GROVE WORKS, BATTERSEA, LONDON, S.W. STAND 130. ROW H.

This firm exhibits a representative collection of colours, paints, varnishes, etc., including several specialities such as muraline, vitrolite, japolite, La Belle enamels, and wood preservative.

Muraline is a washable water paint, sold in the form of a dry powder, which, when mixed in equal proportions with water, can (with the exception of greens), resist lime, and may be applied on new plaster.

Vitrolite calls for mention, being made without white lead, of various pigments (chemically neutral) blended with oils treated to ensure elasticity and toughness. This paint is specially adapted for use in horticultural buildings.

La Belle enamels are sold in 32 distinct colours, and Bath enamels in 4 shades.

Carson's wood preservative can be obtained in green and two shades of brown.

Japolite is an elastic, brilliant, and durable Japan white for the highest class of external and internal decoration. It has great covering power, and flows easily under the brush, leaving a brilliantly smooth surface.

Vitrolite is largely used for the outside and inside of greenhouses, conservatories, and garden frames, and is recommended in preference to white lead for every class of work.

The firm's wood preservative is a combined stain and protective agent which penetrates the wood and effectually prevents decay, while at the same time giving the work a very pleasant appearance.

Estate agents and engineers, as well as architects, builders, and decorators, will find much to interest them among the various exhibits of this old-established firm.

THE CORSITE SALES CO., LTD., COUNTY BUILDINGS, CANNON STREET, MANCHESTER. STANDS 199 AND 200, ROW M.

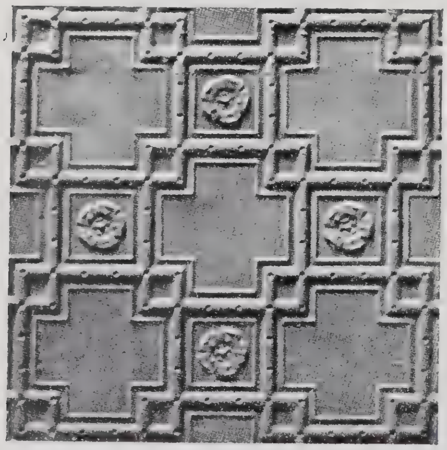
"Corsite" is the particular manufacture of this company, and is made in three grades. No. 1 is claimed to be a permanent cure for dampness. It possesses considerable covering power, something like 50 square yards to the gallon, and is no thicker than water. The manufacturers frankly warn users that the instructions—which are very simple—must be strictly followed if the result is to be certain. No. 2 is a liquid preparation for the prevention of oxidisation and corrosion of metals. In positions exposed to the atmosphere, the company recommends the coating of the metal with paint after the application of "Corsite." Subsequent coats of paint may then be applied without cleaning and scraping the first one, as corrosion is absent.

Corsite Primer is the third grade, and is intended as a preparatory coat prior to the application of ordinary paint.

The Corsite Sales Co.'s preparations have been used in the following buildings:—G.P.O., Blackburn; Fire Station, Blackburn; Town Hall, Blackburn; L. and Y.R., Manchester; G.C.R., Gorton; Cheshire Lines Railway, Liverpool; Braddock and Sons (of Meters, Ltd.), Oldham; Binns, Burnley (own house); Corporation Schools, Liverpool; Frank Hay, Seal Street; Corporation Tramways, Southport; Corporation Gas Works, Oldham; Corporation Gas Works, Burnley; Corporation Gas Works, Bolton; Corporation Gas Works, Blackburn.

Corsite No. 3 is a preparation for which it is claimed that, when applied to woodwork, it prevents and checks the ravages of dry rot and that when used on resinous woods it prevents cracking and blistering.

EMDECA SANITARY AND ARTISTIC METAL DECORATION CO., LTD., 97, QUEEN VICTORIA STREET, LONDON, E.C. STAND 72. ROW D.



The "Emdeca" Decorations are so constant a feature at the various Building Trades Exhibitions, and are so well known to the profession, that a special description of them is hardly necessary. They are displayed at this stand in a variety of pleasant designs, suitable for as many purposes, such as bathrooms, kitchens, lavatories, hotels, etc. These enamelled zinc sheets, which have been in use for a number of years, are of considerable thickness, and are fixed to the walls with paste (mixed with varnish). The walls must be perfectly dry, however, or the result will be unsatisfactory.

The company also exhibits "Stelonite" Stamped Steel Ceilings, which are a speciality. These are mostly designed so that they form a series of squares, which are nailed to battens of corresponding spacing. Steel cornices may be also had, and are used in conjunction with the ceilings.

The following is a list of some of the buildings where "Emdeca" has been used:—Royal Infirmary, Liverpool; the London Hospital, Whitechapel; St. Bartholomew's Smithfield; Guy's Hospital, Borough; Hoxton Asylum, Hoxton; Ophthalmic Hospital, Glasgow; Hemsworth Infirmary, Wakefield; West Sussex County Asylum, Chichester; Mill Road Hospital, Liverpool; Midland Counties Asylum; Mansion House, York; Eastern Counties Asylum; Burton Orphanage; St. Mark's College, Chelsea; Temperance Hospital, Hampstead; Charing Cross Hospital; German Hospital, Dalston; Poplar Hospital; Royal Infirmary, Glasgow; Lady Warden Convalescent Home; Pine Wood Sanatorium, Woking; Hazlewood Asylum, I. of W.; St. John's College, Leatherhead; Commercial Sale Rooms, Mincing Lane; Westminster Public Baths; The Baltic Shipping Exchange, St. Mary Axe; etc., etc.

GROSS, SHERWOOD AND HEALD, LTD., ST. GEORGE'S WORKS, LONDON BRIDGE, LONDON, S.E. STAND 87. ROW E.

This firm of varnish, colour, and enamel manufacturers can claim an experience of 130 years, and must therefore be one of the very oldest in the trade. Their very attractive stand has been designed in the ever-popular Georgian style. Such handsome buildings, always an agreeable as well as a decidedly appropriate feature of a Building Exhibition, are this year apparently more numerous and more artistic than ever, and in the aggregate are the making of the exhibition as a mere spectacle. But they are certainly as useful as they are beautiful; for, in the case of such exhibits as those under notice, they afford invaluable scope for the practical demonstration of quality. The stand is decorated in the firm's flat and glossy Rystolite enamel in a very pale shade of grey, that is very largely in demand for schemes of decoration. There are very attractive exhibits of flat and glossy Rystolite enamel in colours and tints, as well as some exceedingly fine specimens of Messrs. Gross, Sherwood, and Heald's varnishes, as applied to various uses. The floor is treated with oil varnish stain.

The Astrium paint, of which samples are exhibited, has been recently used at the following places:—Buckingham Palace, St. James's Palace, Houses of Parliament, Tower of London, The Royal Mint, Royal Courts of Justice, His Majesty's Prisons, Prime Minister's and Home Secretary's official residences, British Museum, Royal College of Science, Victoria and Albert Museums, Hertford House, Natural History Museum, General Post Office, Inland Revenue Offices, County and Borough Councils, Harrow Schools, Kingston, Chatham, Woolwich, and Chelsea Barracks. For a list of the places at which the exhibitors' specialities have been used, apply to their address.

MAJOR AND CO., LTD., HULL. STAND 94. ROW F.

A very practical and very interesting way of demonstrating the merits of a paint, stain, or varnish, is to display it in position as applied to a building. This is the method that Messrs. Major and Co., like many other wise exhibitors, have consistently adopted.

The pavilion they have erected is certainly one of the most picturesque among the many interesting structures in the Exhibition, and has rather a special interest of its own.

The building which constitutes this firm's exhibit was originally erected as an office for the Garden City Tenants Co., at the Letchworth Cottage Exhibition, held in 1907, and illustrates the effect of "Solignum," as a wood preservative and stain when applied on either external or internal woodwork. The "Solignum" is shown left plain, and also can be seen after being varnished and beeswaxed.

On the verandah a collection of very good models of farm buildings, a railway station, and a "modern" villa, demonstrates the variety of different classes of work to which "Solignum" may be advantageously applied.

Specimens of wood are exhibited (in cases) showing how "Solignum" has resisted the attacks of while ants in tropical countries and prevented destruction by dry rot in our own.

Solignum has been used recently at the following buildings:—Addington Court Golf Pavilion, Surrey, A. Goldsmith, Esq., architect, 63, Falkner Street, Manchester; London and Middlesex Rifle Association Pavilion, Bisley, C. E. Lancaster Parkinson, Esq., A.R.I.B.A., architect, 44, Bedford Row, London, W.C.; Copthall Restaurant, Copthall Avenue, London, P. Morley Horder, Esq., architect, 148, New Bond Street, London, etc., etc.

C. A PETERS, LTD., DERBY. STAND 19. ROW B.

Messrs. Peters are the makers of "Carbolineum Avenarius," which as a wood preservative has a reputation of over 25 years' standing. Its general application is shown in the wood pavilion which forms this firm's exhibit, where a variety of other specialities can also be inspected.

A preparation of "Carbolineum," sold under the name of "Sotor," is specially adapted for use in the case of timbers which are subject to the attacks of sea-worms. Among these the *teredo navalis*, whose ravages have caused great destruction in the past, has been successfully resisted.

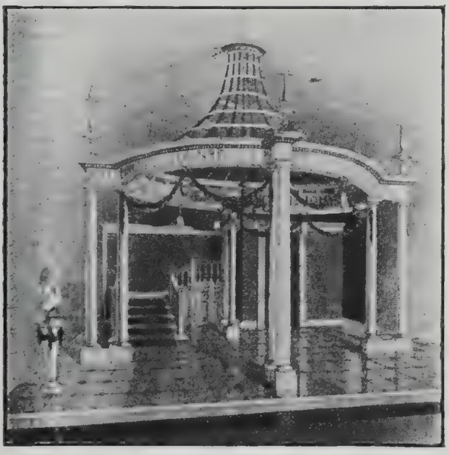
The "Carbotron" portable stove (for burning "Carbotron" fuel) is also shown. It is claimed for this fuel that it gives off neither smoke, smell, nor fumes, and that it leaves no residue after consumption. For these reasons the stoves are without flues.

The Teredo has been known to destroy, in an incredibly short time, a whole range of extensive timber docks, and even to cause the sinking of large ships. Carbolineum Avenarius not only prevents the ravages of this very formidable pest, but gives woodwork a much longer career of usefulness than would be possible to it if inefficiently protected.

This preparation is regarded by estate agents as one of their most trusty resources. They use it extensively in a large number of applications to different varieties of woodwork, particularly in the many and various instances in which posts have to be sunk into the ground.

"Carbolineum" is used by the Admiralty, the War Office, the Post Office, Telegraph Service; also the leading architects, surveyors, corporations, contractors, and estate agents in the United Kingdom, and all over the world.

PINCHIN, JOHNSON AND CO., LTD., MINERVA HOUSE, BEVIS MARKS, LONDON, E.C. STAND 66. ROW D.



The chief product of this firm is "Minerva" Paint, made of guaranteed ingredients in 24 standard colours, which have been very carefully selected for their general utility in ordinary circumstances. Each of these colours can be reduced down to four lighter shades by admixture (in specified proportions) with "Minerva" Gloss White, the result being that the user has at his disposal a very wide range of distinctive tints, which he can always match at any future time by once more adopting the same method of mixing. The system is an ingenious one, and should save the decorator both time and trouble.

The paints are equally adapted to inside or outside work, but it must be pointed out that the best results are only obtainable by careful adherence to the printed instructions.

Other specialities of this firm are "Venus" Copal Varnish, "Deydo" Water Paint, "Silveroid" (a silver paint), and "Syronite," which latter is described as a rust preventative.

The following are some of the firms regularly using these productions: Hotels—Ritz, Carlton, Savoy, Langham, Claridge's, Waldorf, Curzon, Midland Grand, Hyde Park (London); Midland, Manchester; Midland, Derby; Queen's, Leeds; Adelphi, Liverpool; Grand, Birmingham; Grand, Eastbourne; S.W.R., Southampton; Metropole, Brighton; and many others. Shipowners—Cunard Line, Union-Castle Line, Prince Line, Royal Mail S.P. Co., Bibby Line, Ocean S.S. Co., Orient Line, Caucasian S.S. Co., American Line, Hamburg-American Line, Brocklebank Line, Pacific Steam Navigation Co., and many others. Railways—Great Eastern; Great Central; Great Northern; Central London; Great Southern and Western, etc., etc.

RIPOLIN, LTD., 110, FENCHURCH STREET, LONDON, E.C. STAND 102. ROW F.

Ripolin
A PAINT READY FOR USE
on Wood, Metal, Plaster, Stone, etc.
RIPOLIN
TRADE MARK

Ripolin has been on the market for some years past, and is generally recognised to be a high-class paint, possessing qualities of durability which make it of especial value for external work. It is equally applicable to internal work, and when properly used produces an exceedingly smooth and beautiful surface.

This exhibit comprises four compartments or rooms, consisting respectively of a hall, a "Georgian" interior, a bathroom, and an office, in each of which the distinctive requirements of the case—so far as painting goes—are successfully met. Here can be inspected specimens of Ripolin enamel paint (gloss and flat), and the application of Ripolin gold bronze, etc.

This firm manufactures various other specialities, such as Bath Ripolin, black (for blackboards), and silver paint.

In the hall of the pavilion, crimson doors are in rich contrast to the brilliant white columns and surrounding cream-stone surfaces, relieved by a touch of Ripolin gold.

The Georgian interior shows the soft and pleasing effects obtainable with the flat varieties of Ripolin.

In the bathroom, to which the exhibitors seem to have devoted special attention, the dazzling white gloss on the panelling, surmounted by a touch of delicate colouring in flat Ripolin on the frieze and cornice, produces an exquisite finish.

In the fourth compartment, which is used as an office for the reception of enquirers, representatives of the firm are ready and willing to give full particulars with respect to the qualities and uses of Ripolin, which, having been before the public for several years, has been used on almost innumerable important works.

SISSONS BROTHERS AND CO., LTD., HULL AND LONDON. STAND 74. ROW D.

The proprietors of Hall's sanitary washable distemper have here erected, from designs by Mr. T. Gordon Jackson, architect, a small cottage, with porches at front, side, and back, and containing a living-room and a bedroom, both fully furnished, the chief object being, of course, to demonstrate the well-ordered use of the firm's specialities. Thus the roughcast walls are covered with cream-colour distemper; the wood framing with green paint ("Aperfectol"); the gable timbers with the preservative stain known as Rustikol; while the doors and the window-frames are finished with Sisco white Japan enamel. The inside walls of the living-room are coloured with flamingo red distemper; the posts and beams are toned with Sissons's dark oak turpentine stain; while the doors, windows, skirtings, seats, etc., are finished in the firm's Orientolac white enamel.

In the bedroom, the "note" is a restful tone of blue, the walls being coloured with Hall's distemper, while the posts and beams are stained with the same dark oak turpentine stain that is used so effectively in the living-room; but the furniture in the bedroom is stained mahogany colour, whereas for that in the living-room the oak turpentine stain is used.

Hall's distemper has been used in Buckingham Palace, St. James's Palace, the Tower of London, the Royal Mint, Chelsea Hospital, the War Office, the Admiralty, the General Post Office, and innumerable other public buildings.

THORNLEY AND KNIGHT, LTD., BORDESLEY GREEN ROAD, BIRMINGHAM. STAND 54. ROW C.

The beauty and variety of the paints shown at the present Exhibition is an indication of the enormous strides that have been made within recent years in the manufacture of such goods. The manufacture of paints and varnishes has become an intensified science, and many of our foremost chemists are engaged in it, and are making their presence felt in an all-round improvement in the quality and appearance of the product, which they study from every point of view with the acumen of the scientifically trained expert.

At this stand may be seen specimens of Messrs. Thornley and Knight's snow-white and French grey Japans, applied to flat surfaces, over three coats of white lead paint, lightly sand-papered. In the case of two of the columns, the finishing coat of Japan has been flatted down to an egg-shell gloss.

An interesting exhibit is an oak cupboard door varnished by this firm in 1866, and still of good appearance.

A speciality which may be particularly noticed is aluminium Japan, for which great durability and heat-resisting qualities are claimed by the manufacturers.

Additional exhibits include vermilion substitutes, permanent greens, special graining colours, transparent wood fillers, non-poisonous white, flat enamels, etc.

ARCHIBALD VICKERS, 125, VICTORIA STREET, LONDON, S.W. STAND 27. ROW B.

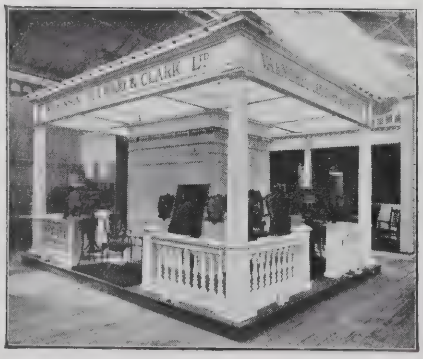
What has been said above with reference to the general improvements in the processes of paint manufacture receives additional confirmation from the exhibits on this stand. A further significant indication of the thoroughness of the knowledge brought to bear on the manufacture, and of the fine enthusiasm of the experts engaged in it, is found in the transactions of the Paint and Varnish Society, at whose meetings, as our own pages have repeatedly borne witness, the papers that have been read, and the ensuing discussions on them, have revealed an amount of keen intelligence and truly philosophical investigation that is highly creditable to the industry as a whole, and that goes far towards explaining how it is that during the past few years such excellent improvements have been effected.

The "Ay-Vee" brand of pure prepared paint is made in sixteen stock colours, exclusive of black, and this stand is entirely devoted to their display. The manufacturer, in order to substantiate the claims he makes for his covering capacity and obliterative qualities has, for the information of visitors, adopted the convincing method of practical demonstration. Those interested may see the colours being applied. The secret of the gloss is due to the special mediums employed, and the preparatory treatment they undergo during the process of manufacture. It should be noted that this gloss is obtained without the admixture of varnish.

This firm's paints are being largely used by builders on the south coast, and they were also used on the Duke of York's School at Dover, for the Board of Works.

Architects on the look-out for a high-class paint at a low figure should visit this stand.

WILKINSON, HEYWOOD AND CLARK, LTD., 7, CALEDONIAN ROAD, LONDON, N. STAND 62, ROW D.



This exhibit comprises a full-size model of a reception room (standing on a raised stage with a surrounding balustrade), finished with Falconite white enamel, except for the panels, which are treated with the Company's well-known colours and paints. Here are shown various coats of arms painted on mahogany shields, and varnished with Italian oil varnish. The heraldic decorations are very well done, and are not transfers. Other shields are displayed, in which are employed various shades of permanent violet, which is a recent production of this firm.

Each specimen of work on this stand bears a conspicuously displayed number, and the methods employed in securing the results shown can be readily referred to, by turning up the corresponding number in a brochure which fully describes the exhibit. This may be had on application at the stand.

Four massive columns support a bold entablature, suitably ornamented, with the company's name in gold lettering. The base is made up of turned balustrades and model posts, and the wall spaces are broken up into dados, fillings, and friezes, and enriched with carvings.

Six panels are shown illustrating simple and artistic schemes of house decoration, which can be easily reproduced by the stencilling process with the special distemper colours manufactured by this firm.

THOMAS PARSONS AND SONS, MITCHAM, SURREY.

This firm's "Lacreite" and "Endelline" enamels have been used in the painting of the following exhibitors' stands:—The Gypsum Mines Co.; Messrs. Clark and Co.; The British Uralite Co.; Candy and Co., Ltd., The Coatostone Decoration Co.

Carbolineum Avenarius

L. & C. HARDTMUTH'S
KOH-I-NOOR PENCIL

Is the most economical Pencil made. It lasts six times as long as an ordinary pencil. But it is the velvety smoothness of the lead that is the great charm of the Koh-I-Noor. There is no other pencil that nearly approaches its quality. The lead of the Koh-I-Noor is specially prepared by a perfected process which gives it a firmness yet delicacy of touch that cannot be imitated. The Koh-I-Noor is made in seventeen degrees to suit all pencil purposes.

Koh-I-Noor Pencils are **4d.** each, and **3s. 6d.** per dozen, everywhere. Of Stationers, Artists' Colourmen, Photographic Dealers, &c. Booklet free from

L. & C. HARDTMUTH,
12, Golden Lane, London, E.C.

KOH-I-NOOR TRACING CLOTH

Is a stout and substantial cloth possessing every advantage for the drawing room. Its surface is smooth and clear, free from blotches. Does not tear or break. Is transparent enough for the finest work. Erasures may be freely made without causing the ink to run. Is excellent for giving impressions by process.

THE GREATEST SATISFACTION IN USING THIS SPECIALITY IS FOUND IN ALL DRAWING OFFICES.

Of Stationers, Artists' Colourmen, Photographic Dealers, &c.

CARRON

"Esto" & "Radiant" Firegrates

are thoroughly up-to-date, labour and fuel saving, they consume every particle of coal, diffusing in exchange a genial warm and healthy glow.

They are built on scientific lines—the low concave shaped bottom grate being the most perfect arrangement for effecting complete combustion.

Grand Prix Franco-British Exhibition.

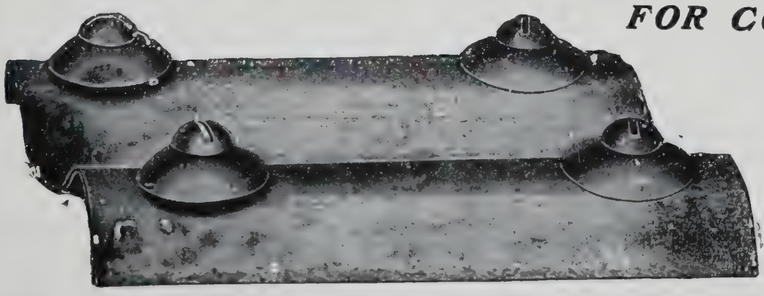
"LIMPET" PATENT BOLTS & WASHERS
FOR CORRUGATED IRON SHEETS.

"There is no doubt in our mind that they ought to be regularly specified where iron sheeting is used."—*Vide* BUILDERS' JOURNAL.



Their great feature is the way in which they adjust themselves to the corrugation and make an **absolutely watertight joint.** They also retard the corrosive action in Galvanized Sheets and combine other advantages.

EXCLUSIVELY ADOPTED BY THE INDIAN GOVERNMENT, THE LEADING RAILWAYS AND MANY OF THE LARGEST MANUFACTURING CONCERNS IN ENGLAND AND THE COLONIES.

PRICE'S PATENT

The latest and most approved Fixing for joining Corrugated Iron Sheeting together.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 22. HOPEMAN.—Mason, carpenter, plumber, slater, plaster, and painter works, of a cottage to be erected at Hopeman. Plans, etc., may be seen with John Wittet, architect, Elgin. Tenders to be sent in by April 22.

EXAMINATIONS.

Systematic and thorough Individual Preparation by

HOBDAY & VENNING, 19, Hanover Sq., LONDON, W.

Full particulars of Courses and Fees on application.

Telephone: MAYFAIR 2549.

ARCHITECTURAL tuition by Correspondence, or under articles; twenty-five years' successful experience.—G. A. T. Middleton, 19, Craven Street, Strand, W.C.

ARCHITECTURAL EXAMINATIONS.

Preparation personally or by correspondence for R.I.B.A., S.A., and Board of Education, ("Architecture," and "Building Construction") Examinations. Write for free booklet. — H. Hodgson, A.R.I.B.A., Claremont, Morley Street, Bradford.

STRUCTURAL STEELWORK

Can you Design your own Steelwork? Do you know how to properly proportion your columns, stanchions, and girders? We guarantee to teach you how to do this in a few lessons by our System of Correspondence Tuition in Architectural Steelwork.—Apply to us for free Booklet J (4th edition), Midland Engineering Bureau, Strand, Derby.

PRACTICAL DESIGNING of STEEL CONSTRUCTIONAL WORK taught by Correspondence, individually or in classes. Elementary and advanced courses arranged for Architects, Engineers, etc. Write for Prospectus B., Embankment Engineering Institute, 64, Victoria Street, Westminster. S.W.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

Examinations will be held on the following dates:—The Preliminary Examination on the 14th and 15th June, 1909. Applications must be sent in on or before the 1st May.

The Intermediate Examination on the 14th, 15th, 17th and 18th June, 1909. Applicotions must be sent in on or before the 1st May.

The Final and Special Examinations on the 24th, 25th, 26th, 28th, 29th June, 1st and 2nd July, 1909. Applications must be sent in on or before the 22nd May.

The Testimonies of Study, etc., with the necessary fees, must accompany the applications, all of which are to be addressed to the undersigned.

The Garden of London. Professor Geddes has been lecturing to the townsfolk of Richmond, Surrey, or those of them who are included in the Richmond Town Advancement Association, on the beauties of their own surroundings. "I have come to the conclusion," he said, "that Richmond possesses natural advantages unrivalled in England, in Europe, or indeed in the whole world." Richmond has felt recently the importance of moving with the times; it has many houses unlet, and its tradesmen suffer in consequence. Hence the formation of the Advancement Association and Professor Geddes' enthusiasm at its first meeting. An intimate acquaintance with Richmond and its surroundings enables us to corroborate Professor Geddes' spirited encomium. The river, the Earl of Dysart's Ham estates, the Royal parks and Sheen Common form a continuous chain of open surroundings that preserve Richmond from the contaminating influences of town. Only on one portion of the circle, extending from Sheen Road to Kew Road, is the approach clear for the ever extending brick and mortar tentacles of London. But on that one side much has been and is being built, which it would be very difficult to eulogise, and such "improvements" as have been effected of late years are not likely to commend themselves as having increased the beauties of the town. Richmond suffers from a plethora of houses that nobody wants, extortionate rents, a very expensive train service, and a great absence of small modern dwellings. The majority of houses on the hill are three or four storied basement residences. Rents in the district can hardly be called moderate. Some small houses are to be had at £40 a year; some of those that go some £10 lower have practically no gardens. A number of new houses are being built in the better roads in Richmond; but the rents and leasehold figures quoted are generally rather high. The rates of Richmond are over 7s. in the pound, and the assessments are heavy; consequently, on a rough calculation a third of the rental must be added for rates. The type of house particularly wanted in Richmond now is one having four bedrooms, a garden (which really should be something more than a back yard), letting at a rental of from £30 to £40 a year. Some houses of this type have been erected recently just off the lower side of Sheen Road; but people who come to Richmond are not very keen on streets on the lower side of that thoroughfare. The railway facilities of Richmond are fairly good, four different companies serving the town, but as the South-Western Railway controls all the lines and prevents all competition, the fares to town are maintained at 9d. single and 1s. 3d. return for a journey of nine miles. There is a small horse tramway from Kew Bridge to the town, owned by the London United Company, who have, as yet, not been able to arrange terms with the Richmond Corporation for its electrification. Bearing in mind how prejudicially the advent of the trams has affected the amenities of riverside places like Teddington, Twickenham, and Hampton on the Middlesex shore, the inhabitants of Richmond have good reason for excluding the trams permanently. Moreover, the time occupied in journeying by train to Shepherd's Bush or Hammersmith to connect with the tube railways would be too long to make them an important factor in Richmond's travelling facilities. The extension of the Piccadilly and Brompton tube from Hammersmith, through Chiswick and Mortlake (two rapidly developing districts), would be a very valuable railway development for Richmond, as it would place it in direct communication with the West End and north-east of London. Professor Geddes' recommendations for improving Richmond may or may not be good. It entirely depends upon the aims of the Advancement Association. If they seek to obtain an increase of steady ratepaying residents, the provision of a Kursaal, which will attract crowds of nonresidents and develop a perhaps undesirable element, is hardly likely to effect their object. If, on the other hand, they look for support to the fleeting crowd who go down to the river and patronise the teashops, the provision of a Kursaal may have the desired effect. But a wet summer may then spell ruin to the tradesfolk, and in any case the daily incursion of crowds of people will have the effect of driving the present inhabitants away. The most pressing factors in Richmond's distress are the very high rents and the unsuitable houses, and until the Advancement Association sees some way of getting over these difficulties we fear Richmond will hardly advance very much. In any case residents can only be encouraged by jealously preserving the rural appearance of the town. A block of red brick flats at the Park gates is not an encouraging symptom of Richmond's development. The aspirations and achievements of Richmond in the matter of town planning are, it seems to us, of much more than merely local importance at the present juncture. They afford a convenient opportunity for studying the general question by means of a particular example. Unhappily it affords us yet another instance of the lack of cohesion and co-ordination whereby so many naturally beautiful districts have been despoiled of their native charm. The Richmond Town Advancement Association is doubtless animated by the best intentions, but we greatly doubt its potency for amelioration on the æsthetic side.

Our Homes. Closely allied with the subject of town-planning is the question of housing. Mr. Burns's Bill, indeed, covers them both; and it was inevitable that discussion upon it should be raised by all those who were interested in what is dubbed "The Housing Question," or by those who think that their material interests are likely to suffer under the proposed new legislation. Nottingham has had a housing question controversy; Birmingham is enjoying one; Leeds is convulsed, apparently, by the projected abolition of the back-to-back house; while the criticisms of a correspondent in the "Glasgow News" on the subject of the Scotch tenement dwelling have roused all the worst passions of the Northern Celt. These little ebullitions in the whirlpool of a great reform may be studied for what they are worth; they will hardly affect the main lines of a measure which cannot be amended to suit the exigencies and building idiosyncrasies of the different towns. The offence of Leeds and its back-to-back houses will not be met by pleas for the neat front gardens, and the abolition of the ugly backyards. In our experience these front gardens are rarely neat; and thus the excuse fails from the start. We do not like back-to-back houses; we said so some time ago, and were duly and not too courteously denounced by a Leeds paper in consequence. But appeals to the business and commercial instincts of our energetic northern peoples against the fulminations of a paper in the slothful south are not very convincing arguments. We grant the business energy of the northern man, though it often appears to rest on the fact that he reaches his office in less than the hour demanded from a London man by the travelling facilities at his disposal. But we doubt if the commercial zest of the northerner does not obscure from him many of the joys of living. After all, while one lives one should endeavour to live among decent surroundings. The making of money should not be the end and aim of life, and civilisation demands that we have some greater outlook on life than the primitive aim of filling our stomachs, important as that may be in the scheme of things. The south is not faultless, dear knows. The London suburban streets, with their pretentious bays, their cheap and paltry carving, their mop trees, their contemptible front gardens, and their farcical back gardens, are at a least an evidence of striving after a measure of refinement. They, at least, monotonous in the aggregate, and repelling in the unit, have not the dreary hopelessness of the slab-fronted terrace houses in our northern manufacturing centres, where the front doors open direct from the street into the front room, and the back doors give upon cramped stretches of asphaltic desolation. Not that the north has stood still in the matter of improvements. But fine squares, monumental civic buildings, splendid parks or tram services, do not a city make. Behind them are unlovely dwellings in treeless streets, to temper the thoughts, the minds, the ideals and aspirations of their tenants. Of what use then to expect high ideals or ennobled thoughts from crude unloveliness? It is expecting grapes from the thistles. The problem will one day be solved. It could be solved by a Bill of one clause. If each dwelling had to be erected on a certain area of ground and was allowed to cover only a fixed proportion of that area, and with certain provisions as to cubical contents and the sizes of rooms, the housing difficulty would be largely removed. It is the ability to crowd houses together that makes land dear, and dear land is bad for builders. A provision such as we suggest might be bad for those of the present generation who have bought land on the old basis; but a readjustment of values would not act more unfairly, perhaps, than a new land tax. It would be no more than the sad experience of those who have bought clothes, jewels, furniture and such things, when they try to realise on them.

The Return of The Native.

So Mr. Thomas Hardy, having reared for himself a goodly edifice of fame as novelist and poet, has returned to his old love, and has prepared plans for a tower and spire for Holy Trinity Church, Dorchester. It is understood that although the literary success that he achieved with "Desperate Remedies" in 1871 led him to renounce architecture as a profession, he has never really ceased to be enamoured of the Mistress Art, but has remained constant to her as an amateur in the best sense of an abused word. It could hardly have been otherwise; for, having been articled to an architect in 1857, he studied Gothic architecture under Sir A. Blomfield, A.R.A., from 1862 to 1867—that is, during the most impressionable period of Mr. Hardy's early manhood, when he was from twenty-two to twenty-seven years old; and now, when verging on seventy, he is going to prove, we make no doubt, the duality of his genius, and that the splendour of his achievements in the realms of literature might have been equalled—it could not be surpassed—in the domain of architecture.

WILLOUGHBY v. TECHNICAL JOURNALS (1902) LIMITED.

At the Assize Courts, Manchester, on Wednesday, April 21st, before Mr. Justice Walton, the case of Willoughby v. Technical Journals (1902) Limited, was mentioned.

Counsel for the Plaintiff: Mr. L. Langdon, K.C., and Mr. Gordon Hewart, instructed by Messrs. Boote, Edgar and Co., Manchester.

Counsel for the Defendants: Mr. Tobin, K.C., and Mr. Hugh Fraser, instructed by Messrs. Bull and Bull, of London.

Mr. Langdon: My Lord, in this case I appear with my learned friend, Mr. Hewart, for the Plaintiff, and my learned friends Mr. Tobin and Mr. Fraser appear for the Defendants. I am happy to say that neither your Lordship nor the Jury will be troubled to hear this case, because seeing the course the Defendants have taken a trial is, I am happy to say, rendered unnecessary. This was an action for libel appearing in a most important publication called "The Builders' Journal and Architectural Engineer," a journal that circulates broadcast amongst architects and builders, and has not only a wide circulation but a deservedly important influence. In that journal, under circumstances which, I daresay, Mr. Tobin will explain to your Lordship, there appeared, on January 13th last, a letter from a correspondent, and an anonymous correspondent. Unfortunately that letter contained grave aspersions on the professional capacity and the integrity of my client, Mr. Willoughby. Mr. Willoughby is a gentleman who has practised as an architect here in Manchester for some 26 years. He is a Fellow of the Royal Institute of British Architects, and is also a Fellow of the Manchester Society of Architects, and in that capacity he has discharged important work as an architect, and has also been called upon to adjudicate on many important matters as an assessor between architects. Naturally, when this letter appeared, attacking him in the way it did, it wounded his feelings greatly and was calculated to do him the greatest of harm amongst his professional brethren and the trades which are connected with them, and these proceedings became a necessity, and they have been taken. I am happy to say on behalf of the Defendants that they have recognised the gravity of the position in which they have placed Mr. Willoughby, and they are willing, through Mr. Tobin, to express their regret and apologise to Mr. Willoughby for what they have allowed to appear in their paper. More than that they consent through Mr. Tobin that, as a substantial mark of the wrong they have done the Plaintiff, and in an endeavour to repair that wrong as far as they can, there shall be judgment for the Plaintiff for 500 guineas and costs.

Mr. Tobin: I appear for the defendants (with Mr. Fraser) who are the proprietors of "The Builders' Journal," and as Mr. Langdon has stated, it is a paper of very high standing and reputation amongst members of the profession amongst which it circulates. It is read by a great many builders, architects and engineers throughout the length and breadth of the country, and anyone looking at its issues, any of them, will see that its articles are regularly most serious and earnest articles, and anything like a libel is absolutely and wholly alien to its character. In this case the letter complained of was communicated to the paper by a correspondent. It was received in hot haste of going to press, and it was inserted by absolute inadvertence. The directors, when they saw the letter, when it was complained of, at once recognised, as gentlemen, that there was only one honourable course for them to pursue, and that they do pursue in this case. They say, through me, that the statements are wholly unfounded. They have never sought to justify those statements from the very first, and in the frankest and fullest way they express their regrets, and tender to the Plaintiff their sincere apology, and the proprietors of the paper further desire to say this, as showing they are anxious to do what they can to put the matter right, that they propose to report in two successive issues of their journal what I am now saying on their behalf, so that everyone who read the original letter complained of may have a reasonable opportunity of reading this withdrawal in Court to-day. I only wish to add that there has never been on the part of any of the proprietors of this paper, or in the minds of any of their staff, the smallest personal feeling against the Plaintiff. On the contrary, there have in previous issues of this journal been articles laudatory of the Plaintiff's work. The Directors feel, and authorise me to say, what I have now said on their behalf, and they have taken a proper course and a dignified course in this matter.

Mr. Justice Walton: I quite understand. The statement you have made expressed properly what they have done. They seem to have made an unfortunate mistake, but there is no suggestion that they did it maliciously. It was a mistake calculated to be injurious to the Plaintiff, and I think they have taken a proper course.

Mr. H. M. Bowes has removed to Charlton, Constant Spring, Kingston, Jamaica.

* * *

Mr. Sydney Searle has removed from 6, Staple Inn, W.C., to 7, Stone Buildings, Lincoln's Inn, W.C.

* * *

Mr. T. E. Eccles, F.R.I.B.A., has been re-elected President of the Liverpool Architectural Society.

* * *

The Bermondsey Borough Council has compiled a return showing the cost of the disposal of refuse for one year in the metropolitan boroughs. For the year a million tons of refuse were disposed of at an average cost of 9s. 1d. per ton. The cost per year per house came to 11s. 10d. In six boroughs there is some adjustment of accounts where a refuse destructor is worked in conjunction with the electricity undertakings. The average amount charged to electricity account—and equivalent per unit generated—is .35d. per unit. In Bermondsey 492,948 units of electricity were generated by means of 19,648 tons of refuse.

* * *

The Duke of Argyll has consented to open the Imperial International Exhibition, the White City's successor, at Shepherd's Bush. The opening ceremony will take place about May 18th. The great Imperial Tower, which is one of the new features, will then be inaugurated, and probably the opening ceremony will take place in it. Three thousand men are at work daily in the grounds preparing for the new exhibition, and the number is to be immediately increased to 5,000. Hundreds of painters with long brushes are engaged in transforming last year's white palaces into the component parts of harmonious colour schemes. The grounds have been extended from 140 to 150 acres, and a number of new buildings, in which many interesting exhibits will be housed, have been added. Large sums have been spent on new roads.

* * *

Employment in the building trades in March last, of which returns have just been published in the "Labour Gazette," was slack in all parts of the United Kingdom, except with painters, who were fairly well employed. It showed an improvement compared with February, but was worse than in March, 1908. Returns received from 591 firms employing 34,573 workpeople at the end of March show that, compared with a month ago, there were increases in the number of skilled workmen employed of 3.6 per cent. in London and 3.4 per cent. in the provinces; while in the case of labourers there were increases of 3.4 per cent. and 0.9 per cent. respectively. Compared with a year ago, there were decreases in the number of skilled workmen of 0.3 per cent. in London, and 14.5 per cent. in the provinces; the decreases in the case of labourers being 2.2 per cent. and 19.9 per cent. respectively.

THE ARCHITECTURAL WORK OF THE LONDON COUNTY COUNCIL.

By W. E. RILEY, F.R.I.B.A., Superintending Architect of Metropolitan Buildings and Architect of the London County Council.

Abstract of a paper read before the Royal Institute of British Architects, April 19th, 1909.

At the London County Council there are thirteen main committees which deal with constructional works, these main committees being divided into 35 sub-committees for purposes of detail, and this part of the Council's operations range in scope from the construction of one of the largest generating stations ever erected in the British Islands to a three-roomed cottage, or a structure of even less importance. Therefore the author would not attempt to go through the details of the whole of the architectural work which has come within his experience during the ten years he has held office under the London County Council, but would indicate only the salient features of the more important items.

Housing of the Working Classes.

Housing schemes are framed under the Housing of the Working Classes Act, 1890, with its amendments of 1894, 1900, and 1903, and are carried out under the three subheads Parts I., II., and III., of the principal Act. Part I. of the Act deals with large clearance schemes which entail an obligation to rehouse the persons displaced. These schemes are carried out by the "local authority," which, for the County of London, is the L.C.C. Part II. is the diminutive operation on the lines of Part I., and the Borough Councils as well as the County Councils are empowered to act. Part III. permits voluntary action on the part of all local authorities, which, for London, embrace the Borough Councils and the L.C.C. The Local Government Board under the amendment of the Act dated 1903 became the confirming authority for all operations under the Housing Acts. In addition to the Housing of the Working Classes Acts under which powers are prescribed, large displacements arise under special Acts of Parliament. These entail rehousing obligations based practically on the same procedure as under the Housing Acts.

It has been laid down that not less than 400 cubic feet of air space per person for adults should be provided in the Council's dwellings, 200 cubic feet per head being permitted for children under 10 years of age, and that the number of persons should not work out at more than two to a room.

Examples of important schemes undertaken by the L.C.C. under Part I. of the Housing of the Working Classes Acts are:—Boundary Street, Bethnal Green; Churchway, St. Pancras; Webber Row, Southwark; Wellington Place, and King's Bench Walk, Southwark; Union Buildings, Clerkenwell.

There are two generally accepted forms of construction adopted in the planning of block dwellings, viz.: (a) Self-contained tenements; (b) Associated tenements. (a) The self-contained tenement has its own independent scullery, water-closet, and offices; and, except where a common laundry is provided, its own washing arrangements. (b) The associated type shares with other tenements the sculleries for preparing food, sinks, water-closets, and wash-houses. Latterly the L.C.C. has invariably adopted the so-called "self-contained" plan. A good example of a large scheme approaching completion is the Bourne Estate and Union Buildings, Bourne Estate consists of two parts. One part, viz., the Reid's Brewery section, is 3⅛ acres in extent, and was acquired in connection with the Holborn-to-Strand Improvement and Southampton Row Widening schemes, which contained a clause stipulating that all persons displaced who had permanent employment in the district should be rehoused within a mile of their former dwellings. The other part, the Union Buildings section, was an insanitary area of 1½ acres cleared under the Clerkenwell and Holborn Improvement Scheme, 1899, under which the obligation was to rehouse 1,414 persons displaced. The Reid's Brewery scheme of rehousing was approved by the Secretary of State, and provides accommodation for 3,902 persons. The average area of the living rooms is 150 ft. super, and that of the bedrooms 100 ft. The average cubic space in the living rooms is 1,275 ft., and in the bedrooms 850 ft. The buildings were planned for the internal blocks to lie north and south so as to obtain the maximum of sunlight in the living rooms, and each tenement has at least one room looking on a garden. The type of plan designed for these buildings is an improved "balcony plan," arranged so that the living rooms and the bedroom do not look on to any of the balconies, and have an unobstructed light. The buildings are five storeys high with a few attics, and are constructed of fire-resisting material, with steel joists and concrete floors. All the sculleries and water-closets are separated from the habitable rooms by ventilated lobbies. The type of plan of the buildings has, since the completion of the first block, been adopted by other authorities for working-class dwellings, amongst others by the Metropolitan Boroughs of Bermondsey and Hackney. This type of plan has been adopted also for Darcy buildings, a small five-storey block of dwellings erected for rehousing some of the persons displaced through the widening of Mare Street, Hackney. The site, though narrow, is an excellent one, as the building overlooks London Fields, a permanently secured open space. The dwellings will accommodate 190 persons in 25 tenements of two rooms and 15 tenements of three rooms. The total cost of the building including all incidentals amounted to £9,719 11s.

Dwellings erected under Part II. are: Cranley Buildings, Holborn; Cobham Buildings and Borough Road Buildings, Southwark; Ann Street Dwellings, Poplar; Sylva Cottages, Deptford.

PALACE OF SOCIAL ECONOMY AND OF THE CONGRESSES AT THE PARIS EXHIBITION OF 1900. CHARLES F. MEWES, ARCHITECT.

Bruce House—a lodging-house—at the corner of Kemble Street and Drury Lane, is an example of the fulfilment of part of the obligation to rehouse under the Holborn-to-Strand improvement. Bruce House contains 709 cubicles in all, affording accommodation for 698 lodgers (men) and eleven porters. It was opened in 1906, and cost, with the necessary machinery and apparatus for lighting, ventilation, etc., £50,020. The elevations are of red brick facings, relieved with glazed and Luton bricks, stonework, and roughcast, and the roofs are covered with green slates. The plan of the building is E-shaped above the ground floor, so arranged as to provide adequate light and air to the cubicles. Each lodger has an independent cubicle having a minimum width of 4 ft. 10½ ins., with an area of 36 ft. super, and lighted by a separate window.

Under Part III. of the Housing Act the operations are carried out on a purely commercial basis, and the cost of land is not written down. The plans and details of the dwellings are not subject to approval by Government Departments. Two fairly large Part III. estates on which block dwellings have been erected are the Caledonian Asylum Estate, Islington, and Wessex Buildings, Holloway. Caledonian Estate is about two acres in extent, being acquired by the Council under Part III. of the Housing Act, and consequently bears no rehousing obligation. The estate is therefore charged with the total capital expended in respect of land, buildings, gardens, etc., and all other outlay in connection with the development of the estate. After making due provision for all expenditure, including debt charges, the accounts show a profit of 1.15 per cent. on the gross rental. The buildings are five-storey block dwellings containing 272 tenements, the four back blocks being of the improved balcony type. The front block has closed staircases with windows and white glazed tiled dado, giving approach at each landing to four tenements, averaging nine rooms for each set of four tenements. On the basis of two persons to the habitable room, six one-room tenements, 116 two-room, 146 three-room, and four four-room tenements accommodate 1,384 persons. The estimated cost of the buildings and incidentals was £57,396 10s., and worked out at 7.86d. per cubic foot.

The most extensive developments under this part of the Act, however, have been the laying out of "cottage" estates. Three large estates of this kind are in progress at the present time, while a fourth, the Old Oak Common Lane Estate, has been acquired, and a scheme for development is in progress. Totterdown Fields Estate at Tooting comprises 38¾ acres. The roads have all been formed and cottages have been erected on about 25½ acres. Norbury Estate comprises about 30 acres. The roads have been formed on about 18 acres, and cottages erected on about 5 acres. White Hart Lane Estate is divided into two parts. The larger or southern section comprises 178 acres; the roads have been formed on about 35½ acres, and cottages erected on about 18.9 acres. The northern section comprises 46 acres, and is not yet ripe for development. The Council has all along intended that this isolated portion should wait till the neighbourhood has opened up and become ready for building accommodation. Endeavour has been made to render the cottage estates successful, both from a commercial and architectural point of view. Variety in planning and treatment of the elevations has been arrived at. The cottages are two-storey buildings arranged in short terraces with spaces at intervals, and they are almost invariably set back from the forecourt fence 5 to 14 ft. Each cottage has its own front door, and its own plot of garden ground in rear. In every cottage suitable fittings are provided.

In no case have more than 33.33 cottages per acre been put on the land, the average number being about 29.14.

For large works, sometimes "open," sometimes "selected," tenders are invited. The cost of block dwellings, including professional and incidental charges, erected during the past five years, has worked out at about an average of £86 per room, or 9.8d. per cubic foot. For cottages, however, it has been found generally most economical to obtain tenders as follows:—The working drawings of the buildings are prepared to ⅛th in. scale, and a few essential details to a larger scale. A simple specification is prepared giving very little detailed description of construction, but specifying the quality of the articles required. To the specifications are attached the Council's instructions for tender, form of contract, and schedule as to rates of wages and hours of labour. No bills of quantities are prepared, but each contractor invited to tender is supplied with a set of drawings, specification, form of contract, etc. I find under this procedure that there is no difficulty in getting excellent contractors, both in large and smaller ways of business, to compete. This simple means of obtaining competition works admirably, not only in the initial process of obtaining tenders, but in the adjustment of variations, etc., for at every step the architect knows just how the cost of the work stands. Care has to be exercised in the granting of advances for work done, but there is no difficulty in framing a table of values on which to work.

The cost of cottages varies considerably according to district.

Cottages recently erected have cost, including professional and incidental expenses:—

At Totterdown Fields Estate, Tooting, 5-roomed cottages, £349 to £384; 4-roomed, £235 to £273; 3-roomed, £192 to £216; the average cost per cubic foot being 6.14d. At White Hart Lane Estate, Tottenham. 5-roomed cottages, £253 16s.; 4-roomed, £204 4s.; 3-roomed, £168 16s., the average cost per cubic foot being 4.97d.

Electricity Buildings.

In 1902 it became necessary to construct buildings in connection with the electrification of the whole of the tramway system within the County of London. This involved the erection of a large generating station at Greenwich, and a repair depot, car sheds, and sub-stations placed at convenient positions near the routes. Of these buildings 22 sub-stations are already in full work transforming the current, 10 car sheds accommodating 1,324 cars are in use, and the Greenwich Generating Station is approaching completion. The Greenwich Station is to accommodate plant for generating high-tension 3-phase current at 6,600 volts, to supply the substations on both sides of the river for tramway purposes. The site adjoins the Thames about 150 yards east of the Greenwich Hospital. The area is about 3.7 acres, with a frontage to the river of about 240 ft. The building is divided into two bays, one of which is occupied by the boilers, and the other by the engines, turbines and dynamo machinery. It is erected on a concrete raft 6 ft. thick, which extends over the whole area of the boiler and engine rooms. In this concrete raft are placed R.S.J.'s forming grills at the various points where stanchions carry

BASEMENT PLAN

KENSINGTON FIRE STATION: PLAN.

the superstructure. The boiler-house is 455 ft. 9 ins. long, 84 ft. 6 ins. wide, with an average height of 105 ft., and accommodates 48 boilers of the Stirling and Babcock and Wilcox types arranged in 24 batteries of two boilers each, 12 batteries on either side of a central gangway. The engine-house is built parallel to the boiler-house. The dimensions are—455 ft. 9 ins. long, 83 ft. 6 ins. wide, with an average height of 103 ft. The floors of the engine-room and of the galleries, which provide access to the steam-valves, are constructed of coke-breeze concrete covered with terrazzo paving. The internal wall facings are of glazed brick. The gantry to carry a 50-ton travelling-crane is supported by steel stanchions which also carry the roof principals. The roof framing of the pump-house is of steel, with brick arches. These are covered with concrete, on which asphalt is laid, forming a flat to carry a 50,000-gallon tank, which provides water for the boilers. An endeavour has been made to treat the elevations of the station with simplicity. The materials selected are stock-bricks, with Portland stone for sills, copings, and dressings. The roof is covered with Bangor slating and patent glazing (Luxfer Prism Syndicate, first portion; Messrs. Helliwells, second portion). The total cube of the building is 9,670,000 cubic ft.

New Cross Car Shed.

This car shed, on the south side of New Cross Road, covers nearly four acres, and accommodates 295 double deck cars. To obtain a level working floor it was necessary to form an average gradient of 1 in 27 from the New Cross Road and to excavate the back portion of the site to a depth of 14 ft. The plan is roughly a square, and nine bays of roofing run north and south, the standard span being 43 ft. 3 ins. between centres of stanchions. The westernmost bay is arranged as workshop and paint shop. Generally the walls are of yellow stock brickwork with a dado of salt-glazed bricks 5 ft. 6 ins. high, to resist grease. The stanchions, roof-trusses, and girders are of mild steel, the total weight of steelwork being about 1,700 tons. The roofs are covered with blue Bangor slating and patent glazing. The elevation to the entrance is of Portland stone. The building cost about £87,000.

Technical Institutes, etc.

The special educational establishments which have recently been created are:—The Central School of Arts and Crafts and the London Day Training College in Southampton Row; the School of Engineering and Navigation at Poplar; the Westminster School of Art and Technical Institute; the School of Arts and Crafts at Hammersmith, and other Technical Schools at Shoreditch, Paddington and Brixton.

The Central School of Arts and Crafts and the London Day Training College.

The school premises extend 107 ft. along the Southampton Row frontage; the training college occupies the remaining 110 ft. The buildings were placed in contiguity, so that economy might be effected by the common use of rooms by the students of both school and college, and by avoiding the reduplication of heating apparatus, plant, etc. Incidentally the combination of the two buildings under one roof lends itself to breadth of treatment. The college is for the professional training, in teaching, of students who are receiving their academic education in the University of London, at King's, Bedford, and other colleges. The school building has a basement and five other floors, and an endeavour has been made to classify as far as possible the various trades, and to devote a whole floor to each of the main groups. The principal drawing and modelling studios are on the fourth floor, and are carried up through the fifth floor to the roof, and are top-lighted.

The college building has seven storeys, including the basement and entresols. A controlling factor of the lower portion of the building was the lecture theatre, which it was necessary to place so as to be convenient of access from the adjoining Central School. This theatre, which is seated for 300, is situated on the ground floor, the remainder of which is occupied by the entrance hall and staircase and the upper part of the gymnasium.

The height of both school and college from the street to the cornice is 75 ft. 6 ins. Above this the roof, which is covered with lead, rises to a further height of 12 ft. The facades generally are faced with Portland stone, the lower part to 12 ft. 6 ins. above the street with granite from the Colcerrow Quarries in Cornwall. Dressings of Hopton Wood stone have been used in the halls and staircases and in the exhibition hall. The construction throughout is fire-resisting, and provision is made for alternative means of escape in case of fire. The ventilation is on a simple extract system, fresh air being admitted through ventilating radiators. The cost of the two buildings, exclusive of equipment, is estimated at approximately £115,000.

The School of Engineering and Navigation at Poplar

cost approximately £27,000, exclusive of machinery equipment. The main front is faced with Portland stone; other walls have stock brick facing. The columns in the entrance hall are of Hopton Wood stone. The roof is covered with green Cumberland slates. The casements throughout are of steel.

The Westminster School of Art and Technical Institute

is somewhat typical of the Institutes. It had to be designed, however, as an addition to the existing School of Art erected by the late Baroness Burdett-Coutts, and recently taken over by the Council. The construction is fire-resisting throughout. The class-rooms are about 14 ft. high; the corridors are ceiled about 10 ft. up, and the space above utilised for the pipe mains, electric-light leads, and ventilation ducts. Casements are of steel, arranged so that the windows can be cleaned from inside the building. Ventilation is by a simple extract system, with electric fans at roof level operating through metal ducts, fresh air being admitted through ventilating radiators. The heating is by low-pressure hot water. The corridors are paved with hard red tiles, the class-rooms with pitch-pine blocks. The joinery generally is yellow fir, painted; the smoke doors and staircases are of oak in no place less than 2 ins. thick. The class-room walls are plastered: those of the workshops are fair-faced with gault brick. The lower part of the facade is of Portland stone, the upper of stock brick, with Portland stone window jambs and heads, cornice, and quoins. The forecourt railings and gates are wrought iron. The buildings cost £21,000.

Fire Brigade Stations.

The present Cannon Street station, which stands at the corner of Cannon Street and Queen Victoria Street, was erected by the Works Department of the Council at a cost of £16,000. The building, which is faced with Portland stone on both fronts, was completed in 1907. Kensington station was erected on a site covering an area of 6,100 sq. ft. The building, which was completed in 1905, was erected by Kerridge and Shaw, of Cambridge, at a contract price of £10,980. The elevation generally is of red brick with Portland stone dressings, the portion immediately fronting the street being entirely faced with Portland stone.

Vauxhall is a typical sub-station. The building was erected by the Works Department at a cost of £8,400, and the station was completed in 1903. The elevation is of picked stocks with Portland stone dressings. It is now being extended to the capacity of a full station.

Street Improvements.

The Holborn-to-Strand improvement presented the opportunity of making as great a mark on the architectural appearance of London as is likely to occur for many years to come. Improvements between Holborn and the Strand were first mooted in 1836, when a Select Committee of the House of Commons was taking evidence as to necessary improvements in the metropolis. A connecting street was proposed between Holborn and the Strand by way of Lincoln's Inn Fields. Improvements were suggested by James Pennethorne in 1847 in connection with the building of a Record Office on the Rolls Estate, who proposed a spur street almost on the line of the western arm of Aldwych. Again, a proposal was made by Mr. Teulon in 1878. It may be of interest to note that this scheme shows an island garden in the Strand, not unlike that recently proposed when the suggested setting back of the Strand frontage was under consideration. The desirability of an improvement was first considered by the Metropolitan Board of Works in 1855 and again in 1883. Their successors, the London County Council, have also considered many plans for this improvement. One point of prime importance was the question of the retention or removal of the Church of St. Mary-le-Strand. Its suggested removal aroused public opposition, with which this Institute can probably sympathise, as it undoubtedly forms a highly picturesque object in all views of the Strand, and its removal would have deprived that part of London of one of its most picturesque and interesting features. Previous schemes showing the new thoroughfare terminated by the church had been objected to, and the crescent-shaped Aldwych, with the "island site" between that street and the Strand, was finally decided upon.

The Council, in the earlier stages of the improvement, fully realised the necessity of obtaining the best results in the new streets which, while affording improved facilities for traffic, it was hoped would result in an architectural treatment of great dignity; it was held that, if a high standard of excellence were obtained the cost of the improvement would be reduced. This Institute cooperated with the Council in selecting eight architects, who were invited to submit sketches for the various frontages. Those selected by the assessors as submitting designs which were considered suitable for adoption by prospective lessees were Mr. H. T. Hare, Mr. W. Flockhart, Mr. M. Macartney, and Mr. L. Stokes. However desirable in the interests of architecture the adoption of any of these schemes would have been, the Council has hesitated to impose upon its lessees any coherent scheme as suggested by these exponents, with the result that each design submitted for new buildings is considered on its own merits. The Council has become, by reason of the surplus land acquired in carrying out improvements, one of the largest landowners of London, with a rent roll of £325,000 a year, and having regard to the interests of the ratepayers, it is most desirous of avoiding any restrictions as to elevation, etc., which might delay the letting of land. The building conditions have been amended in such a way that I do not hesitate to describe them as less restrictive than those in operation on any other large London estate. The result indicates that the architectural treatment is decidedly above the average hitherto attained in other metropolitan improvements. If the general effect of the remainder does not fall below this standard the result will be one for congratulation.

The Council preserves a suitable record of architectural and historical buildings which are demolished in connection with improvement schemes. Every building is carefully surveyed, and, if desirable, suitable photos are taken; where any valuable detail, either in stone, wood, or iron, is found, a measured drawing is prepared.

In connection with street improvements, which form a very important part of the work of the Council, attention is at once arrested by the fact that the actual or estimated gross cost of county improvements effected by the Council since 1889, excluding bridges, has amounted to £11,000,000, towards which the local authorities have in some cases contributed. This large sum can only be regarded as the cost of patching up mistakes and remedying deficiencies which should never have arisen had any attempt been made originally to lay out London on a definite plan.

Discussion.

Mr. Andrew Taylor, in proposing a vote of thanks to Mr. Riley, observed that in considering the architectural work that had been put before them, it should be remembered that Mr. Riley's position was an extremely difficult one, as it was not always possible to convince the numerous committees and sub-committees as to what was architecturally the best course to adopt. Some of the L.C.C work was of an engineering character; but it must be admitted that Mr. Riley had tackled the architectural problems very successfully. The speaker, however, questioned how far work of this nature should be done to the exclusion of the general profession. He thought that any exceptional or special work should be thrown open to competition; and he felt sure that Mr. Riley would raise no objection to this view. He had greatly appreciated Mr. Riley's paper.

Mr. T. J. Bailey, in seconding the vote of thanks, said he could support the remarks made by the previous speaker as to the difficulties that arise in working for various committees, and to the limits of economy.

Mr. John W. Simpson, in supporting the vote of thanks, observed that he would like to strike a more enthusiastic note than had characterised the remarks of the previous speakers. He had been greatly impressed by the dignity and beauty of much of the work they had seen upon the screen. He had to admit that it could well bear comparison with the very fine examples of American architecture they had seen in connection with the paper recently read by Mr. Swales. He was most happy to express his high appreciation of Mr. Riley's lecture.

Mr. William Woodward, also supporting the vote of thanks, said that the paper was terse and very much to the point. He had no hesitation in saying that Mr. Riley's fire station designs would meet with the unqualified approval of architects generally.

Mr. Riley briefly replied.

EXTERNAL LEADWORK.

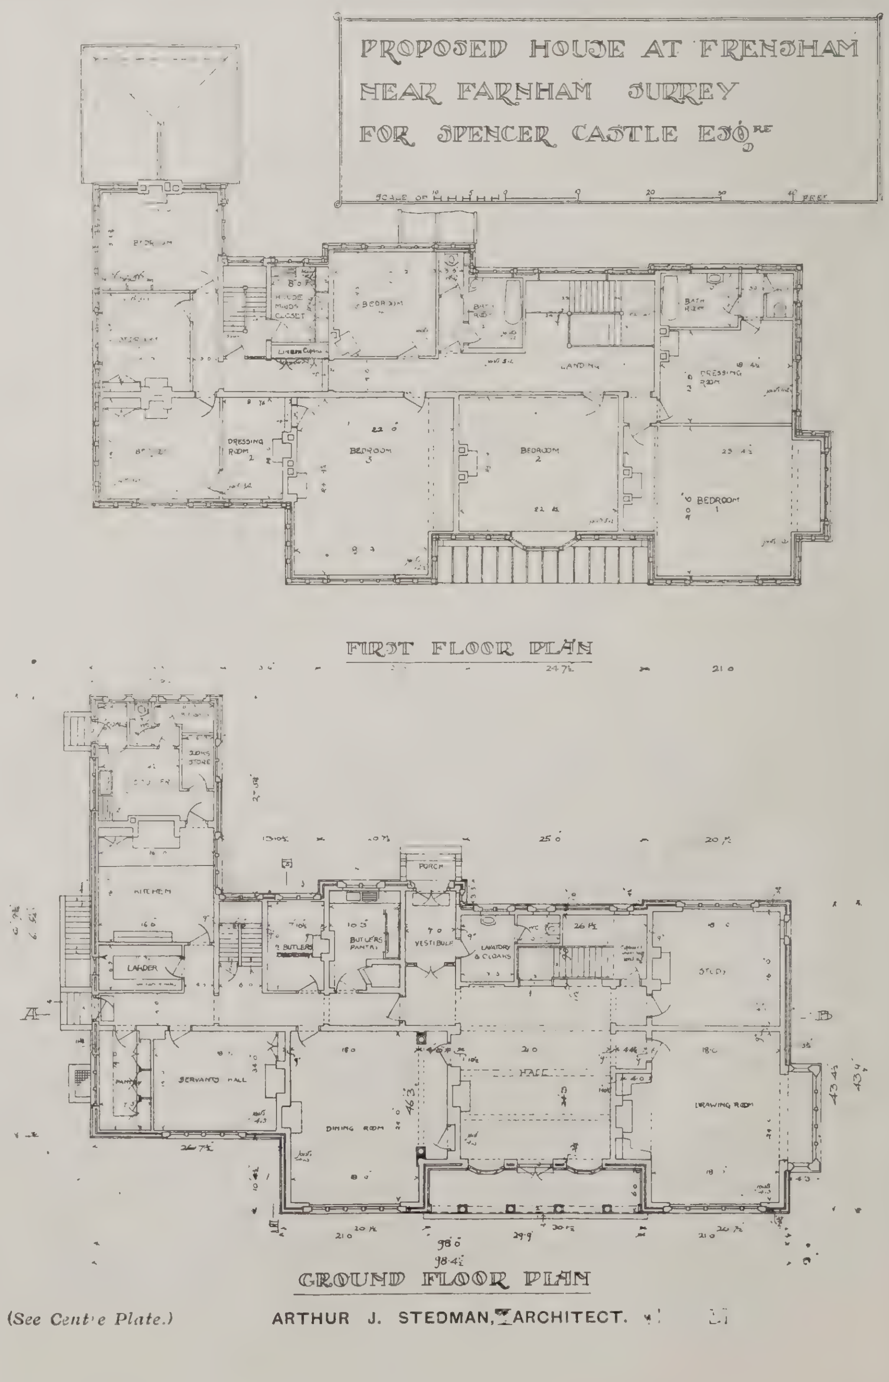
Mr. F. W. Troup, F.R.I.B.A., lecturing at the Carpenters' Hall, London Wall, E.C., said that he had had some difficulty in arriving at a title for his subject, but the description he had used, namely, "External Leadwork," seemed the best, as it excluded sanitary work.

The care, accuracy and precision which must be observed in all modern sanitary work absorbs so much of the plumber's time, that the other branch of his craft—the decorative and ornamental use of lead—had suffered. Lead has lost caste, and from being a material of which men were proud, and eager to possess as a covering for their temples, etc., has dropped into a position of utilitarianism. It is regarded by some in the same light as galvanised iron.

Comparing cast sheet lead with milled or rolled lead, the lecturer remarked that the latter is now always used for roof work. Originally all lead for roofs was made in sheets specially cast on a sand bed. Ever since the time of Sir Christopher Wren, however, the use of milled lead gradually increased; but to this day the whole of the leadwork for the roof and other parts of the building of St. Paul's Cathedral is cast in sheets in the crypt, in a casting frame 17ft. long by 6ft. wide.

Milled lead has one advantage which has had much to do with its introduction, namely, that it can be made of any thickness. A great deal of skill is required to cast sheets of lead of 6 pounds to the square foot. It is said by some plumbers, he continued, that sheets cast in the old way are hard and more difficult to work. This may be true, but it is a mistake to say that they cannot be wrought up as well as milled lead. Another objection sometimes raised is that cast sheet lead cracks, and has holes in it. This applied chiefly to the thin sheets, and for sheets weighing 6 pounds to the square foot the lecturer recommended the use of milled lead.

He wished to distinguish clearly between the two kinds of sheet lead, namely, "cast"



(See Centre Plate.) ARTHUR J. STEDMAN, ARCHITECT.

and "milled"—that which is rolled out between steel rollers. By the aid of a slide of an old engraving showing the interior of a plumber's shop, with the various implements of his trade, the lecturer next described the preparation of cast sheet lead. The casting frame is like a long table, with a rail about 4in. high round it. This is covered with sand spread evenly over the surface about 2½ins. thick. This *must* be damp—it is best to keep it permanetly damp—well mixed, and about the consistency of snow when it is right for snowballing. The sand is levelled down with a strike, with a long handle, and finally polished with a float. The lead, having been melted, is ladled out into the head-pan. The lower end of the sand bed is made to slope down rapidly, so that the superfluous metal can run away into a pot. The strike, which is raised off the sand the thickness of the sheet to be cast, is brought close up to the head-pan, and when the lead is emptied on to the frame the strike is rapidly run the full length, sweeping off all superfluous metal. The boards forming the bottom of the casting frame should have holes bored in them, to allow the steam to escape, otherwise the sheet will blow up in a bubble, which will be knocked off by the strike. Many other details were furnished by the lecturer, who next passed on to leadwork on roofs. A slide was shown from Viollet-le-Duc, showing how leadwork was laid on the old French cathedrals. It weighed 10lbs. or 12lbs. per square foot, and was intended to last 1,000 years, yet so laid that any sheet could be replaced without disturbing those around it. The open rolls which they used were much more effective than the modern wooden cored rolls, and the boards on which the lead was laid had spaces of from 1in. to 1½ins. between them. This was better for the timber, but could only be done where the sheets of lead were very stout.

Some slides followed of Beauvais cathedral roof, showing the method of arranging the rolls, and the hooks for keeping the sheets in position; Chalons-sur-Marne, with its herring-bone rolls, also famous for its roof covered with figures coloured; a sketch of the method of using lead rolls on Godalming Church spire; the fleche from Gordon's College, Aberdeen, showing the rich effect of the fringing on the angles; the upper part of a spire at Calais, the lecturer drawing attention to the English flavour of the work, which probably dates back to the English occupation. We will now, he said, run through a few more elaborate examples. The fleche at Amiens, from a drawing in Burgess's books was shown, and attention was drawn to the cast lead ornament, gilding, lead figures, tinning ornament, and foliage; the hospital at Beaune; and Jacques Cœur's house at Bourges.

Then we come to the later use of lead for gutters and pipes for taking water off the roofs, which superseded gargoyles. An example was shown of a very simple one from Friesland; a lead cistern from Poundisford Park, with the head and pipe over—this example was round, which the lecturer remarked was obviously the correct shape. square or rectangular ones need ties, otherwise they would bulge when filled with water. Also heads were shown from Coventry, Durham Castle, Knole and Bucklebury, near Reading. Next, he said, we come to leadwork covered with colouring and gilding. Several examples were shown from St. John's College, Oxford, from drawings made by the lecturer in 1889. Next a slide was shown of several heads from Abbot's Hospital, Guildford, in which tinned ornament had been used, and this method of decorating was fully described by the lecturer.

Referring briefly to the lead statues, he said most of those we see now are merely cheap substitutes for bronze. Lead is really an unsuitable material for this kind of statues, for unless elaborately supported inside by iron rods, they are bound to collapse. The mediæval method was to build up the skeleton in wood or iron, and then to hang on the lead in plates, beaten up and fixed together.

Lead fonts were next briefly dealt with, and several examples shown, including one from Dorchester, in Oxfordshire, which had been cast flat, bent round and joined, which was the method usually adopted.

In conclusion, several very beautiful examples of modern leadwork were shown, including a lead head and clock turret and clock face by the lecturer, from the house of Mr. Joseph King, near Wittey; a cistern by Mr. Weir Schultz; a panel by Mr. Prior; and two vases by Mr. Lethaby.

ROYAL SOUTHERN HOSPITAL (LIVERPOOL) EXTENSION COMPETITION.

Designs for an out-patient department to the hospital were invited from a limited number of architects, Mr. Alfred Culshaw, F.R.I.B.A., being appointed assessor. It was stipulated that the cost (including the necessary quantities, the architect's commission, fixed fittings, electric light, and heating) should not exceed £8,000, the author of the first selected design to carry out the work, the second and third designs to be awarded premiums of £21 and £10 10s. respectively. The drawings required consisted of ground and basement plans, two sections and four elevations, all to ⅛-in. scale. The necessary accommodation on the ground floor was to include a main external door wide enough for the simultaneous ingress and egress of patients; a vestibule and small porter's office, a receiving room for patients, close to vestibule, and about 120ft. super.; a waiting hall to accommodate 175 seated people, from which the dressing and consulting rooms could be directly approached; lavatory and closet accommodation, the latter in basement if necessary; a retiring room for medical staff, about 100ft. super.; a retiring room for nurses, about 100ft. super.; a private entrance for joint use of medical and nursing staff, this not essential; an isolation room about 100ft. super., near to the receiving room, and provided with an external door; male and female dressing-rooms, about 450 and 400ft. super. respectively; five consulting rooms, each about 150ft. super., and an examination room about 100ft. super., adjoining one of the consulting rooms; a minor operation theatre, about 240ft. super., also adjoining and in connection with one of the consulting rooms; a recovery room, about 100ft. super., adjoining minor operation theatre; a dispensary about 200ft. super.; a splint room about 260ft. super., the latter to be in the basement, if necessary, where accommodation was required also for a low-pressure boiler and for fuel, and where 1,200ft. super. of space was to be provided for subsequent appropriation.

It was required that the elevations should be of red brick with stone dressings, and harmonise with the existing hospital and nurses' home, and should be devoid of superfluous ornament. We must confess that this

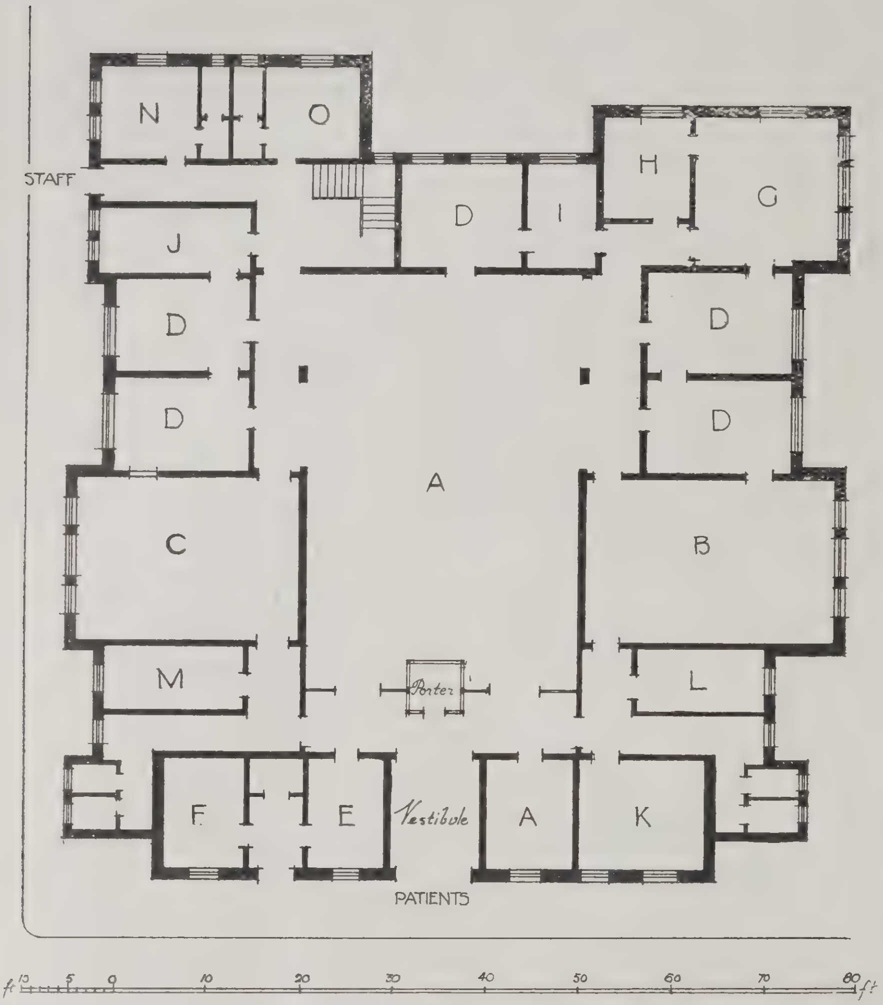
② MESSRS BRIGGS & WOLSTENHOLME & THORNLEY



latter requirement has been fulfilled to the letter in almost every case, though whether the significant clause in the conditions requesting the architect to state his fee in the report accompanying his work, was the determining factor, we hesitate to say.

The first selected design is that of Messrs. Haigh and Thompson, Imperial Buildings, Exchange Street East, Liverpool; the second, that of Messrs. Briggs, Wolstenholme and Thornley, May Buildings, North John Street, Liverpool; the third, that of Messrs. Willink and Thicknesse, 14, Castle Street, Liverpool. From the purely utilitarian point of view there can be no question but that Messrs. Haigh and Thompson's plan is the most satisfactory arrangement submitted.

The main entrance is, perhaps, rather skimped, this being due to the placing of the staff entrance on the same front in a balancing position. And though this arrangement does not result in as satisfactory an elevation as is obtained by one central entrance on the main front, the plan is distinctly more workable. (In the other designs it will be noted the staff entrance is in the side street.) To us the most admirable feature in the plan is the disconnection of the dressing rooms and their attendant baths from the main hall, and the accessibility of the consulting rooms from the latter, which is well cross-ventilated on either side. It will be seen that, as in the other plans, the hall rises above the lower surrounding rooms, and is lighted by a clear storey. The convenient central position of the operating theatre also compares very favourably with the alternative arrangements adopted by the other competitors. Probably the principal defect in the plan is the treatment of the isolation room, which is not isolated at all. However, in actual practice we believe that this is not found to be a matter of vital importance. The general disposition of the rooms and the convenient access everywhere obtained mark the plan as by far the most ingenious. With regard to the elevations, we must admit disappointment: they are impersonally mediocre to a degree.

In the design of Messrs. Briggs, Wolstenholme and Thornley, we should have liked to see more evidence of a rigorous regard for economy. Considerable trouble seems to have been taken to ensure the isolation of the isolation room by the planning of a disconnecting lobby; and the main entrance is commendably adequate, but otherwise there are many features of the plan open to criticism. The central waiting space is insufficient, and the additional room provided in connection with the hall proper, is scarcely a satisfactory solution. The non-central position of the operating theatre and the placing of the consulting rooms too much in the rear, and the dressing-rooms and baths too far forward, all detract from the value of the plan. The whole scheme appears to us to err on the side of expensiveness. However, we must congratulate the authors on the elevations. These, conceived in a manner, which we would label, with some hesitation, "Tudor," show expert handling of the rules of composition.

Messrs. Willink and Thicknesse's design again is comparatively extravagant, and the planning not strikingly happy. It will be noticed, for example, that the foot baths open off the main hall. But the design of the facades is distinguished by the use of simple forms in reasonable proportion.

The trustees appointed by the King for the erection of the Chapel of the Order of the Thistle have selected Mr. R. S. Lorimer, A.R.S.A., F.R.I.B.A., as architect for the design and execution of the work. Mr. Thomas Ross, F.S.A. (Scotland), will act as honorary consulting architect to the trustees.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
April 30	WHITBY SECONDARY SCHOOL. Application for conditions (prepared in consultation with Mr. Paul Waterhouse, the Assessor) should be addressed, before April 30th, to the Secretary, Education Offices, County Hall, Northallerton. The Committee reserve the right to restrict the number of competitors.
May 1	RESIDENCE FOR ASSISTANT MEDICAL OFFICER, BRIGHTON WORKHOUSE. The Guardians invite competitive designs for the above from Architects practising and having offices in the Parish of Brighton. Conditions and site plan from B. Burfield, Clerk to the Guardians, Parochial Offices, Prince's Street, Brighton.
June 1	MOLESEY ISOLATION HOSPITAL. The East and West Molesey U.D. Council invite competitive plans, with specifications for the above. Full particulars can be seen at the Council Offices, Dundee Villa, East Molesey.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading. Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively. Assessor: Mervyn E. Macartney, F.R.I.B.A., F.S.A.
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31.	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	WALLASEY U.D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Reading County Offices Competition.

Members of the Institute proposing to enter for this competition are requested to communicate with the undersigned before taking any further steps in the matter.—Ian MacAlister, Secretary R.I.B.A.

Monument to Peter the Great at Riga.

A monument to Peter the Great is to be erected in Riga, and the Municipality invite competitive sketches from home and foreign architects. The authors of three selected sketches will be respectively awarded 1,500, 1,000 and 500 roubles (a rouble is equivalent to about 2s. 10d.). The competition closes on May 1st. Further information can be obtained from the Municipality of Riga.

Our Plate.

The house at New Southgate is to be erected in Bowes Road, and is externally faced with mottled brickwork, and the roof slopes, covered with old roofing tiles. The general motive has been to obtain a simple exterior with an avoidance of any "special" feature, and wide iron casements by Messrs. Humphries, Jackson, and Ambler, of Manchester, are introduced in broad frames with oak pins left projecting. The brickwork up to damp course is to be tarred, and the ironwork generally painted a soft apple green. The interiors are treated with like simplicity—the rafters and beams in the hall and dining room are left revealed and ceiled in between, and these rooms are panelled out in plain oak panelling. Mr. E. Parker, of 4, Bishopsgate Street, E.C., is the contractor, and the leaded glazing by Messrs. William Morris and Company, Westminster, S.W. Messrs. Castle and Warren are the architects.

The house now being erected at Frensham, Surrey, commands extensive and charming views of the surrounding scenery, especially on the west front. The bricks used are red (local hand-made). The roof is covered with a dark brown local tile, giving the appearance of old tiles. Bath stone dressings are used, with English oak half-timber framing and white stucco work. The hall and vestibule are panelled in oak, and the ceilings have oak beams and joists; the staircase and stairs are all in oak, being partially in view of the hall through arched openings. The dining room joinery is also in oak. The drawing-room has a panelled ingle nook and panelled dado, with a large bay window. The hall and corridors are heated by hot-water pipes and radiators carried out by Messrs. C. P. Kinnell and Co., the sanitary, plumbing and drainage work is by Messrs. Doulton and Co., and electric light is to be installed throughout by Messrs. Drake and Gorham. The general contractors are Messrs. Goddard and Sons, of Farnham, and the architect is Mr. Arthur J. Stedman, of Farnham, Surrey.

AN EXHIBITION OF COTTAGE DESIGNS.

An exhibition of cottage designs promoted by the Council of the Manchester Royal Institution will be opened in the Manchester City Art Gallery in June.

The promoters desire particularly to illustrate designs of workingmen's cottages which have already been erected, and of which reliable particulars as to cost and construction can be given, and they wish to discourage representation by picturesque drawings, and to rely rather on working drawings and photographs to show the designs.

The exhibition will be open for about nine weeks, and after about a month at the City Art Gallery, the drawings will be moved first to the Queen's Park, and secondly to the Ancoats Museum galleries.

While the promoters have in view the desirability of exhibition designs for cottages which shall give definite information as to the sort of cottage which may be reasonably within the reach of the working man in town or country, and shall not be misleading from mere cleverness of draughtsmanship, they are prepared to receive suggestive designs for laying out groups of cottages.

Mr. Percy Worthington is acting as hon. organising secretary to the Exhibition, and will be glad to receive applications for forms and particulars from those interested in the subject as landlords, architects, or builders. Forms and particulars may be obtained from him at his address, 46, Brown Street, Manchester.

Mr. S. Rings, M.S.A., has accepted the honorary appointment of architect to the German Protestant Church and Schools, Whitechapel, which was held by the late Mr. E. A. Gruning, F.R.I.B.A.

THE ROYAL AUTOMOBILE CLUB.

Our attention has been courteously called by Messrs. Mewès and Davis to the fact that from the article in our last issue it might be inferred that Mr. E. Keynes Purchase, F.R.I.B.A., of 20-22, Maddox Street, is only acting in an honorary capacity with regard to the Building of the Royal Automobile Club in Pall Mall, and that this is not the case. He and Messrs. Mewès and Davis have been appointed by the club to act as joint architects, and he is equally responsible with them for the whole scheme and the carrying of it into execution.

His name should have appeared at the foot of all the plans and sketches in our last issue with that of Messrs. Mewès and Davis as joint architects.

The continuation of the article dealing with the work of these architects will appear in our next issue.

TRADE BOARDS BILL.

Memorandum by the Employers' Parliamentary Council.

The Employers' Parliamentary Council have addressed the following memorandum on this Bill to Mr. Winston Churchill:—

This Bill, which is intended to establish wages boards for the fixing compulsorily of rates of wages which employers may legally pay, is objected to by the Employers' Parliamentary Council upon the following and other grounds:—

So far as the trades scheduled in the Bill are concerned, the value of the article of commerce produced by them is determined not altogether by the wages paid in production and the cost of the raw material, but by unrestricted competition. It may fairly be assumed that the average rate of profit in the so-called sweated trades is not materially higher than the average rate of profit in trade generally. If it were so, capital would be attracted into the "sweated" trades until the rate of profit reached the normal level. If, then, the profit earned by employers in these trades is not in excess of the profit earned by other employers, it would appear that there is no source from which an increase of wages can come except by the enhancement of the price of the product, which would lead to increased competition from manufacturers abroad who are not subject to the restrictions contemplated, and hence to the extinction of the trades in this country.

It is doubtful whether any scheme for the fixing of wages would be in practice enforceable; and in any case employers who did observe the minimum rate of wages would certainly not continue to employ persons who in their opinion were not worth the amount payable. They would therefore discharge a considerable number of the older and less competent workpeople, while a greater strain would be put upon those who remained, in their efforts to comply with the employer's requirements.

There is abundant evidence to show that the establishment of a minimum wage, even when its observance can be secured, does not increase the total amount paid in wages, but simply causes a reduction in the higher rates of wages, the more competent workmen having thus to pay for the increased wages of the less competent.

Apart from any question of the principle involved in the Bill, the provision is especially objected to by which the Board of Trade is to be empowered to set up a wages board for any trade whatever. With regard to the trades to which the Bill is to apply in the first instance, Parliament will decide for itself as to their inclusion or otherwise, and it is submitted that Parliament should in like manner decide on the inclusion of any other trades. It is admitted by the advocates of the Bill that the establishment of a minimum wage is a measure to be resorted to in very exceptional circumstances only, and it cannot be right that such a measure should be forced upon any industry without the deliberate decision of Parliament.

It is to be noted that many of the industries to which the Bill might be applied have already established voluntary agencies for the settlement of disputes, and it would certainly not conduce to the harmonious working of these industries if such voluntary arrangements could be overridden by the appointment of wages boards, possibly at the instigation of a small number of discontented persons.

Trade and Craft.

Some Serviceable Pumps.

Messrs. W. H. Wilcox and Co., whose offices are at 23, Southwark Street, London, S.E., have issued an illustrated list showing several of their pumps of various types. In the Willcox-Turner patent triple-acting plunger pump there are two independent pistons, which, operated by crank levers connected to a handle, work to and from each other as the handle is worked to and fro. When the handle is moved to the left, the pistons separate, thus delivering the water through the ports at both ends of the pump cylinder, and at the same time filling the space between the two pistons. When the handle is moved to the right, the water is discharged from between the pistons through the centre port, and the two end spaces are filled. Hence there is constant delivery through end and central ports. Two cup leathers are fixed back to back on each piston, and one of them is always forcing, thus ensuring perfect suction and delivery, while slip is reduced to a minimum. The pump being brass-lined, there is no sticking or scoring of leathers by rust. All parts can be renewed without skilled labour; and the sucking and delivering being in equal quantities, there is, besides increased capacity, an equal strain on all parts of the pump. This pump may be adopted not merely for hand use, but also for windmill and other mechanical power. Acting both for lifting and forcing, it will suck vertically 25 ft., and will force to about 100 ft. Where portability is required, the pumps are mounted on stands or barrows. The stand pumps are admirable for lifting out of ponds, trenches, shallow wells, etc., and the barrow pumps are in large demand for horticultural and estate use. The triple action power pump is shown in the list as of two patterns, the pillar pattern being mounted on a cast-iron column for direct belt driving, while the vertical plank pattern is for bolting to a wall or similar support. The patent triple-action twin-type plunger pump, for hand or power, consists of two Willcox-Turner pumps coupled together, with accurately-balanced link motion. This pattern is capable of delivering against a head of 120 ft. on slow speed, and is admirably adapted for irrigation work, where a considerable quantity of water is required to be delivered. Architects and contractors who are responsible for water supply and distribution, or any kind of pumping, will find this list very serviceable and suggestive.

Hawksley's Staircasing Specialities.

The Andrews-Hawksley Patent Tread and Engineering Company, Columbia Works, Prestins Road, Poplar, London, E., who are well-known as staircase experts, have issued a well-illustrated catalogue in which the latest improvements in their special lines are attractively and instructively set forth.

The Hawksley tread consists of a solid cast-iron frame, into which are hammered the best oak blocks on the cross of the grain. The blocks being fixed independently of each other, any that become worn can be struck out with a mallet and chisel, and new blocks substituted. The simplicity, durability, economy, and, above all, the entirely satisfactory efficiency of the system may be inferred from the fact that it has been adopted at most of the London railway stations. These treads give a firm and pleasant foothold, and are perfectly noiseless.

The patent reversible tread is a combination of wrought-iron round and flat bars, bolted through oak or pine blocks on the cross of the grain. Constant traffic fills in the grain of the wood with dust and grit, making the wearing surface as hard and as rough as concrete, and thus providing an absolutely safe foothold. But the chief advantage of this tread is that it is reversible; when one edge is worn, it can be reversed back to front, the hosing being unscrewed and brought to the front also. After both edges have been worn, the entire tread can be turned right over, and the same process repeated, so that the tread has four lives. These treads can be fitted to any existing staircase, landing, or step, old or new, and are specially adapted for worn stone or concrete steps.

Hawksley's Patent 1908 "Ideal" woodblock tread has a perfectly level surface that can be kept absolutely clean, and it is therefore particularly useful for hospitals, schools, etc.

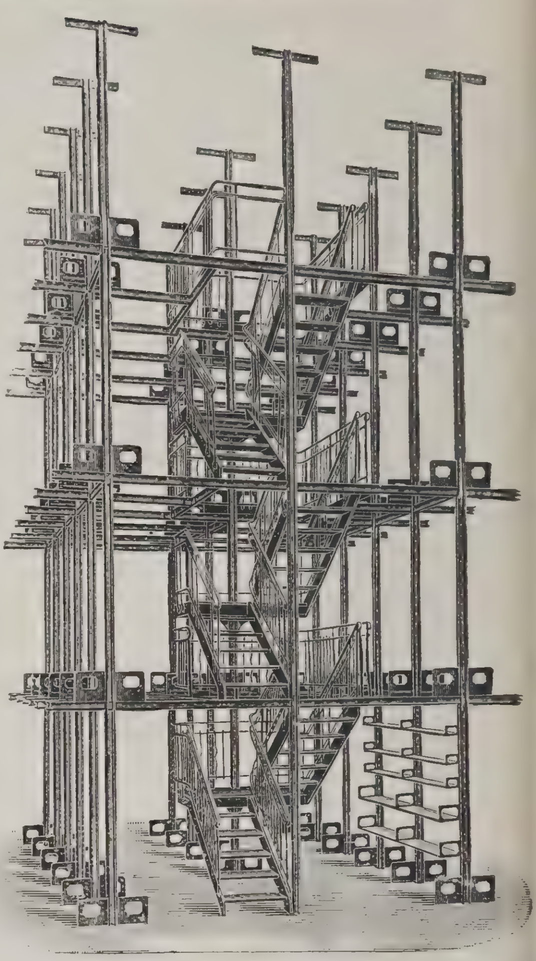
The catalogue shows also a rubber studded tread, rubber floor treads for many services, an iron fire-escape tread, and illustrations of the firm's iron staircases, grilles for lift enclosures, reversible coal-plates, and other interesting applications. The firm execute light constructional work in iron and steel for all purposes; and an interesting example of their staircasing work is now nearing completion at the St. James's Park Station of the Metropolitan District Railway.

A Space-Saving System of Library Construction, &c.

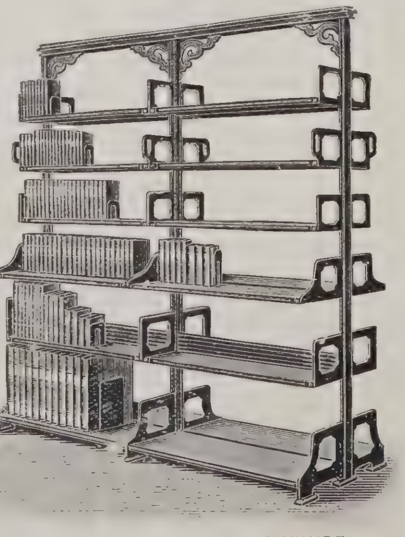
In last week's issue we noticed, on page 341, the new illustrated catalogue of the Adjustable Shelving and Metal Construction Co., Ltd., of Gwydir Chambers, 104, High Holborn, W.C., setting forth their patent system of internal construction for libraries, warehouses, etc., and describing their space-saving fittings for the storage of books and documents. In answer to enquiries, we now give additional particulars of this system.

Many adaptations of the system to various requirements have been made. The firm's patent book stacks, with adjustable shelving, are lightly but strongly built, and are so constructed that the shelves, even when fully loaded, can be adjusted to any desired height. These stacks may be entirely detached or self-supporting, so that they can be placed in the middle of the room or along the walls, like any article of furniture; or they may take the form of fixtures to the walls, or of suspended book-brackets, steel or wood cabinets, provided with doors or with shutters. Again, the firm supply adjustable fittings that can easily be applied to any existing book-case or cupboard.

The inter-flooring construction is a patent space-saving system that is used in conjunction with the general construction of the building. The uprights pass through the various storeys, and serve the dual purpose of racks for the shelving and stanchions for the intermediate floors. The floors may be constructed of hard wood, iron gratings, cement, glass, steel plates, or the firm's special system of corrugated sheets covered with cement. Such structures may be several storeys in height, but the floors need rarely be more than 2ins. in depth, as they do not take the weight of the loaded stacks, the whole weight being carried by the uprights. As none of the weight of the structure is taken by the walls, these need only be of minimum thickness; and, piers being unnecessary, the whole wall space is available for windows. Every possible inch of space is available for storage, as the uprights serve the purpose of racks for the shelving. It is stated that in the case of the Royal Library, Berlin, which is thirteen storeys high, this new system, with its 2in. floors, gained 7ins. in each storey as compared with the old method. Therefore in the thirteen storeys there was a total gain of 7ft. 7ins., or the height of another storey, thus affording accommodation for 350,000 more books—surely a most striking vindication of the claim that this is a space-saving system.



INTER-FLOORING CONSTRUCTION AND ADJUSTABLE SHELVING FOR LIBRARIES, ETC.



ADJUSTABLE SHELVING FIXTURE.

An essential feature of the system is that the book stacks are constructed with adjustable parts, which can be rearranged at will. By means of a kind of ratchet arrangement, the plates that form the sides of the shelves can be easily raised or lowered, and whole sections can be transferred without trouble from one stack to another.

Architects are advised to obtain the firm's catalogue, which fully explains and illustrates the system in its various adaptations and developments. We have here mentioned only its essential features, but the catalogue shows numerous modifications for a large variety of services. Among them are patent collapsible document stacks, with or without doors; patent stacks for stores and warehouses; cabinets for card index binders; cupboards for maps (to be sent up singly or in ranges); shelving for shop windows; show cases for shops and museums; and many other items of use and interest.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

CONCRETE AT OLYMPIA.

This year's Building Exhibition at Olympia has a very good show of exhibits connected with concrete. The great preponderance is in the exhibits of systems of reinforced concrete. The following is a classified list of the firm's represented :—

REINFORCED CONCRETE.

Row B24.—Patent Indented Steel Bar Co., Ltd.
Row B28.—James H. Tozer and Son, Ltd.
Row C41.—Armoured Tubular Flooring Co. Ltd.
Row C56.—Lewis Construction Co., Ltd.
Row E76.—Expanded Metal Co., Ltd.
Row E80.—Trussed Concrete Steel Co., Ltd.
Row F90.—United Kingdom Fireproofing Co., Ltd.
Row G115.—Sideolith.
Row H141.—D. G. Somerville and Co.
Row P239.—Edmond Coignet, Ltd.
Wall space 146.—Mark Fawcett and Co.
Gallery Row B21.—Empire Stone Co., Ltd.

REINFORCED BRICKWORK.

Row D64.—Kleine Patent Fire-resisting Flooring Syndicate, Ltd.
Row Q253.—Fireproof Partition and Spandrel Wall Co.
Row R258.—Richard Johnson, Clapham, and Morris.

PORTLAND CEMENT MANUFACTURERS.

Row D63.—Associated Portland Cement Manufacturers (1900), Ltd.
Row K187.—Saxon Portland Cement Co., Ltd.
Gallery Bay 9a.—Wouldham Cement Co., Ltd.

CONCRETE MIXERS.

Wall Space 145 and Gallery Bay 26a.—Ransome-ver Mehr Machinery Co.
Gallery Row B36.—Stothert and Pitt, Ltd.
Gallery Row B2.—Sam Deards.

REINFORCING STEEL BENDING MACHINES.

Row O228.—John Barker and Co., Ltd.

CONCRETE BLOCKMAKING MACHINES.

Wall Space 158.—Matthew Wylie.
Gallery Row B2.—Sam Deards.

ARTIFICIAL STONE, CONCRETE PAVING, COPINGS, ETC.

Gallery Row B21.—Empire Stone Co., Ltd.
Gallery Row B37.—Ceriog Granite Co., Ltd.

CONCRETE SLAB PARTITIONS.

Row G128.—Acton Patent Concrete Partition Co. (1909), Ltd.
Row H132.—Horace W. Cullum and Co.

CONCRETE ROOFING TILES.

Row B35.—Sharp, Jones, and Co.

COVERINGS TO FLAT ROOFS.

Row C42.—Vulcanite, Ltd.
Row C44.—F. McNeill and Co.
Row F101.—Ruberoid Co., Ltd.
Row R259.—Robert W. Blackwell and Co., Ltd.
Gallery Bay 16.—George M. Callender and Co., Ltd.

From the above it will be gathered that this group of firms form one of the most important sections of the exhibition. The stands, taken as a whole, are well arranged to display the distinctive features of each exhibit, and in many cases are large and imposing structures.

In the reinforced concrete sub-section, though we note the absence of a few prominent names, we find the industry thoroughly well represented, and more completely so than any other important section of the building trade. Beyond these exhibits there are very few different systems of reinforced concrete used in this country, so that those architects, engineers, and others who visit the exhibition with the object of gaining some knowledge of up-to-date building methods can feel assured that if they have carefully investigated the claims of the firms exhibiting who are recorded in the above list under reinforced concrete and reinforced brickwork, they will have mastered the subject which is the greatest advance in building construction there has been for 400 years. The importance of the subject can hardly be grasped; it will only be possible to gain a clear idea of it when we look back after a decade or two; for the moment we are too close to gain perspective—we are in the Concrete Age, and we hardly grasp the purport of it all.

Broadly speaking, there are three subdivisions of the reinforced concrete exhibits which we may call—(1) systems of construction employing ordinary commercial sections of steel; (2) special forms of reinforcement; (3) special methods of construction, or means of executing work.

Belonging to the first sub-division solely we have only the Coignet system, in which the reinforcement is arranged in various ways to resist the stresses in structural members, and to meet various conditions. Belonging to divisions 1, 2, and 3 is the Armoured Tubular floor, consisting of ribs with tubes filled between (both shop-moulded) and a filling of concrete thereon done *in situ*, thus doing away with centring; the ribs are reinforced with a special section of corrugated bar with projections thereon to give mechanical bond. To divisions 1 and 3 belong two other systems in which tubes are filled between shop-moulded ribs to economise centring; but in which ordinary commercial sections of steel are employed, viz., The United Kingdom Fireproofing Co.'s and D. G. Somerville and Co.'s. Both these firms also execute floors completely constructed *in situ*, in which ordinary sections of steel are arranged in the manner of early constructors. In division 2 we place the Expanded Metal Co. (who supply a sheet reinforcement formed by slitting or shearing sheet steel, and opening it into a diamond-shaped mesh called "Expanded Metal"), James H. Tozer and Son, Ltd. (who supply a sheet reinforcement of woven-drawn steel wire called "Lock Woven Mesh"), the Patent Indented Steel Bar Co., Ltd. (who supply bars rolled with indentations thereon, and made from high carbon steel, having a higher elastic limit and ultimate strength than ordinary mild steel bars, in place of which the "Indented Bars" are intended to be used), the Trussed Concrete Steel Co., Ltd. (who supply mild steel bars of special section, having flanges an either side of a square, these flanges being cut and turned up at points to form prongs to serve to reinforce structural members against diagonal tensile stresses), Sideolith (who supply special mild steel sections expanded or opened out to form "Skeletons" consisting of main upper and lower members united by diagonal ties, the latter serving to reinforce against diagonal tension), and Mark Fawcett and Co. (who supply rolled steel joists of special section, *i.e.*, with top flanges smaller than the bottom ones, with holes punched out of the webs, leaving diagonal members intended also to resist diagonal tension). In division 3 we place the Lewis Construction Co., Ltd. (who employ their "Dovetail Corrugated Sheeting" as a permanent centring instead of boards, framing up the reinforcements therein, so that the whole forms a complete unit, economising labour, and obviating displacement in filling in the concrete), and the Empire Stone Co., Ltd. (who place concrete around a number of metal cores with rods attached thereto, and then cut the concrete slab up while soft by a special saw to form beams, from which the cores are afterwards withdrawn, when they can be laid side by side to form a hollow floor without any centring being needed; the process was invented by M. Seigwart, and is known by his name). These firms arrange their reinforcements in various ways, and employ various means, and generally it may be said that all fulfil structural requirements and provide efficient constructions. In their differences lie the reasons for them all meeting with approval, for they suit many conditions, and in certain circumstances one or other may provide the best solution of the problem. As regards reinforced brickwork, the Kleine system applies to floor construction, and consists of hollow brick blocks laid in cement mortar between steel beams, with steel flats embedded in the mortar between the joints; generally a filling of concrete is employed to provide extra compressive resistance. The other firms, *i.e.*, the Fireproof Partition and Spandrel Wall Co. and Richard Johnson, Clapham and Morris, are exploiting an idea which, though not exactly novel, has only within the last few years been recognised as possessing great advantages in the way of strength and economy of material and cost and saving of weight. Both firms employ steel reinforcements laid in the joints of the brickwork, so as to give it continuity of action, and render it practically homogeneous and capable of sustaining great loads as a beam.

The Portland cement manufacturers exhibiting all employ the most up-to-date processes of manufacture, and their cement is of the utmost reliability, and the finest quality. Modern cement is vastly superior to that obtainable up to only a few years ago, due to finer grinding, better chemical supervision and proportioning, and better burning. The concrete mixers exhibited are known as the "Ransome," the "Smith," and the "Smales." The two former belong to the batch type, the first-named having a drum which only rotates, while the latter has a cone-shaped drum, which both rotates and can be turned over to discharge its contents. The "Smales" is a continuous mixer, having blades working in an open trough. The economy and superior quality of the concrete obtained by the use of mixers is considerable.

The reinforcing steel bending machine is known as the "Kennedy," and is now used by a number of contractors for fashioning steel sections of various shapes. It is a very efficient and economical machine, and is worked by hand labour. There are only two concrete blockmaking machines exhibited, and in this respect the exhibition is deficient. The "Smales" (Sam Deards) machine is a very good one, with a large output. It makes solid blocks with which cavity walls are erected. The "Ideal" machine (Wyllie) has been largely used, and has proved that concrete blocks made in such machines provide good, strong, and weather-resisting walls that are economical, and often much cheaper than brickwork of the ordinary pattern. The artificial stone and paving exhibits provide nothing exactly new or novel, nor do the concrete slab partitions. The latter are now much used, and are cheap and highly fire-resisting. Messrs. Sharp, Jones and Co. exhibit some concrete roofing tiles of a novel form, and show another direction in which concrete can be employed to advantage and to displace materials that have long held the field for such purposes. In respect to concrete roofs and tanks the exhibits of covering materials are interesting. They all consist of sheet fabrics impregnated with waterproofing materials. They form elastic coverings that are unaffected by small cracks developing in the concrete underneath and they have considerable powers of resistance. They form an economical and satisfactory solution to the problem of waterproofing concrete.

REINFORCED CONCRETE SYSTEMS.

The Considere System.

(Concluded from Page 284, No. 738).

In the first part of this article we described and illustrated the construction of Considère piles. We now supplement the particulars there given by a view (Fig. 3) of a group of piles after driving at a chocolate factory built on the Considère system at Noisiel. The average length was 37ft., all being octagonal, of 14ins. diameter across flats. A 2-ton monkey, with a drop of 7ft., was used for driving, the monkey falling direct on to the head of the pile, no dolly or elastic cap or cushion of any kind being employed. over 500 of these spirally reinforced piles were employed in the foundations of this job for the Menier Chocolate Co.

The columns of the main building of the above factory are each 2ft. 3ins. square, and each support a load of about 700 tons.

Fig. 4 shows bowstring and arched bridges erected over the railway and river Sée at Avranches, France. The former is of 100ft. span, and the arch of 110ft. span, the total length being 281ft. The bowstring and the arch are both reinforced with rods arranged in spiral manner.

A Considère bridge has been erected over the Cambridge main line of the Great Eastern Railway at Angel Road Station, Tottenham. The viaduct has a total length of about 725ft., and comprises 17 spans of 42ft. 9ins. each. The width between parapets is 40ft. Figs. 5 and 6 show completed sections of the work.

A jetty head 136ft. long by 32ft. wide in 45ft. of water has been constructed on the Considère system at Thames Haven for the London and Thames Haven Oil Wharves, Ltd.. It stands on piles reinforced as before described, and has cross braces also spirally reinforced. We shall describe and illustrate this work in a separate article in a future issue.

The Considère system has only been on the English market about two years, but it has made considerable progress in that time as is shown by the following list of contracts executed or in hand:—

RECONSTRUCTION OF JETTY HEAD AT THAMES HAVEN, for London and Thames Haven Oil Wharves, Ltd. Jetty head is 136ft. long by 32ft. wide. The deck level is about 45ft. to 48ft. from the bed of the river. Vessels up to seven or eight thousand tons burthen are accommodated. Work completed. Engineer, A. E. Carey, M.I.C.E. ANGEL ROAD STATION BRIDGE for G.E. Railway. Bridge over main line to Cambridge, comprising 17 spans of 42ft. 9in. each, with approaches, etc. Work approaching completion. Engineer, John Wilson, M.I.C.E. ABERDEEN HARBOUR EXTENSIONS for Harbour Commissioners. New quays, 3,300 lin. ft. frontage. Piles now being made. Engineer, R. Gordon Nicol, M.I.C.E. ACKERGILL (N.B.).—Slipway for Royal National Lifeboat Institution, consisting of column supporting keelway and platforms. Work not yet commenced. Engineer, W. T. Douglas, M.I.C.E. COWDENHEATH (SCOTLAND). — Piled foundations, columns, and floors for shop and dwelling house. OBAN (SCOTLAND).—Repairs to pier. CARNARVON.—Low water landing stage for Carnarvon and Anglesey ferry.

Avrances Viaduct, Coutances Viaduct, Bergerac footbridge, Paillon River bridge, Perigueux footbridge, bridge over the River Aron at Cercy-la-Tour, bridge over the River Oued Hammam, Tunis. Vic-sur-Aiene bridge, bridge over the line from Busigny to Somain (Chemin de fer du Nord), bridge over River Oued Khol, Tunis, bridge over the River Oued Mellique, Tunis, bridge over the line from Paris to Soissons (Chemin de fer du Nord), seven bridges over the line from Paris to Chartres (Chemin de fer de l'Etat), five bridges over the lines from Paris to Bondy and Noisy-le-sec (Chemin de fer de l'Est), bridge over River Oued Bou-Zenna, Tunis, bridge over River Oued, Hammam, Tunis; bridge over River Oued, Krelef, Tunis, bridge over River Oued, Maden, Tunis, two bridges and a footbridge at Cairo, for the Societe des Oasis, Egypt, bridge at St. Jean la Riviere, bridge over No. 1 Valley de Cougne, bridge over No. 2 Valley du Cougne, bridge over the Valley of Ribas, Meiner chocolate factory, and Boulogne Port works.

The Selfridge Stores.

We regret owing to great pressure on our space that we have been obliged to hold over the concluding article on this building. This will appear in our next "Concrete and Steel" Supplement.

FIG. 3. GROUP OF CONSIDERE PILES, WITH OUTER SHELL REMOVED TO SHOW SPIRAL REINFORCEMENT.

THE DANGERS OF BREEZE CONCRETE.

By **D. B. BUTLER**, Asoc.M Inst.C.E., F.C.S.

Summary of paper read before the Society of Architects, on April 22nd.

During the past few years the author has met with increasingly numerous instances of failure of concrete composed of Portland cement and breeze, failures as a general rule caused by the expansion of the mass, resulting in more or less serious consequences to the structure of which it formed part. These failures have generally occurred where the concrete has been used to form flat roots or fireproof concrete floors, on the well-known embedded rolled joist system of construction; in some instances the expansion has been but slight, though noticeable; in others it has been sufficient to push out the brickwork walls, causing serious bulging and thus endangering the safety of the whole structure; while in one extreme case a flat roof composed of breeze concrete, not only expanded sufficiently to push out the parapet walls and seriously endanger the stability of the structure, but the internal disruption set up within the mass was sufficient, owing to incipient disintegration, to cause it to become buckled and distorted and thoroughly rotten.

Careful investigation of some of the foregoing cases of failure justified the opinion that the mischief lay with the cement, but in many instances the most careful and searching investigation, both chemical and physical, disclosed nothing sufficiently definite in character to enable the investigator to lay his finger with positive certainty on the cause of the trouble. In nearly all the samples of so-called "Breeze" concrete a very considerable quantity of material other than pure coke was noticeable in the aggregate, such as clinkers, stones, shale, ashes, etc., together with, in some instances, a noticeable amount of coal. It may be remarked in passing, that judging from the quality of the "Breeze" which may daily be seen being delivered to buildings in the course of erection, presumably for incorporation in fireproof floors, etc., many a clerk of works must be imbued with a pleasing and childlike faith in the ability of Portland cement to stick together any kind of rubbish; it appears to be an established belief with some users that to produce a good concrete, it is only necessary to have good cement, and that any dustbin refuse or other rubbish will serve for aggregate, and it is not until failure occurs that they realize that they have been asking and expecting the cementing medium to perform impossibilities.

It is questionable whether on account of its combustible nature, pure breeze, i.e., fine coke. is desirable as a fireproof material; an instance has recently been brought to the author's notice in which a breeze concrete enthusiast used that material for a boiler setting, which eventually took fire and gradually smouldered away, with results that can be better imagined than described. Whatever may be the disadvantages of other extraneous material found in breeze, it will be readily understood that coal is not a desirable constituent for concrete; in the first place on account of its smooth shiny surface, the adherence of the cement would be extremely poor; in the second place, it is worse than useless as a fireproof material, on account of its tendency to decompose on heating. The question arose, however, whether apart from being undesirable for the reasons aforesaid, either coke breeze or coal was in any way dangerous as being likely to cause expansion of the concrete.

The first experiment was of a somewhat rough and ready nature and was made with coal. An ordinary bituminous house coal was crushed and sifted to about the fineness of standard sand, i.e., passed through a 1-20in. sieve and retained on a 1-30in.; with this coal a 3-1 mortar was made, and two small 2oz. glass bottles filled with the mixture; one bottle was filled quite full, and the other was filled to within a quarter of an inch of

CONSTRUCTED OF REINFORCED CONCRETE ON THE CONSIDERE SYSTEM.

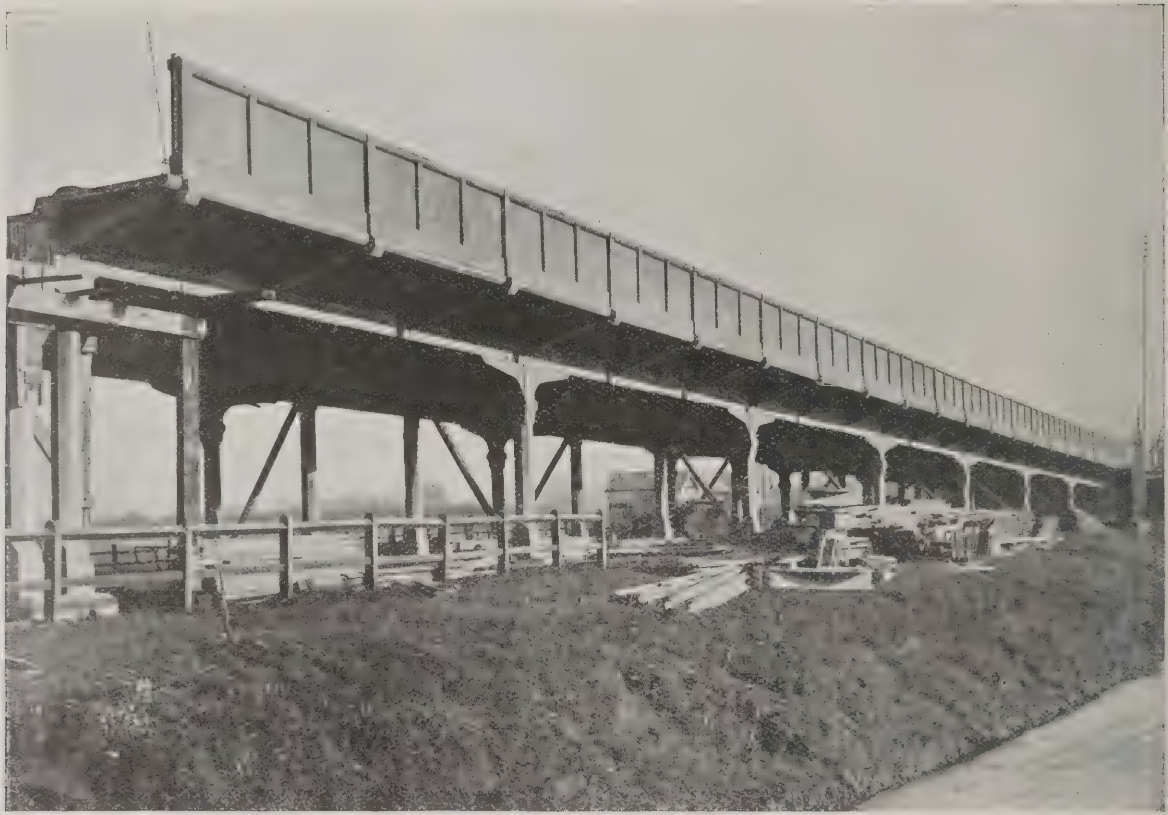

FIG. 5. VIADUCT OVER THE G.E. RAILWAY AT ANGEL ROAD STATION, TOTTENHAM, CONSTRUCTED OF REINFORCED CONCRETE ON THE CONSIDERE SYSTEM.

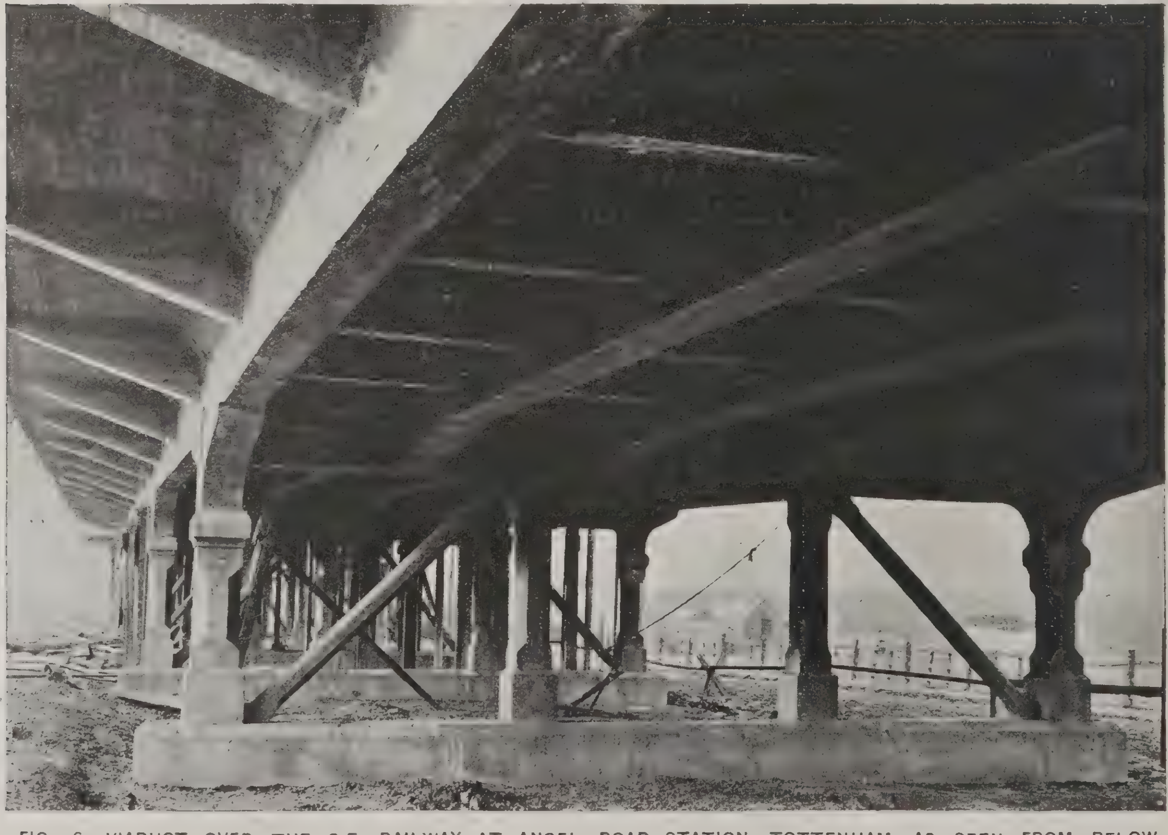

FIG, 6. VIADUCT OVER THE G.E. RAILWAY AT ANGEL ROAD STATION, TOTTENHAM. AS SEEN FROM BELOW.

the top and sealed down with a paste of neat cement, the object of the sealing being to ascertain whether the imprisonment of any hydrocarbons set free from the coal would have any bursting effect. For comparative purposes a similar bottle was also filled with a paste of neat cement and 3-1 mortar of standard sand. Sixteen cements of various qualities and different origin were tried, some being sound when tested for expansion by the Faija test and the Le Chatelier Boiling Test, and some otherwise; the samples were those which passed through the author's hands for testing in the usual course, and were not specially chosen except for the purpose of obtaining as varied a selection as possible. English, German, Belgian, and Swedish cements were represented.

The whole of the bottles eventually cracked, with the exception of the one filled with standard sand-cement mortar. But while those filled with the Coal Mortar generally cracked within two or three days, and with a very few exceptions continued to expand until the bottles burst away into several pieces, those filled with the neat cement and the sand mortar frequently did not develop any cracks whatever till several months, and it was the exception rather than the rule for them to continue expanding sufficiently to burst the bottle. It was observed in one test that both the neat cement and sand cement mortar bottles remained perfectly sound after eleven months, and then only developed very minute cracks, whereas the coal-mortar bottle was cracked in twelve days, and burst right off in forty-two days. This suggests that the cause of the cracking after such protracted periods might be due to unequal expansion of the glass and the mortars at varying temperatures; according to Ganot's Physics the co-efficient of linear expansion between 1 degree and 100 degrees C of glass is 0.000008613, and wrought iron (which is said to be the same as cement) is 0.000012204 or nearly 50 per cent. higher. Though as before stated the bottle test is only a rough one, it serves to show that coal developes dangerously expansive properties when mixed with cement, but since there is no clearly marked difference between those bottles sealed down with neat cement and those unsealed, it does not favour the theory that the expansion is in any way due to the evolution of gas within the mortar.

The next step was to test samples of so-called "Breeze" of various origin, to ascertain if the coal sometimes present (probably partially burned) was unsafe, and also if there were other constituents present which might prove detrimental. Several samples of good breeze were procured; also some which the author was assured by the breeze merchant would never be sanctioned by a good clerk of works; the constituents of the latter, however, did not differ materially from the ingredients to be found in breeze concrete from many important constructive works.

With all the samples tested the general method was to separate them into their several fractions or constituents, so as to be

able to identify, if possible, the cause of the expansion, if any. Each sample was therefore carefully separated out as follows:

(1) The fine material passing through a 1-10in. sieve.

(2) The fine material passing through a ¼in. sieve, but retained on a 1-10in. sieve.

(3) The coarse material retained on a ¼in. sieve; this was picked over by hand and separated out into its various constituents, such as clinkers, coal, coke, etc.

An "average" sample was also prepared, being (1), (2), and (3), mixed together in their proper proportions.

The variety of materials in some of the samples of so-called "breeze" was considerable, and in addition to coal, coke, and clinkers, rubbish of all sorts was present, such as bits of steel saw, nails, brass, and iron turnings, and other metal fragments, broken pottery, etc., etc., in fact, savouring rather of the rubbish usually found in the dust bin, than of coke breeze proper. The percentage of each fraction was carefully recorded, as will be noted in the tables given in the appendices, and as a convenient size for making into mortar for testing purposes, each fraction was broken up to pass a 1-20in. sieve.

Two cements of previously ascertained stability of volume were used for the experiments:—

A, produced from the well-known lias formations near Rugby.

B, produced from the chalk marl deposits and clay in the Midland Counties.

The bottle test, previously described as having been carried out with the coal mortars, was somewhat crude, and also qualitative rather than quantitative; moreover, as previously pointed out, it might conceivably be influenced by the difference between the co-efficient of expansion of the glass and of the mortars at different temperatures. In order, therefore, to render them more accurate and of a quantitative nature, the subsequent experiments with coke breeze mortars were made with prisms or rectangular bars 100 millimetres long and 22mm by 22mm cross section, the expansion and contraction of which were accurately measured in the Bauschinger Micrometer Calliper Apparatus.

Cement and Standard Sand.—Eight bars or prisms were made with each kind of cement, four being made with neat cement, and four with 3—1 standard sand-cement mortar. Two of each series were kept entirely in air and two placed in water after 24 hours, and kept therein during the three months with which this record deals. Each bar was measured after 1 day, 7 days, 28 days, and 3 months, and the measurements recorded, the results of which are given in Appendix II.

Breeze Sample No. I.—Described as "Fine Pan Breeze;" it consisted mainly of clinker and coke with traces only of coal. Separated out as previously described, about 32 per cent. passed through a 1-10in. sieve, and 35 per cent., through a ¼in. sieve. Of the remaining 33 per cent. about 22 per cent. was clinkers, and 11 per cent. coke, with .08 per cent. coal. Each of these fractions, after being broken up to pass a 1-20in. sieve, was made into prisms or bars with the two different kinds of cement, two bars of each being left in air, and two placed in water after 24 hours, and measured after 1 day, 7 days, 28 days, and 3 months. The figures giving details of these experiments will be found in appendix III. It will be observed that the expansion, APPENDIX. VIII.

+ Indicates Expansion. — Indicates Contraction. * = 2-day Measurements.

though measurable, is practically negligible in each case, being about 0.1 per cent.; the air bars as with the standard sand bars, generally show slight contraction.

The two cements give identical results with each fraction or portion of the breeze, and the same remark will be found as a general rule to apply throughout to the whole of the subsequent experiments, whether the expansion be great or small.

Breeze Sample No. II.—Described as "Coarse Pan Breeze." This sample consisted of coke and clinker only, in pieces averaging about 2in. diameter, the proportions being about 35 per cent. of clinker to 65 per cent. of coke. Treated in an exactly similar manner to No. 1, the results are likewise practically negative, as will be seen by reference to appendix IV.

Breeze Sample No. III.—Described as "Coke Breeze," consisted of coke and clinker, with a little coal. The coke varied from 2in. diameter to fine dust. About 48 per cent. passed through a ¼in. sieve; the remaining 52 per cent. sorted over gave 40.6 per cent. coke, 8.6 per cent. clinker, and 2.64 per cent. coal. These results, detailed in appendix V., are also mainly negative. The coal being such a small fraction, it was not possible to make such extended experiments as one would wish, but so far as they go, they show that this particular coal, a species of anthracite, was practically harmless.

Breeze Sample No. IV.—Described as "Furnace Ashes." This sample was very damp when received, and had to be dried before it could be treated. About 26 per cent. passed through a 1-10in. sieve, and 22 per cent. through a ¼in. The remaining 52 per cent. was sorted out into coke about 15 per cent., coal 1.5 per cent., and clinkers 35½ per cent. Each of these five fractions tested with the two cements as before described, again gave practically negative results as per appendix VI.

Breeze Sample No. V.—Described as "Gas Works Clinkers," consisted of clinkers only, ranging in size from 4in. diameter downwards. They were crushed to pass a 1-20in. sieve as before described, and tested in the same way as previous samples, but with negative results, as per appendix VII.

All the foregoing samples having given negative results, attention was next directed to samples of "Breeze" which the contractors supplying them described as "sometimes used for floors, but which they neither used nor recommended;" Nos. VII., IX. and X., moreover, were described as "such that would not be allowed by a clerk of works for fireproof flooring," but the author found them to differ very little indeed from the ingredients found in many samples of breeze concrete taken from important works.

Breeze Sample No. VI.—Described as "Ashes or Furnace Refuse." About 21½ per cent. passed through a 1-10in. sieve and 15½ per cent. through a ¼in. sieve. The remaining 63 per cent. after sorting gave roughly 34 per cent. coke, 27 per cent. clinkers, and 1 per cent. shaley matter.

Treated as before the results were again negative, as will be seen from the appendix VIII.

Breeze Sample No. VII.—Described as "Ashes or Furnace Refuse. About 15 per cent. passed through a 1-10in. sieve and 17 per cent. through a ¼in. sieve, the residue of 68 per cent. on the ¼in. sieve giving 32 per cent. clinkers, 23 per cent. coke, and 13 per cent. coal.

It will be noticed that this sample contains a considerable quantity of coal, whereas No. 6, a material described by the suppliers in exactly the same terms, contains none; as will be seen by reference to appendix IX., this coal does not appear to have exerted any deleterious influence upon the specimens, probably due to its being of an anthracitic rather than of a bituminous nature, but this point will be dealt with more fully later on.

(*To be concluded.*)

R.I.B.A.

At the meeting of the R.I.B.A., held on April 19th, the hon. secretary (Mr. Alexander Graham) regretfully announced the decease of the following associates:—Mr. Charles Thomas Whitley, elected in 1870; Mr. William Candler Reed, 1845; and Mr. Horace Moger, 1903.

THE BUILDING TRADES' EXHIBITION.

SECOND NOTICE.

Visit of the Prince and Princess of Wales.

On Saturday last, April 24th inst., the Prince and Princess of Wales, accompanied by Lady Shaftesbury and the Hon. Derek Keppel, paid the Exhibition a visit extending over an hour and three-quarters. The Royal party arrived punctually at noon, and were received at the entrance by Mr. H. G. Montgomery, M.P., and Mr. Hugh C. Montgomery, the Directors. The Prince and Princess evidently took a keen interest in the exhibits, and entered into animated conversation with the attendants wherever progress was arrested. The Royal party walked down the gangway between Rows D and E, and halts were made at the stands of the following exhibitors:—Hall and Co.; Carter and Co. (where the Prince made a minute examination of the various exhibits); Emdeca Sanitary and Artistic Metal Decoration Co., Ltd; J. A. King and Co.; Newellite Glass Tile Co.; Campbell Smith and Co.; and the Trussed Concrete Steel Co., Ltd., where the first stop of any length was made to inspect the manufacture of models of the Kahn Bar. Passing on, the Royal party visited the following stands:—C. H. Norris, Ltd.; Pinchin, Johnson and Co., Ltd.; Stavers and Stavers; The "Excellence" Wood Block Flooring Co.; Kleine Patent Fire-resisting Flooring Syndicate, Ltd.; and the Associated Portland Cement Co.'s stand, where the Prince witnessed a demonstration of the capabilities of the concrete-crushing machine. Continuing down the same row, the Royal party stopped at the stands of Höfler, Ltd.; The Durato Asbestos Flooring Co.; Wilkinson, Heywood and Clark, Ltd.; The Zeta Wood Flooring Co.; James Gibbons; H. C. Cleaver, Ltd.; and R. Waygood and Co., Ltd., at which the perfect little model of a passenger lift was operated at the request of the Prince. Gross, Sherwood and Heald's Rystolite was next inspected, and then the annexe was entered. Passing between rows Q and R, the stands of Duggan, Neel and McColm; Doulton and Co., Ltd.; Gardel, Ltd.; Wm. Harland; Yates Haywood and Co. Ltd.; and Werner, Pfleiderer, and Perkins, were the objects of a close and interested examination. The remaining stands viewed in the annexe were: The India Rubber, Gutta Percha and Telegraph Works Co.; Sirapite Plaster; Jos. F. Ebner; The Guild of Decorators' Syndicate, Ltd.; The Eureka Sash Balance; Allen and Norris; The Birmingham Guild of Handicrafts, Ltd.; The Binfield Brick and Tile Co.; and The British Uralite Co., at which point the main hall was again entered. Passing between Rows A and B, and, incidentally, displaying great interest in the following stands:—C. A. Peters, Ltd.; Clark and Co. (Xelite); Phillips and Son; The Patent Indented Steel Bar Co. (where the Prince listened attentively to a description of the firm's reinforcement), the Royal party entered the passage between Rows C and D, and inspected the stands of the Crittall Manufacturing Co.; The Newellite Glass Tile Co.; Wm. Oliver and Sons; and The Bath Cabinet Makers Co., Ltd. The stands of McNeill and Co.; The Daneshill Brickworks; The British Stone and Marlbe Co.; The Patent Tip-up Bath Co.; Thos. Mitchell; The Aerograph Co., Ltd.; and Dawson and Co., Ltd.; next received interested attention. The party having now arrived at the entrance, a number of the stands occupying wall spaces were examined, including those of the Manu-Marble Co., Ltd.; The Patent Safety Ladder Co.; and The Non-Explosive Gas Co. Passing down the gangway between Rows G and H, the Royal party paid particular attention to the stands of the following exhibitors:—Ellkay and Co.; John Line and Sons; and Bellman, Ivey and Carter; and returning between Rows F and G, those of Major and Co.; Geo. Farmiloe and Co.; Wm. Thomas and Co.; Candy and Co.; and The Well Fire Foundry Co. At the stand of Ripolin, Ltd., the Princess graciously accepted a beautiful bouquet, which was presented by Miss Heath. The Royal visit concluded with the inspection of four more stands, namely, those of H. J. and C. Major; John Daymond and Son; Mallinson and Son; and Benham and Sons. Passing through the vestibule the Prince and Princess mounted the big Daimler car and drove away.

National Federation of Building Trades' Employers.

On Tuesday, April 20th, representatives of the National Federation of Building Trades Employers' Federation, paid an official visit to the Building Exhibition at Olympia, and, after making a round of inspection, the members were entertained to tea as the guests of Messrs. H. G. and H. C. Montgomery, the promoters of the Exhibition. The tea, which commenced at 6 p.m., took place in the Grill Room.

At the conclusion of the meal, Mr. Ernest J. Brown proposed a hearty vote of thanks to Mr. Montgomery for the courtesy extended to the Federation. His remarks would be brief, as doubtless they were all very anxious further to inspect the very fine Exhibition. It was pleasant to feel that the members of the Federation were not strangers there. He believed that the present exhibition was the finest ever got together, and it spoke eloquently for the splendid powers of organisation of Mr. H. G. Montgomery and

Photo: Topical.

THE PRINCE AND PRINCESS AT THE EXHIBITION. SATURDAY. APRIL 24.

his brother; to them both he extended his hearty congratulations. The Exhibition had been opened absolutely to time; and he thought it was only right to mention how greatly they appreciated the work of the younger Mr. Montgomery. The brothers were inseparable, and they were indebted to both. In conclusion he thanked them for their very kind invitation, and for proving themselves such extremely good hosts. To second the vote of thanks he would like to ask a well-known friend of theirs who had but recently returned from Germany.

Councillor John Dawson, of Dewsbury, heartily seconded the vote of thanks. He had spent some considerable time in examining the exhibits, and he would like to add his testimony to that of Mr. Brown, namely that the Exhibition was in every way excellent, and worthy of prolonged inspection. He was amazed that so much had been done in so short a time. It was true that he had just returned from visiting various important cities in Germany, in the company of the Housing and Town Planning Association. Before this it was more than thirty years since he had been to Germany; and what had always impressed him most was the wonderful structures to be seen there. The Germans had always displayed a spirit of marked cordiality and friendliness. At a banquet to which members of the English party were invited, the band played the English National Anthem as they went in. Several most cordial speeches were made, and whenever the name of an Englishman or a Yorkshireman was mentioned the band simultaneously struck up the National Anthem to an accompaniment of hearty acclamation and applause. He, unfortunately had been called upon to respond, and had done so, the while tinkling glasses with the President, a noble, grey-haired old gentleman. Everywhere kindness, and even affection, were notably manifested, and he was convinced that the more the two races knew of each other, the better would it be both for the individual and the nation. Although the Germans excelled in town planning, and the English might well learn a lesson from them, they could not equal the cottage homes of England.

Mr. H. G. Montgomery, M.P., in reply, observed that he greatly appreciated all the kind things that had been said about the Exhibition. He had listened with great interest to Mr. Dawson's remarks about his visit to Germany, and he could thoroughly endorse everything that had been said. He was pleased to announce that on Thursday (April 22nd), he was going to conduct 30 Germans over the Exhibition, and hoped to have them taken round the provinces in order to familiarise them with what was taking place in the trade. It was the first time that the Exhibition had been honoured by a visit from the Federation in its corporate capacity, and he sincerely hoped it would not be the last. He was quite confident that more prosperous times were in store for the building industry, and that business was decidedly on the mend. He hoped that, when in two years' time the Exhibition was again held, they would be able to come to him and admit the truth of his predictions.

The Bath Stone Firms, Ltd., Bath, London and Portland. Stand 155. Wall Space.

An interesting feature of this stand is a representation of the Monk's Park (Bath) stone quarry, 80ft. below the surface, in the county of Wiltshire. The stone is quarried in long tunnels, 20 to 25ft. deep, and is cut out from the solid rock, and the process of quarrying is here shown.

Examples of Portland stone and Bath stone masonry are shown. The Portland masonry is in stone from the well-known quarries at Combefield, belonging to the Bath Stone Firms, Ltd., from which the stone was taken for the bulk of the Government building in Whitehall, for the Victoria and Albert Museum (South Kensington), and for the Admiralty buildings, etc.

The Bath stone masonry is in Monk's Park stone, which is clean, fine grained, and particularly suitable for the dressings of windows and tracery work.

Samples are also shown of the firm's fluate, which is a material for hardening and preserving building stones, marbles, tiles, terracotta, etc., and is sold in the form of crystals. The following is a short list of places at which this firm's stones have been used. The name of the architect is given in parentheses):—Portland stone: Selfridge Stores, W. (R. F. Atkinson); Kingsway Hall, Kingsway, W.C (Gordon and Gunton); new offices for London, Edinburgh, and Glasgow Assurance Co., Ltd., 180, Euston Road, N. (Beresford Pite); Harcourt House, Cavendish Square, W. (Gilbert and Constanduros); Town Hall, Brixton Hill, S.W. (Warwick and Hall); Royal Exchange Buildings, E.C. (E. George and Yeates); War Office, Whitehall (W. Young); new Government offices, Great George Street, Westminster (J. M. Brydon); Victoria and Albert Museum, South Kensington (Sir Aston Webb); Admiralty Buildings, Spring Gardens and Pall Mall (Leeming and Leeming, Sir Aston Webb); Royal College of Science, South Kensington (Sir Aston Webb); Royal Infirmary, Stanley Grove, Manchester (E. T. Hall and J. Brook); Union of London and Smith's Bank, Hull (Dunn and Watson); new Central Post Office, Hull (H.M. Office of Works); new Town Hall, Stockport (Sir A. Brumwell Thomas); new Cotton Exchange, Liverpool (Matear and Simon). Bath stone: Theatre of Varieties, Tottenham (Wylson and Long); Ladies' Club, Seymour Place, London (Durward Brown); Royal Dental Hospital, Leicester Square (Young and Hall); Salisbury House, Finsbury Square (Davis and Emanuel); Moreton Hall, Warwick (Romaine-Walker and Besant); Congregational Church and School, Hainton Avenue, Grimsby (Bell, Withers, and Meredith); Roman Catholic Church, St. Mary Magdalene, Bexhill (A. Young); Lea Park Mansion, Witley, near Milford (Hants) (Paxton H. Watson); Friar Park Mansion, Henley-on-Thames (Satchwell and Edwards); flats, etc., Parkside, Knightsbridge, London (Hart and Woodhouse); King's Sanatorium, Midhurst (H. P. Adams); school for Christ's Hospital, Stammerham, Horsham (Sir Aston Webb and Ingress Bell).

Robert W. Blackwell and Co., Ltd., Parliament Chambers, 14, Great Smith Street, Westminster, S.W. Stand 259. Row R.

The Genasco ready roofing exhibited by this firm is adapted for use on structures varying in character from a factory to a farm building. The felt which constitutes an important part of Genasco is of the highest quality, and is manufactured especially for Messrs. Blackwell and Co. The saturating compound is obtained from the famous Trinidad Lake, and is possessed of many fine qualities. The firm claim for it superiority over the ordinary slate or shingles, on the ground that it will not easily catch fire, and will not warp or go to pieces through the ravages of time. It can be obtained in four styles—model, stone surface, whitestone (in two weights), and smooth surface (in four weights), each of which is described lucidly and convincingly in an interesting little booklet to be had gratis from this stand. Many styles of coloured paints designed especially for painting rubber roofings are also on show.

Bristowe and Co., 20, Tothill Street, Westminster, S.W. Stand 12. Bay. Gallery.

At this stand special attention is drawn to the rather cleverly named "Tarvia," "the material which supplies the solution of modern roadmaking problems." It can be applied either in the construction or the re-metalling of roads with any material, or as a purely surface treatment. It is supplied in liquid form or as a matrix ready for use; and as a liquid in two grades (a) for use in conjunction with dry stone for constructive purposes; (b) for surface dressing only. No less an authority than Mr. W. J. Dibdin has certified that the washings from Tarvia-treated roads could not possibly interfere with fish life in any stream whose flow is large in proportion to the quantity of road-water entering it. "Tarvia" has been supplied to H.M. India Office, and to more than 160 local authorities, as well as to several railway companies at home and abroad. Tarring machines and other appliances of this kind are also shown, as well as a number of sanitary fittings, including the Parker patent safety pipe joint for making water-tight sewers.

Vincent Brooks, Day and Son, Ltd., 48, Parker Street, Kingsway, W.C. Stand 40. Row B. Gallery.

At this stand are shown various reproductions by various processes from drawings—the process adopted where only a few copies are required being the Dorel True-Scale System, and, for larger supplies, True-Scale Photo-litho. The firm are now able to reproduce "absolutely true to scale" in one piece, subjects that are 22ft. in length. It is claimed that the prints are absolutely permanent, showing black lines on machine drawing paper, Whatman's linen, or tracing cloth, by either process.

Burn Brothers, Rotunda Works, 3, Blackfriars Road, London, S.E. Stands 38 and 39. Row B. Gallery.

Sanitary fittings in great variety, chiefly in ironwork, are shown at these extensive stands. Here are cast-iron drain pipes and soil pipes and fittings, with and without access doors; manhole covers and frames, ordinary and patent; the automatic Certus flushing tanks and flushing syphons; the patent whirl spray sewage jet, patent automatic sewage sprinkler, patent controlled syphons; various kinds of valves; drain-testing smoke machines, drain plugs and various kinds of bag and other stoppers, drain rods, suction pumps, etc.; the whole forming an instructive exhibit for those responsible for the devising, inspection, or execution of what may be distinguished as the fundamental installations of sanitary work.

George M. Callender and Co., Ltd., 25, Victoria Street, Westminster, S.W. Stand 16. Bay.

The fact that Messrs. Callender and Co.'s bituminous solution, which is on exhibition at this stand, is supplied in a form quite ready for use, without involving the addition of any thinners, is sufficient recommendation in cases where extreme expedition is the desideratum. The solution dries quickly, and forms an effective protection for iron and steel. Thus, its appropriate use upon any surface exposed to the elements, and thereby inviting the stealthy and insidious encroachment of corrosion, is

Photo: Topical.

MR. LEWIS HARCOURT, H.M. FIRST COMMISSIONER OF WORKS, VISITS THE EXHIBITION ON THURSDAY LAST.

clearly demonstrated. In view of the fact that an immense amount of iron and steel is now being used in constructional work, it becomes increasingly apparent that more adequate measures must be taken to ensure its complete protection. Thus, any development in the direction of solving a serious and pressing problem should meet with rightful recognition. The solution dries hard, and in addition to being proof against cracking or flaking, is guaranteed to be unaffected by extremes of temperature.

Campbell, Smith and Co., Ltd., 25, Newman Street, Oxford Street, W. Stand 70. Row D.

This firm show a new and improved form of the patent Bexhill casement, which consists of a pair of casements hung together in the centre, with the ends pivoted into blocks which slide in channels in the head and sill. A cam action in the head has been substituted for rack action in the sill. These casements are simple and solid in construction, having steel channels with gunmetal runners. They can be rigidly locked in any position, and cannot rattle. The fittings being of solid metal, there is no possibility of shrinkage. The casements can, by a simple movement, be arranged in several positions, conveniently for cleaning without danger, or ventilation without draught, and when closed they are rain-proof and draught-proof.

Coatostone Decoration Co., 77, Mortimer Street London, W. Stand 17. Bay.

Coatostone, a composition giving the effect of natural stone to plaster, cement, wood, and other surfaces, is shown in its various applications, and in several tints, to imitate various kinds of stone. It is also largely used for the renovation of old stonework, and acts as a preservative. It flows evenly from the brush (to which it does no injury), and is adaptable to either indoor or outdoor work. It is particularly useful for the freshening of old cement stucco or terra-cotta fronts. Coatostone is applied like ordinary plaster, and gives a natural stone appearance. It is trowelled on to brickwork with a backing of Keene's or Portland cement and sand, and is finished from ⅛in. to ¼in. in thickness. As made for external work, it is weather-resisting, and proof against the acids of the atmosphere. Coatostone special roughcast is supplied in white or colours to approval, and is sent out mixed as a thick paste ready for immediate use. Applied with a large brush and stippled with a sponge, it will give a roughcast effect to any texture desired. Other specialities are a colouring for roughcast and brickwork, a stone preservative, and a stone backing solution.

The decoration of this exceedingly artistic pavilion is well supported by some excellent examples of joinery, in particular the nine-panelled door, which is of excellent workmanship. The joinery work was executed by Messrs. P. H. Barker and Son, of Hitchin.

Crittall Manufacturing Co., Ltd., 11 and 12 Finsbury Square, London, E.C. Stand 49. Row C.

Metal casements, patent sashes, metal shop fronts, and wrought-iron gates and fencing are shown at this stand. The "Economic" casement is recommended on the grounds that it will not warp or twist, will always open and close easily, offers the minimum obstruction to light, is watertight and weather-tight, provides against condensation, does not rattle, and allows ample adjustment for ventilation. In the manufacture of these casements, there is no brazing, every joint being welded, the bars of various sections, and of different metals. As an alternative to lead cames, the firm recommend the patent "Fenestra" joint, in either tee or moulded sections, in which a slight swelling in the vertical bar at each cross joint supersedes the straight intersections of the mitred joint. The result is an eminently architectural sash. Official tests, conducted at the Royal Arsenal, Woolwich, of the "Fenestra" joint sashes, show their completely satisfactory behaviour under strong wind-pressure. The firm show, also, various types of steel lockers and cupboards, compact, cleanly, and sanitary, with many specimens of storage bins, racking, and shelving.

Messrs. R. Crittall and Co., 197, Wardour Street, W. Stand 252. Row Q.

In our notice of Messrs. Crittall and Co.'s exhibit last week, we omitted to mention an interesting new development in heating apparatus which may be seen at their stand. It consists of a hot panel and a heated floor. The idea is specially applicable to sanitary blocks in hospitals and bath-rooms, and is carried out in conjunction with the jointless flooring material. In the present instance the Durato flooring has been used both for the panel and the floor. The heating coil is embedded in the panel or floor itself, and consists of solid drawn copper pipes, so that there is no danger of leakage. The valves are outside, and the temperature can therefore be controlled without difficulty. Architects will doubtless be interested in this new development in heating, and will pay a visit to the stand to see the panel and floor for themselves. Where it is necessary to get rid of the usual radiator, this method of heating will doubtless make a strong appeal.

Duggan, Neel and McColm, Ltd., Langbourne Wharf, Milwall, E. Stand 49. Row F.

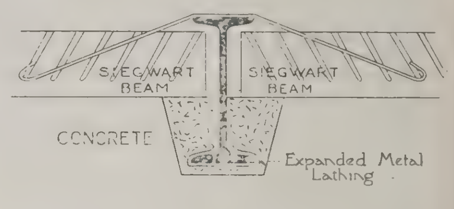
In a tastefully-designed stand are illustrated various methods of using the "Dodo" enamel, which, while applied as easily as paint, is far more durable and gives a much finer finish. It is an air-drying enamel, and gives a surface equalling that of the highest-class coach work. It is suitable for both outside and inside work and, being specially prepared to withstand sea air and salt water, it is particularly suitable for yachts. It may be tinted to any shade for matching. "Dodo" flatting dries with a velvety, non-glossy flat surface, which is secured without special care in the application. It is prepared in eggshell finish and dead flat. "Dodo" undercoating, and a special priming coat, the "Dodo"-filler, are also shown.

England Works, North Street, Leeds. Stand 149. Wall Space.

Objects of special interest to those who are concerned in arranging the fittings of schools and similar buildings are shown here in considerable variety. They include the England patent self-contained cloak-room fittings, patent automatic ball-bearing door pivot, patent steel skylight and casement frames, a patent emergency bolt for double-action doors; and samples of the "England" patent tubular framed wire doors.

Empire Stone Co., Ltd., 231, Strand, W.C. Stand 21. Row B. Gallery.

At this stand there is a fine collection of paving slabs as supplied to the principal Corporations; some handsome red paving slabs; samples of "Empire" stone dressings in various colours; a moulded spandril and square steps; a combined kerb and channel; samples of *in situ* paving, grooved and channelled, as laid for numerous schools, asylums, cattle markets, stables, etc.; mosaic and terrazzo paving steps, dado, etc.; and the "Siegwart" fireproof floor. The "Siegwart" floor is of ferro-concrete construction, which can be quickly placed in position without the use of centring, and is at once completely dry and load-bearing. It is of the hollow-beam type, and the beams are made up to 20ft. spans, supporting girders being employed for greater spans or exceptional requirements as to load. The floor is sound-proof and a bad conductor of temperature, and is, of course, fire-resisting. Many interesting photographs of works in which the firm's specialities have been employed are shown at the stand.

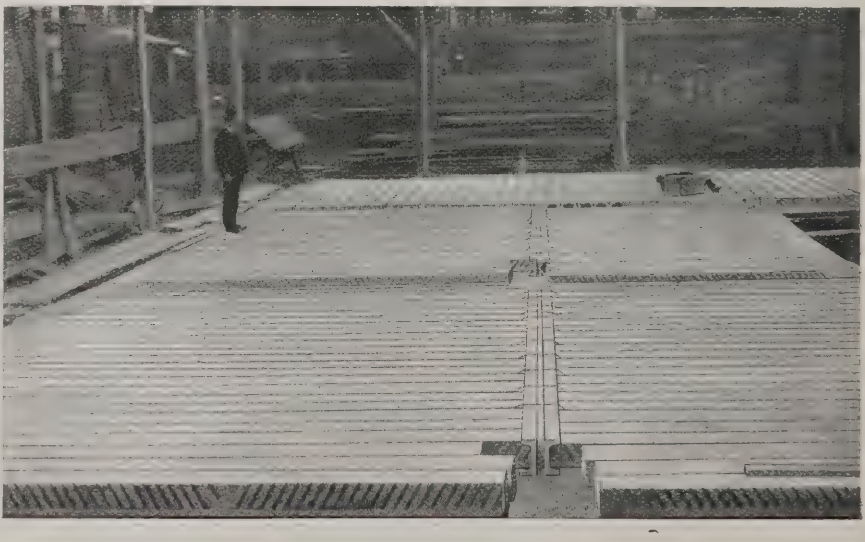


George Farmiloe and Sons, Ltd., 34, St. John Street, E.C. Stand 95. Row F.

Paints, lead, glass, casements, and sanitary fittings make up an exhibit that certainly does not lack variety of interest. Among the paints is Zingessol, a washable water paint, the colours of which, as shown at the stand, lend emphasis to the claim that they are applicable to the highest class of decorative work. The glass, much of which is shown *in situ*, forming parts of the firm's pavilion, is of various kinds, plain and fancy, sheet, rolled, and muffled, bevelled, silvered and embossed. Conspicuous in this class of exhibits is the firm's registered "Oceanic" glass, as adopted at the new War Office. This glass, while showing a distinctly descriptive and artistic pattern, with a seashell for motive, has a smooth and flat cutting surface. It is made in four standard tints—blue, green, claret, and amber—and of a special green for use where the light is particularly strong.

William E. Farrer, Star Works, Cambridge Street, Birmingham; also London, Leeds, and Cardiff. Stand 5. Row B. Gallery.

Shown at this stand is Farrer's 1909 pattern patent Facile rotary sewage distributor.



THE SIEGWART FLOOR, (EMPIRE STONE CO., LTD.)

Its special feature is that no dosing valves or apparatus of any kind are required, a patent gauging tube in the stand post controlling the starting and stopping of the distributor, and causing dosing or continuous distribution according to the requirements of the supply. Farrer's patent sludge valve and ejector combined is also shown. At this stand are shown also samples of the Helliwell patent glazing, which, while requiring neither putty nor paint, is guaranteed absolutely watertight. The system is very extensively employed for roof lights on railway stations, market halls, baths, factories, and horticultural buildings. Also is shown the Helliwell Openshut louvre ventilator, which is made in steel, zinc, or copper, and is worked from the ground level by rods and screw gearing. The ventilator is so arranged that when it is open neither snow nor rain can drive in. It is adapted for public baths, markets, factories, and all roofs where ventilation without leakage is required. The Helliwell patent glazing works are at Brighouse, Yorkshire; London offices, 11, Victoria Street, Westminster, S.W.

The Farringdon Works and H. Pontifex and Sons, Ltd., Shoe Lane, London, E.C. Stand 134. Row H.

The display of baths and sanitary goods at this stand includes, in the former class, porcelain enamelled iron baths of various patterns, among them being a bath specially designed for use in cottages. Among the lavatories are some that have been adopted for L.C.C. schools. The closets and sinks show details that are of special interest.

John Freeman, Sons and Co., Ltd., Penryn, Cornwall, and at 11, Little College Street, Westminster, S.W. Stand 29. Row B. Gallery.

The quarries of Messrs. John Freeman and Co. are capable of an annual production of no less an amount of dressed granite than 500,000 cubic feet. It has been supplied by this firm to a large number of Government works both at home and abroad, and is now being prepared for the new entrance lock, etc., of H.M. Dockyard, Portsmouth. The following is a selection from a somewhat lengthy list of contracts where this company's Cornish granite has been used:—L.C.C. Technical Schools, Southampton Row; new Scotland Yard extension; new Sessions House, Old Bailey; Ashton Memorial, Lancaster; Embankment wall; new London County Council Hall; foundation, Victoria Memorial, Calcutta; new entrance lock, Bombay; new entrance lock, West Hartlepool; Vauxhall Bridge; Kew Bridge; H.M. Dockyards, Keyham, Gibralter, and Portsmouth; new entrance lock, Newport; etc., etc.

B. Finch and Co., Ltd., 82, Belvedere Road, S.E. Stand 237. Row P.

This firm's new patent Weir lavatory has its overflow in the form of a weir, so that any excess of incoming water finds a rapid and easy outlet in the form of a cascade into a cylindrical recess at the back of the lavatory, where it passes through a grating. The largest sized lavatory valves in use cannot cause an overflow, so that disaster to ceilings below is entirely prevented. At each discharge the overflow chamber is flushed automatically, and the recess is sufficiently large to admit the hand with a sponge for cleaning. This principle is also applied to lavatories in table ranges, for use in schools, clubs, and institutions; the table range having as its principal feature a channel midway of and integral with the basins to receive the waste. The weir system is also seen in a very ingeniously devised surgical lavatory, which, as well as the knee-action waste-fitted lavatory, will be examined with special interest by architects concerned in hospital work. Finch's bath shower is worked by one lever, blending the water perfectly, and giving any desired temperature without risk of scalding; and their silent Facile closet, of which the flush is hydraulic, not pneumatic, requires no headroom, the cistern resting on the seat.

Ham, Baker and Co., Ltd., 13, Grosvenor Road, Westminster. Stand 19, Bay.

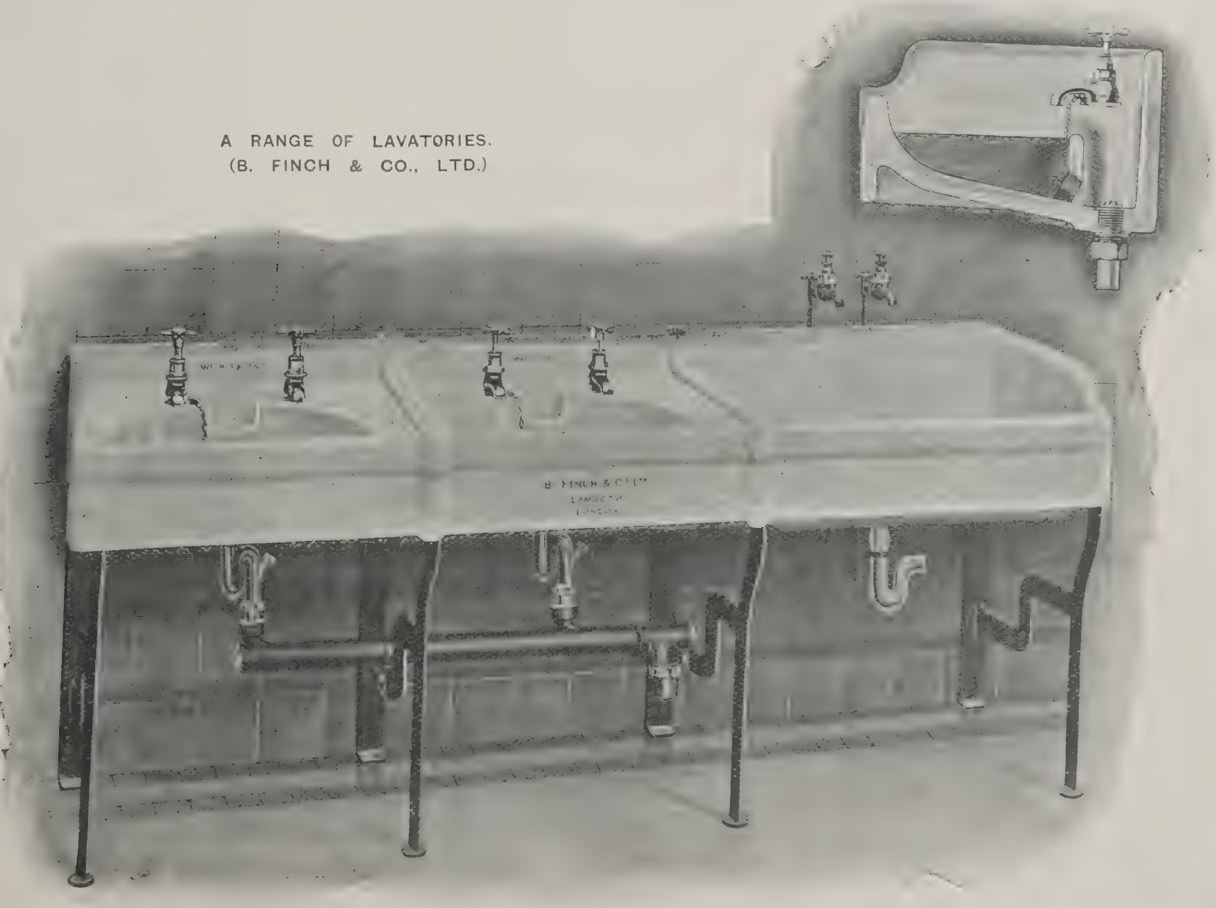
Noticeable among the sewage installation exhibits at this stand are working models of (1) a patent automatic travelling distributor, for rectangular filter beds, and (2) a patent rotary automatic distributor. Some fixed sprays for filter beds are also shown, as several types of pumps for the use of contractors.

S. C. and P. Harding, Ltd., Alliance Works Denmark Hill, S.E.; and Paris. Stand 28. Row B. Gallery.

Many objects of interest to the architectural and engineering draughtsman, and to the surveyor, are shown on this stand. A special line is the "Alliance" refill sectional and field book, which is handy, neat, and economical. The cover is made of pliable Morocco leather, opening perfectly flat, and refills can be obtained in substitution for the sheets that are filled up. The "Alliance" sectional pads are printed directly from a specially engraved block, and consequently a very high degree of accuracy is ensured. These are stocked in rulings of various sections—eighths, tenths, twelfths, twentieths of inches, and in millimetres. The improved drawing-office furniture and fittings shown include the "Perfect" adjustable drawing table, specially constructed to enable the draughtsman to work standing or sitting, the table being easily adjustable to any plane or angle; the "Improved Perfect" drawing cabinet for filing drawings on the vertical system, which, while only 20ins. in depth, is capable of holding 300 to 400 drawings; the adjustable drawing board trestle, which folds into a very small space when not in use; and drawing cabinets made on the sectional division principle. The firm also show samples of their "True to Scale" method of copying plans, etc.

Wm. Harland and Sons, Merton, London, S.W. Stand 257. Row R.

A handsome white pavilion shows to advantage some of this firm's enamels and varnishes. The structural portions are treated with Harland's enamel filling composition and preparation white, and finished with their non-cracking "Snowite" enamel. Inside the panels show a few of the firm's



A RANGE OF LAVATORIES.
(B. FINCH & CO., LTD.)

flat enamels of various colours; and plaster slabs show the applicability of various paint products to plaster walls.

Hempstead Patent Brick Co., Hemel Hempstead, Herts. Stand 79. Row E.

A building constructed of Hempstead hollow porous terra-cotta partition blocks affords a striking illustration of the actual appearance of these blocks *in situ*; and sample blocks of various sizes are exposed for handling and inspection. Among further exhibits are tubes and blocks for fireproof floors, firing bricks and oven tiles, and models of several fireproof doors.

Japanol Enamel Co., Culford Works, London, N. Stand 79. Row E.

Japanol is supplied in thirty-six stock tints for inside and outside work, on wood, metal, stone, cement, brickwork, plaster, etc., and many of these tints and their applications are exhibited at this stand. It is made as an enamel and also as a glossy or flat paint, and is recommended for ship, yacht, house, and general painting. The bath enamel Japanol is supplied at the same price as the other varieties.

George Jennings, Ltd., Lambeth Palace Road, London, S.E. Stand 25a. Row B. Gallery.

This well-known firm of sanitary engineers is showing among many other well-chosen exhibits, a bathroom in the Empire style, fitted in a most elaborate manner with a lavatory and bath complete. This firm's "Closet of the Century" possesses many features of exceptional merit, chief among which are its simplicity, its sanitary efficiency, its effective flush, the disconnection of the closet outlet, and the "ventilation" of the syphon leg by atmospheric circulation, thus preventing any possibility of escape or accumulation of foul air. A representative range of spray baths, shower baths, lavatories, etc., is also shown. The warm fresh air ventilating grate, which is to be had in two sizes, is of pleasing design, and may be obtained with or without tile frames. The various catalogues to be had gratis are well illustrated, and many interesting reproductions of the firm's workshops, showing the actual process of an article's manufacture, are given.

The Kleine Patent Fire-Resisting Flooring Syndicate, Ltd., 133-136, High Holborn, W.C. Stand 64. Row D.

This firm have given notice that on Monday, May 3rd, at 11.30, they will carry out various fall or impact tests on their exhibit, which will be broken up. These fall or impact tests will be given for the purpose of demonstrating the safety of the floor under falling weights and the complete absence of thrust on the steelwork. Architects and engineers who would like to be present should apply for a card of admission to the Kleine Syndicate, at 133, High Holborn, or at the stand.

Leeds Pottery and Middleton Fireclay Works, Leeds. London Office: W. P. Corby, 11 and 12, Finsbury Square, E.C. Stand 23 Bay. Gallery.

This is a very extensive display of various descriptions of earthenware goods, including faience, terra cotta, bricks of various descriptions, and sanitary ware. The exhibit of faience, terra-cotta, and Ceramo ware shows the adaptability of the construction and decoration, and is intended to prove the possibility of obtaining a permanent colour scheme under the most trying atmospheric conditions. There is a fine collection of glazed bricks in white, ivory white, salt glaze, and many other colours, and as these are made by the plastic process they are thoroughly homogeneous, the glaze is permanent, and the colours are fast. They are, therefore, confidently recommended to make sound building construction, as well as producing artistic effect. High quality marks also the red facing bricks, as well as those for engineering construction. The sanitary goods shown at this stand are also a varied and interesting display, which will well repay careful inspection.

Mander Bros., Wolverhampton, and Noel Street, Oxford Street, W. Stand 48. Row C.

Among the specialities on view at this stand are Matsine, Olsina water paint, Suffield green, Florax, Olsina white enamel, wood filler, Woodsolin, and many kinds of varnish, among which latter may be mentioned white Coburg, white oil, pale copal, specially adapted to indoor work; fine copal for use on exposed surfaces, etc., and many other kinds. Matsine is the name given to a series of transparent colours which show richly against the background upon which they are placed. Olsina water paint presents a series of shades at once simple and refined. Suffield green is the result of many years of experiment in the laboratory and retains its colour admirably. Florax is a household sanitary finish, primarily for the purpose of preserving stained or natural wood. Olsina white enamel gives a pure porcelain-like finish; and while the wood filler fills pores of open grained woods without detracting from the beauty of the grain, Woodsolin is an effectual preventive of dry rot and other forms of decay.

The Nautilus Fire Co., Ltd., 215, Tottenham Court Road; also at Yeovil and Worksop. Stand 172. Wall Space.

The neat, compact, and effective improved "Nautilus" grates, interiors and ranges shown at this stand are supplemented by an exhibit of a patented improvement in domestic kitchen range boilers—the "Asbest," which, of wrought-iron, with a central flue, is cased in asbestos, and is exceptionally durable and efficient, the packing reducing liability to damage, and preventing waste of heat. The Bush fire will be examined with interest; and the firm's scheme—shown in operation—for heating three rooms from one fire is attracting much attention.

Norton and Gregory, Ltd., Castle Lane, Buckingham Gate, Westminster; and Glasgow. Stand 1 Bay. Gallery.

Prominent amongst the most varied and most interesting array of exhibits at this stand are samples of the firm's "Perfect" adjustable drawing table, which is so constructed as to enable the worker to vary the slope of his drawing boards at will to any plane between horizontal and vertical—an immense advantage as compared with the old but still too common unmovable bench. The drawing board is detachable, and the T-square or straightedge is kept in position by special means of attachment. The table is furnished with a lock-up drawer and a tray for instruments, and other conveniences render the apparatus a marvel of comfort and efficiency. The firm show, also, some specimens of Velography, their speedy method of plan reproduction on various media, such as linen, parchment, and paper. The firm apparently supply every requisite for the draughtsman's office, and there is a particularly fine show of mathematical, surveying, and drawing instruments. Two useful drawing instruments are the "Simplon" adjusting protractor set square, of which the arms can be fixed at any required angle by means of a thumbscrew; and the "Simplon" adjusting reversible set square, which, mounted on a brass base, can be set at any angle, and reversed like an ordinary set square. The "Simplon" section lines is another ingeniously adjustable instrument.

J. F. Phillips and Son, 21, Old Queen St., Westminster, and at Brighton. Stands 205 and 906. Row N.

In our notice of this firm's exhibit of Barker's patent cable system of vacuum water heating (low pressure), it should have been stated that recent installations on the cable system, actually carried out by Messrs. J. F. Phillips and Son, 21, Old Queen Street, Westminster, S.W., Richmond Buildings, Brighton, and Knight Street, Liverpool, are as follows:—New Elementary Schools, Ramsgate; new Secondary Schools, Chichester; Battle Union, Sussex (complete domestic water supplies to infirmaries, casual wards, dining halls, heating, etc., etc.); Royal Portsmouth Hospital, Portsea; Avenue Lodge, Patcham; Knight and Lee, Ltd. (showrooms, workrooms, offices, etc.); Southsea; Union Church, Brighton, with school and institute; Rusper Church, Sussex; the Tabernacle, Worthing; the Standard Tablet Factory, Hove; the Aquarium, Brighton, etc., etc.

James D. Prior, Empire Works, Holiday Street, Birmingham, Stand 166. Wall Space.

At this stand is given a working demonstration of a method of warming bedrooms and hall with the "waste heat" from the sitting-room fire by means of the Venetian firegrate and heat distributor. The latter is a peculiar form of tubular hot-water boiler, constructed of seamless copper tubes and gun-metal fittings. It collects most of the heat would would ordinarily escape up the chimney, and applies it to the economical heating of other rooms.

Alexander Ritchie and Co., Ltd., Castle Baynard Wharf, 12, Upper Thames St., E.C. Stand No. 153. Wall Space.

The fire has been described as "the heart of the house," and doubtless the same idea underlies the declared determination of the patriot to "fight for hearth and home." Modern taste is providing him with hearths that are worth fighting for, whether they are regarded from the practical, the æsthetic, or the merely sentimental point of view.

The "Castle Baynard" hearth fires exhibited by this firm are admirable for their efficiency, cleanlines, and comeliness. They are suitable either for raised hearths or for hearths upon the floor level. The fire is formed of firebrick in three parts, the back being circular in shape, and overhanging. An oval-bottomed grate fits into a rebate, and is removable to give access to the ash pan In this system, air ducts are discarded, and it is not necessary to sink the grate below the floor level.

This firm show also the "Drawwell" grate.

The firm, who are contractors to H.M. Government, the London County Council, the Corporation of the City of London, the Metropolitan Asylums Board, and many borough councils and other local boards, are manufacturers of all kinds of hardware, and they show a selection of their "Castle Baynard" kitcheners, baths, lavatories, and builders' ironmongery in general. Their catalogue, consisting of 660 pages, lavishly illustrated, must be one of the most comprehensive of its kind, and it includes sanitary appliances and heating apparatus, ornamental signs, railings and gates, balconies and porches, ventilating apparatus, and stable and cowhouse fittings, as well as a complete collection of gardening implements and horticultural buildings and apparatus.

An extensive list of buildings in which this firm's goods have been requisitioned could be given, but the firm prefer not to publish such lists.

Arthur Sanderson and Sons, Ltd., 52-55, Berners Street, W. Stand 67. Row D.

This firm have a very strong line in the now well-known Paripan, which is described as "The British-made lacquer." It is made in white and all colours, and in two varieties, glossy and flat, is applicable to all surfaces, and can be used for exterior work as well as for interior decoration. It is stocked in forty-two standard colours, and any tint can be matched to order. Some very novel and beautiful designs in wall papers are shown, and there are also some most attractive decorative copper panels for friezes or for framing as pictures. It is not an exaggerated claim that their schemes in old-fashioned chintzes and panels are "novel and refreshing." Decorators and dealers in wall papers will be greatly interested in the neat, compact, adjustable wall paper stand, which enables the grouping of wall papers in varying positions and at different heights in windows and show-rooms. It is collapsible, and occupies but little space when out of use. At this stand is also shown a sample of the Gilmour door.

Sharp, Jones and Co., Parkstone, Dorset, and at Southall, Middlesex. Stand 35. Row B.

This firm is showing its ingenious rock-concrete roofing tile, the chief feature of which is the neatly-contrived double ridge which interlocks with a corresponding member on an adjacent tile, thus ensuring perfect watertightness. The material employed in the manufacture of this tile is specially selected, both as regards the aggregate and the cement; and the product results in a very dense and hard concrete, free from porosity. The method of fixing is simple in the extreme, and its effectiveness is unquestionable. This tile is to be obtained in any desired colour, which the firm guarantees to be durable. It is also made in glass, and the introduction of one or two in a roof thus permits the ingress of light, while the rigid form of the whole remains undisturbed. Messrs. Sharp, Jones and Co., have fitted their tiles on many Government buildings in the colony of Nigeria.

The Silicate Paint Co (J. B. Orr and Co., Ltd.), Charlton, London, S.E. Stand 50. Row C.

This firm have acted as pioneers in many paint productions, and their "Duresco" washable water paint had a long start of many similar commodities that now crowd the market. That it is still easily able to hold its own and to maintain and extend its vogue is a strong testimony to its value. Samples are also shown of the firm's enamel glossy varnish paint.

Josiah Smart and Son, 53, Victoria Street, Westminster, S.W. Stand 11. Row B.

At this extensive stand are shown in the asphalte section models representing the method of asphalting various kinds of roofs, of lining reservoirs, and of inserting damp-proof courses; and there are many samples of asphalte in various stages of preparation. In the tar-macadam section, there are models showing the method of laying the materials, of which numerous and various samples are exhibited.

The Stone Preservation Company, Bridge House, 181, Victoria Street, London, E.C. Stand 71. Row D.

This firm's exhibit, which is to be seen at the stand of J. A. King and Co., constitutes stone in a plastic state, with which it is possible not only to restore decayed stonework to its original appearance, but also to endue it with a permanent lease of life. In cases of ancient buildings where disintegration has set in, restoration can be effected while still preserving the venerable tone of the whole. New stonework treated by this process hardens with age, and is guaranteed effectually to resist the attack of all atmospherical acids. Many examples of restored and half-restored stone are on exhibition, and form convincing proof of the satisfactory results to be obtained. The process is economical, and can be applied effectively to ordinary cement stuccoed buildings, if not previously painted. The Royal Geological Society have acquired a specimen of stonework restored in this way to be placed in the museum.

Stothert and Pitt, Ltd., Bath; and 53, Victoria Street, S.W. Stand 3. Row B.

The "Smith" mixer for tar macadam, exhibited at this stand, is a batch mixer. It is fed while revolving, and is discharged by tilting while revolving, thus giving the clean discharge that is essential for a sticky material like tar macadam. The discharge, moreover, is under perfect control, and can be either partial or entire. The machine consists of a drum of double conical form, supported and guided by a frame, which can be tilted at will while the drum is revolving. The materials to be mixed are fed in at one end of the drum, and when mixed are discharged at the other end by tilting the drum while running at full speed. The interior of the drum is provided with rigid blades, arranged in sets, each set of blades forming a "shingled" spiral. The alternate sets are reversed winding, and overlap each other in the middle of the drum. The endwise transfer of materials set up by the spirally-arranged blades is materially assisted by the conical shape of the shell, and the resultant mixture is of the highest quality obtainable.

The Well Fire and Foundry Co., Ltd., 33, Dover Street, Piccadilly, W. Stand 100. Row F.

Besides showing their patent well fires and patent pyramid fires, this firm make an attractive display of iron mantel registers, wood mantelpieces, wrought ironwork, electric fittings, and door furniture. The appearance of the well fire principle is now too familiar to need detailed description; but it may nevertheless be usefully pointed out that the rapidly achieved popularity of the system depends on the following points:—The ashes can be removed while the fire is burning; the size of the fire can be regulated in accordance with the weather; the fire will burn for ten to twenty hours without requiring the slightest attention; it actually consumes smoke, and has cured many smoky chimneys; it will consume coal, wood, or peat. Moreover the well fire is inexpensive to buy as well as economical in the consumption of fuel, giving out nearly three times as much heat for less than half the coal as compared with ordinarily efficient fires. Well fires are fixed in thousands of important buildings in all parts of the world. The pyramid patent grate is of the barless type, and while remarkably cheap is of high efficiency.

VISIT OF THE GERMAN DELEGATES TO THE EXHIBITION.

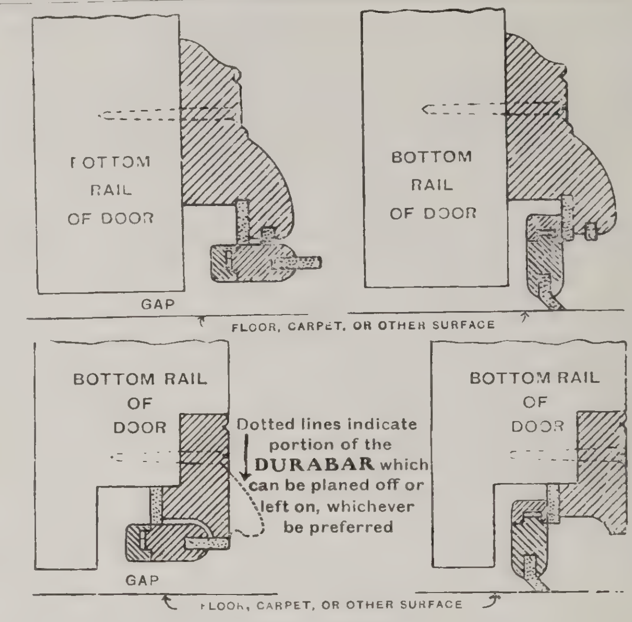
Photo: Topical.

The Zeta Wood Flooring Co., Ltd., Crispin's Wharf, Marshgate Lane, Stratford, E. Stand 85. Row E.

High-class wood-block flooring, on various systems, plain and ornamental, are exemplified at this stand, where also is demonstrated in detail the "Zeta" dowelled system, as supplied by this company to the London County Council.

"Durabar" Draught and Weather Bar. Stand 59. Row D.

At the stand of Mr. James Gibbons, whose exhibits were noticed last week, is shown the "Durabar" combined draught, dust, and noise excluder, and weather bar (Groome's patent), a neat self-acting appliance for stopping the clearance space which must always be allowed beneath doors and casements. The mere act of shutting the door brings the Durabar into action, completely closing the space beneath; while immediately the door is unlatched the Durabar automatically flies up. It is in use in many important buildings, such as the Piccadilly Hotel, London, and has been adopted by the Egyptian Government, and the London and North-Western Railway Co. An illustrated leaflet giving full particulars can be had from The Draught, Dust and Weather Excluder Co., 10, Palace Chambers, Hereford.



BOTTOM RAIL OF DOOR
GAP
FLOOR, CARPET, OR OTHER SURFACE

THE DURABAR DRAUGHT EXCLUDER.

John C. Bonnin and Co., 1, Broad Street Place, Finsbury Circus, E.C. Stand 177. Wall Space.

At this stand is shown the "Silbermann" heating apparatus, for which this firm are the sole agents for the United Kingdom. The "Silbermann" fireplace consists essentially of a closed metallic casing, which is so divided and partitioned as to give the utmost possible radiating surface, while ensuring that the hot air emitted from the apparatus shall be completely sterilised—an invaluable provisions for bedrooms and sick rooms.

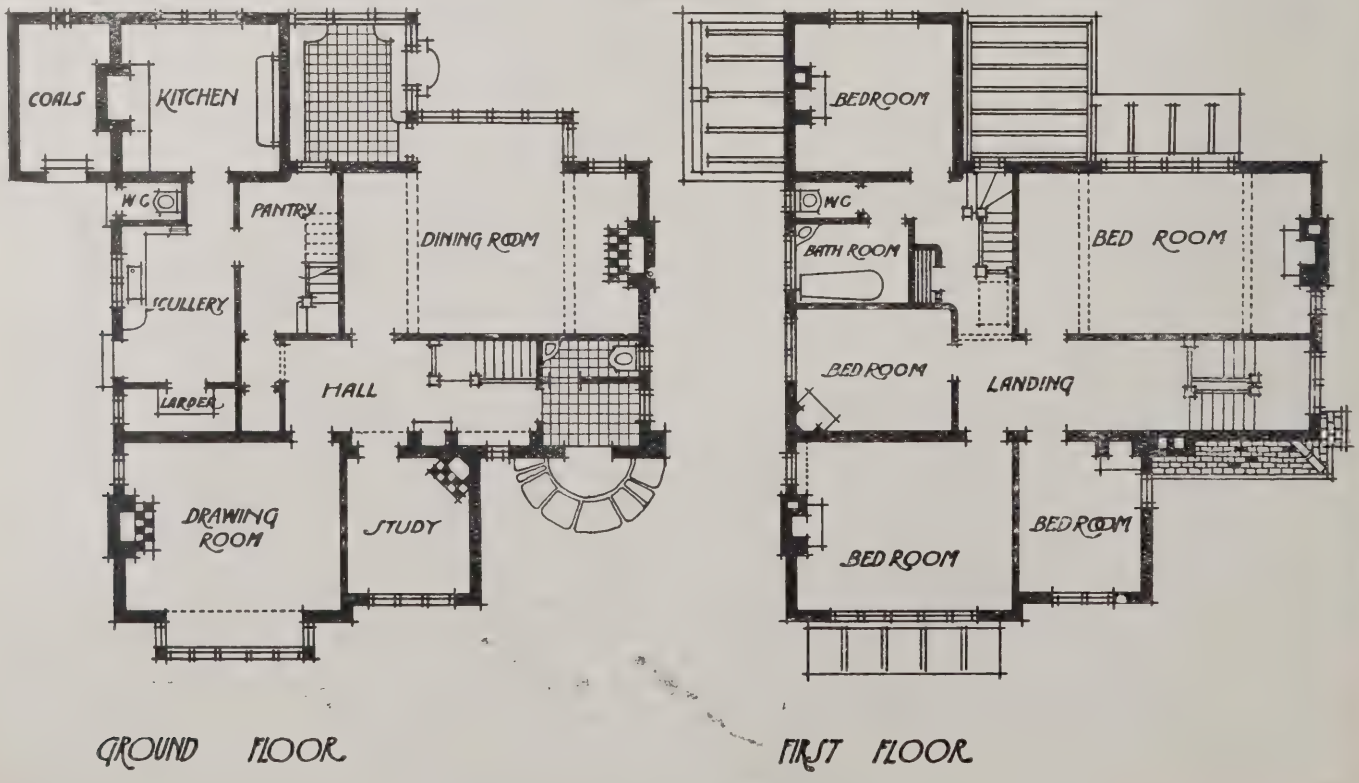
Sam Deards, Victoria Works, Harlow, Essex. London Office: 88, Chancery Lane, E.C. Stand 2. Row B. Gallery.

At this stand is shown "The Superior" patent roof glazing, which is applicable to all kinds of glass roofs, from the smallest daylight to the largest size of roofs of baths, motor garages, railway stations, etc. No screws, putty, paint, or india rubber are used; and the steel bar is entirely covered with pure uniform sheet lead. A special feature is the lead cap, which is separate from the lead covering, and can, therefore, be renewed without damage to the lead-covered bar. Glazing bars cut to length and drilled ready for fixing are supplied to builders, who can thus supply their own glass and labour.

Various boilers are also shown at this stand; where also are to be seen Smale's Patent Cement Block Making Machine, and Smale's Patent Mixing Machine, and the same inventor's patent Cement Block Cutter or Guillotine.

The "Rapid" Block Making Machine has on either side of the table or bench a fall-down press box which forms the mould of the cement block. These are alternately filled with the damp material as it leaves the mixer, and are at once moved to the right or left under the press, when the top plate is brought to bear upon the concrete by the side lever, and upon depressing the foot lever, a most powerful pressure of many tons weight is exerted upon the block, and upon release the box is drawn back, the sides of the mould fall down, the cement block, as pressed, is taken away on its iron plate to the open air to set, when after three days it can be turned and will be ready for use in from 10 to 14 days as required. A lamp keeps the face of the press warm, so that it the more readily leaves the cement and prevents hugging or damage to the face of the blocks; the box being thus done with, the sides and front of same are put together again and recharged. In the meantime, the other box has been filled, and is brought at once under the press as soon as the first one has been removed. Any thickness of block can be made, either for inner walls, partitions, or outside walls, and of any pattern that may be required.

Smale's Patent Mixing Machine mixes the necessary materials to the required degree. The materials are intermixed, first in a dry state, and just before leaving the machine are thoroughly damped and made consistent. The cutting machine consists of two knife edges working in a frame, between which the block is placed. This machine does away with the necessity for using special moulds for corner or angle blocks.



HOUSE AT NEW SOUTHGATE. CASTLE AND WARREN, ARCHITECTS. *(See Centre Plate.)*

Federation Notes.

NORTHERN COUNTIES FEDERATION OF BUILDING TRADE EMPLOYERS.

The quarterly meeting of the Board of Representatives of the Northern Counties Federation was held at the Grand Hotel, Middlesbrough, on Thursday, April 15th, at three o'clock in the afternoon, Mr. J. Davidson (Stockton-on-Tees), president, in the chair.

The president, previous to commencing the ordinary business, congratulated, in the name of the members, the secretary (Mr. W. H. Hope) on the high honour the Poor Law Service had conferred on him by unanimously electing him last month as President of the National Poor Law Officers' Association (Incorporated). Mr. Hope suitably acknowledged the vote of congratulation.

The minutes of the annual general meeting held at Newcastle-on-Tyne, on December 17th, 1908, which had appeared in the "Builders' Journal," were read, and were signed by the president as correct.

The secretary read a letter from the Ivoril Plaster Co., Middlesbrough, inviting the members (after the termination of the business of the Federation) to inspect Messrs. Stewart's new premises, which had been finished throughout with their Ivoril Plaster. The invitation was accepted, and the visit subsequently paid.

The secretary explained that the National form of contract approved by the R.I.B.A., the National Federation, and the London Institute of Builders, had received the careful consideration of this Federation. At the last Executive Council meeting, a special sub-committee was appointed to consider the observations of the local associations upon the use of the form, and any amendments that were desirable, and they recommended that it is undesirable at the present time to seek to disturb the form of agreement now in use. The parties to it had only arrived after very many years' negotiations at the present form, and the proposals for amendment that had been received did not justify their seeking to reopen the question. The agreement, taken generally, was fair, though it still left much to the discretion and determination of the architect that ought to be the subject of review if requested.

The committee further recommended that in any consideration of Clause 30, there should be no extension of the contractor's liability, but that, on the contrary, it should be stated that at the expiry of the maintenance period the building owner should be held to have finally accepted and approved the works, and that the contractor should be absolved from all further responsibility in respect of the works, which is no doubt the intention of Clause 17. Further, that it is undesirable to substitute new words for those of Clause 30, which have already been under judicial review, and have received the interpretation of the Court of Appeal, who were unanimous in stating that the words were quite clear in their meaning (it was the Court below that suggested that there was any doubt in construing the words). The Court of Appeal said, in Robins v. Goddard (1905), C.A., that in view of the arbitration clause the certificate of the architect was not conclusive as to the work and materials and was not to be confined to making good defects, and the fact that it had been issued did not relieve the contractor of any liability. The architect himself is under no legal liability with regard to the issue of his certificate, and the judicial decision does certainly not create one.

That an interpretation is sought to be placed on Clause 27 that, they submit, was never the intention of the parties to the agreement, by taking from the contractor his usual trade profit on goods handled and fixed by him, and for which he is responsible under the terms of the agreement.

That the Administrative Committee be asked to watch the action at law between the South Shields Corporation and Messrs. Niell, with a view to affording all necessary protection to contractors against injury that may be sustained through the arbitrary use of powers conferred by the Clause.

And that the question of prime cost sums be fully considered by the Administrative mittee.

The secretary reported that he had written to the National Secretary in anticipation of the adoption of the report.

After discussion upon the report, on the proposition of Councillor Stephen Easten, seconded by Mr. J. Pelton, it was resolved and carried unanimously—"That the recommendations drawn up and submitted by the sub-committee to this meeting be approved, and that the action of the secretary in communicating the view of this Federation to the National secretary be endorsed, and that the recommendations as they now stand be forwarded to the National Federation for the consideration of the Administrative Committee."

The Executive Council recommended that where representation is claimed by the local associations upon the number of their honorary members, from whom no return is received, "That the same proportion of the local subscription received from the honorary members by the local associations be paid to this Federation in respect of honorary members as in respect of ordinary members." After consideration of the proposition of Councillor Stephen Easten, seconded by Mr. T. Wilkinson, it was resolved:—"That the recommendation of the Executive Council be adopted, and that in future representation shall be upon the total membership, and that payment shall be made to the Federation on both ordinary and honorary members."

The secretary reported that as a result of the applications made to Durham County Council, this authority had drawn up and adopted a form of contract which accepted the principles contended for by this Federation, viz., the reference to arbitration for settlement of all disputes, and that the bills of quantities should be part of the contract; and while the committee were under the impression they had conceded all that the Federation had asked, the draft form had not, in fact, been submitted to them until it was printed and adopted.

Councillor Stephen Easten pointed out that as the contract now stood, it was not all that they desired, but it should be given a fair trial, and the experience of members of its use might be considered after it had been in operation for some time. It was agreed to act on Mr. Easten's suggestion.

As a result of the consideration of a complaint against the conditions of this authority's form, this Federation forwarded a copy of the National form of contract, asking the Council to adopt it for future use.

The Darlington Association had approached this Federation and asked the cost of affiliation with this Federation. This information had been given, and that Association was favourable to joining.

On the proposition of Mr. T. Wilkinson, seconded by Mr. J. Pelton, it was resolved—"That this Federation ask the Darlington Association to ascertain the general feeling of their members by taking a postal vote, and that they be asked to receive a visit at an early meeting from Mr. A. G. White, the National Secretary, if he can make it convenient to attend."

The question of holding a pic-nic during the summer months was raised, and it was decided to refer this to the Executive Council for consideration.

Councillor J. T. Armstrong moved that the Federation hold its next meeting at South Shields, which was agreed to unanimously.

The members, after visiting Messrs. Stewart's premises and being shown over them by Mr. Masters, the president of the Middlesbrough Association, who is the proprietor of the Ivoril Plaster, were subsequently entertained to tea by that Association, to whom a hearty vote of thanks were accorded for their generous hospitality.—W. H. Hope, Secretary.

HULL ASSOCIATION.

Hon. Secretary: A. Peers.

The general monthly meeting of the Hull Association was held at the Builders' Exchange, Posterngate, on Wednesday evening, April 14th, the president, Mr. E. Quibell, being in the chair, and supported by a gratifying attendance of members.

The nomination through the bricklayers' section of Mr. F. Hall for membership was accepted.

The Management Committee's recommendation to pay £15 towards the National reserve fund was carried.

It was decided that an outing in connection with the association be held on Wednesday, June 30th, to Harrogate, Knaresborough, and Pately Bridge, the arrangements to be left in the hands of the Management Committee.

The question of alteration in the rules of the association was introduced, but it was decided that no improvement be taken in the matter at present. A draft was approved of a "workshops notice" to notify the employees officially of the closing of works and shops for the week of August Bank Holiday, it having previously been decided to observe that week as a general holiday throughout the building trades of Hull.

It is expected that this arrangement will meet with approval and appreciation from all concerned.

Other matters arising produced considerable discussion, bringing out many interesting and useful points.

YORKSHIRE FEDERATION.

The monthly meeting of the Executive Council of the Yorkshire Federation was held at the Exchange Hall, Town Hall, Dewsbury on Thursday, April 15th. Mr. A. J. Forsdike (junior vice-president) occupied the chair, and twenty delegates were present from affiliated associations. The minutes of the preceding meeting were read and approved. Apologies for absence having been reported from the president (Mr. W. R. Thompson) and other members, Mr. Forsdike referred to the unfortunate absence of the president through illness, and moved that the sincere sympathy of the Federation be tendered to the president, with an expression of the earnest hope that he will have a speedy and complete recovery. This was seconded by Mr. S. Coop, president of the Dewsbury Association, and carried unanimously. A resolution was also unanimously passed, on the motion of Mr. W. T. Ledgard, seconded by Mr. H. Fallas, conveying the Federation's cordial sympathy to Mr. A. Mastin, of Sheffield, coupled with an expression of their great pleasure in hearing that he is making a favourable recovery.

The treasurer reported receipt of subscription of £30 from the Sheffield Association.

The minutes of the Finance and Emergency Committee were read and considered in detail. The Emergency Committee reported that the documents in the York case had been carefully considered, and that they had generally approved the draft case to be submitted for opinion of counsel. The secretary had been instructed to approach a Leeds solicitor, and arrangements were made for an inspection of the premises with a view to expert evidence being given if necessary. Subsequent developments, however, having been considered, it was resolved, on the motion of Alderman W. H. Jessop, J.P., seconded by Mr. J. Townsley, to inform the National Administrative Committee of the present position, and invite them to state whether they still desire the Federation to take counsel's opinion of the general position of a contractor in relation to the architect, proprietor, and sub-contractor, especially in cases where certain specialities or defined sources for purchases of materials are expressly selected by the architect.

An amended form of sub-contract was submitted by the Finance and Emergency Committee. After discussion and amendment it was resolved, on the motion of Mr. J. T. Levitt, seconded by Mr. W. Robinson, that the form as now amended be approved.

The Finance and Emergency Committee reported that they had carefully considered the reciprocal relations of members under the inter-trading rule, and suggested regulations for the governance of the rule. On the motion of the chairman, seconded by Mr. H. Fallas, it was resolved that the draft regulations be referred to the local associations for their consideration and written observations. It was reported that the Hull Association had made several suggestions for amendment of the approved form of contract. It was resolved, on the motion of Mr. W. T. Ledgard, seconded by Mr. J. T. Levitt, to forward these suggestions to the National Administrative Committee for their consideration in connection with any others submitted to them. It was reported that the Bradford, Dewsbury, Hull, Sheffield, and Wakefield Associations had agreed to purchase a number of copies of the Federation Directory, on preferential terms, for distribution among their members. Members were reminded of the Building Trades Exhibition to be held at Olympia from April 17th to May 1st, and especially of the official visit arranged for Tuesday, April 20th, at 6 p.m. (An account of this visit appears on another page.)

The minutes of the Northern Centre Conciliation Board and the March report of the Lancashire, Cheshire, and North Wales Federations, were read.

It was reported that the York Local Conciliation Board had unanimously voted in favour of the Masters' Notice fixing the radius in which the working and Conciliation rules apply.

Alderman W. H. Jessop, J.P., kindly stated that he would endeavour to see the West Riding Architect at an early date, and ascertain his decision with respect to the use and recognition of the National form of contract.

Members were reminded that the annual meetings of conciliation boards should be arranged as early in May as possible, in order to permit of any appeals which may be made from the decision of a local conciliation board being heard by the Northern Centre Board at their annual meeting.

The arrangements for the next meeting were left in the hands of the president and secretary.

The representatives were entertained to tea by the president and members of the Dewsbury Association, to whom a hearty vote of thanks was accorded for their generous hospitality.—J. Davidson.

SHEFFIELD ASSOCIATION.

Secretary: Thos. Smith.

In the Sheffield Association report on page 331 of the issue of this journal dated April 14th, the word "not" was accidentally omitted from a passage occurring in the last line of the page. The reference was to an understanding with the Sheffield City Council and City Police in regard to the question of builders' hoardings. It should have appeared that the association "had been met very considerately by the Council, who had informed them that it was *not* their intention to require a close-boarded hoarding in suburban positions where there was a minimum of traffic," etc.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

The March monthly meeting of Barnsley Federation of Building Trades Employers was held under the presidency of Councillor G. Haigh, who was supported by twelve members.

The report of the last Yorkshire meeting was submitted by the senior vice-president, Mr. E. Broley. An animated discussion took place on the proposed certificate to be signed by workmen before entering any employment in the building trades. Ultimately it was resolved that the secretary should write to the secretary of the Yorkshire Federation for information as to whether the insurance companies were the originators of the proposal, or whether the scheme was formulated by the National.

Messrs. Bentley and Kaye, stone merchants, Rastick, Yorkshire, were unanimously elected hon. members of the Federation.

A very lengthy and animated discussion again took place, re the proposed adoption of the intertrading rule, upon which the opinions of the different speakers were sharply divided. A slight majority of the members declared that the Barnsley rule bearing on this vexed question was quite good enough, if only the members would interpret the rule in its proper form and loyally abide by it. The stumbling block of the Barnsley rule appears to be the phrase "where possible," which undoubtedly gives a wide and practically unlimited scope as regards the letting of contracts to others than members of the Federation. Nothing definite was settled, and the much discussed intertrading rule will receive the further attention of the members at their next monthly meeting.

WAKEFIELD ASSOCIATION.

Secretary: J. Beaumont.

A meeting of the members of the Wakefield and District Association was held at the Bull Hotel, Wakefield, on Thursday evening, April 1st, Mr. Tom Lee (president) in the chair. Mr. Henry Fallas warmly thanked the members for the vote of sympathy with him in his illness, passed at the last meeting, and expressed his pleasure at being again well enough to attend the meetings of the Association.

The members of the local Conciliation Board of Building Trades representing the employers were elected as follows: Alderman Judge, Mr. George Crook, Mr. Tom Lee, Mr. D. F. Parker, Mr. H. Fallas, and Mr. J. Pashley. A communication from the secretary of the Yorkshire Federation of Building Trades Employers was read, asking for the observations and recommendations of the Association on several questions under the consideration of the Federation, including the National form of contract, certificates of employment, sub-contracts, and intertrading, and the president (Mr. Lee) and Mr. H. Fallas, who had recently attended a meeting of the Federation at Huddersfield, made a report on these matters. Messrs. E. A. Elvey, G. Crook, J. Pashley, C. H. Prince, J. Slack and A. Martin joined in the discussion on the questions raised, and the representatives of the Association were directed to lay the views of the members before the members of the Federation at the next meeting. On the motion of the president, seconded by Mr. Crook, it was decided to apply to the Federation for a sufficient number of copies of the Official Directory to enable each member to be supplied with a copy.

Coming Events.

Wednesday, April 27.

Quantity Surveyors' Association, Caxton House, Westminster.—Meeting in Chinese Salon of the Holborn Restaurant.—Mr. Maurice Kahn on "Reinforced Concrete, Design, Quantities, and Practice." 7 p.m.

Saturday, May 1.

Junior Institution of Engineers.—Twenty-fifth Anniversary Dinner at the Hotel Cecil, 7 for 7.30 p.m., the President, Mr. James Swinburne, F.R.S., in the chair. Mr. R. B. Haldane, P.C., M.P., Secretary of State for War, as guest of the evening.

Thursday, May 13.

Paint and Varnish Society, St. Bride's Institute, London, E.C.—Mr. J. Cruickshank-Smith, B.Sc., on "The Physics of a Pigment." 8 p.m.

Saturday, May 15.

Edinburgh Architectural Association, 117, George Street.—Visit to Borthwick Castle and Church.

Monday, May 17.

Royal Institute of British Architects, 9, Conduit Street, W.—Sir W. B. Richmond on "Smoke Abatement." 8 p.m.

Thursday, May 27.

Society of Architects, Staple Inn Buildings, Holborn, E.C.—Whitsuntide Excursion to Kent.

COMPLETE LIST OF CONTRACTS OPEN.

With a few exceptions, items of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 30. HORSHAM.—Erection of the school hall at the Grammar School. Applications to be made to the architects to the governors, Frederick Wheeler and Godman, Bank Chambers, Horsham, where drawings, specification, and conditions of contract can be seen by April 30.

The Wellington Monument. It cannot be said that Mr. Ernest George's letter to "The Times" anent the proposed completion of the Wellington Monument has met with a very satisfying reply from the Completion Committee. Mr. George, on behalf of his Council, was "wanting to know, you know," and his letter was a recapitulation of the points raised by Mr. John Belcher which have already appeared in our pages. We presume that the Council of the R.I.B.A. are anxious to ascertain what steps the committee propose to take to remedy the signs of stress which have appeared in the monument, and to learn what provision will be made for the extra weight upon the structure which the erection of the equestrian figure will entail. It is the misfortune of the Council that, as in many other things, it moves rather late in the day. The rough plaster model, cast from Stevens's original model, was placed in position so far back as 1903, and a second model, revised by Mr. John Tweed, was erected in place during 1907. It cannot therefore be said that the Completion Committee are acting with undue precipitancy; and the possible danger of adding a superincumbent weight to the monument was at least of as much moment in 1903, when the committee's intentions first began to take shape, as at the present day. Mr. Harold Hodge employed the opportunity for sarcasm which the Institute methods provided for him. "It was no duty of the committee," he says, "to meet expressly to answer a roving request for information as to a design which had been exhibited in public for many weeks in the year before last," and retorts that the intelligence of the Dean and Chapter may be sufficiently trusted to warrant a belief that they consulted expert opinion before agreeing to the committee's proposal. The R.I.B.A. is in the anomalous and unfortunate position of a prophet without honour in his own country; and its well-meant and disinterested efforts to act in all things for the honour and welfare of architecture as a great art are only regarded by outsiders as the impertinent intrusions of a body of professional men working entirely in their own interests The remedy is to hand; but the R.I.B.A. as at present constituted, is not likely to utilise it. It is very certain that until the Institute occupies an official and recognised position in the public mind its declarations and decrees will fail to elicit the sympathy and respect which such a society should command. Some enquiries subsequently made of members of the Chapter of St. Paul's by a representative of "The Times" go to prove that that body is fully informed with expert opinion on the subject. The weakness and cracks had first been detected by the Foreman of Works to the Cathedral authorities, and had been remedied. The Dean and Chapter welcomed suggestions from those competent to offer them; but it was not apprehended that there would be any difficulty in strengthening the monument, so that, while not altering its appearance in any way, it would carry the statue.

"Let Glasgow Flourish." The Town Planning Bill is likely to suffer acutely at the hands of its friends. In Glasgow there is a disposition to damn it with faint praise. The Town Clerk of that city, in a report prepared for submission to the Corporation, while admitting that "in principle the Bill marks a distinct advance in endeavouring to substitute a systematic and comprehensive scheme for the haphazard and limited methods at present available," nevertheless opines that "from the Scottish standpoint it is not worth having with its serious defects and flaws," and he suggests that unless these are amended, this part of the Bill should not apply to Scotland. The Bill, he points out, ignores the city's existing powers, makes no provision by which local authorities can be recouped for expenditure incurred in the execution of a scheme, and does not show sufficient cognisance of local circumstances. This almost inevitable consequence of extreme centralisation was pointed out in these columns when the Bill was first printed, more than a year ago, and we are therefore the less disposed to minimise the difficulties that the astute Glaswegians have now raised. Nevertheless, we trust that they will not persevere in the effort to render an essential part of the Bill inoperative as regards their important city. Their example might prove contagious, to the possible destruction of the vital principle of a Bill which, looked at "by and large," has won the approval of those who set the general good above and beyond local or sectional interests, some of which must necessarily suffer from the operations of so sweeping a scheme. In the meanwhile, as if in further vindication of the independence of the North, there comes an announcement that plans for rebuilding the central area of Port Glasgow, at a cost of £100,000, have been submitted by the trustees appointed by the late Mr. Lithgow, the millionaire shipbuilder. . Narrow and congested alleys are to be swept away, and streets of an average width of 50 ft. to 60 ft. are to be substituted, with substantial and sanitary working-class dwellings for 1,750 people. The trustees are "to see the work pressed to a finish;" but will not the imminence of the Town Planning Bill give them pause? In these times of depression, we are very reluctant to see work postponed; and that is one strong reason for wishing that the Bill may be allowed to come into operation with the least possible delay. The sooner it gets through, or, alternately, the sooner it is smashed—an improbable contingency, perhaps—the sooner will begin the building boom for which we are all so anxiously waiting.

De Gustibus. The Museum for National Industries at Stuttgardt having been enriched by "a permanent exhibition of objects which are flagrant examples of bad taste in modern furniture, etc.," the "Observer"—the oldest and the most art-loving of Sunday newspapers—has industriously "collected the opinions of a number of persons of acknowledged authority and influence in the world of art" as to whether the establishment of a similar Chamber of Horrors in London is desirable. Strangely enough, the question has elicited serious replies from men whose opinions on art are worthy of attention. They all discountenance the idea of exhibiting shocking examples. Mr. Walter Crane thinks that people are apt to acquire a liking for what they see. "The public are easily educated to like the ugly. The eye gets accustomed to and welcomes what is usual, and resents an innovation, no matter how great an improvement." Mr. Crane, like all the rest of the gentlemen whose opinion in this delicate matter of shocking examples was sought, talked about architecture! He remarked that "the modern steel-frame building was not honest, because it did not explain itself, but was faced with terra-cotta, which had nothing to do with construction." He added that the enormous shop-fronts of plate-glass annoy him more than anything else in London street architecture. Mr.

M. H. Spielmann thought that any really representative Museum of Monstrosities should certainly include the old-fashioned street lamp-posts, and that most chimney-pots are shocking. Waterloo Bridge is a great consolation to him; he thinks it the most dignified and beautiful bridge in the world; and he acknowledges that, owing largely to the influence of the R.I.B.A., there has been, during recent years, a remarkable improvement in English domestic architecture. Wall-papers, he thinks, are growing too gaudy, perhaps as a revulsion from the other extreme. "What people want is not good taste, but novelty." Mr. Aymer Vallance also regrets the revulsion to Early Victorian wall-papers. "People are not guided by principle, and whatever happens to be the rage for the time being they accept." Asked what he considered to be the ugliest building in London, he replied, "St. Paul's Cathedral!" He is in love with late Gothic, which has become "perfectly English," and deems that Italian and Moorish styles are exotic to this country. The other gentlemen whose opinions are cited are "a high official of the British Museum" and Mr. Bernard Partridge, the "Punch" artist. The former thinks that the "pepperpot" cupolas on the National Gallery are among the worst architectural blemishes of London; the latter, that no Museum of Monstrosities would be complete without at least one of the statues in Trafalgar Square.

The Trade Boards Bill. The debate on the Trade Boards Bill in the House of Commons on Thursday last was sustained for about five hours, but brought forth no very striking addition to the pros and cons with which readers of this journal are already well acquainted. Mr. H. Marks moved an amendment in these terms: "That, in the opinion of this House, no legislation can be effective to secure fair wages for workers in this country which does not prevent foreigners who work at lower wages from sending the product of their cheaper labour here in competition with them." This amendment, which was seconded by Sir W. Bull, was withdrawn, in deference, no doubt, to the recommendation of Mr. Balfour, and the Bill was read a second time. It had the effect, however, of diverting the debate from those aspects of the Bill with which the building trades are more intimately concerned, and of bringing into prominence the encouragement it affords to foreign competition. Sir F. Banbury, however, predicted that, within a few years of the passing of the Bill, the idea that trade unions could look after themselves would disappear, and Parliament would be asked to extend the measure to all industries, whether they were protected by trade unions or not—a view that has been stated with greater amplitude in these columns.

Architects' Charges in the United States. The question of the remuneration of the architect has been agitating the minds of our trans-Atlantic brethren for many years past, and the advisability of instituting an increase in the hitherto accepted percentage has formed a favourite topic for discussion at numerous conventions. We are now glad to learn that, at the recent convention of the American Institute of Architects held in Washington, an important change was adopted in the rate of charges for professional services, a proposal to increase it from five to six per cent. being unanimously adopted. The charges as thus amended now form part of the revised schedule sanctioned by the American Institute. During the course of the discussion it was pointed out that whilst the architect's remuneration had been stationary in the past forty years, the cost of production, brought about by an increase of office expenses and draughtsmen's salaries, had nearly doubled. It was also rightly urged by some of the speakers that proper professional equipment required a longer preparation and a more thorough education, and that the responsibility of the architect had been enormously increased by the requirements of the modern structure with its engineering, mechanical, and electrical fittings. One well-known American architect considered that professional services, under modern conditions and requirements, could only be adequately remunerated by a charge of seven and a-half per cent. upon the total cost of the work, but ultimately, as we have said, the six per cent. basis was adopted. We hope to give in a future issue, the full revised schedule of the "Proper Minimum Charges sanctioned by the American Institute of Architects," and we advise those of our readers who are interested in the question of architects' fees to compare this document, clause by clause, with that issued under the auspices of the Royal Institute of British Architects. For instance, there is no ambiguity (as in our own unfortunately-worded schedule) with regard to the question of the ownership of the architect's drawings and specifications, which, as "instruments of service," remain (under Clause 12 of the American document) the property of the architect, whilst its first Clause is sufficiently definite in its statement that the minimum charge of six per cent. is based upon the total cost of the completed works. Again Clause 4 is to the effect that for building works conducted under separate contracts (rather than under a general contract) a *special* fee may be charged in addition to the ordinary scale of charges. Clause 6 touches upon a question which English architects would be well advised to settle once for all upon the same lines. It has reference to the employment of the professional specialist, and is as follows, viz.:—"Where heating, ventilating, mechanical, structural, electrical, and sanitary problems are of such a nature as to require the services of a specialist, the owner is to pay for such services. Chemical and mechanical tests and surveys when required are to be paid for by the owner."

Payment in respect of extra labour thrown upon the architect by reason of changes made by the client after a definite scheme has been approved, or through the delinquency or insolvency of a contractor, is provided for under Clause 8, whilst Clause 10 defines the basis of the settlement to be followed with regard to the architect's remuneration in the case of the abandonment or suspension of the work. After very careful consideration, we are compelled to admit that American architects manage their affairs far more successfully than their *confrères* in this country, where the official scale of charges for professional services has been so badly and vaguely worded that it is a constant source of irritation and a fruitful subject of litigation both to architect and client. But we have so often drawn attention to the many blunders made in drafting the R.I.B.A. scale of charges that it is quite superfluous to particularise them again.

SOCIETY OF ARCHITECTS.

There was a gathering of nearly 200 at the twenty-fifth annual dinner of the Society of Architects held at the Trocadero Restaurant, on Friday, April 23rd, when the chair was occupied by the President, Mr. Geo. E. Bond, J.P., and amongst those present or invited were:—Mr. Ernest H. Lamb, C.M.G., M.P.; his Honour Judge Rentoul; Messrs. A. A. Hudson (President of the Tribunal of Appeal); Edward White (Vice-Chairman London County Council); W. E. Riley, F.R.I.B.A. (Architect London County Council); G. L. Gomme, F.S.A. (Clerk London County Council); E. B. Barnard, M.P. (Chairman of the Metropolitan Water Board); Walter Cave (President of the Architectural Association); Howard Martin, F.S.I. (President of the Surveyors' Institution); E. Purnell Hooley, M.Inst.C.E. (President of the Association of Municipal and County Engineers); W. S. Wallis (President of the Institute of Builders); F. G. Rice (President of the Master Builders' Association); C. McArthur Butler, F.C.I.S. (secretary); etc., etc.

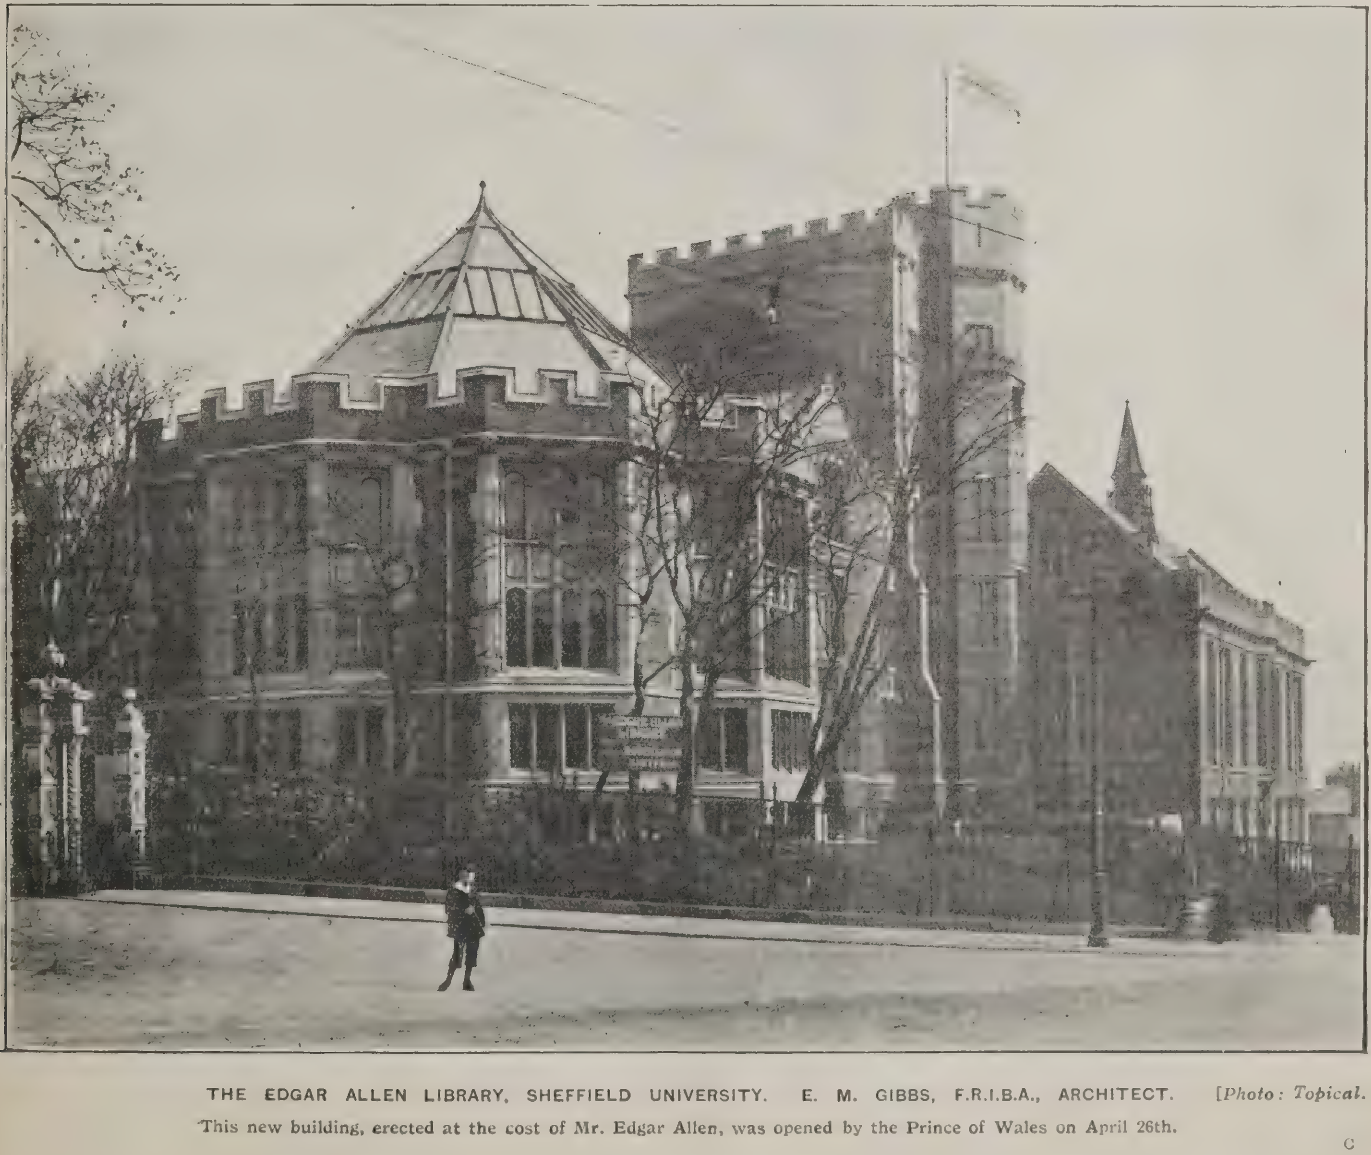
After the dinner, the usual loyal toasts were submitted from the chair and loyally honoured.

Judge Rentoul proposed the toast of "The Houses of Parliament" in a witty and entertaining speech, in which he eulogised the Houses of Lords and Commons in a humorous vein.

Mr. Ernest Lamb, M.P., whose name was coupled with the toast, responded, and said he wanted to say a word with reference to the Bill for the registration of architects. He would like to sound this note of warning—that while they in the House of Commons were sincerely anxious to do their best with the Bills that come before them, it behoved those who were more especially interested in any specific Bill to come, as far as possible, to a unanimous decision on their own behalf first of all. He thought the time had come when the profession should decide whether or not architecture was a profession or whether it was an art, because if a profession he agreed that it had a right to ask for protection in the form of registration, but if it was an art he thought it would be well to leave it to its own free development. If an Act of Parliament was asked for, it went without saying that before a Bill could be carried, a very exhaustive enquiry would have to take place, and he threw out the suggestion as to whether it would not be in the interests of the profession for such an enquiry to take place at the present stage, because at such an enquiry it would be bound to come out that there was not a unanimous demand on behalf of the profession itself for registration. He emphasised the need of closer union under their own central body before they came to the House of Commons and expected an Act for registration. He believed that if the profession could come to something like a unanimous decision on the matter, they would not find the House of Commons backward in giving them the support they needed.

Mr. E. B. Barnard, M.P., in submitting the toast of the evening, "The Society of Architects," said it was best to rely for advice upon the men who had concentrated their attention upon a particular subject. He was glad to propose the toast of the Society, which was asking for registration, not solely for itself, but mainly in the interests of the public.

The toast was enthusiastically honoured, and the President of the Society, in reply, delivered an eloquent speech, mainly concerned with the question of registration. Having briefly touched upon the history of the Society's efforts in this direction, he said that in promoting the Bill the members of the profession were not actuated entirely by selfish motives, because they maintained that it would prove of equal advantage to the building public. They desired to improve the status of the architect by securing for him legal recognition, permitting only the duly qualified to assume the title, and at the same time they wished to raise the general standard of professional practice by instituting a more thorough system of education and training, thus better preparing the architect for the onerous duties involved in his daily work. Secondly, they desired to protect the public from the evil results of the incompetence of persons who, without a single qualification, now styled themselves architects and practised as such. With regard to the first proposition, all sections of the profession were agreed that architecture demanded the whole-souled devotion of its *bona-fide* followers, and as a consequence its practice ought to be strictly confined to persons educated to perform those duties in an artistic and practical manner and to recognise and appreciate the delicacy of their great responsibilities. As the dominant principle of their Bill was the establishment of a scheme of compulsory qualifying examinations to be passed by every person before he commenced to practise, it was first necessary to prevent any augmentation of that undesirable, unqualified, nondescript class which was now practising architecture for profit only during intervals which its members occasionally secured from the pursuit of their more legitimate trades and callings. These qualifying examinations would prove a valuable stimulus to real and useful study among their students, for, given the necessary artistic qualifications, they would still be compelled to take advantage of all their educational opportunities, and to devote some appreciable portion of their spare time to the task of acquiring by study some knowledge of the practical, scientific, and business sides of professional practice. At present many architectural pupils neglected all their opportunities. The presence of this class in their ranks was an injustice to the *bona-fide* practitioner and the building public, and clearly demonstrated the necessity for some form of qualifying test. With regard to the second proposition, viz., the benefit of the public, he suggested that the health, comfort, and convenience of the community, its great financial interest in building operations, and all the pleasures it might derive from the contemplation of beautiful surroundings, were dependent to a large extent, not so much upon the qualifications or otherwise of the stars of the first magnitude in the architectural firmament, but more especially upon the artistic sense, practical ability, and commercial rectitude of the general body of practising architects throughout the country. At the present moment it was equally possible for a chimney sweep as for one of the young unqualified men he had referred to, to put out a brass plate and style himself "architect," and except by having a personal knowledge of the individual practitioners the public had no present means of differentiating between the qualified and the unqualified. He was not of the opinion that these examinations would prove an effective remedy for all professional and public evils, but he did maintain that the previous education, study, and special preparation of which these examinations would be the test would prove to be of infinite value to their future students, and ultimately to the advantage of future clients. The main opposition to their Bill might be fairly described as paradoxical, for it emanated from a select few who contended that artistic qualifications could not be tested. What that contention was really worth might be judged by the fact that at present the majority of these persons belonged to a body which had now for many years applied the very test they said was impossible, and, further, by making that test compulsory, they had practically admitted the initial principle of registration. Yet they said that the success of the Bill would result in a serious clipping of the wings of genius and tend to reduce their art to a dead level of stereotyped mediocrity! That was both illogical and absurd; but even considered from their point of view, he would suggest to them that they ought not to confuse the high artistic ideals of the few with the existing general practice throughout the country, and he would ask them if at the present moment they were perfectly satisfied in their own minds that the existing general conditions of practice throughout the country and the existing educational facilities were conducive to the best and highest interests of architecture as an art. They must all recognise that architecture was a constructional art, and, in its very highest form, sprang inevitably from the workings of true genius with sound practical knowledge in the best materials at its command. Therefore, he had no hesitation in saying that the upward flight of true architectural genius would be materially assisted by future artistic aspirants being constrained to acquire such an amount of practical knowledge of the scientific principles of construction and of the inherent properties of the very varied list of materials used in modern buildings as would enable them to pass successfully the suggested qualifying examinations. A duly qualified architect, competent to do justice to his clients, must not only be an artist, but also a scientist and a practical man of business. But for years now a cloud of false sentiment had been hanging over the



THE EDGAR ALLEN LIBRARY, SHEFFIELD UNIVERSITY. E. M. GIBBS, F.R.I.B.A., ARCHITECT. [*Photo: Topical.*

This new building, erected at the cost of Mr. Edgar Allen, was opened by the Prince of Wales on April 26th.

profession. Although this Society was rapidly growing, still they wished it to be distinctly understood that in pursuing their present path they did not aim at competition or rivalry with any other organisation, for apart from the public benefit, their only aim was to promote and advance the art and practice of architecture, and to maintain the honour and best interests of the profession as a whole. They claimed that the vast majority of practising architects throughout the country were in agreement with them, both as to the nature of the evils complained of, and as to the remedy for those evils, the remedy being the Bill which had now been before the country and the profession for 21 years without inducing the submission of any reasonable or adequate alternative. The time was now ripe for a mutual cessation of suspicions and petty jealousies, and for all sections of the profession to send fully accredited representatives to discuss this question in a reasonable and friendly spirit, and to agree, if possible, upon the main principles of the Bill to be submitted to Parliament, backed by the unanimous voice of the profession. The difficulties suggested by their opponents as standing in the way of success would appear to them to be far less formidable upon a closer view, and might be entirely removed by friendly discussion among gentlemen predisposed to efface self rather than further to jeopardise the honour and best interests of a grand and noble profession.

"The Local Authorities" was proposed by Mr. Walter Cave (President of the Architectural Association), and responded to by Mr. Edward White (Vice-chairman L.C.C.), and the Mayors of Marylebone and Rochester; and the last toast of the evening was that of "The Visitors," submitted from the chair and acknowledged by Mr. G. H. Leavey.

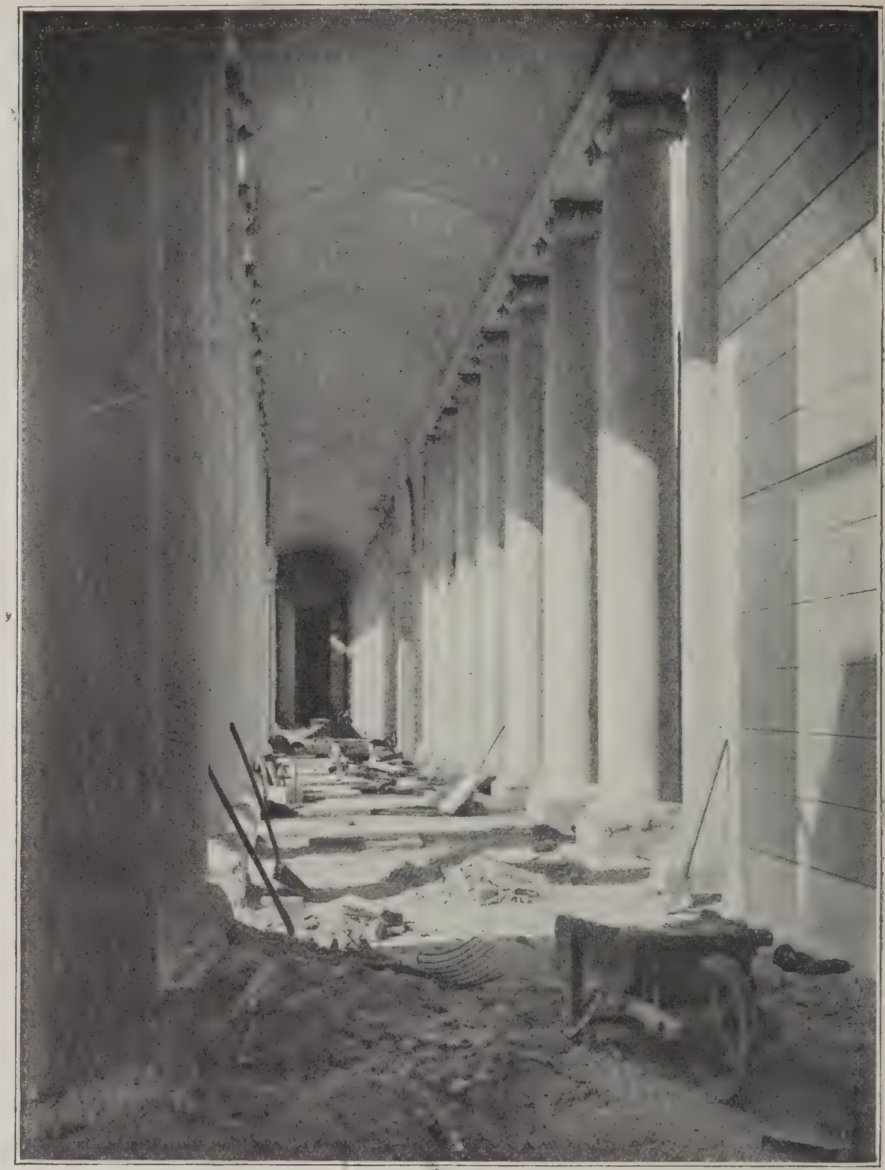
Architects of the Day.

1.—Messrs. Mewès and Davis.

(Concluded.)

As an artist possessed of great decorative instinct, Mr. Mewès has been recognised since his early student days, and examples of his matured powers in this direction are to be found in all of his numerous works—in the masterly treatment of such rooms as the dining-room of the Ritz Hotel in London, in the charming character of the little shop of the artist-goldsmith, Lalique, in Paris, in the clever handling of the staircase hall of the bank in Zurich, and again in the magnificent interiors of the steamships of the Hamburg-America line: *Kaiserin Auguste-Victoria*, *König Wilhelm II.*, *Cleveland*, *Cincinnati*, and *Amerika*, the latter in collaboration with Mr. Davis. In perhaps no other way can the taste of an architect be so quickly and accurately gauged as by a study of his designs for interiors, and especially of those interiors where ample funds are at his command, and he has practically a free hand to make the room as rich and elaborate as he sees fit. It is much more difficult to treat a rich room with restraint and dignity than one where much of what appears to be refinement is in fact due to insufficient funds to pay for any elaboration.

The costly work entrusted to Mr. Mewès and the way in which he has treated it in every instance, especially the interiors, and notable among these interiors those of the great steamships, displays a taste at once rare, refined, and robust. What, for instance, could be more charming than the ladies' room of the SS. *Kaiserin Auguste-Victoria?* Yet, what large handling, and how very simple in its scheme! We have only to think of ships out of number where the idea of using trellis as the form of decoration for some room has been adopted; but in how many instances is it either refined or knowing? In most instances it has been carried out by a decorating firm which has "adapted" a design for an iron grille or painted decorative panel to *treillage*; and the wood has been sawn, twisted, bent, and carved to "adapt" it to the lines of a ductile material or form suitable to be executed only in paint or plaster.



COLONNADE, CHATEAU DE ROCHFORT-EN-YVELINES (SEINE ET OISE).

CHARLES F. MEWÈS, ARCHITECT.

There is something about a ship that conjures up to the imaginative mind all sorts of childhood dreams—pirates, great figure-heads, and lanterns, treasure, great supplies of fruit from tropical climes, sea monsters, dolphins, red and yellow sails, coils of rope, strange forms and all that is picturesque, indefinite and extraordinary. It is probably due to this fact that we owe much of the weird ornamentation that does so much to make one feel that the ocean liner is the modern monster of the sea. To find a designer throwing all this aside and regarding his problem in design as that of a temporary residence, sanely recognising that most steamship passengers do not wish to be reminded of the fact that they are on the ocean, is extremely rare. Yet this is exactly what Mr. Mewès has done. His designs vary from those for a house on land only so far as the different lines of construction make necessary. There is no attempt at wild originality, no pose of "genius"; throughout the whole is thoughtful, masterly design studied after the styles of the most scholarly epochs of the Renaissance in France—the periods of Louis XIV. and XVI., and the best of the First Empire.

For purity of character in design we have an admirable example in the great Chateau of Rochfort-en-Yvelines which, as with all Mr. Mewès' other works, reveals high scholarship. Nowhere is there a break, a bungling of a corner, or a part of the plan which does not work out perfectly; nowhere the suggestion of ignorance that so often accompanies the "original" composition. This is not a composition for which much originality can be claimed, for it is frankly a restudy of the Hôtel de Salm, now used as the Palais de la Légion d'Honneur in Paris. There is nothing about it that has the least suspicion of the experimental, unless it be the dome over the circular salon overlooking the terrace, which is the least successful thing about the design. One must regard it rather as a French work of art than as an idea developed solely by a given artist. In planning and in homelike character it has advanced beyond and above its model, corrected its venerable shortcomings, eliminated its principal faults.

Little, if anything, except mediocrity, is even wholly original with one person; most *efforts* at originality are mere debasements of an original which is the result of the advancement of a standard of excellence through decades, or even centuries, by earnest men working along similar lines, inspired by a like conceived ideal.

Most great originals result from the attempt to do what many others have attempted to do, and in succeeding in doing it better than it has previously been done. The Chateau de Rochfort-en-Yvelines is an original work in the sense that it carries the study of beauty of proportions and fitness to its purpose a step farther than its prototype, and in plan a mighty step still farther. This is an unusual thing to take place in modern, at least very recent, work in any country, though many of the best buildings in the Teutonic and Anglo-Saxon countries are the result of such studies. Taking one of these as an example, one may ask, for instance, of the Travellers' Club—perhaps the finest architectural design in Pall Mall—whether it is equal to the Pandolfini Palace, and a copy of it, or only an inferior imitation of Raphael's fine design; or, on the contrary, an improvement by an architect of *not* greater power and skill than the famous Italian painter, but with the advantages of modern training and more advanced thought having to deal with the same problem and solving it in substantially the same way, but in more exact and refined terms. One may ask the same question of such buildings as the Boston Public Library, the Madison Square Garden Tower and the "Herald" building in New York—to mention only three of the best works of the last quarter-century on the other side of the Atlantic. These all belong to the great school of pure design, as well as being designs of a pure, chaste character. It is unfortunate that the terms purity, innocence and ignorance as applied to design are commonly confounded. Purity in design is not ignorance, neither is it innocence, but as in morals only taste in the choice of one's adventures and experiences. It is just this taste in the selection of a subject from which to work onward, that we observe in the design built at Rochfort. It may be objected that an architect of the ability of Mr. Mewès ought to be able to compose—and that he *is*, undoubtedly, able to compose a design of a more individual character; that the probability is that the client selected the model by demanding a house like the Hôtel de Salm; that he—the architect—did the only thing possible for him to do—make as near a faithful copy as possible under somewhat modified conditions. Such objections would probably be sustained. It is when the new conditions are taken into account, when we note the number of opportunities to depart from the example and lose or improve upon it, and find that these opportunities have been invariably taken advantage of to materially improve the design, we recognize this to be the work of no mere copyist, but of a very analytical and synthethic mind, trained and observant. Thus, the slight heaviness of the orders in the Court of Honour is eliminated, and also the weakness due to the colonnade forming a porch at either side of the central block behind the entrance portico. In the old building this weakness is accentuated by the unfortunate manner of turning the internal angle, in the new it is avoided by bringing forward the wall line to that of the return of the colonnade, which becomes an engaged order. In the old, the scale of the colonnade is lost by the use of a very high balustrade, and a needless attic over the entrance portico gives a heavy and public character to this feature; in the new, these are both substituted by a blocking course which serves the ordinary purpose of a balustrade, and the important scale and more domestic character result. In the old structure the round *salon* is towards the Quai d'Orsay, on an approximate level with the street; the principal horizontal shadow—that under the architrave—cuts the building in halves (for the dome counts with the entablature of the order), and the engaged columns are too widely spaced to be quite happy in effect: the result of the whole is too low to be quite pleasant. These defects do not appear in the building at Rochfort. Over the projecting *salon* the dome is made lower, and the colour so affected by the covering that the white tone of the stonework extends from the terrace to the roof; the surrounding colonnade is made up of two additional bays, the window openings are longer and more graceful. This study and improvement extend to the *motifs* and details throughout, and the whole is enhanced by being set upon a high terrace. The wall of the terrace with its low colour-tones gives a pleasant transition between the regular lines of the building and the rugged effect of the ground upon which it stands. From the Court of Honour terraces and gardens the dark line of roof above serves only to emphasize the beauty of the walls below; but from a distance the skylights, chimneys and dormers produce an effect that is the one jarring note in an otherwise remarkably fine monumental modern country house.

The Chateau de Rochfort-en-Yvelines is, as will be seen from the illustrations, a very large building; and very large buildings, especially when they are country residences, present great opportunities for the man of talent, and we may expect a great deal that is interesting; little things are often more difficult and their defects are more immediately noticeable; but if we turn to the little town house of M. Guitry, in Paris, we find the same thoughtful treatment, the same direct, simple management of the parts, and a kind of personal charm which is always so pleasant in a building small enough for the observer to take in the whole design at a glance.

In the bank at Zurich, which is a straightforward strong-looking commercial house, there is the same primary element of magnificent simplicity; a clean firm elimination of the superfluous.

Besides his partnership with Mr. Davis in London, and his own practice in France, Mr. Mewès has another partnership, with Monsieur Alphonse Bischoff, who makes Cologne his home and business centre and attends to the works by the firm in Germany of which the more important include the large town houses of Baron von Oppenheim at Cologne, Mr. Warburg at Hamburg, and the Hotel Esplanade, also at Hamburg.

ARCHITECTURE AT THE ROYAL ACADEMY.

Generally speaking, the one hundred and forty-first exhibition of the Royal Academy of Arts and Sciences is decidedly dull; and it cannot be said that the Architectural Section of it rises above the general level. There are few things of merit, and not very many of interest; still, as of yore, the walls are adequately covered. The most interesting and forceful exhibit, "Israel and the Law," Mr. J. S. Sargent's big decorative lunette painting, is not in the architectural room, but in Gallery VIII., and intended for the Boston Library, U.S.A. In the architectural room Mr. Lutyens' works will inevitably attract attention, No. 1410, "New West Wing, Temple Dinsley, Herts," is a severely simple but pleasing facade in brick, quite characteristic of its author. No. 1411, "Garden view of a house at Ilkley," shows Mr. Lutyens in a new vein, and is an attempt, apparently, at a French chateau treatment. The introduction of classic detail does not come quite happily, however; the chimney stacks are rather coarse, and the general effect is somewhat restless. More successful than either of these is the facade in Kingsway (No. 1487). There are details in the composition at which one might cavil, but on the whole the design is dignified and meritorious. Mr. Belcher sends two water-colours of houses, Nos. 1436, a stone "House at Bampton, Oxon," and No. 1440, "Tatmore Place, Herts." The last-mentioned, in brick, appears almost commonplace; the manner of presenting both buildings in distant bird's-eye views precludes, however, a just appreciation of their architectural merits. In a fine drawing by Mr. Gascoyne, Mr. Dawber shows an interesting scheme for a Surrey house (No. 1429), and the same architect has a large pen-and-ink drawing of the rebuilding of Nether Swell Manor (No. 1467). Mr. Ernest Newton has a water-colour (No. 1435) and a pen-and-ink sketch (No. 1459) of Ardenrun Place, Surrey, a rather ambitious yet successful work. Mr. Voysey's incursion into Gothic detail in the little stone house at Coombe Down, Bath (No. 1450), will interest many. The small windows seem rather in the nature of a *volte-face* for this architect, and the oriels are too small in proportion. A finely drawn piece of detail for Bank premises, Okehampton, by Messrs. Horace Field and Simmons (No. 1451), raises hopes that are only partially fulfilled by the general view of the same building (No. 1546). "The Knoll, Leicester," is a quiet piece of Elizabethan design by Mr. W. H. Bidlake, shown in two views (Nos. 1424, 1447). We might here say that the separation of different views of the same building is a mistake in hanging. It occurs several times this year. Messrs. Buckland and Farmer show an interesting house (No. 1419), a village in the Elan Valley (No. 1369), and a Hostel for Women Students at the Birmingham University (No. 1365). The architects very rarely disappoint one, and this year their work is distinctly enjoyable. Messrs. Baker and Masey's Rhodes Memorial, Cape Colony (No. 1490), a well-ordered classic composition, is disappointing. It hardly appears cyclopean enough for the situation or for Watts's "Physical Energy"; and less of the orders and more of the Titanic treatment shown us in various Bismarck memorials by German architects would have been in better keeping. Mr. Lucas's design (No. 1521) for a club facade in ferro-concrete, doubtless a reminiscence of a recent competition, does not strike us as being very happily suited to the material. It would be most difficult and expensive to construct the shuttering for the construction of such a front. Mr. Flockhart's premises, No. 180, New Bond Street (No. 1533), is a clever piece of design shown by a good sketch; the projecting centre bay seems likely, however, to over-balance the frame of the building. Messrs. Lanchester and Rickards's design for the Reformation Memorial at Geneva (No. 1553 and 1595) is rather unfairly skied. It is a capable piece of town planning portrayed by Mr. Rickards's vigorous pencil, and deserves a better place. Mr. Walter Tapper's monumental chapel for the Community of the Resurrection, Mirfield (Nos. 1567 and 1578), shown by two very fine drawings by Mr. Charles Gascoyne, will add to his already high reputation for ecclesiastical work. Mr. Eustace C. Frere shows two small works at Leyton, Nos. 1402 and 1584, so slight that their merit lies mainly in the author's exceedingly clever water-colour method. Mr. R. Weir Schultz's Cathedral Church of All Saints, Khartoum (Nos. 1607 and 1610) will elicit general interest. It is a plain cruciform building in rough ashlar, with a pantiled roof, and has no reminiscence of any particular style. The exterior depends upon simplicity and scale for its effect; the rather florid design for a Garrison Church at Khartoum, near by, suffers in consequence. Two designs in the room we fail to realise the particular purpose of. They are apparently sketched out in ordinary writing ink, and then worked over with unpleasant washes of dirty yellow, which has the effect of blurring all the lines and the additional effect of making them painful to look at. In fact, this method of presentation is so irritating that it precludes any examination of the intrinsic merits of the designs. An ambitious scheme for the rebuilding of Clifton College Chapel by Sir C. A. Nicholson, Bart. (No. 1625) completes our survey of the noticeable exhibits, but we must not omit, in passing, a mention of Mr. A. Gilbert Scott's design for the Glamorgan County Hall (No. 1525). It is not classic architecture, and has no resemblance to County Hall; but is, nevertheless, an interesting and fascinating study. The ability to use steel joists hardly excuses, however, such extraordinary intercolumniation.

Views and Reviews.

Maid of Orleans Commemoration.

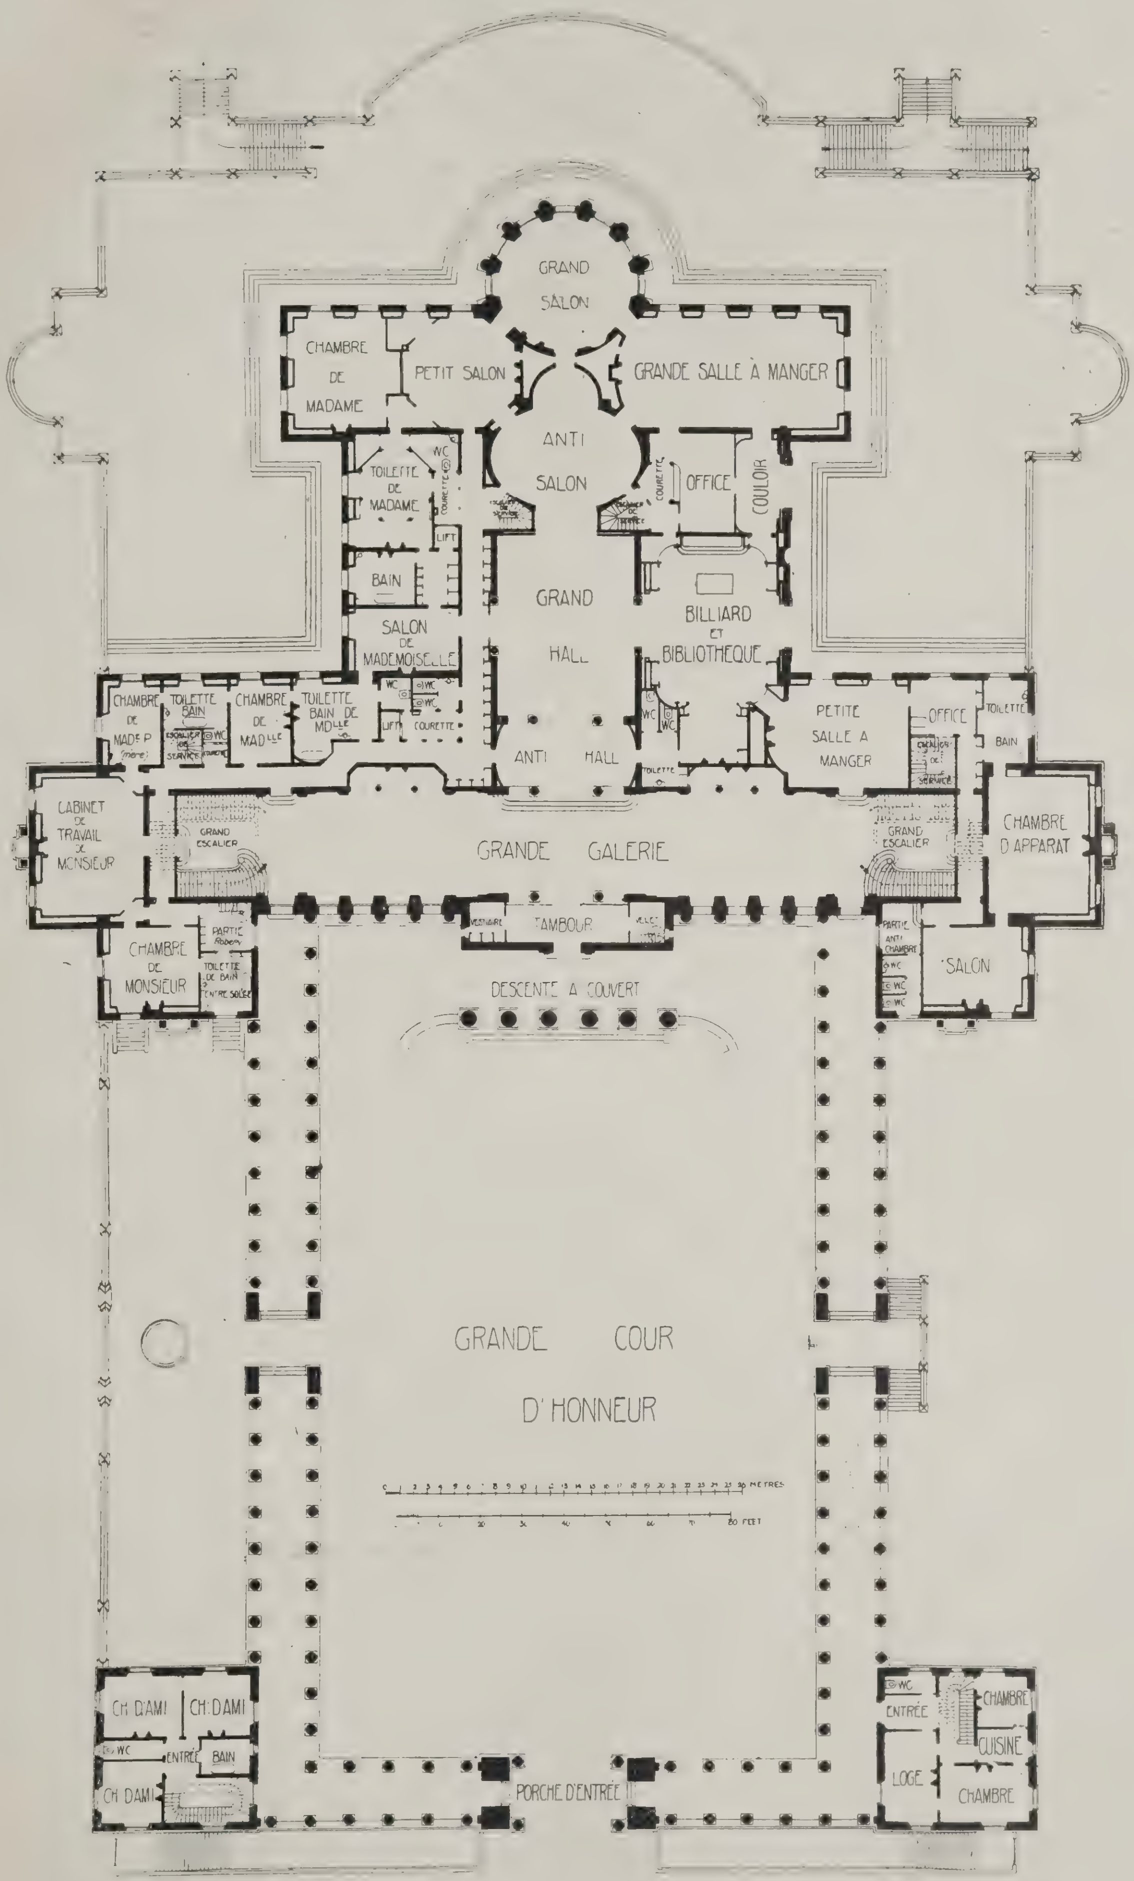
The Blessed Jeanne d'Arc, Maid of Orleans. Written and illustrated by work of the Artists of the Bromsgrove Guild, Worcestershire, England. Printers and Publishers, Allday, Ltd., the Shakespeare Press, Birmingham. Price 1s.

This is a sixteen-page quarto booklet, produced with appropriate chastity of taste, and embodying a brief but withal somewhat rhapsodical account of the meteoric career of the "glorious maid." It has been published at the wish and with the consent of the Archbishop of Westminster in connection with the important religious ceremonies and solemnities for in Rome the beatification of the Maid. The booklet is adorned with excellent pictorial reproductions of commemorative statuettes, medallions, and badges, that have been designed and made by the Bromsgrove Guild. The most important of these is the statuette showing Jeanne holding across her breast in her open palms the sword of Fierbois. The others respectively show her riding into Rheims, and kneeling ecstatic among her sheep in the fields at Domremy. On the reverse of both these medals is a representation of Westminster Cathedral.

Building Construction.

"Practical Building Construction," by T. P. Allen. 5th edition, revised and enlarged. Price 7s. 6d. net. London: Crosby Lockwood and Co., Stationers, Hall Court, E.C.

We are pleased to see that the appearance of the latest edition of this work shows that an appreciation exists of what is, on the whole, a sound treatise on building construction. The author, on the title page, states that the handbook is designed for those preparing for the Surveyors' Institution and similar examinations, and there is no doubt that a complete mastery of the subjects dealt with would enable any student to face such an ordeal with confidence. Particularly is this so in regard to the chapters on carpentry and joinery, which are especially complete both in the letterpress and illustrations. A chapter on fireproof floors is well up-to-date, many of the latest methods of construction being explained, and the necessary details shown by well executed diagrams. The chapter on sanitation is perhaps the least satisfactory, and the author has here made one or two curious slips. For instance, it is stated that baths, lavatories, and w.c.'s should, besides having traps immediately under the fitting, discharge into the open air directly over a gully. This is certainly the practice for baths, lavatories, and even sinks, but the idea that w.c.'s should also be treated this way has long since been exploded. If now seen, it will only be a relic of a system that was out of date at least fifteen years ago and which never attained much vogue. Other similar points might be noted, which are somewhat misleading, but they detract but little from what is generally an excellent work, both for the student and for the purpose of reference.



CHATEAU DE ROCHFORT-EN-YVELINES (SENE ET OISE): PLAN. CHARLES F. MEWES, ARCHITECT.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
June 1	MOLESEY ISOLATION HOSPITAL. The East and West Molesey U.D. Council invite competitive plans, with specifications for the above. Full particulars can be seen at the Council Offices, Dundee Villa, East Molesey.
June 4	COTTAGE HOSPITAL, BODMIN. Architects are invited to submit competitive designs for the above, to be erected at an approximate cost of £2,000. Premiums, £12 12s., £8 8s., and £5 5s., for the three sets of plans *which the Committee may select.* Premiums of selected Architects to merge in Commission. Site can be seen on application to Henry D. Foster, Hon. Secretary to the East Cornwall Hospital, Bodmin, from whom particulars are to be obtained.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading. Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively. Assessor: Mervyn E. Macartney, F.R.I.B.A., F.S.A.
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	WALLASEY U.D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

National Welsh Library, Aberystwith.

Professor Reginald Blomfield, A.R.A., has accepted the assessorship in the above competition on the nomination of the President of the Royal Institute of British Architects.

Willoughby v. Technical Journals (1902) Limited.

At the Assize Courts, Manchester, on Wednesday, April 21st, before Mr. Justice Walton, the case of Willoughby v. Technical Journals (1902) Limited, was mentioned.

Counsel for the Plaintiff: Mr. L. Langdon, K.C., and Mr. Gordon Hewart, instructed by Messrs. Boote, Edgar and Co., Manchester.

Counsel for the Defendants: Mr. Tobin, K.C., and Mr. Hugh Fraser, instructed by Messrs. Bull and Bull, of London.

Mr. Langdon: My Lord, in this case I appear with my learned friend, Mr. Hewart, for the Plaintiff, and my learned friends Mr. Tobin and Mr. Fraser appear for the Defendants. I am happy to say that neither your Lordship nor the Jury will be troubled to hear this case, because seeing the course the Defendants have taken a trial is, I am happy to say, rendered unnecessary. This was an action for libel appearing in a most important publication called "The Builders' Journal and Architectural Engineer," a journal that circulates broadcast amongst architects and builders, and has not only a wide circulation but a deservedly important influence. In that journal, under circumstances which, I daresay, Mr. Tobin will explain to your Lordship, there appeared, on January 13th last, a letter from a correspondent, and an anonymous correspondent. Unfortunately that letter contained grave aspersions on the professional capacity and the integrity of my client, Mr. Willoughby. Mr. Willoughby is a gentleman who has practised as an architect here in Manchester for some 26 years. He is a Fellow of the Royal Institute of British Architects, and is also a Fellow of the Manchester Society of Architects, and in that capacity he has discharged important work as an architect, and has also been called upon to adjudicate on many important matters as an assessor between architects. Naturally, when this letter appeared, attacking him in the way it did, it wounded his feelings greatly and was calculated to do him the greatest of harm amongst his professional brethren and the trades which are connected with them, and these proceedings became a necessity, and they have been taken. I am happy to say on behalf of the Defendants that they have recognised the gravity of the position in which they have placed Mr. Willoughby, and they are willing, through Mr. Tobin, to express their regret and apologise to Mr. Willoughby for what they have allowed to appear in their paper. More than that they consent through Mr. Tobin that, as a substantial mark of the wrong they have done the Plaintiff, and in an endeavour to repair that wrong as far as they can, there shall be judgment for the Plaintiff for 500 guineas and costs.

Mr. Tobin: I appear for the Defendants (with Mr. Fraser) who are the proprietors of "The Builders' Journal," and as Mr. Langdon has stated, it is a paper of very high standing and reputation amongst members of the profession amongst which it circulates. It is read by a great many builders, architects and engineers throughout the length and breadth of the country, and anyone looking at its issues, any of them, will see that its articles are regularly most serious and earnest articles, and anything like a libel is absolutely and wholly alien to its character. In this case the letter complained of was communicated to the paper by a correspondent. It was received in hot haste of going to press, and it was inserted by absolute inadvertence. The directors, when they saw the letter, when it was complained of, at once recognised, as gentlemen, that there was only one honourable course for them to pursue, and that they do pursue in this case. They say, through me, that the statements are wholly unfounded. They have never sought to justify those statements from the very first, and in the frankest and fullest way they express their regrets, and tender to the Plaintiff their sincere apology, and the proprietors of the paper further desire to say this, as showing they are anxious to do what they can to put the matter right, that they propose to report in two successive issues of their journal what I am now saying on their behalf, so that everyone who read the original letter complained of may have a reasonable opportunity of reading this withdrawal in Court to-day. I only wish to add that there has never been on the part of any of the proprietors of this paper, or in the minds of any of their staff, the smallest personal feeling against the Plaintiff. On the contrary, there have in previous issues of this journal been articles laudatory of the Plaintiff's work. The Directors feel, and authorise me to say, what I have now said on their behalf, and they have taken a proper course and a dignified course in this matter.

Mr. Justice Walton: I quite understand. The statement you have made expressed properly what they have done. They seem to have made an unfortunate mistake, but there is no suggestion that they did it maliciously. It was a mistake calculated to be injurious to the Plaintiff, and I think they have taken a proper course.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Base for Cast-iron Stanchion.

TRING.—A CONSTANT READER writes:—"A cross-shaped C.I. stanchion, 9ins. x 9ins. x 15ft. high, carries a load of 50 tons. Calculate a proper base plate if the ground is good gravel. Would a concrete base be sufficient, and what should be the dimension of concrete to resist this load?"

If the ground is good gravel, a safe pressure of 5 tons per square ft. may be allowed. This makes the necessary area of concrete block $= \frac{50}{5} = 10$ sq. ft., say 3ft. 3ins. square. Assuming that the concrete is best Portland cement concrete 1 to 4, a safe stress of 15 tons per sq. ft. can be allowed, thus making the necessary area of the base plate $\frac{50}{15} =$ 3.33 sq. ft., say 22ins. square. The usual thickness of this plate would be about 1¾ins. This plate must be sufficiently stiffened by ribs; or, as an alternative, the stanchion might be provided with a plain base and be bolted on to a ribbed cast-iron stool about 8ins. high, and tapering to 22ins. square at the base. The thickness of the concrete block should be about 18ins., this being about twice the amount of overhang of the block over the base-plate. If the base-plate is designed as indicated above, the concrete base would be sufficient. A.

Capacity of Cylinder.

HEREFORD.—H. C. writes:—"How many gallons are contained in a cylinder, 5ft. 6ins. in circumference, 4ft. 6ins. high, which has an overflow pipe 3ins. below the top? Also, how would you find the number of gallons if it was a square or oblong tank, instead of a cylinder?"

A cubic foot of water contains 6.23 gallons of water. A gallon of water occupies 276 cubic inches, or nearly 0.15 cubic foot. A gallon of water weighs 10 pounds, at 62 degs. F. A pound weight of water occupies 26⅔ cubic inches. To find the area of a circle, multiply its diameter by itself, and that product by 0.7854; or, multiply the radius by itself, and that product by 3.1416 (πr^2). A circle 5ft. 6ins. in circumference has a diameter of 1ft. 9ins., and a radius of 10½ins. Having found the area of the cistern, in either square feet or square inches, multiply the area by the net height of the cistern, 4ft. 3ins., and either divide this product by the number, 276, of cubic inches to the gallon, or, if you have calculated in feet, multiply it by the number, 6.23, of gallons in a cubic foot of space. Had the cistern been square or oblong, the process is the same, i.e., find the cubic contents, and then the gallons contained by these. Your cistern contains 10.2 cubic feet, 635 pounds of water, and 63.5 gallons. You will find full information about water in "Specification" INGENIOR.

West Walton Church.

PRESTON.—J. M. C. writes:—"Could you give me a short description of West Walton Church, Norfolk, or inform me where I could get the same?"

A full description of West Walton Church appeared in "The Builders' Journal," Vol. 92, page 711, and further illustrations on page 752 of same volume. Measured drawings were published in the A.A. Sketch Book of 1887, a sketch of the tower has appeared in "John o' Gaunt's Sketch Book," and sundry details of carving and ornament in Colling's "Gothic Details." G.

Books on French Cathedrals.

LONDON, S.W.—"CLOVIS" writes: "What guides and books, architectural and otherwise, are published (preferably in French), on the Cathedral Church of Rheims or Reims in the North of France? I have already Miltoun's 'Cathedrals of Northern France,' and also Bumpus' book on the same subject. Is there a book by the late Mr. Le Duc on this subject?"

Probably the "Histoire et Description de Notre Dame de Reims," in two volumes, by Ch. Cerf, published at Reims in 1861, will suit your requirements. Flodoard's "Histoire de l'Eglise de Reims," may also be useful, and references occur in Viollet le Duc's Dictionary of Architecture. G.

Reinforced Concrete.

LONDON, S.W.—"FER." writes: "Do the terms 'ferro-concrete' and 'reinforced concrete' refer to two different systems of construction? I have maintained that the two titles are different names for the same system of constructing in concrete and steel, but am told that there is an actual difference; one term signifying one system, and the other another."

The term "reinforced concrete" is the larger term, including "ferro-concrete." The latter is the term adopted by the proprietors of the "Hennebique" system, and, this being one of the earliest introduced into this country, the term "ferro-concrete" has been since rather loosely and indiscriminately applied to reinforced concrete in general.

Sea Sand for Concrete.

T. E. writes: "Referring to my query published in your issue of March 17th, and the answer thereto, I desire to say the question was asked in all seriousness, and therefore not 'writ sarkastic.' Knowing that the sand on our sea coasts varies to some extent in its sharpness (if you will allow me, for the moment, to ignore your interpretation of that term), it would have been very interesting to me, for other reasons than mere curiosity, to know where the material of sufficient sharpness as to allow of the term being applied, is to be found. As you seem to imagine you are giving me a 'poser' when you say you would like to know if I can find commercial sand which conforms to my interpretation of the word 'sharp' (which interpretation, by the way, you seem to be well acquainted with, although it was not given), I would point out that crushed rock sand is extensively used for concrete. This sand conforms to my interpretation of the word 'sharp.' Also, pit sand is generally 'sharp,' and termed as such, in comparison to sea sand. Your definition of the expression 'sharp and clean' is to me, I must confess, somewhat vague, and the term is, I venture to think, more often seen worded thus: to be composed of 'clean,' 'sharp' sand. I am aware that sand containing loam, etc., cannot be considered 'sharp,' as the existence of foreign matters tends to destroy the advantage obtained by that quality. At the same time, however 'clean' sand may be, it cannot be considered 'sharp' if the particles are not angular and gritty."

We do not know of sufficient variation in the sharpness of sea-sand to affect the quality of concrete made with same. Our correspondent is apparently trying to split hairs on this point. As regards "sharp" sand, we do not admit that crushed rock sand is extensively used for concrete, and we do not regard it as a commercial commodity. Pit sand, as we said before, has almost all been water-worn, and therefore is not "sharp" in the sense given the word by our correspondent. We can only add that we stand by our previous reply in every particular, and if architects and engineers were to insist upon "clean" sand being really angular, they would greatly increase the cost of any concrete work they had in hand.—Ed. "B.J."

Cast v. Milled Lead.

GREAT YARMOUTH.—A. S. H. writes: "What are the advantages of using old lead recast instead of milled in church restoration? Milled, I have understood, is more reliable than cast. What is the relative cost, taking new lead at 18s. per cwt., between milled and recast lead?"

You are quite mistaken in believing milled lead to be more reliable than cast—the latter, properly used, is more lasting and on all counts much to be preferred, particularly if old material can be re-used in this form. Old lead has a considerable quantity of silver and arsenic in it, which is the cause of the beautiful white oxide which forms on it. Modern lead blackens owing to its desilverisation. Cast lead is more easily dressed than milled, and is therefore preferred for bossing up. Its lasting properties are probably due to the preservation of the natural hardened skin lost in milling. Old lead is often as thick as 12lbs. to the foot, and owing to its liability to sand flaws and inequalities of thickness in casting, should not be used less than 6lbs., but as milled lead of less weight than this is not likely to be used in church work, this is no disadvantage. The relative cost of milled and recast lead, weight for weight, should present little difference if a good plumber is employed to do the work. It would, of course, be recast on the site on a wood table with a sand bed and projecting curb, on which a cross-piece or "strike" is slid up and down to gauge and level the molten metal. G.

Depreciation.—Compensation.

NO ADDRESS.—NO NAME writes: "(1) What is a fair depreciation per annum to allow on a house, just built at a cost of £230? (2) Being employed by a limited company, and having private work to do for the directors at their private residences, what would be a workman's position (should an accident occur to him whilst so engaged) under the Compensation Act?"

(1). If the house is well built and is of freehold tenure, there should be no depreciation; provided, of course, that it is always kept in repair. If it is a leasehold, depreciation must be reckoned in accordance with the length of the term for which it is held; no immediate allowance for depreciation need be made unless the unexpired term of the lease is less than for sixty years. (2). The position of the workman entirely depends on his "employer" at the time the accident occurs—if the Limited Company pay his wages, then they alone are responsible. but if the director himself pays the workman's wages (he only having temporary leave of absence from the Company), then the workman would have to look to the director personally for compensation. F.S.I.

Royal Academy Schools.

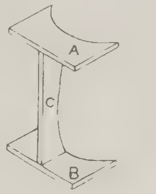
CROYDON.—S.W.S. writes: "Can you give me any information on the standard of the examination for entrance of architectural students to the schools of the Royal Academy. Are the questions (and answers) published? I have full particulars of what is required for admission as probationer, but want a more definite knowledge of what is required for admission as student in the two subjects of examination: perspective and architectural history."

Full particulars of the subjects required in the examination for entrance to the Royal Academy Schools may be obtained on application at Burlington House, W. (Apply to the secretary, Royal Academy School of Architecture.) As the number of vacancies is limited, and the number of candidates variable, the standard is necessarily also somewhat variable and competitive; but we may state, as being of some guidance to the standard, that a candidate who has passed the intermediate examination of the R.I.B.A. and prepared the usual drawings required as testimonies of study for the final, would probably have no difficulty. The examination is held in January annually; questions are not published; the subjects of design and perspective drawing are similar to those set in the various qualifying architectural examinations. B.B.

Entasis in Plastering.

CHESTER.—CESTRIA writes: "We have a large number of iron columns to case in breeze concrete, and finish in Parian cement. Could you oblige us by saying which you think is the quickest way of applying the finishing coat? The base is octagon, with a mould run round the top of base, from this mould to capmould the circular shaft has a slight entasis. Which is the quickest way to form and finish the entasis? Can you suggest a better way than by hand?"

This is more a question for a practical plasterer, but apparently the best way to deal with the swelled portion would be to form the circular mouldings above and below it in the usual way, and then to make a template as in the illustration, and work up the entasis by hand. The parts A and B can be passed round the circular moulding while the part C gives the form for the entasis.



HENRY ADAMS.

Tenant's Fixtures.

DUBLIN.—H. G. L. writes: "I should be glad if you could inform me if a wooden framed building erected by a tenant on concrete foundations is in law the property of the tenant or of the landlord, in case of the lapse of a lease or of the landlord taking over the property for any reason."

The removability of a building, or part of a building, which has been erected by a tenant depends entirely upon the degree to which it has been affixed. If it has been so built, or secured, as to have become, practically, a part of the freehold, it has become the property of the landlord, and cannot, therefore, be removed by the outgoing tenant. In the case you mention, I am of opinion that the tenant is legally entitled to remove the wooden superstructure but not the concrete foundations. F.S.I.

Steel Roofs.

LAVENDER HILL, S.W.—BOLT writes: "What governs the number of holding-down bolts to be provided to the feet of the rafters in a steel roof? The horizontal component of the reaction usually works out to one bolt, or less, but often four are used."

As far as calculation goes, the horizontal component of the reaction is the only factor that determines the number of holding-down bolts used. One bolt cannot, however, be used unless it can be placed behind the vertical plane as the roof, and this is not a good practical arrangement; for this reason two are usually used, one on each side of the rafter. Although four bolts are often used where two would do, there does not appear to be any important reason for this arrangement. A.

Assistant to Municipal Body.

WESTCLIFF-ON-SEA.—ENQUIRER writes. "Would there be much chance for an architectural assistant (age 31) of securing employment with an urban district council or district council as assistant or assistant surveyor, if he passed the necessary examination, but did not serve his articles in such an office? I would also like to know what are the qualifications required, and if there are likely to be many openings if one did qualify. Would the associateship of the R.I.B.A. be any use in making application for a post of this kind, and what are the most useful examinations to pass? Where can the necessary coaching be obtained?"

These appointments, especially for the more highly paid officials, although often advertised, are generally given to men whose training has been in similar surroundings. Apart from this preliminary training, we should say the Surveyors' Institute examination or the Statutory examination to qualify as district surveyor in London or building surveyor under local authorities (next examination October, 1909), would carry more weight than the R.I.B.A. associate examination in this particular sphere; shorthand is also often a most valuable recommendation. Information as to coaching for the above examinations is best obtained from the various educational agencies whose addresses appear herein in the educational columns.

B.B.

Loss of Light.

NEWCASTLE-ON-TYNE.—E. G. writes: "The enclosed sketch plan (not reproduced) shows three adjoining houses (back parts only), and I am the owner of the middle one, numbered 41 and B. Above the scullery shown I intend erecting a bath-room. The existing party wall dividing A and B, and forming the wall of my scullery, is the point in dispute. Owner A says I cannot raise this wall any higher to form my bath-room, on account of the light to his kitchen window. Now owner C has a bath-room exactly in the same position as I am intending to place mine, and my contention is that I have good light in my kitchen, despite this bath-room wall of C's, and consequently I hold that owner A will have as much light in his kitchen as I have in mine. No work for remuneration is carried on in his kitchen, consequently all the light he can claim is a reasonable amount. (1) Must I obtain the consent of owner A before I can carry the party wall any higher? (2) Also if he refuses consent can I legally carry up my own 4½ feet and add another 4½ feet to it, so as to give me a 9 feet wall on my own ground? I may say the City Council have already sanctioned the plans as sent in. The wall in question will be about 8 feet higher than the existing party wall."

You are quite right in supposing that no damages for loss of light can be recovered by law unless the loss is real and actual, and not of merely a theoretical or fancied character, and you are equally right in thinking that the loss of light to a kitchen would not legally be regarded as being so serious as would be the case if the room were used for manufacturing purposes. From your sketch plan I should say that the loss of light in this case will be inconsiderable. The answers to your questions are:—

(1) Yes; neither party may raise the wall so as to increase the burden upon it, or interfere with his co-tenant's uses, without permission.

(2) Yes, if the party wall stands equally upon your land and upon that of your neighbour. You own one-half the wall, and so does he, and each has a right of support to his own half from his neighbour's half.

F. S. I.

Partnership.

YORKSHIRE.—PARTNER writes: "On what basis is a partnership between two young architects and surveyors usually arranged? 'A' has been in practice about four years and has a fair connection, and 'B' wishes to join him. 'A' is a good designer, but not by any means practical, whilst 'B' is very practical and a good land and quantity surveyor, which knowledge 'A' lacks. 'B' has had exceptional opportunities of superintending works in progress, both public and private. How would the amount of money to be put into the business by 'B' be arrived at, and how should the work of the office be divided to render the partnership fair to both parties?"

A somewhat similar question was answered on page 95, Vol. 26, of "The Builders' Journal." In this instance, however, the circumstances rather alter the case. Presumably an equal partnership is contemplated—in that event the sum of money to be put in by the new partner should be half that requisite to purchase the practice—say, two years' purchase, calculated on the nett profits. No hard and fast division of the office work will be possible; naturally each partner will undertake the work most suited to his capabilities. A proper deed of partnership should be drawn up by a qualified solicitor, and provision made therein for the eventuality of a future dissolution.

G.

Sign on Drawings.

LONDON.—PARCHMENT writes: "What is the meaning of the mark, similar to a letter S, drawn on the boundary lines of plots in drawings? I have noticed it on plans of sites attached to agreements and other legal documents."

The sign S to which you refer, when found upon a plan is merely a bracket, and means that the properties on both sides of the line (across which it is marked) are communicating, or are both included in the one area.

F. S. I.

Public Works Department.

DEVONPORT.—A. K. writes: "Where can I find information relating to the Public Works Department other than that of India and the qualifications necessary for entering it?"

We are not sure whether our correspondent refers to the Public Works Department of Ireland and the outlying parts of the Empire, *e.g.*, for the Anglo-Egyptian Government of Egypt, etc. There is a regular syllabus for the former department, consisting of composition, architectural drawing and details, quantities, estimating and specifications, building materials, sanitary science and survey and levelling. The whole staff, however, numbers only about a dozen men. Applications to sit for examination must be made to the Civil Service Commissioners. Indeed, it would be best to apply to the Commissioners at Burlington Gardens, W., for detailed information, which varies from time to time as circumstances arise. They will also supply information as to the English Office of Works, for which examinations, covering much the same syllabus, are frequently held, although the vacancies are extremely limited. Past examination papers can be obtained from the Civil Service Press, 27, Chancery Lane, W.C., post free, ½d.

Floors for Dancing.

TRICHINOPOLY.—E. B. writes: "Could you give me instructions how to construct a dancing floor set on springs, or let me know of any books containing this information?"

I have seen several designs for dancing floors on springs, but not one that was based upon reasonable principles. The majority of this class are arranged so that the bearers which carry the floor joists rest upon volute springs. The motive force, however, to cause the springs to work is not the weight upon the floor, but the change of weight, and this is infinitesimal when the floor as a whole has to be taken into account. To be effective, the boards themselves should be upon springs, so that about one spring to each couple dancing would come into action individually. I know of no practical method of doing this, and recommend an ordinary floor with shallower joists than usual to reduce their stiffness, and placed further apart to allow the flooring to spring, the strength being secured by the thickness of the joists and the jointing of the floor boards. Such a floor for a room 80ft. by 40ft. would be given by the arrangement shown herewith in plan Fig. 1 and section Fig. 2.

CONTRACTORS' SECTION.

(MONTHLY.)

DRY-ROT AND LEGAL LIABILITY.

By a Barrister.

Cases have recently come before the Courts which serve to show that the question as to who is liable for the dry-rot which sometimes breaks out in the woodwork of a building is not by any means easy to determine. Incidentally it necessitates the solution of the problem:—For how long does a builder or an architect remain liable for defects which appear after completion? This is a question to which it is by no means easy to give a short and satisfactory answer. One may look through all the clauses of a most carefully drawn contract without finding anything which places a time limit upon the liability of the builder. True, a maintenance clause frequently provides that he shall be liable for a definite period to maintain and repair; but the contract is generally silent as to the relative rights and liabilities of the builder and building owner after that period has elapsed.

The question under discussion most frequently arises in connection with what are known as *latent* defects.

But a latent defect may not become patent for years. Some error in building may cause the foundations to give way; some departure from the specification may have led to the use of improper materials. Finally, dry-rot may break out under the floors to such an extent that the entire woodwork has to be renewed. How far, then, can the builder or architect be held responsible?

It will be convenient to discuss this question on the present occasion with sole reference to the occurrence of dry-rot. This is a latent defect, which may only become manifest after the elapse of a considerable period of time. If it can be shown that the occurrence of dry-rot is due to some breach of contract on the part of the builder, it is manifest that he must be held liable.

Building contracts may, for the present purpose, be divided into two classes: (1) contracts in elaborate form, in connection with which there is an architect employed and which are drawn in some such form as that recommended by the Royal Institute of British Architects. (2) Contracts in which the work is done without the intervention of an architect, but in accordance with specification.

The discussion may best be opened by considering some common data which may be conveniently generalised in the form of the following assumed case.

A builder was employed to add a new wing to a house. The contract and specification provided that a layer of cement concrete 6ins. thick should be put under the floor of the hall and passages, and that a patent damp-proof course should be laid beneath all woodwork both in the outer walls and in the sleeper walls. Work and materials were to be approved by the architect of the building owner, who was named in the contract. The house was so situated that the ground floor was below the level of the soil of the upper part of the garden. The builder did the work; but before it was completed and before the final certificate was given, there were symptoms of dry-rot in the woodwork under the ground floor. An attempt was made to put this right before the final certificate was given, and a deduction was made on account of it. Eventually the architect granted his final certificate, and the builder left the work. A year or two later the floor began to give way, and on its being removed it was found to be extensively infected with dry-rot. Upon investigation it was found that the ventilators were blocked up with chips and shavings; that there was no damp course on some of the sleeper walls, and that a portion of the concrete under the hall had been omitted. It was also found that the soil beneath the wood floors for which no covering layer of concrete had been specified was damp. The local building by-laws provided that a layer of cement concrete should be placed underneath all wood floors, but the local authority did not enforce this by-law very strictly.

In such conditions, who is to bear the loss occasioned by the dry-rot?

First, as to the position of the building owner. It is clear that unless the appearance of dry-rot is an evil which may occur in any building however well designed and constructed, the building owner may be entitled to lay the burden on the builder or the architect. This is because a building owner is entitled to rely on the professional skill and judgment of those who undertake to do work for him. The architect must exercise reasonable care and skill; and if there is an omission from the specification of some elementary precaution which would account for the growth of the mycelium of dry-rot, it is conceived that this would be sufficient to fix both the builder and the architect with liability.

It appears, however, to be accepted doctrine at the present time that it is not every building that is liable to be affected by dry-rot. The disease only occurs when there is bad ventilation or when, owing to some defect of construction, damp is able to reach the woodwork. In the circumstances of the case above stated, with whom does the responsibility rest? If the dry-rot broke out owing to the absence of concrete beneath the floor, that was not the fault of the builder, for concrete was not specified beneath the rooms but only in the hall and passages. If, on the other hand, the dry-rot began and spread owing to the absence of a suitable damp course, that was the fault of the builder, because he should have complied with his specification. In the circumstances, the incidence of liability could only be ascertained by bringing an action against the builder and architect jointly.

The plaintiff in such an action would be beset with certain grave difficulties. The builder might certainly shelter himself behind the final certificate of the architect. The work was to be done to the approval of the architect, and how can that approval be better expressed than by the final certificate which practically authorises the builder to demand the balance of the contract price from the building owner? So far as the absence of the concrete is concerned, that is a matter for which the builder is not responsible. Moreover, on the particular data of the case assumed, the builder could plead by way of defence that the dry-rot was discovered and in fact eradicated before the final certificate was given at all.

Next let us consider the position of the architect. Assume that the dry-rot was due partly to the absence of concrete beneath the floors and partly to the absence of a proper damp course. Could the architect be blamed on either or both of these grounds?

It is manifest, in the first place, that the two things are entirely distinct. The absence of concrete under the floors was a matter which depended upon the design of the building. The absence of a proper damp course was primarily due to the negligence of the builder, although it might incidentally have been due to the negligence of the architect in not supervising the builder and seeing that he carried out his contract.

First as to the liability of an architect for a negligent design. It is extremely difficult for a charge of negligence to be brought home against a professional man for what may really be an error in judgment.

The doctor does not guarantee a cure; the lawyer does not undertake that he will win a case; the architect does not guarantee that he will bring the very highest degree of skill to bear upon the work for which he has been employed. The building owner could only hope to succeed on this head of negligence as against the architect by showing that, in the opinion of members of his profession, he omitted to specify what was a reasonable precaution. This of course is not an easy task to perform, having regard to the natural reluctance of one professional man to testify against another.

It is nevertheless clearly one of the duties of an architect to supervise the work during construction, and to see that the builder complies with the specification. If bad work is done and concealed from the architect, it is no justification for him to say that the builder did it without his knowledge. The clerk of the works generally supervises the details of a contract, but where there is no clerk of the works employed, the architect's duty as supervisor becomes all the more onerous.

There is authority for saying that if an architect omits to see that the builder complies with the specification, or covers up bad work, he may be held liable for negligence.

Thus the fact that an architect may be held liable for negligence in passing bad work is illustrated by a case where the plaintiff employed a builder to build a house for him in accordance with certain plans. The builder was to be paid on the certificates of the defendant, who was the plaintiff's architect. The defendant certified, and the plaintiff accordingly paid the builder. This action was then brought by the plaintiff, who alleged that in consequence of the defendant's negligence in superintendence, the house was not built in accordance with the contract. The jury found a verdict for the plaintiff.

The fact that an architect may be held liable for dry-rot has been clearly established in the Scotch case that is recorded in "Emden's Building Contracts," 4th ed., p. 78. There a builder was employed to build a house to the specification of the defendant, an architect. No clerk of the works was employed. Many months after the completion of the work the whole ground floor became infected with dry-rot. The building owner made a claim upon the builder, who denied all liability. He then brought an action against the architect claiming damages for negligence. The Court of Session in Edinburgh held that the architect was liable.

In the course of the judgment in that case, it was stated that:—"To some extent an architect is an artist—that is, as regards the design and plan. But for the rest, his work is just ordinary tradesman's work—drawing specifications and supervising the work. He is not supposed to do all the supervision personally. His substitute can do much of it as well as he can himself, but if he undertakes to do it he is bound either to do it himself, or to have it done by some person whom he employs in whom he has confidence. I think the meaning of the contract is that he shall see that the work is done well before he certifies it."

So much for the liability of the architect. In a case where there is no architect employed, the problem assumes a somewhat simpler aspect. The builder then acts as skilled adviser, as designer, and as superintendent of the work; and if an outbreak of dry-rot can be shown to be due to any default on his part, he can be held liable in damages. There is one recent authority on the point. In the case of *Grove v. Judge*, "Law Times Journal," Feb. 13, 1909, p. 333, an action was brought in the Watford County Court to recover damages from a builder. It appeared that in 1905 the defendant built a house for the plaintiff. No architect was employed. The house was completed in July, 1905, when the plaintiff entered it, and continued to live there until September, 1908. In that month the floor gave way owing to dry-rot. The outbreak of this was alleged to be due (1) to improper damp-course; (2) the laying of damp course below the level of the soil; (3) covering up of ventilators; (4) laying of damp-course below the level of the woodwork. The County Court judge came to the conclusion that the damp course was not, in fact, laid at the proper level, and that the ventilation was defective. He also held, upon the evidence, that the outbreak of dry-rot was due to these causes, and declined to accept the suggestion that the use of linoleum on the floors when laid was the cause of the mischief. In the event, he entered judgment for the plaintiff.

Finally, there is recorded at least one case in which both architect and builder were held jointly liable for an outbreak of dry-rot.

In view of these decisions, which appear at first sight to be at variance, it is difficult to lay down any general principle, or to solve the problems presented to us by the facts of the case mentioned in the early part of this article. An architect has been held liable; a builder has been held liable; and both together have been held liable. How, then, shall a building owner decide who is to be sued? This is an important question, because an abortive action means heavy costs. It is one which can only be answered after all the facts of the case have been ascertained and carefully considered.

SCAFFOLDING AND APPLIANCES AT THE BUILDING EXHIBITION.

By A. G. H. Thatcher.

Recollections of several past building exhibitions prompt one to turn to the various devices in scaffolding and the patented appliances connected therewith. The result always forces one conclusion, that impermanent as such structures are the ideas put forward for their improvement are still less lasting. Ladders, cradles, boats, lashings, cripples, and safety appliances have all been shown in the past, but whether due to faults in their construction, or to the well-known conservatism of the trade, their life on the whole appears to be limited in duration. The exhibition that has just closed has had this branch of the trade fairly well represented, and although little that is novel has been shown, much of interest has been placed before possible users and hoped-for purchasers.

Perhaps the most striking and most novel exhibit was the power winch shown by Broom and Wade, Ltd., of High Wycombe. It consists of an ordinary barrel hoist, as shown in Fig. 1, with a small petrol motor fitted to one of the A sides near the base. Its utility is undoubted, and for small jobs where fairly heavy loads have to be carried or where speed is a desideratum its use would be an advantage.

The same firm also supply a winch fitted with drums of different diameters for rapid and combined hoisting and lowering. It was originally known as Fishburn's, and its continuance over several exhibitions proves it to be one of the few exceptions that have caught on with the trade.

Several cripples are shown, but only two possess any idea particularly striking. The first of these, Fig. 2, was shown by Mr. Edward Leigh, of 85, Tamworth Road, Croydon.

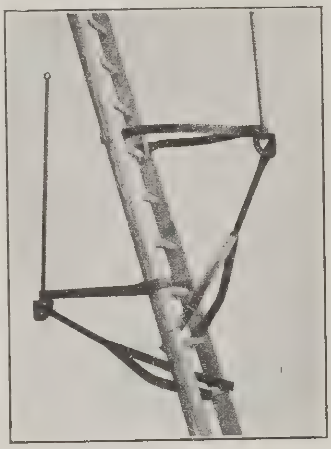

FIG. 2.

In this arrangement the weight when fixed is partly carried by the ladder sides, but it has the added advantage of being supplied with a guard rail. Cripples though useful are somewhat dangerous to work from, and the platform they carry is narrow, 18ins. at the most. Any method, as this, of increasing their safety, especially in these days of compensation, is to be sought for.

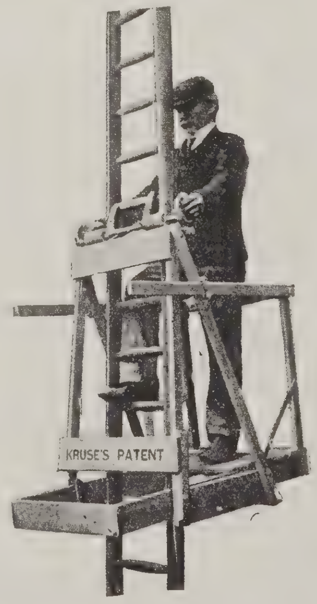

FIG. 3.

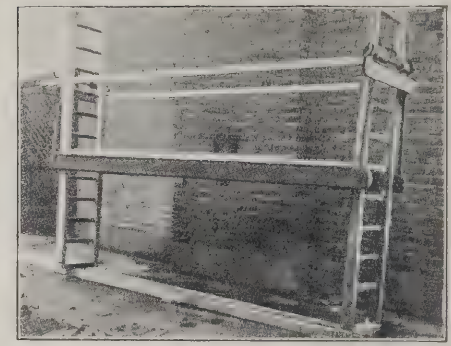

FIG. 4.

Kruse's patent has a similar purpose, but is constructed of timber. For working in, the element of safety is again considered and made plain. Unlike others it forms a platform in itself, and by any workman conversant with its use is readily raised or lowered. It is certainly a step in the right direction.

The clip to the ladder rungs is also used by the patentee to build a scaffold as shown in Fig. 4. It is raised and lowered in a similar manner to the cripple itself, two men of course being necessary in this case.

A cripple fixed to the top of an ordinary step ladder is also shown. This certainly increases the platform room, but the tops of steps are not so safe to work from, the centre of gravity being high in proportion to the stability of the structure.

Of appliances to take the place of the hempen or wire rope as a scaffold connection, there seems to be no end. Many such have been introduced into this country from abroad, and it always appears to be a tempting theme for practical ingenuity. One of the latest and certainly one of the best is that supplied by the Patent Rapid Scaffold Tie Co., of 124, Victoria Street, Westminster. Its use is illustrated by Figs. 5, 6, and 7.

Its good qualities are rapidity of fixing and rigidity afterwards. No wedges are needed, and any tightening is easily effected by an ordinary spanner. The loose nut is bossed on so that it cannot be lost. The chief disadvantage is its weight, a ledger connection weighing with the chains about 6½lbs. This compares unfavourably with the hempen or wire cord, mostly where cartage is concerned. The immense strength it gives may easily be taken to be of more value than this, especially for heavy work.

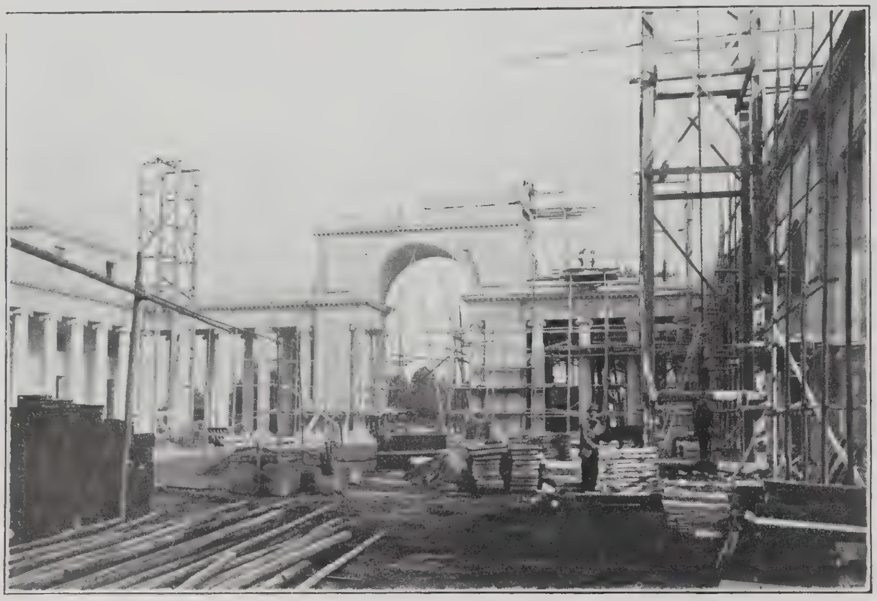
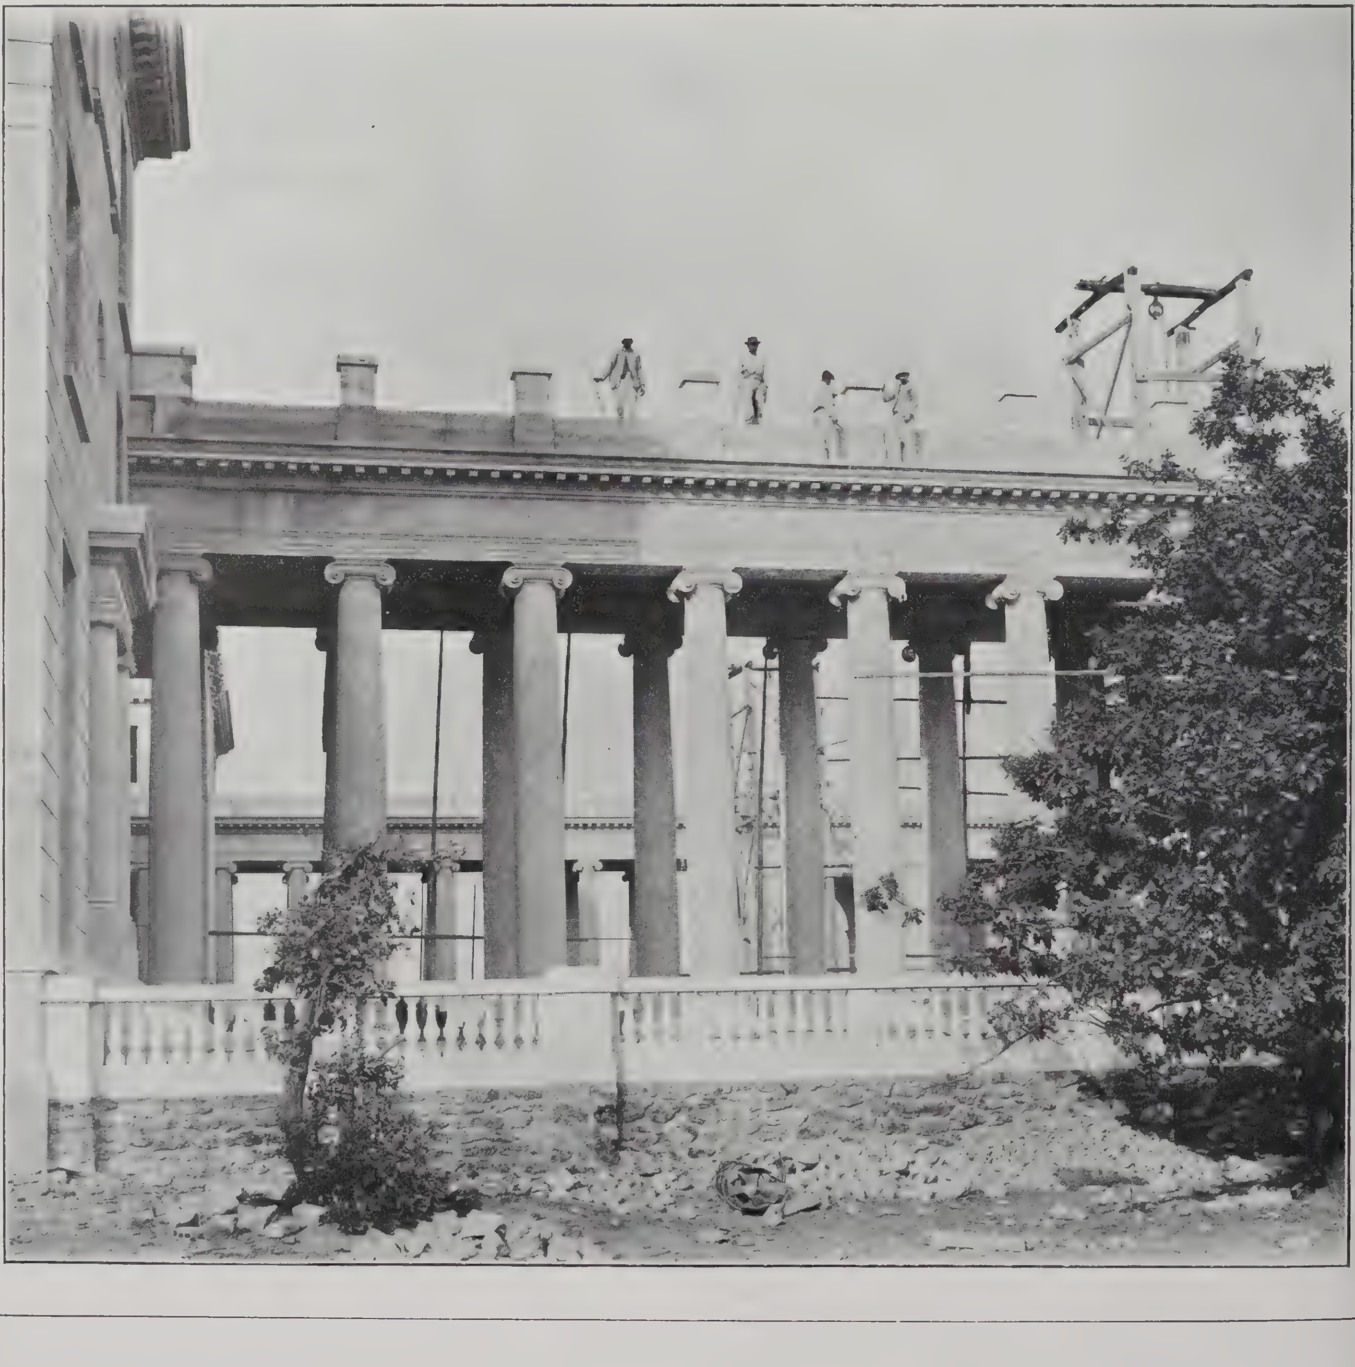
2.—General View.

3.—The Colonnades bordering the Court of Honour.

4.—Entrance Portico.





For the bracket supplied by the same firm (Fig. 8) it is claimed that by its use one scaffolder can fix the ledgers, but the safe handling of poles on a scaffold usually demands the services of two men.

Messrs. Stephens and Carter, of Green Street, Paddington Green, show amongst other exhibits a safety basket as Fig. 9.

The iron hoop built in the construction prevents the handles and bottom tearing out, a danger that is often present with an ordinary basket that is at all worn. The cost is practically the same as when made in the usual way, so that there can be no real objection to the improvement.

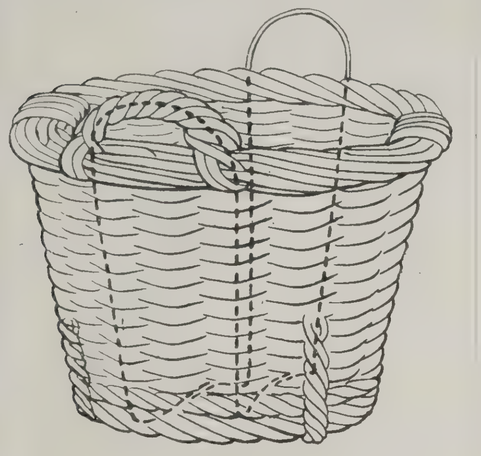


FIG. 9.

The Clipper Plank clamps by W. T. Nicholson and Clipper Co., Ltd., of Salford, are useful to join planks in their run without any support from beneath.

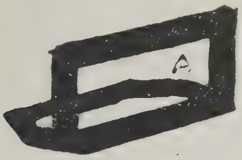

FIG. 10.

The boards are passed through the aperture A (Fig. 10) forming a lap, and any superincumbent weight causes the iron to grip and keep them in position. They serve a useful purpose and if placed in the centre of the span which the boards bridge, give the greatest strength where it is required. Their use would prevent such an incident happening as was recently noticed on a building. A workman finding a single board of insufficient strength to support him, lined it, not with a single board but with two, and *butted them to meet in the centre of the span.*

The proposals of the Master Joiners and Builders' Branch of the Manchester District Building Trades Employers' Association in reference to working hours and wages have been substantially rejected by a vote of the men. The masters' scheme proposed that the time for starting and finishing be so adjusted that the week during March, April, May, June, July, August, September, and October, equal 49⅜ hours; for November and February, 44 hours; and for December and January, 41⅜. Other stipulations were:—That the wages be 9⅜d. per hour; the boundary circle with a radius of two miles from Albert Square as a centre; and as to "country work," that all men sent out of the district and lodging away from home, should receive 3s. 6d. per week and travelling expenses out-and-in once a week.

The members of the 40 branches in the district, comprising some 3,000 members, were asked to vote on the issue, and sufficient has been ascertained to justify the declaration that the masters' terms have been repudiated, save a proposal dealing with train fare and kindred expenses in lieu of the 3s. 6d. per week allowed by the old rules.

Matters of Opinion.

II.—The Taxation of Land Values and Its Effect Upon Building.

In the preparation of the present year's Budget, which the Chancellor of the Exchequer introduced last Thursday, it had been rumoured that a further projected tax upon land as a means of meeting the present deficit was rejected, as the estimated yield was too poor to warrant the introduction of such an impost. That this was not the case is made evident by Mr. Lloyd George's statement which provides for three taxes on land. In response to numerous requests from builders and others we had decided to open our columns to a discussion on the subject, based on the Glasgow Bill, of some two years ago, which sought to rate land for Municipal purposes. Mr. Horsburgh's paper, which follows, is based upon the proposals of the Glasgow Bill, and was accepted by us as a preliminary criticism on these proposals for the purpose of eliciting opinions and suggestions from builders and other interested, it being one of the contentions of those who support land value taxation that it will tend to stimulate building. Needless to say this is an aspect we cannot ignore. Mr. Horsburgh's criticisms on the question of developed properties in towns must be mitigated as regards the Budget scheme, under which such properties will only be subject to an occasional impost when things are "booming"; but his criticisms regarding undeveloped land apply also to the Chancellor's proposals, and the whole article holds good as regards municipal rating, the supporters of which are not likely to be satisfied or pleased by the Chancellor forestalling them.

It may be helpful to state here the Budget proposals as regards land, which Mr. Lloyd George has explained in greater detail to one or two newspaper representatives since his speech in the House of Commons. To "The Westminster Gazette" he stated the three taxes as follows:—

"The first is an increment tax. All the land in the Kingdom will be valued at its present value. That is the first operation. If it increases in value subsequently, then, either on transfer or at death, the proposal is that the State should secure 20 per cent. upon that increment.

"The second is a 10 per cent. tax on the determination of a lease. When a lease falls in, not merely does the land revert to the landlord, but the house as well. The 10 per cent. will be charged on the difference between the interest which the landlord had in the land before the date of the lease and that which he has acquired on the expiry of the lease. In fact, he pays 10 per cent. on property which he has acquired without expenditure.

"The third is a tax of one-halfpenny in the £ upon undeveloped land. This is practically a tax upon vacant building sites which have acquired a special value owing to their being near a town or village, and upon mineral rights. There seems to be some misapprehension as to this. It is not altogether a tax on mining royalties in form, but it is in substance. The royalties received by the landowner in respect of his interest in the mine are evidence of the value of the minerals which have not been raised and which are still underground, and I have no doubt a valuer would take them into account when assessing the price which he should put upon the landlord's interest in the property.

"The first two are growing taxes. They will produce a minimum this year, but they will grow heavily. Our anticipation is that they will assume considerable dimensions, as we are basing our estimate on the prospect of land appreciating in this country owing to the growth of population and the spread of wealth."

In the "Daily Mail" of Monday last, the Chancellor has given some further explanations. Asked whether the new tax of a halfpenny in the pound on the capital value of undeveloped land would apply to places of public recreation—race-courses, cricket grounds, football grounds, golf links, tennis courts, and playgrounds, Mr. Lloyd George stated that it would apply to all undeveloped land which has a special building value, unless that land is thrown open to the public on reasonable conditions. A good many gentlemen with private parks near a town, throw open those parks to the people under fair restrictions for the protection of their amenities. A special exemption had been made in cases of that kind. As to racecourses, a clear test will be applied. If the course is private property, with a distinct building value, and if the proprietors make money out of the land, they will be liable to pay. Epsom Downs, being always open to the public, would probably escape. Many of the racecourses in open country referred to have no special value as building sites. Where they have, then, of course, they are liable to the tax. But the land must be worth more than £50 an acre to begin with. That rules out all poor land without a special building value.

"The conditions defined will apply equally to cricket grounds and football grounds and golf links. They will not apply to public playgrounds, nor even to private playing grounds when the proprietors give reasonable free access to the public for their enjoyment."

The definition suggested a further question to the interviewer. Lord's and the Oval, the Chelsea football ground, and all other football grounds in the middle of large towns—these have a distinct special building value, they are worth more than £50 an acre, and they are not open to the public for enjoyment except when the public pay for admission. Are they liable to the tax?

Mr. Lloyd George replied that it depended entirely on whether they came under the head of "public amenities," and that point will be decided in each case by the Commissioners of Inland Revenue. There are certain open spaces which it would not be in the public interest to build upon, and these will be exempted. But to ask about any specific instance would be like asking a judge to give his views on a case before it had been argued.

Another question was: What is implied by "or other purposes" in the text of the resolution for the land value duty:

> An annual duty in respect of the capital site value of land which has not been developed for building *or other purposes*, and the capital value of ungotten minerals, at the rate of one halfpenny for every pound of that value.

Mr. Lloyd George replied to the effect that a resolution cannot be taken as expressing a substantial definition of one's proposals. All it does is to give a kind of comprehensive authority for introducing a Bill which deals with finance. Therefore, one makes one's resolutions as wide as possible. What is said about this particular resolution applies to them all. Property may be developed for a good many purposes which could not be described as building. It is desired to cover in the exemption all cases in which the land is fully used for a legitimate purpose.

We are open to receive opinions from all points of view, but it must be understood that our attitude is entirely non-committal and that we propose to maintain a neutral position in the discussion. The taxation of land values is either of importance to builders or it is not, and upon this we should be glad to hear from the builders themselves.
—The Editor.

THE TAXATION OF LAND VALUES IN TOWNS.

By Victor D. Horsburgh, A.R.I.B.A.

The stoutest upholder of "things as they are" could not for a moment maintain that our present system of rating is perfect or even decently just. On the contrary, a little reflection would demonstrate it to be irrational in conception and erratic in incidence. Real and personal property cannot pay taxes, but they are used as the measure of the share that each citizen is required to contribute to the public service. That real property is often a false measure of ability to pay can be easily shown. There may be some degree of reason in taking from the landlord so many shillings out of each pound of rent he receives, because he actually handles the money on which the tax is laid. Often, however, he holds the property under burdens that leave him little or no profit from it. In these cases the Imperial tax passes on, to be borne by those in actual enjoyment of the rent, but his share of the local rates remains on the landlord in full. It is unreasonable, however, to presume that the occupant is able to pay rates on the same sum as the landlord. He does not receive, but pays out the rent and must be poorer in consequence. Our curious laws argue that having paid out money he must be able to pay more. They proceed on the assumption—surely a faint one—that the income or profit will be in proportion to the rent. The inequity of rent as the measure of a tenant's just share of, or at least ability to bear taxation, is becoming more and more recognised. A tradesman paying a shop rent counted in thousands may make an income counted in hundreds, while a business man on the floor above who does not require a shop window may be in the reverse position, making an income of thousands while paying a rent of hundreds.

Origin of the Proposal.

The agitation for the Taxation of Land Values did not arise wholly out of the recognition of such anomalies, but from a desire in certain quarters to secure to the local service a share—some say the whole—of the rise from rural to urban values of land, consequent on the growth of towns. The Land Values Taxation (Scotland) Act, 1906, popularly known as "The Glasgow Bill," proposed that a capital valuation "as between a willing seller and a willing buyer" of all privately owned land in towns, should be made. The land only, apart from the buildings on it, was to be valued. Then an annual value of one twenty-fifth of the capital value was to be assumed, and a rate not exceeding ten per cent. of the latter imposed on owners only. Holders of feu-duties and ground rents were to be included and taxed as owners of ground values. The new tax was to be in addition to the existing rates, and its produce was to go to their relief. The House of Commons referred the Bill to a Select Committee for report. After hearing evidence the Committee reported in December, 1906, condemning the idea of a supplementary tax utterly, and recommending the abolition of the existing rates and the substitution of a tax on Land Value for them. Owners and occupiers were both to be rated on the new standard, and owners of feu-duties and ground rents were included as before. The Committee further recommended that a valuation should be made and considered before a scheme of taxation was drawn up.

This latter recommendation the Government proceeded to carry out, but their Bill was dropped when the House of Lords insisted that the valuation should be optional on Local Authorities, and so the matter rests. Much confusion exists in the public mind on the subject, and no wonder.

Confusing Ministerial Declaration.

In June, 1907, the late Prime Minister threw overboard part of his Committee's scheme by assuring a deputation that existing feu-duties would not be taxed. In March, 1908, the Lord Chancellor jettisoned most of the remainder by a declaration in the House of Lords that to place the rates wholly on Land Value was impracticable, as "it would be eaten up altogether." Meanwhile the Scottish Solicitor-General—then Mr. Ure—has all along insisted that feu-duties must be taxed. These things irresistibly suggest that an overworked Government has not been able to study the matter, but has proceeded on the insistences of a band of enthusiasts.

Supporters of the measure may object to opposition as unreasonable, on the ground that the Government's programme is one of inquiry only. The reply will be to argue that no feasible scheme of rating can follow the valuation. We must credit the taxation party with the belief that there is a workable scheme. That being so, let them declare at least its leading points. Otherwise the pursuit of what may be a mere phantom is working incalculable mischief to our greatest national industry, namely, housebuilding, and that, too, in a time of already severe depression.

Ground Rents and Feu-duties.

That Land Value taxation has been propounded mainly for Scotland is fortunate for controversial purposes. For there a perpetual tenure at unalterable ground rents or feu-duties is practically universal. This raises the incidence of a new tax in the simplest form, and readers can apply the arguments with due modification to the more varied English tenures.

In valuable central streets the feu-duties being old are often nominal and rarely more than trifling in amount. As sources of revenue or sharers of the burden of taxation these old feu-duties may be disregarded. In the suburban districts of the larger towns the original feu-duties imposed by the landowners amount to from £30 to £150 per acre, and on the outskirts of the smaller towns from £5 to £30. The feu-duties of the intermediate areas may be taken as roughly graduated between the low old central and the higher new suburban duties. When flats or rows of houses are built, it is usual, as in the case of ground rents, to place on each house an improved feu-duty averaging throughout the suburbs about one-seventh of the rent. As many of these as are necessary to meet the original feu-duty of the site are handed over to the landowner, and the remainder are the property of the builder. He usually sells them to Trustees, Insurance Companies, Charitable Institutions, and the like, at rates which were as high as 33 years' purchase at the end of last century, but which have now fallen to about 23 years' purchase. In view of the slow rate at which the ample areas of ground offered for building around our towns are being taken up, and in view of the general fall in value of suburban property, it is plain that suburban feu-duties represent the full value—or more—of the land on which they are imposed. That the trifling feu-duties of those long-settled central districts do not represent the land value is equally clear. There are cases where the value of a city property amounts to six or more times the cost or value of the buildings on it. In such cases the remaining five-sixths may, for present purposes, be admitted as Land Value. Computing this annual land value by the Glasgow Bill's method, the result may equal or exceed the rental of such properties as are not fully developed, but will fall considerably short of the rental of those that are so developed.

Probable Sum of the New Value.

Our new ratable value will therefore be suburbs and areas without what might be called a commercial value, one-seventh of the old, and central and commercial areas anything between one-seventh and—let us say, five-sixths of the old value.

Having arrived as best we can at our new ratable value, the problem of its taxation follows. Until an official valuation is made the question is quite open, ministerial declarations notwithstanding. We may lay on Land Value the whole rates, an additional rate, or an additional rate on owners only. The writer believes that the first method will prove impossible, and the others productive mainly of trouble. His excuse for entering on their discussion at all is the danger to all classes in the persistence in a difficult question of economic change, of a body of reformers who seem to be more distinguished for political zeal than for practical instinct in the probable incidence of their scheme. So far as can be seen at present, "the whole rates" are as likely to be attempted as a partial rate. The latter will be touched briefly and the "whole rates" will be argued from mainly, as giving the broadest view of the matter.

The over-all ratable value of each town will then naturally depend on the proportion of centre to suburbs. Facts being meanwhile out of our reach, we can only guess that the limited central areas will not raise the general average to more than one-sixth of the old value.

Effect in Principal Streets.

Now if the ratable value is reduced to a sixth, the rates are naturally multiplied by six. The present rates in Edinburgh including Burgh Assessment, Water (which is on Rental), and Poor and Education rates, allowing for the fact that the latter is charged on four-fifths of the rent only, amount on commercial properties to about 4s. 10½d. in the £. The owner's share is about 1s. 10½d. and the occupant pays the remaining 3s. The unhappy ratepayer who owns and occupies—say, a central shop, will thus be charged 29s. 6d. in the £. Supposing his Land Value to be only two-thirds of his old assessed rent, he will be required to pay a sum equal to nearly 20s. in the £ on the latter. Readers who are ratepayers in valuable central positions in more highly rated towns can apply the figures to their own cases and make the woeful calculation for themselves. While the owners and occupiers of the principal central streets are flying for shelter to side streets or the Bankruptcy Court, the owners of suburban properties will be passing the burden on to the owners of the whole land value in their case—the holders of the feu-duties, and enjoying complete relief from taxation. The occupiers here will also pay under the Select Committee's Scheme a rate six times higher than of old, but on a basis of only one-seventh of the former value. In other words, they will pay a little less.

We can almost hear the reformer exclaim —"Impossible, a 30s. rate can never be imposed." "Impossible," for the reasons stated by the Lord Chancellor we hasten to admit; retorting however, "the result of the basis selected by you in apparent ignorance of its 'impossible' smallness."

Effacement of Land Values.

If the rates were laid on Land Values in Edinburgh the owner would pay 11s. 6d. and the occupier 18s. in the £. This seems sufficient to efface the land value. 11s. 6d. leaves a balance, but the rates of which it is a part are always rising. The more than "willing seller" would look in vain for the "willing buyer," who, knowing that he could not find "willing" tenants to pay their rates of 18s., would transfer his willing buying to some form of property more liquid than land and buildings. If by any chance some marketable Land Value were left here, in towns more highly rated it would be utterly effaced. The community would have appropriated more than half of the annual value, and wasted or suppressed the remainder. No tax on annual value of land can appropriate capital value because it is open to the Government to abolish the tax. Land nationalization once effected would probably endure for all time. But an experiment in taxation is liable to repeal and change. Therefore capital value in land effaced in whole or part by an annual tax would lie dormant merely, to revive in more favourable times. Rates such as these, or sufficient to obliterate the annual land value could only be collected for one year. In the second year no capital value could be returned from which to compute a basis for the tax. The Select Committee's scheme seems intrinsically impotent and self-destructive. Yet potent enough in mischief in its mere discussion by responsible politicians.

A City Example.

The mere valuation of town sites presents difficulties. Taking the case of a fully developed central property of the admitted value of £20,000, the buildings being capable of erection for £4,000, a presumable land value of £16,000 is left. Then the property next door may consist of a site of identical dimensions, containing smaller and older buildings producing only half the rent of the first example. Considering the possibility of future development the value may be as high as £16,000, while the buildings are worth only £2,500. The presumable land value is, of course, in this case, £13,500. The rent of the first property would be about £800 and the second about £400. As the new value is to be that of the land divested of building and certain other improvements, the value of the two sites must for rating purposes be the same. Supposing this mild difference to be adjusted and a land value of £15,000 placed on each, the resulting annual value will be £600. To the apparent inequity of taxing one owner on a sum lower, and another on a sum higher than his rental, the reformers reply that the owner of the less developed property will be forced to develop it to the full extent in order to secure a revenue out of which to meet the tax. They forget that he cannot do this without loss unless there is a market for the additional accommodation, and that even in prosperous times there is no sufficient market to utilize an instant and wholesale building of our streets up to the height limit. Regarding the occupier, this £600 value as a measure of his ability to pay would be a wild shot in the dark. Rent, while it may not measure his profits, does measure his opportunities. The occupier is a party to the rent, but he has no such interest in the Land Value, which measures a comparatively intangible and fluctuating element in another man's property.

Unbuilt Land.

With regard to unbuilt land on the outskirts of our towns, let us consider an average case. A landowner sets aside one hundred acres of land as ripe for building. He has plans of roads and drains prepared, fixes a feu-duty of, say, £50 per acre, and succeeds for a few years of brisk speculation in getting rid of his land at that price to the extent of about five acres per annum. Then a period of depression such as the present time sets in when for years he disposes of little, or no, land at all. Meanwhile he is getting for the unfeued balance an agricultural rent of £3 per acre. No doubt the rating authorities in consideration of the time that must elapse before the unbuilt land can be fued will accept a valuation based on something between £3 and £50—let us say the average, £26 10s. per acre. The high rate that must follow will, to put it mildly, be uncollectable on a revenue of £3. But the landowner will attempt to sell his land rather than feu it and hold in exchange heavily taxed feu-duties. If he succeeds he will walk off with the land value, free and unscathed by this remarkable legislative effort, leaving the tax on the man who has paid that value. Builders of houses in the outskirts of our towns do not—with the rarest exception, pay down the price of the land. They prefer to take it burdened by an annual charge which represents the price. Their finances are based on this custom, and the buyers of their houses find the same system convenient. If owners offer the land for sale only, which so far as we have means to judge, they must, the condition of suburban house-building will be one of paralysis till a new generation adjusts itself to the change. As suburban sites hitherto have been neither bought nor sold there cannot be an actual buyer to serve as a model for the "willing buyer." The latter gentleman must be less than a counterfeit, he must be a mere invention. The value of a built site may be hypothetical in some degree, and more so if a special tax of unknown amount is impending on it. Some value has, however, been demonstrated by a successful development. Our undeveloped site has all its troubles before it. The value is potential and dependent on what the future brings forth; surely a speculative basis on which to place the town's revenue.

The "Willing Buyer" and the "Willing Seller."

The owner of developed sites also, is with us always, waiting to be taxed and to be clothed in the Glasgow Bill's character—the "willing seller," but where is the "willing buyer" in this case? He was here yesterday, he is not here to-day, he may be here again to-morrow, or he may never return. When the valuation is being made we may be sure he will be invisible. He must generally be a mere bogey; an artificial semblance of a willing buyer rigged up by the municipal party to the controversy to uphold their their views.

Land Values Already Taxed.

The fact that land values are already taxed in the case of built land is no longer questioned. Two properties identical in every other respect may be situated in an obscure and a popular street respectively. The higher rental that the latter is rated on can only be accounted for by the popularity of value of the site.

If a tax could be limited to a rate that would leave a land value worth holding and worth taxing; and if the fear of future increase could be allayed,—which are large suppositions—a share of the land value of suburban and unbuilt ground would, doubtless, be secured by a tax. But the tax, if laid on commercial centres, would generally hit the wrong man. The most valuable streets in a town are nearly always the oldest, and the value has been growing more or less steadily since the end of the Napoleonic Wars. That is nearly a century ago, and commercial properties have, on the average, changed hands many times since. Each vendor has presumably walked off with a share of the increment. In cases, however, a present-day owner may be enjoying the whole increase. Perhaps only yesterday one such fortunate sold what had descended to him unburdened from his great-grandfather and secured the land value, or—if you like—the unearned increment in cash. Here we have two men, the buyer and the seller. One, the buyer, has paid out the land value. The other, the seller, has the land value in his pocket. Down comes the tax,—on which? On him of the empty pocket! Fresh students of the question will gasp in amazement; but this is a sober fact, inherent in the scheme no matter how the new rate is divided or limited. Every present owner who has paid for his property will suffer this inequity in a degree proportionate to the date of his purchase. Reformers may urge that the present rates remain with the buyer. The buyer, however, knows this and discounts it in the price, but the recent buyer did not know that a tax—of crushing amount in central areas—was about to descend on him, based on a value which he had parted with to another man.

Will Aggravate Over-crowding.

With unbuilt ground taxed at the same rate as the sites of the neighbouring buildings, projectors of new building schemes will be unable to provide for open spaces or reasonably large gardens. Similarly, owners of open spaces devoted to recreation will be forced—as the reformers say—to develop their land to its full capabilities. Such grounds are often in central situations, and even a moderate supplementary tax will force the occupants out; and the owners to cover the ground with buildings in order to secure the means of paying the tax. The evils of overcrowding would become aggravated in centres and suburbs alike.

Excepting that of the most valuable central streets, we have seen that the holders of the feu-duties and ground rents are the owners of practically all the remaining land values. As they must own by far the greater part of the total land value of any modern town, it follows that the proposed tax would not be a Land Value tax at all unless it included them. The first slice out of the Land Value goes to the holder of the feu-duty or ground rent; the second slice goes, under the name of interest, to the bondholders when the property is burdened; and the remainder to the feuar or owner, lease-holder, or responsible incumbent, whatever his tenure may be. The only point on which the members of the reforming party are in agreement, is that they will tax the third party—the owner perhaps of a mere contingent balance. For the reason just stated they cannot avoid when details are considered, bringing the owner of the first slice in. That being so, how can the owner of the intermediate share hope to escape? If Land Value equals a sixth of Rental Value, and if feu duties are the greater part of land value, to omit them would reduce the new rating value to a still more minute fraction of the old, futile as a basis for taxation.

The ten per cent. supplementary tax, proposed by the "Glasgow Bill," levied on a basis so small as Land Value would have but a trifling yield in the shape of new municipal revenue. It would work mischief, however, out of all proportion to its yield, and far in excess of ten per cent., because of the establishment of the principle of municipal appropriation of the Land Value, and a consequent fear of a future increase of the rate. Supplementary rates rising higher than 10 per cent. would rapidly approximate to the effect of the substitutionary rate for the same reason and long before 100 per cent. was reached bonds would be called up, owners would rush to sell, and in a panic-striken market prices would be such as to produce a wholesale smash in our commercial centres.

Could Only be Effected Here by Land Nationalisation.

Taxation on Land Value may be applicable to a newly settled country. For starting from early prairie values and taxing any subsequent increment the community would grow up with its customs adjusted to conditions which prevented speculation or investment in land. In our own land such a condition could only be reached after a property revolution, when a new generation had adjusted itself to the new order of things. This revolution would surely be produced in the towns by any considerable tax of this nature, and we would be faced by an intermediate stage of financial and industrial collapse. To carry out the reform without incurring this calamity would require a scheme of Land Nationalization or Municipalisation under which liabilities were assumed when assets were appropriated.

The political position of the question is confused enough, but this seems plain—that those who pay rates on high city rentals would pay still more, and those who pay rates on low suburban rentals would pay something less. This aggravation of existing inequalities will hold, whether the tax be substitutionary or supplementary.

Taxation in Proportion to Revenue.

Although an occasional impost such as Death Duties, may be reasonably laid on capital, an annual tax on that basis could only be permanently productive if it did not exceed the amount of the revenue. Land valuation will often place a considerable value on property which yields no considerable revenue, and as payment of the tax will be accepted in currency only, the result must be, for the authority, bad debts; and for the owner, disaster. We have no source from which to pay an annual tax, but revenue, profit, or income, and a rating reform that does not adjust the taxes more accurately to these is an aggravation of present evils and indeed cannot be permanently productive.

While to crush out the landowner may be right or wrong, it is at least a definite political and social policy, but it does not seem to be a sane policy from any point of view to free one class from contribution to the rates altogether which a substitutionary tax, if it could be worked at all, would do.

Land Value Too Fluctuating.

Though profit would be a fairer basis, Rent is a fairly stable payment in hard cash, which the tax-gatherer can lay hold of. Land Value is in comparison a delicate fluid element growing or dwindling with each breath of prosperity or adversity; translatable into cash only in a favourable market, liable to vanish if threatened, and too elusive for fruitful tax-gathering.

A PORTABLE SCAFFOLD—BELGIAN STYLE.

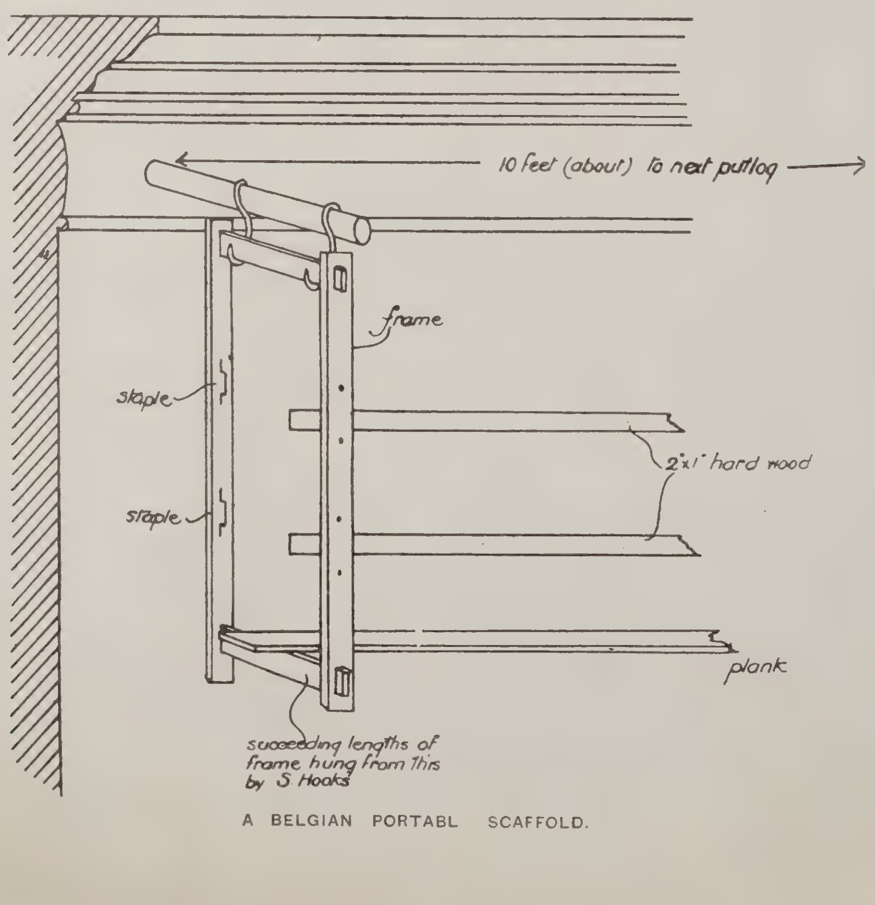
During a recent visit to Brussels the writer saw a type of portable scaffold which appeared to be generally used in painting stuccoed houses. It may be new to some of our readers.

No long ladders are used; probably they are not permitted. Holes are provided in the frieze below the cornice, or, where there is no cornice, about 5ft. below the coping. These holes are situated about 10ft. apart, and are covered when not in use by portable pateras of a more or less ornamental character, according to the design of the house. When painting is to be done, the pateras are removed, and putlogs are inserted and secured in the interior of the roof and left projecting about 4ft. From each of these putlogs is hung a frame about 1ft. 6ins. wide, with sides of about 2½ins. by 1½ins., and having two cross-pieces of similar scantling, one at each end.

The ends of the cross-pieces are rebated to form a tenon, passed through holes cut in the sides and secured by small cotterlike wedges. The frame is hung on the putlog by light iron S-hooks, and secured as well by a lashing to prevent slipping off at the ends. Bolted to the inner sides of the frame are four light iron staples, about 2½ins. by 1½in. inside measure, two on each side. These are for the purpose of receiving light hardwood laths to serve as guard rails, whether a workman is working in a seated or in a upright position. The bottom rail carries an ordinary painter's scaffolding plank and to it hooked by S-hooks a further frame or frames to any required length. The frames are made in several sizes; the smallest (indicated in the accompanying sketch) is about 5ft. to 6ft. long, and the larger sizes are multiples of this up to about 20ft. in length; the cross rails, of course, recurring about every 6ft. to 6ft., and the staples above each rail in similar relative positions. The sketch gives a rough idea of the arrangement.

Supposing a house front is to be painted, the putlogs, at about every 10ft., each carry a hanging frame or frames, sufficiently long to reach down to first-floor level. All the frames, with their planks, guard rails, and safety ropes, to prevent swaying away from the building, are set up before operations begin. Then a man is allotted to every section on a given level, and the whole front is painted down without having to move a ladder or plank or a section. The lowest storey is done from steps or trestles probably.

The whole arrangement is very light and handy, and easily erected or taken down, and apparently quite as safe as ladders. It has probably been long in use, for every house on a lengthy boulevard appeared to be provided with the necessary holes for putlogs, which, when covered by the pateras, attracted no attention, the pateras entering readily into the general designs of the building. The only part of the arrangement that did not appear very safe was the top plank resting just under the put-log. This had no extension for guard rails, but it would not be difficult to add something suitable for this purpose.



10 feet (about) to next putlog
frame
staple
staple
2"x1" hard wood
plank
succeeding lengths of frame hung from this by S. Hooks

A BELGIAN PORTABL SCAFFOLD.

EMPLOYERS' INSURANCE.

The financial responsibilities of building contractors are now so numerous and so extremely onerous as to be well-nigh intolerable. The ruinous risks they run with respect to accident claims by workmen and by members of the outside public must necessarily be covered by some effective system of insurance if the contractor is to be freed from a perpetual burden of apprehension and anxiety. The only question that arises is as to the choice of the medium of insurance. A solution of that difficulty is supplied by the Federated Employers' Insurance Association, Ltd., whose head offices are at 8, King Street, Manchester. This association has been founded by builders for the benefit of builders, and its directors are all well-known building contractors of high standing. The capital is £100,000, of which more than £53,000 has been subscribed. The liability of employers for accidents to workmen, and for accidents to the outside public, form, of course, special features of the association's transactions; but it also undertakes insurance against fire, damage to plate glass, and other risks. Moreover, it offers guarantees for the due performance of contracts in cases in which sureties are required. Then, unlike our somewhat lopsided legislative enactments, it does not tacitly and callously assume that the master-builder himself runs no risk of personal injury. On the contrary, it realises that he is vulnerable and mortal, and offers a policy which, applicable to building trades employers only, provides compensation for all accidents and all illnesses. From time to time, speakers at meetings of the various associations affiliated to the National Federation have testified in particular to a most inestimable feature of the transactions of the Federated Employers' Insurance Association—its practice of prompt settlement. We have therefore much pleasure in drawing attention to the special advantages which the association set forth in the advertisement pages of our present issue.

Builders' Notes.

The Crown authorities will shortly have to decide upon designs for the rebuilding of much of the property in and about Regent Street. The Westminster City Council are desirous of widening the entrance to Argyll Place; and widening Foubert's Place but the cost of the land is prohibitive unless the Crown authorities are willing to make a deduction in view of the general improvement.

* * *

Mr. Maclean, M.P., intends to reintroduce the Leasehold Enfranchisement Bill at an early date. The Bill empowers the lessee of a long leasehold to compulsorily acquire the freehold, or, alternatively, requires that the ground rent should be transmitted into rent in perpetuity. All this is to be done on an equitable market price, which is to be settled by arbitration. It is believed that the principle of the Bill will have a most beneficial effect in encouraging development and building.

* * *

The Westminster City Council will, it is expected, be shortly negotiating further with the "Bakerloo" Railway Co. for a new passenger subway from the Trafalgar Square Station to the south side of Charing Cross. The City Council is asking for a lump sum towards the cost of the work, which involves the removal and rebuilding of some existing structures.

* * *

The half-yearly meeting of the Executive of the Scottish Building Trades' Federation was held in the North British Hotel, Perth, on April 23rd. Delegates were present from Aberdeen, Dundee, Inverness, Perth, Kilmarnock, and Edinburgh. Mr. James Leslie, Aberdeen, presided. The secretary, Mr. James Cameron, solicitor, Edinburgh, submitted reports on the state of trade in Coatbridge, Perth, Dundee, Inverness, Paisley, Glasgow, Kilmarnock, Aberdeen, and Edinburgh and Leith, and without exception they showed trade to be in a depressed state, but there are signs of an improvement taking place in some quarters. A proposal was brought forward to adopt a national crest for the Scottish Federation. A sketch was submitted by the secretary, and unanimously approved, and the matter will come up for final confirmation at the general meeting, which falls to be held in Inverness on 3rd September next.

* * *

The annual dinner of the Newcastle and District Clerks of Works and Builders' Foremen's Association was held on the 23rd ult., in the Continental Restaurant, Newcastle. Mr. George Bennison, the chairman, proposed the toast of "The Building Trades of Newcastle and District." He said that last year he had made allusion to the depressed state of the building trade, and expressed the feeling then that it could not be worse. He was sorry to say, however, that it had turned out to be even worse this year. Contracts were very scarce, and prices were so low that contractors could not get a job at a fair price. The prices were lower than they were a year ago, and he regretted to say that he could not see any immediate prospect in the building trade. Nothwithstanding the low prices there were the provisional items and P.C. sums, which were such a bone of contention, and these were matters that should be taken up. They were well worthy of mutual consideration, and it was a great pity they were creeping into contracts so much as they were. Mr. D. Purdie in responding alluded to the Association as a buffer state between the master builder, the architect, and the client, and said that by their lectures and meetings the Association was an educational force. If the master builders and the architects would only recognise this more fully there would be greater support from the master builders and the architects, both at the lectures and the social gatherings.

* * *

The contract for the great railway to be made across the Andes from Arica in Chile to La Paz in Bolivia, attaining an elevation of upwards of 12,000ft., and having a length of a little over 300 miles, has been given to Messrs. Sir John Jackson, Ltd. It is understood that the actual money voted for the scheme is £3,000,000. Sir John Jackson states that the line will undoubtedly be the highest in the world. The first fifty to sixty miles will be across a desert, and the first business will be to provide a complete system of water supply over that distance. The next fifty miles will be through the Andes. The last two hundred miles will be over the high tableland upon which La Paz, the highest city in the world, is built. Beyond this are the higher ranges of the Andes. At present the only means of transit to the coast is by mule trains, in which two mules have to carry fodder and water for every baggage-carrying mule.

* * *

The Auctioneers' Institute has addressed a memorial to the president of the Local Government Board on the subject of the Housing and Town Planning Bill, strongly objecting to the measure, which will, in its present form, operate inequitably, harshly and disastrously upon owners of property and ratepayers. They urge that it tends towards the destruction of representative local government, and towards bureaucratic government, that it is a coercive measure, that it makes no provision for the broadening of the basis of assessment for the purpose of poor and other local rates, notwithstanding that land and buildings are seriously overburdened already with rates and taxes, and if the Bill becomes law local burdens will be greatly increased; that it proposes to make serious alterations in the law relating to landlord and tenant, and the proposed innovations are in many respects inequitable, and contrary to public policy, while no provision is made for the re-housing of the thousands of undesirable tenants who will be displaced by the contemplated municipal improvement schemes. They deal with the various clauses, and submit that many require drastic alteration, and that some should be deleted.

* * *

At a meeting of wholesale and builders' ironmongers in the N.W., W., and N.E. districts of London, held on April 23rd, it was decided to cease price cutting in respect of a number of articles. It was agreed to draw up a tentative price list of certain goods for a six months' trial from June 1st next. We learn, from "The Ironmonger" that this list contains the following specific articles:—Rainwater goods, soil pipes and underground drainpipes, galvanised furnace pans, manhole covers, cut nails, cast cased portable coppers, galvanised iron cisterns and tanks, hot-water tanks, japanned roll-edge baths, porcelain baths (ordinary builders' qualities), water-waste preventers, builders' closets, and New River plumbers' brassfoundry. S.A.C. ranges were also included, and ordinary portable ranges up to 36in., but we understand that the proposal to include Larbert's ranges is left on the "optional" list. The suggestion that the list might be augmented by the inclusion of such articles as lead and pipes, sinks, felt, corrugated iron, and zinc was not adopted, as it was thought that, if the scheme was reasonably successful, it would better to include additional articles in the list which would be due on January next. It is proposed that the new prices shall be incorporated in the net pocket lists issued by the interested firms, and that the prices shall rule in all ordinary transactions, such as sales over the counter, small orders by post, and so on; but that they shall not be binding for large quantities, or where competition is encountered from outside the area. One of the builders' merchants present agreed to act as hon. secretary for the time being, and, if the state of business should render such a step necessary, another meeting will be called before the time comes to consider the December list.

Proposed New Buildings.

In London.

Following is a selection from the list of new works to which the Building Act Committees of the London County Council recommended the consent of the Council at its meeting yesterday:—

Rebuilding of the Trinity Presbyterian Church, abutting upon Buck Street, Kentish Town Road and Union Terrace, St. Pancras, on the application of Messrs. G. Lethbridge and the trustees.

Erection of a building on the northern side of Church Lane, Tooting, on the application of Mr. A. G. Hastilow, on behalf of Mr. R. Cox.

Erection of buildings on the western side of Hertford Road, Hackney, northward of the De Beauvoir Mission Hall, on the application of Messrs. Gordon, Wilson and Co., on behalf of Messrs. Willey and Co.

Erection of buildings on the northern side of Wyatt Park Road, Wandsworth, to abut also upon the western side of Daysbrook Road, on the application of Messrs. J. S. Quilter and Son, on behalf of Messrs. Chapple and Utting.

Erection of buildings on the eastern side of Berner Street, St. George-in-the-East, at less than the prescribed distance from the centre of the roadway of the street, on the application of Mr. H. T. Bromley, on behalf of the executors of the late T. P. Priestley.

Erection of a house on the southern side of Troughton Road, Greenwich, with its flank abutting upon Rathmore Street, and the erection of four houses on the southern side of Troughton Road, eastward of Rathmore Street, with irregular open spaces at the rear, on the application of Messrs. J. Davey and Co., on behalf of Mr. R. G. Abbott.

Erection of a building on the northern side of King's Road, Chelsea, westward of Upper Manor Street, with an irregular open space at the rear, on the application of Mr. R. Blomfield, on behalf of the London and County Banking Company.

Erection of a building upon the site of Nos. 1, 2, 3, and 4, Spur Street, Leicester Square, on the application of Messrs. Treadwell and Martin, on behalf of Messrs. G. E. Wallis and Sons.

Erection of an addition to block D at the premises of Messrs. Garton, Hill and Co., York Place, York Road, Battersea, whereby each division of such block will exceed in extent 250,000 cubic feet, and be used only for the purposes of the manufacture of saccharine and glucose, on the application of Messrs. Garton, Hill and Co.

Erection of a pump-house at the Grove Road generating station, approached out of the north-eastern side of Grove Road, St. Marylebone, on the application of Mr. C. Stanley Peach, on behalf of the Central Electric Supply Company, Limited.

Erection of buildings on the site of Nos. 117, 118, 119, 120, 121, 122, 123, and 123a, Grange Road, Bermondsey, on the application of Messrs. G. Elkington and Son.

Erection of a library building between Nos. 114 and 120, New Cross Road, Deptford, on the application of Mr. J. Sutcliffe, on behalf of the Deptford Metropolitan Borough Council.

Rebuilding of Nos. 482 and 484, Fulham Road, Fulham, on the application of Mr. G. A. Gale.

Erection of a mission hall building on the eastern side of Mitcham Road, Tooting, to abut also upon the northern side of Longmead Road, on the application of Messrs. Gelder and Kitchen, on behalf of the trustees of the Tooting Wesleyan Mission.

Erection of buildings on a site on the eastern side of Herbert Road, Woolwich, to abut also upon the southern side of Plumstead Common Road, on the application of Mr. J. Rush Dixon, on behalf of the Woolwich Metropolitan Borough Council.

Erection of a building on the eastern side of Old Ford Road, Poplar, on the application of Mr. H. Heckford, on behalf of the Poplar Metropolitan Borough Council.

Erection of a one-storey addition to Red House School, Love Lane, Bromley-by-Bow, on the application of Messrs. Holman and Goodrham, on behalf of the Rev. E. Sinker, M.A.

Erection of a building to abut upon Dean's Mews, Cavendish Square, St. Marylebone, on the application of Mr. W. Hearn, on behalf of the Belsize Motors London Agency, Limited.

Certain deviations from plan for the proposed rebuilding of Nos. 185 and 186, Sloan Street, Chelsea, on the application of Mr. J. P. Briggs.

Deviation from the plans approved on December 21, 1908, for the erection of a building upon the site of Nos. 71, 72, and 73, St. James Street, and Nos. 1, 2, 3, 4, 5, and 6, Little St. James Street, Strand, so far as relates to the omission of the staircase between the fourth and fifth floors, and the provision in lieu thereof of a staircase in the north-eastern open space, on the application of Messrs. W. Woodward and Sons.

Erection of a fitting shop at the Poplar Metropolitan Borough Council's electricity works on the northern side of Yeo Street, Poplar, to abut upon the western side of Violet Road, on the application of Messrs. Nicholls and Reynolds, on behalf of the Poplar Metropolitan Borough Council.

Erection at the premises of the National Motor Cab Company, Barlby Road, Kensington, of two blocks of buildings, each to exceed in extent 250,000 cubic feet, and to be used only for the purposes of a garage for motor cabs, on the application of Mr. E. Keynes Purchase, on behalf of the National Motor Cab Company.

Erection at the premises of Lewis and Allenby, Limited, abutting upon Regent Street, Conduit Street, and New Burlington Place, St. George, Hanover Square, of a division next to Regent Street, to exceed in extent 250,000 cubic feet, and to be used in part as shops, showrooms and workrooms, and in part as offices, on the application of Mr. F. T. Verity, on behalf of Lewis and Allenby, Limited.

In the Provinces.

BIRMINGHAM.—A L.G. Board enquiry will be held to-day (Wednesday) at the Council House into an application by the City Council to borrow £4,200 to purchase a site for a police station in Allison Street.

BRIDGWATER.—A L.G. Board inquiry has been held into the application of the Town Council to borrow £8,500 for alterations and additions to the Municipal Buildings.

LLANDRINDOD WELLS.—A L.G. Board inquiry has been held into the application of the U.D. Council for a loan of £10,000 for a pavilion, to be erected in the Recreation Ground. Mr. R. Wellings Thomas, F.R.I.B.A., of Llandrindod Wells has prepared the plans in conjunction with Mr. W. A. Millward, the Council's surveyor.

SCUNTHORPE.—A L.G. Board enquiry has been held respecting a loan of £5,000 to the District Council for building an additional gasholder.

SWANSEA.—A new docks exchange and offices are to be erected at a cost of £15,000, in Cambrian Place.

WHITLEY BAY.—Plans for a new skating rink, having an area of about 250 square yards, were deposited on Monday last. The new rink is to be constructed on the Rockcliffe estate and the architects are Messrs. T. K. White and S. J. Stephenson, of 59, Grey Street, Newcastle-on-Tyne.

Buildings in Progress and Completed.

ABOYNE.—Under the supervision of Fryers and Penman, architects, of Largs, N.B., William Morris and Company (Ruskin House), Ltd., Westminster, have recently filled the Episcopal Church here with stained glass of the Early XV. Century. The east window is richly decorated with Passion subjects, and the remainder of the windows are made of actual old glass collected by the firm from early English and Continental buildings, and have heraldic and scriptural features introduced, acquired at the recent sale of the Brackenridge Collection of Ancient Glass. The church was erected by George Coats, Esq., of Glen Tanar.

DERBY.—The schools in connection with the Institution for the Deaf and Dumb have recently been extended, the architect being Mr. Arthur Eaton, of Derby. The constructional steelwork and fireproof floors were supplied and fixed by Messrs. Homan and Rodgers, Manchester.

BRISTOL.—The tender of Messrs. James Crispin and Sons, engineers, Bristol, of £2,345 for heating and hot water supply apparatus to the new School for the Blind, Southmead, has been accepted, the architects being Messrs. Edmeston and Gabriel, London and Bristol.

SALTBURN-BY-THE-SEA.—The foundation stones of the P.M. church and schools, which occupy a prominent site in the centre of the town, were laid on the 12th ult. The block is designed in late Gothic, freely treated, a bold square tower forming a prominent feature at the corner. The facings are in Huncoat pressed red bricks, and the dressings in grey terra-cotta with dragged face. The joinery is to be executed in pitch-pine; pulpit, choir fronts, etc., in oak. The accommodation provided in the church is for 500 persons all on ground floor. The contract has been let to Mr. J. G. Porteous, of Guisborough, Yorks, and amounts to £4,300, the architects are Messrs. George Baines and Son, 5, Clements Inn, Strand, London, W.C.

Memoranda.

Mr. J. S. Gibson, vice-president R.I.B.A., has taken into partnership Mr. F. P. Skipwith and Mr. W. S. A. Gordon, and their business will be carried on under the name of J. S. Gibson, Skipwith and Gordon, architects, at 5, Old Bond Street, W.

The partnership between Messrs. Lennox, Robertson and E. C. Morgan Willmott, A.R.I.B.A., of 20, Working Street, Cardiff, has been dissolved. Mr. Willmott's new address is 295, Mary Street, Cardiff.

* * *

The name of the architect of the house at Woking illustrated on page 363 of our issue of April 21st, should have been given as Mr. Edward A. Verger, of Woking.

* * *

Messrs. R. Waygood and Co., Ltd., of Falmouth Road, S.E., who are lift makers by royal warrant to his Majesty King Edward VII., intimate that they have been commissioned to supply an electric passenger lift for the President of the Brazils, and have also received the order for a hydraulic passenger lift for the Turkish Houses of Parliament.

* * *

Messrs. Parry, Blake and Parry, of 82, Victoria Street, Westminster, have reason to congratulate themselves on the result of the recent Surveyors' Institution examination, 240, of their pupils being successful, nearly all the candidates prepared by them. Of the seven prizes awarded, six were taken by pupils of this firm, viz., the Institution prize, Special prize, Beadel prize, Penfold gold medal, Crawter prize, and Galsworthy prize.

Trade and Craft.

Messrs. Young and Marten's Expansion.

Messrs. Young and Marten, Ltd., Caledonian Works, Stratford, London, E., have opened extensive new showrooms at the junction of the main roads to Cambridge and Colchester at Stratford, E. A dome, a cantilevered clock, and a representation in mosaic work of the firm's auspicious emblem, the Rising Sun, are outstanding features of the imposing new premises at "Young and Marten's Corner."

Young and Marten's vast showrooms really constitute a permanent building exhibition of comprehensive character, comprising every article that architect can specify or builder buy. Elaborate racking spaces on each side of corridors running at right angles to the long counter ensure the execution of orders. The following departments are now housed in one building: Gas and electric light fittings, bells, cookers, shop-window fittings, and sundries; builders' ironmongery and brasswork; plumbers' and sanitary engineers' goods; colours, varnishes, and decorators' requisites; ranges, chimney-pieces, and mantels; builders' castings of all kinds. In the building immediately opposite can be inspected: paperhangings; window glass and fascias; timber and wood goods; drain pipes, Staffordshire goods, and cement. The value of Messrs. Young and Marten's permanent exhibition of "everything for the builder" is definitely increased by the tasteful manner in which many of the goods are selected and displayed. The baths and lavatories, for instance, are shown in a series of bath-rooms, illustrating various styles of decoration, while the range of closets and appliances, fitted complete with flush-pipes, very materially assist the choice of suitable apparatus.

The paperhanging department is extensive and important. It is housed in newly constructed and well-lighted premises, where "matching" can be accomplished by the natural light that is essential to this delicate process. All the designs shown in the new pattern books are available, and the firm make a special point of very prompt delivery. The firm's extensive railway stores and sidings at Maryland Point will now become the centre for the execution of post orders; the company's London delivery teams are very numerous and extremely well organised; and their motor lorries cover long distances with heavy loads. Many an architect and many a builder has had reason to feel gratefeel for the facilities afforded by these "universal providers" for builders, who assemble and focus, from a wide area, and redistribute over an area that is still wider, extending to the colonies, to India, the West Indies, South America, the Gold Coast, and China, goods of all descriptions that come within the scope of the builders' merchant.

Carron Gas Appliances.

A useful hand-list of gas-heated apparatus for the kitchen has been issued by the Carron Company, whose works are at Carron, Stirlingshire, and who have show-rooms at 15, Upper Thames Street, E.C.; 23, Princes Street, Cavendish Street, W. Cooking and heating apparatus of many types and patterns are shown, and the list affords valuable guidance in the selection of this class of goods.

Congo Roofing and Damp Coursing.

The Barrett Manufacturing Company, Spencer House, Smith Place, London, E.C., have forwarded for notice a list and some samples of their Congo roofing and damp-coursing materials. Congo roofing is made of a strong woollen felt, which is saturated with a special composition that arrests decay and renders the material waterproof and indestructible. It contains no tar, asphalte or rubber, and is unaffected either by water, by the acids of the atmosphere, or by the extremes of temperature. It is manufactured in four thicknesses—half-ply, suitable for sheds and other light structures; one-ply, for farm buildings, for lining walls, ceilings, tunnels, subways, etc., and for other uses in damp-proofing; two-ply, for roofing any class of building, and applicable to chemical works or other buildings subject to acid or alkali fumes, while steam does not injure it; and three-ply, which is good for any class of permanent construction. The material, which is of a uniform pleasant slate-grey colour, and, being elastic and pliable is not affected by vibration, is easy of application, and admirably clear instructions, illustrated by diagrams, are issued by the vendors. The Congo damp-course, which is used extensively for waterproofing foundation walls, is unaffected by gases from the earth, or by contact with lime or cement, and is in no way affected by moisture.

MONTHLY OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

International Building Trades Exhibition.

As announced last month, a visit of about 100 Federation members was made to the above Exhibition, and (as reported in last week's issue of "The Builders' Journal") the party were received by Mr. H. G. Montgomery, M.P., and entertained to tea. Afterwards the president thanked Mr. Montgomery for his invitation, and, the latter having replied, the party proceeded to inspect the very interesting exhibits.

Government Departments and Tendering Without Quantities.

It was reported last month that the War Office had replied to our request that in future, as far as practicable, quantities will be supplied for works of over £500 in value. A reply to the same effect has since been received from H.M. Board of Works, to whom our application was referred by the Postmaster-General.

Comparative Statement of Wages and Hours.

A circular has been sent to the local association, through the Federation, requesting particulars of the current rates of wages and hours for the purpose of the publication of a comparative statement in an early issue of the Journal. Those who have not yet replied are requested to do so immediately.

The Trades Disputes Bill,

which sought to make arbitration compulsory in trade disputes on the application of either party, and to which this Federation offered objections through the Employers' Parliamentary Council, has been dropped.

Housing and Town Planning Bill.

The objections of this Federation to clause 30 of this Bill have been sent to the President of the Local Government Board, and a request preferred that the clause should either be deleted or amended so that where a dwelling is reported as not up to the necessary standard of sanitation or repair and so entered on the quinquennial survey called for by clause 30, it should be open to the owner, on satisfying the surveyors that these defects had been subsequently remedied, to have the fact entered on the public register referred to in sub-section 2 of clause 30. Result is not yet known. Several members, in the debate on the second reading, on April 5th, made objection to the quinquennial survey. The Bill was read a second time, and referred to a Committee of the whole House.

N.A.O.P. Agreement.

A meeting of the joint committee under above agreement was held on April 21st, when various suggestions for the improvement of the agreement were considered, and after a friendly discussion were remitted to a sub-committee to consider and report to a further meeting, to be held probably on May 25th.

Half-yearly Meetings.

In consultation with the Portsmouth Association, the president has fixed Tuesday, July 20th, for the half-yearly Executive Council Meeting, and Wednesday, July 21st, for the general meeting. It is understood that the Mayor of Portsmouth has kindly consented to open our proceedings at the General Meeting and welcome the Federation. He has also granted the free use of the banqueting room at the Town Hall for that day. For the Council Meeting, the Grand Jury Room at the Town Hall has been secured; but, should the banqueting room be free on July 20th, the Mayor has promised to place it at our disposal.

Court of Arbitration.

As the result of correspondence in which it was suggested on behalf of this Federation that it should be represented on the panels to be formed in connection with the above Court, it is stated that "the Board of Trade have endeavoured to obtain the services of well-known and representative employers, and, at present, not those of representatives of particular industries. The Board considers that these representative employers would fully appreciate the interests of the employers' side in any dispute; and in cases in which they are not familiar with the technical details of the industry affected, they have power to appoint technical advisers to advise them. Should, however, the parties to a dispute request the Board to appoint a Court including employers and workpeople from their own industry the Board would give the request their most favourable consideration."

Apprenticeship Form.

The South Wales Federation report having adopted a form of apprenticeship for the use of members. Copies can be had by any part of the Federation at the same price as its own local associations are supplied.

Meetings of the Journal Committee and Administrative Committee were held on April 20th.

The Secretary was appointed to attend a meeting of the International Congress Committee at Brussels on April 26th, and did so. The rules for the proposed International Federation were considered and roughdrafted. They will shortly be submitted to the various Federations for consideration. The secretary also attended the celebration of the twenty-fifth year of the Belgian Builders' and Public Works Contractors' League, which took place on April 24th and 25th. The Journal Committee was re-elected, except that the name of Mr. W. R. Thompson, president of the Yorkshire Federation, was substituted for that of Mr. Nicholson.

Reports from the branches as to the working of the form of contract were considered, and remitted to a sub-committee for further consideration and report, as also a draft Fair Wages Clause. It was decided to again issue the forms calling for a return of membership and men and apprentices employed.

Trade Boards Bill.

Mr. Churchill has consented to receive a deputation from the Employers' Parliamentary Council to urge the objections entertained to certain clauses of the Bill, especially as to the power of extension to other trades than those scheduled in the present Bill.

A. G. WHITE, Secretary.

THE NORTHERN CENTRE OF THE NATIONAL FEDERATION.

COMPOSED OF

The Lancashire, Cheshire and North Wales Federation, The Yorkshire Federation and The Northern Counties Federation.

Secretary: JAMES DENVER, Cromwell Buildings, Blackfriars Street, Manchester

The quarterly meeting of the Northern Centre of the National Federation was held at the boardroom of the National Federation, Bedford Street, London, on Wednesday, April 21st, at 10.30 a.m., when the president (Councillor Stephen Easten, Newcastle-on-Tyne) presided over an attendance of sixteen representatives from the various districts (whose names are recorded in the attendance book) and the secretary.

The minutes of the annual meeting held in London in January were read and confirmed.

Arising out of the minutes, the Yorkshire representatives reported on the case of the York member.

A letter was read from the National Federation *re* the N.A.O.P. agreement, and the action of the secretary thereon confirmed.

It was resolved that the official stationery of the centre should, when reprinted, bear some reference to "The Builders' Journal" as being the sole organ of the Federation.

Some discussion took place on the proposals for amending the National form of contract; but as the National Federation had appointed a committee to fully consider the same, it was resolved to leave the matter in their hands.

Nominations of representatives from the three Federations on the Centre Conciliation Board were reported by the Secretary, and formally confirmed.

This concluded the business.

Northern Centre Conciliation Board.

The annual meeting of the Northern Centre Conciliation Board has been definitely fixed to be held in Leeds on Tuesday, May 18th, at 2.30 p.m. Associations having any matters to bring before the Board should forward the same on to the Employers' Secretary as early as possible for consideration at this meeting.—JAMES DENVER, Employers' Secretary.

THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

Secretary: JOHN TOMLISON, Cromwell Buildings, Blackfriars Street, Manchester.

The monthly meeting of the Administrative Committee of the Lancashire, Cheshire, and North Wales Federation was held at the boardroom, Manchester, on Friday, April 16th, when the President (Mr. William Bullen) presided over an attendance of eleven representatives.

The minutes of the last meeting were read and confirmed and reported upon.

Messrs. William Livesey and Sons, joiners and builders, of Blackburn, were elected to individual membership of the Federation.

In accordance with a resolution of the Executive Board, the committee then proceeded to consider the proposals for amending the rule providing for the election of the Administrative Committee, and after some considerable discussion a draft rule was adopted, for which it was decided to give notice to the local associations.

Proposals for amending the National form of contract from various local associations were then considered, and after debate on the various points raised, it was agreed to forward the same on to the National Federation.

Correspondence was reported between the National Secretary and the War Office and H.M. Office of Works, in which the two departments had agreed to supply quantities for all jobs over a cost of £500 in future "where practicable," and it was agreed to accept the concession.

A very lengthy discussion took place regarding the present state of trade and unremunerative prices, but no formal resolution was passed thereon.

Some correspondence was read which had taken place between the National Secretary and the Rochdale Association regarding the attitude of the latter association to the Conciliation Boards, and the Secretary was instructed how to deal with the same.

A meeting of the Insurance Committee was held on Friday, April 30th, for the purpose of considering the amended proposals of the Federated Employers' Company, but their report is not yet to hand.

The Administrative Committee also met on Monday, April 3rd, to receive counsel's report in the case of a Bolton member, but their report is not yet to hand.

LOCAL ASSOCIATIONS AFFILIATED TO THE LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

ACCRINGTON AND DISTRICT.

Secretary: James Whittaker.

This association having been organised and constituted, Mr. James Whittaker, of Inglewood, Whalley Road, Accrington, has been appointed secretary.

ASHTON-UNDER-LYNE, STALYBRIDGE, AND DISTRICT ASSOCIATION.

Secretary: G. H. Tonge, A.S.A.A.

The annual meeting and dinner of the Ashton, Stalybridge and District Association was held at the Pitt and Nelson Hotel, Ashton-under-Lyne on March 31st. The chair was occupied by Mr. E. Marshall, vice-president, and there was a good attendance of members.

A report of the year's work was read by the secretary, Mr. G. H. Tonge, which was unanimously approved. Amongst the matters referred to in the report were the question of admitting labourers on conciliation boards, and reconsideration of joiners' working rules. Mention was also made of an arrangement which had been made for the admission of plumbers as members of the Association, or the nomination of their own representative. A report was presented of negotiations which had taken place with a view to securing a preference for *bona-fide* builders in the matter of prices for bricks. The meeting approved the action of the executive, and a resolution was passed requesting the committee to continue the negotiations until satisfactory arrangements had been entered into.

The treasurer's report was presented by Mr. Z. Pike and adopted. Arising out of the report, a discussion took place on the question of a contribution to the Federation Reserve Fund, and the matter was referred to the Executive Committee. The officers for the year were elected as follows:—President, Mr. Jas. Storrs; vice-president, Mr. E. Marshall; treasurer, Mr. Z. Pike; who, with the following, form the Executive Committee:—Messrs. J. Saxon, A. Jeffreys, T. Dean, E. Kirkby, J. Shuttleworth, E. Gibson, and G. H. Cook. The members, together with a

number of invited guests, afterwards partook of dinner.

After dinner the usual toasts were honoured.

MANCHESTER, SALFORD, AND DISTRICT ASSOCIATION.

Secretary: J. Tomlison.

The plasterers' and painters' branch of the Manchester, Salford, and District Association held their monthly meeting on Tuesday, March 9th, when Mr. James Higson presided over a good attendance of members. Matters of trade interest were considered, and several resolutions passed thereon.

The monthly meeting of the general committee of the association was held at the boardroom, Blackfriars Street, on Thursday, March 11th, when the president (Mr. George Macfarlane) presided over a well-attended meeting.

Correspondence was read from the National and Lancashire and Cheshire Federations regarding the International Building Trades Exhibition, and the National form of contract, and resolutions were passed thereon.

It was decided to issue again the telephone card to members of the association, and the secretary was instructed to proceed therewith.

The Joiners' Branch met on March 11th for the purpose of considering a communication from the operatives regarding the proposals for alterations to the working rules. It was recommended that the amended overtime, grinding, and discharge rules should come into operation as from May 1st next.

A deputation attended from the Wood-cutting Machinists' Society for a definition of a clause contained in their rules with this association regarding "flat cutting," which was duly given.

Two meetings have been held of the manufacturers of patent plaster partitions, members of the association, regarding the fixing and finishing of their plates, and a resolution has been sent on to the Plasterers' Branch on this subject.

A meeting of the Joint Committee of Joiners, Masons, and Plasterers met on April 1st to receive a report and to discuss one or two points arising out of the notices given to the operatives of each trade for alteration to their working rules.

The Stonemasons' Branch of this association have met on two or three occasions for the purpose of meeting representatives from the Operatives' Society to discuss the proposals for amending the present working rules, but without any decision being arrived at, and the matter will go before the Conciliation Board according to rule.

The monthly meeting of the General Committee was held at the Boardroom on Thursday, April 15th.

A resolution was passed instructing the secretary to write to the secretaries of the National Federation and the Operative Plasterers' National secretary, regarding the N.A.O.P. agreement.

A special general meeting of the association was held the same afternoon for the purpose of electing the employers' representatives on the local Conciliation Board.

Election of the Bricklayers' representatives was postponed, but representatives for the Joiners and Stonemasons were duly elected.

A vote of condolence and sympathy was passed with the wife and family of the late Mr. J. B. Kendall.

The Plasterers' and Painters' Branch held their usual monthly meeting at the Boardroom, on Tuesday afternoon, April 20th, when Mr. James Higson presided over a good attendance of members.

Some discussion took place with reference to the notice given the Operative Plasterers for alterations to the present working rules, and it was ultimately left in the hands of the chairman and secretary to call a special meeting if necessary.

A letter was read from the manufacturers of patent plaster partitions forwarding a resolution with reference to master plasterers being allowed to fix their slabs, and it was resolved that a further joint meeting be held between the branch Committee and the manufacturers on the subject.

A meeting of the Joiners' Committee was held on Monday, April 26th, when a deputation from the Operatives' Society attended to discuss the notice and counter-notice for alterations to rules.

It was ultimately agreed to withdraw the proposals for amending Rule 1; the employers desiring an extension of the winter months, and the operatives desiring similar hours to those at present in force in Liverpool, also an advance in wages of ½d. per hour.

The operatives agreed to submit the proposals of the employers regarding the boundary again to their members, the employers desiring that the radius be two miles from Albert Square, whereas the present radius is taken from the Royal Exchange and various points named.

A very lengthy discussion took place on the subject of walking time or travelling expenses, the operatives claiming that the amounts offered by the employers would not cover their actual out-of-pocket expenses, and suggesting that the amounts be doubled. Ultimately the employers agreed to amend their rates as follows:—From 2 to 3 miles out, 3d. per day; from 3 to 4 miles out, 4d. per day; from 4 to 5 miles out, 5d. per day.

The operatives, after retiring for private consultation, agreed to accept the amended terms, subject to the confirmation of their committees.

It was mutually agreed to accept the old rule with reference to country work.

Some considerable discussion took place on the proposals of the employers for defining the district within which the rules shall apply, which they desired should be a radius of five miles from Albert Square, except where this overlaps some other federated district, when it shall be a matter for mutual arrangement. The operatives submitted a map marked out with their suggested radius, which included some 13 to 15 miles on the Altrincham side; it was agreed that it was a matter that would have to be arranged with the various districts, and it was decided to leave the same in the hands of the president and secretary from both sides.

It was agreed that the revised rules come into operation as from May 1st [instant].

LLANDUDNO AND DISTRICT ASSOCIATION.

Secretary: E. P. Morris.

Several meetings of the Llandudno and District Association have been held in connection with the contract for the new Carnegie Free Library. Plans were prepared, quantities issued, and tenders invited. When the tenders were received it was found that they exceeded the amount the District Council were authorised to spend on the building, with the result that the lowest tenderers were asked to send in amended prices, together with the original bill of quantities priced so that the new tenders could be verified. In view of the official statement that the quantities would not form part of the contract, it was felt that this request was not fair, and that fresh quantities should be issued. This request was acceded to, and the successful contractor was Mr. Edward Owen. Efforts were made to obtain the quantities as part of the contract, but without success; and the condition was accepted under protest, on condition that the R.I.B.A. contract form should be used.

A small sub-committee is considering the question of universal starting time.

The Association intend inviting the local architects to a conference on the question of quantities.

RADCLIFFE, WHITEFIELD, PRESTWICH AND DISTRICT ASSOCIATION.

Secretary: W. Lomax.

A lecture by Mr. H. Burke, on "Reinforced Concrete Construction," was, by invitation of the committee of the Radcliffe and District Association, delivered in the lecture hall of the Public Library, Radcliffe, on March 29th, and was attended by a good number of members and persons interested in the building trade.

Mr. Burke said that while the reinforced concrete system of construction was comparatively new in this country, a vast amount of such work had been and was being done in France, Italy, Germany, Austria, and America; and he had recently read that, in linking New York to Havana, it was found necessary to bridge a tidal way of eleven miles, which was being spanned with 186 arches in reinforced concrete. In our own country, prohibitive by-laws had retarded the extension of the system. The Great Wall of China, and the Roman Pantheon, were cited as early essays towards concrete construction, and in the former case reeds were used as a sort of reinforcement. Modern developments seem to have sprung from the idea, successfully carried into practice by a French gardener, M. Monier, of strengthening tree-pots by embedding wire netting in the clay of which they were made. The principle of reinforcement, the lecturer reminded his hearers, is that the embedded metal takes the tensile and transverse strains; and the aim is to make the metal and the concrete "work together simultaneously and harmoniously." Both theory and practice were illustrated in a series of diagrams and photographic views, comprising in all about fifty slides. Many practical hints on the details of construction were given, and the lecture was followed throughout with close attention.

WIGAN AND DISTRICT ASSOCIATION.

Secretary: R. Hollows, A.C.A., etc.

In connection with the notice and counter-notice of alterations to joiners' working rules, in which the Wigan Association is interested, further meetings have been held since the last report appeared, and amendments and additions to the old working rules have been agreed upon as set out hereunder. The operatives agreed that the following addition to the starting time rule should be made: "Any employer having a shop beyond five miles radius from the Wigan Market Place and taking a job in Wigan and district shall comply with the rules of the Wigan employers. Should any employer require his men to travel by train or tramcar to a job within a three-and-a-half mile radius, the workman on payment of the return fare by the employer shall travel by the car or train leaving the terminus or station at the first time immediately preceding the starting time of work. With respect to the railway train or car, this clause to apply only to those starting within twenty minutes preceding the starting time. With respect to meal hours and starting times for country jobs, a joint agreement between the employers and employees' societies may be made to fall in with the running of the trains."

An addition to the "country jobs" rule, bringing the joiners on a par with the bricklayers, was agreed to as follows: "And should a Wigan employer have a job exceeding three-and-a-half miles from the Wigan Market Place, he shall be at liberty to start men on the job."

It was further agreed that a new rule be made as follows: "No workman shall work for anyone other than a bona-fide employer who has a joiners' shop which is rateable, provided always that this does not apply to a legitimate member of the building trade who provides the material in addition to the labour. No workman to be allowed to systematically do work at night for any outside party."

The piecework and prepared woodwork rule was allowed to remain as at present, and a limitation of apprentices agreed to of one apprentice to two workmen employed on an average of the two preceding years, as a concession for the above new rule.

The rules were signed at a meeting held on Thursday, March 25.

THE YORKSHIRE FEDERATION.

Secretary: J. DAVIDSON, 14, Park Road, Leeds.

LOCAL ASSOCIATIONS AFFILIATED TO THE YORKSHIRE FEDERATION.

BRADFORD ASSOCIATION.

Secretary: J. Davidson.

The monthly meeting of the Bradford Association was held on April 27th. A letter was read from the president stating that he was now recovered from his recent illness, and hoped at an early date to be able again to take an active part in the work of the association. The treasurer presented his monthly report, and urged upon the members the desirability of paying their subscriptions at an early date. The minutes of the Yorkshire Federation were read and approved, and satisfaction was expressed at the successful issue of the case which was recently pending against a York contractor.

It was decided to hold the annual meeting of the Bradford Local Conciliation Board on Tuesday, May 11th, at 7.45 p.m.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

The monthly meeting was held on April 19th, and owing to the unavoidable absence of the president, the vice-president (Mr. O. Mawson) occupied the chair.

A further letter was read from the Leeds and Yorkshire Architectural Society with respect to the preparation of plans by builders.

A committee was appointed to go through the times for winter working hours, submit an amended arrangement to the representatives of the operatives' societies, and ascertain whether they are willing to enter into a mutual arrangement for revision, with a view to the same taking effect next winter.

The date for the annual meeting of the Leeds Conciliation Board was left in the hands of the president and secretary.

Messrs. Mawson and Tomlinson reported that they had, with other members, on the invitation of the Leeds Education Committee, inspected the work carried out at the evening classes in connection with the Technical School. The members were of opinion that every reasonable facility should be granted by employers to apprentices in order that they might have an opportunity of attending the classes, and in this way increase the general standard of efficiency of the skilled artisans in connection with the building trade.

It was resolved to obtain a sufficient number of copies of the Yorkshire Federation Directory to enable one to be supplied to each member.

A discussion took place on the recent acceptance of tenders for school repairs by the Leeds Education Committee.

YORK ASSOCIATION.

Secretary: J. Hague, Solicitor.

An executive meeting of the York Association was held at headquarters on March 2, when several important questions were discussed, and deputations were received from the Operative Joiners and the York Pageant Committee. The latter deputation consisted of Mr. Geo. Wilson and Mr. E. R. Tate, who produced plans and specifications, and enlisted the co-operation of the association in the construction of the various properties required. The whole of the members present expressed their cordial sympathy with the undertaking, and at once undertook to be responsible for the construction of the various thrones, pedestals, and altars required. Mr. George Wilson thanked the members present for their ready and unanimous help, and the deputation withdrew.

The general quarterly meeting was held on March 11th, at headquarters, the Lord Mayor presiding over a good attendance. After the minutes had been read and confirmed, the secretary gave a report on the finances of the annual dinner, and on the new calendar list of members, which was approved.

It was unanimously resolved to forward £20 to the subscription account of the Yorkshire Federation.

The questions of the National form of contract, declaration as to health, and admission of labourers to conciliation board, were duly considered, and in each case the executive's recommendations were approved.

The summer excursion was left over to the executive committee for consideration and report.

The chairman appealed to the members generally to assist in the making of necessary properties for the forthcoming pageant, and to do all they could to promote its success. The secretary was asked to furnish the Pageant Committee with a list of the association members.

THE NORTHERN COUNTIES FEDERATION.

Secretary: W. H. HOPE, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

LOCAL ASSOCIATIONS AFFILIATED TO THE NORTHERN COUNTIES FEDERATION.

MIDDLESBROUGH ASSOCIATION.

Secretary: Walter Rigby.

The monthly meeting of the Middlesbrough and District Association was held in the Grand Hotel, Middlesbrough, on Wednesday, April 7th, at 7.30 p.m.

The president (Mr. W. Masters) presided over a good attendance of members.

The secretary reported that the negative resolution *re* proposed new agreement for use between full contractors and sub-contractors, also the affirmative resolution in reference to desirability of a uniform time for starting work for the different trades connected with building operations, had been forwarded to the Tees-side Federation as requested.

It was reported that the National Association had sold out the supply of apprenticeship indenture forms, and did not intend printing more, as it was thought that the local associations or federations should draw up their own forms to meet local conditions. After some discussion, it was decided to advise Tees-side Federation as follows:—"This Association suggests that this matter be taken up by the Tees-side Association, and that an indenture form be issued by them to the local associations. It is also suggested that the Tees-side form be modelled upon the one now in use issued by the National."

By resolution, the quarterly meeting of the Northern Counties Board of Representatives was fixed for Middlesbrough. It had been decided to hold the meeting on April 15th, at 3 o'clock, at the Grand Hotel.

It was unanimously decided that this association invite the Board to tea after the meeting.

Re the request of the National secretary as to return of comparative statement of hours and wages, it was decided to forward information as required.

The question of a summer outing was brought up, and very favourably received. A suggestion that this might be extended from an association to a federation outing met unanimous support, and the secretary was instructed to forward a resolution to Tees-side Association bringing the matter forward for their consideration.

The following new members were accepted:—Messrs. La Brea Asphalte Co., Newcastle; T. Hunt, Brickworks, Linthorpe.

TYNE AND BLYTH DISTRICT BUILDING TRADES FEDERATION.

W. H. HOPE, Solicitor, Post Office Chambers, 14, Norfolk Street, Sunderland.

TYNE AND BLYTH FEDERATION.

Secretary: W. H. Hope.

At the annual general meeting of the Tyne and Blyth District Federation, which was held at the Hotel Metropole, Newcastle-on-Tyne, on March 30th, Mr. W. T. Weir (Newcastle-on-Tyne) in the chair, there were present representatives from Newcastle-on-Tyne, North Shields, South Shields, and Blyth.

The honorary auditor submitted the audited balance sheet, which had been considered by the Executive Council, who recommended its adoption. On the proposition of Mr. J. T. Armstrong, seconded by Mr. J. C. Hope, the balance sheet was adopted, and Mr. Mabley thanked for his services.

The wage returns received from the local associations, along with the estimated expenditure for the ensuing year, together with the recommendation from the Executive Council, were considered, and, on the proposition of Mr. J. C. Hope, seconded by Mr. J. Pelton, it was resolved:—"That the subscription from the local associations to the Federation for the current year be the same as last year, viz., at the rate of 2s. per £100 wages paid."

The secretary presented his annual report, which dealt with the work of the Federation (and included a report from Mr. Creasor on the work of organisation) for the past year. On the proposition of Mr. W. T. Weir, seconded by Mr. W. Foster, Mr. Hope was thanked, and his report adopted.

Arising out of the report of the work of organisation, on the proposition of Mr. R. Heslop, seconded by Mr. A. Ross, it was unanimously resolved:—"That this meeting recommend to the Executive Council that consideration be given to the remuneration of the organising secretary."

The Executive Council reported that they had elected the following officers for the ensuing year:—As chairman, Mr. W. T. Weir, Howdon-on-Tyne; vice-chairman, Councillor J. T. Armstrong, South Shields; honorary auditor, Mr. W. Mabley, South Shields. The report was received.

The recommendation passed by the Executive Council with respect to the organisation of North Shields Association was placed before the meeting, and, on the proposition of Mr. J. Pelton, seconded by Mr. W. Foster, it was unanimously adopted.

The question of amendment to the National form of contract was considered, and after much discussion it was resolved to recommend to the Northern Counties Federation:—"That Clause 27 as interpreted at present is causing a serious injustice to builders, by depriving them of a proper trade discount, which was never the intention of the parties to the agreement. This clause requires amendment so as to allow a trade discount, and to allow a profit on all goods handled and fixed by the contractor."

A meeting of the Executive Council of the Tyne and Blyth District Federation was held at the Hotel Metropole, Newcastle-on-Tyne, on March 30th, Mr. W. T. Weir (Newcastle-on-Tyne) in the chair, when representatives were present from Newcastle-on-Tyne, South Shields, and Blyth; North Shields being unrepresented.

The minutes of the Council meeting held at Newcastle-on-Tyne on March 16th, which had been printed and circulated among the members, were taken as read.

On the proposition of Mr. W. Foster, seconded by Mr. J. T. Armstrong, Mr. W. T. Weir was unanimously elected chairman. Mr. Weir thanked the members for his election, and said he had pleasure in accepting the honour, and moved a vote of thanks to the retiring chairman, Councillor Stephen Easten, who was unavoidably absent from the meeting. This was given accordingly.

On the proposition of Mr. R. Heslop, seconded by Mr. J. C. Hope, Mr. J. T. Armstrong (South Shields) was unanimously elected vice-chairman. Mr. Armstrong suitably returned thanks for his election.

On the proposition of Mr. J. T. Armstrong, seconded by Mr. J. C. Hope, Mr. William Mabley (South Shields) was unanimously re-elected honorary auditor.

The honorary auditor submitted the audited balance sheet for the past year, and proposed that a recommendation for its adoption be placed before the annual meeting. This was seconded by Mr. R. Heslop and agreed to.

The question of the annual subscription was discussed, along with the wage returns and estimated expenditure for the current year; and on the proposition of Mr. R. Heslop, seconded by Councillor J. T. Armstrong, it was decided to recommend to the annual meeting:—"That the subscription for the current year be the same as last year, viz., at the rate of 2s. per £100 of wages paid to cover the subscription of the local associations to the Northern Counties Federation of Building Trade Employers and the Tyne and Blyth District Federation needs."

The question of organisation was discussed, and it was decided to advise the annual general meeting to recommend to the North Shields Association:—"That the North Shields Association be recommended to appoint two of their members, along with Councillor J. T. Armstrong (South Shields) and the organising secretary, to interview the non-members within the area governed by their Association, explaining the objects of the association and inviting them to join."

THE MIDLAND CENTRE OF THE NATIONAL FEDERATION.

Secretary: F. W. Amphlet, 58, New Street, Birmingham.

LOCAL ASSOCIATIONS AFFILIATED TO THE MIDLAND CENTRE,

BIRMINGHAM ASSOCIATION.

Secretary: E. J. Bigwood, J.P.

A meeting of the Local Conciliation Board was held at the Imperial Hotel, Temple Street, Birmingham, March 26th, Mr. C. H. Barnsley presiding.

Mr. F. G. Whittall (president, Birmingham Building Trades Employers' Association) explained what had taken place at the Conciliation meetings with the various branches of the trades. He pointed out that the points to be decided were:—The ordinary hours of work; the time of commencing overtime; and the desirability of introducing a night-shift rule. With reference to the last item, Mr. Whittall said that the Birmingham Building Trades Employers' Association were quite ready to have a night-shift rule, but that it must be with all trades or not at all.

Mr. Grove (the Bricklayers' Society) explained that a vote was being taken from their members on the employers' proposals, and that as the result of the ballot would not be known till March 29th, he was not in a position to vote.

Mr. Saunders said that the carpenters would agree to the 8 o'clock starting time in the winter months, and overtime after 5 in the summer and 4.30 p.m. in the winter, if the other allied trades agreed.

Mr. Dye (of the Masons' Society) said that if the employers would have a worked-stone rule, the operatives would agree to the 8 a.m. starting time during the winter months.

It was decided that the meeting should be adjourned till March 30th, at 3 p.m.

The adjourned meeting was held at the Imperial Hotel, Temple Street, at the time above mentioned, Mr. C. H. Barnsley again presiding.

The minutes of the meeting held on March 26th having been read, confirmed, and signed, Mr. W. Grove (of the Bricklayers' Society), reported that their members could not agree to the employers' proposals, the voting being 136 for and 440 against.

It was resolved that Rule 2 (Hours of Work) should read as follows:—The ordinary hours of work shall be from 6.30 a.m. to 5 p.m. on each of the first five working days of the week, with one and a half hours per day allowed for meals, but during the winter months the hours of work shall be as under:—October 24th to November 24th inclusive, 7 a.m. to 5 p.m. (with one hour for meals); November 21st to January 29th inclusive, 8 a.m. to 4.30 p.m. (the men to have had breakfast before commencing work, and to have half an hour for dinner); January 30th to February 26th, inclusive, 7 a.m. to 5 p.m. (with one hour for meals).

It was also resolved that Rule 4 (Overtime) shall read as follows:—All overtime made at the request of the employer, after the termination of the ordinary working hours, up to the recommencement of ordinary working hours on the first five working days of the week, and after one o'clock on Saturday up to 12 midnight, also all Bank Holidays, except Good Friday, shall be paid for at the rate of time and a half; but from 12 midnight on Saturday, during Sunday, and Christmas Day, it shall be paid for as double time. Overtime shall not be paid until a full ordinary day has been worked, except in cases over which the workman has no control, or time lost owing to inclement weather.

It was proposed by the Stonemasons that all stonework and patent stones be fixed by masons, except in the case of girder pads or a single head or sill. The above proposition was put to the meeting and defeated.

The employers withdrew their notice of a reduction of masons' fixers' wages.

It was also proposed by the Stonemasons:—"That piecework be not allowed, and no worked stone, or part worked stone, to come into the district from a lower-paid district." The voting on the above matter being equal, under the rules it was referred to the Midland Centre Conciliation Board.

It was proposed and resolved that, pending the settlement of matters now under consideration, the old rules shall apply till May 1st.

The meeting closed with a vote of thanks to Mr. C. H. Barnsley for presiding.

COVENTRY AND DISTRICT ASSOCIATION.

Secretary: W. Ivens.

Members of the Coventry and District Master Builders' Association, to the number of 28, on Wednesday, April 28th, paid a visit to the Building Exhibition at Olympia. The party included the president (Mr. C. Garlick) and the secretary (Mr. Wm. Ivens), and it was generally agreed that the exhibition was the finest of its kind yet seen. A model of a refuse destructor similar to the one proposed to be erected in Coventry, naturally attracted the special attention of the visitors, who, however, were delighted with the Exhibition as a whole.

LEICESTER ASSOCIATION.

Secretary: S. A. Dove.

The monthly meeting of the Council was held on April 28th, at the Saracen's Head Hotel, Leicester, Mr. Yates (president) presiding. Two new members were admitted, bringing the total membership to 137. Mr. Yates reported the meetings held with the Bricklayers', Carpenters' and Bricklayers' Operatives' Committees with reference to alteration of working hours, and he was pleased to say that after some lengthy meetings, also a meeting of the Local Conciliation Board, a settlement had been arrived at with the bricklayers and carpenters. With respect to the labourers' society, a meeting was to be held on May 4th to endeavour to

come to a settlement with that society. The hours of work agreed upon now are as follows:—March 17th to October 16th, 6 a.m. to 5 p.m., 1½ hours meals; October 17th to October 31st, 6.30 a.m. to 5 p.m., 1½ hours meals; March 1st to March 16th, 6.30 a.m. to 5 p.m., 1½ hours meals; November and February, 7.30 a.m. to 4.30 p.m., 1 hour meals; January, 8 a.m. to 4.30 p.m., 1 hour meals; December, 8 a.m. to 4 p.m., 1 hour meals. It was resolved that the other branches connected with the association should meet and consider the advisability of getting uniformity in the working hours as soon as possible.

Mr. W. Foulds was elected a member of the Bricklayers' Committee in place of Mr. F. W. Bowles, resigned.

A matter was brought up with reference to private firms employing operatives in competition with the builders, and it was decided that a special meeting with the branches affected should be held to consider the question.

The half-yearly meetings of the Plumbers' Institute are being held in Leicester this month.

STOURBRIDGE AND DISTRICT ASSOCIATION.

Secretary—Percival D. Folkes, Chartered Accountant.

The annual dinner of the Stourbridge Association was held at Stourbridge on March 23rd. A good attendance included Mr. C. Griffiths (president), Mr. T. J. Mason (vice-president), Councillor H. Smith (president of the Midland Centre), Mr. F. G. Whittall (president of the Birmingham Association), Mr. J. Bott (president of the West Bromwich Association), Mr. F. W. Amphlet (secretary of the Midland Centre), and Mr. P. D. Folkes (secretary of the Stourbridge Association).

The toast of "The National Federation" was proposed by Mr. J. H. Walker, and responded to by Councillor H. Smith and Mr. Fred. W. Amphlet. "The Stourbridge Branch" was proposed by Mr. F. G. Whittall, who spoke of the advantage the intertrading rule had been to those associations that had adopted it. Mr. C. Griffiths responded.

The toasts of the "Allied Trades" and the "Visitors" were also given.

THE SOUTH-WESTERN CENTRE OF THE NATIONAL FEDERATION.

BATH ASSOCIATION.

Secretary: E. J. B. Mercer.

The quarterly general meeting of the Bath Association was held at headquarters, "The Red House," on March 3rd, when Mr. Frank B. Parsons (president) presided over a fair muster of the larger employers. Amongst those were Mr. G. Hayward (vice-president), S. Ambrose, F. J. Blackmore, and A. W. Wills (ex-president), etc.

After the minutes had been read and adopted, the following firms were elected members, viz., Messrs. C. Gainer and Co., horticultural builders; Messrs. Young Bros., iron-founders; Messrs. Kirkham and Son, decorators; and Mr. Ernest Ireland, building contractor.

It was agreed to pay one year's subscription to the "Builders' Journal," for the use of the secretary.

The date and place of the annual outing were agreed to be settled at a later meeting.

A general discussion then took place as to difficulties arising out of business matters with architects and clients, a stronger cohesion between all members when mutual assistance and advice on delicate matters may be rendered, being much desired.

It was reported that tenders were being asked for the building or widening of a bridge and other works under the auspices of the Rural District Council, which contained an objectionable clause, viz., that the contractor should be responsible for the accuracy of the quantities, and by a unanimous resolution the secretary was instructed to write to Mr. E. H. Sheppard, surveyor to that authority, asking that the clause should be deleted from his specification. A very courteous reply was afterwards received from that gentleman, who, whilst afraid the objection was too late in the present instance, fully agreed that any excess of work beyond the specified quantities should be paid for in accordance with the schedule of prices, and stated that he would in future note the objection raised by this Association.

The officers of this Association for 1909 are the following:—President, Mr. Frank B. Parsons; vice-president, Mr. George Hayward; hon. treasurer, Mr. Sydney Sydenham; secretary, Mr. Edward J. B. Mercer; committee, Messrs. Stephen Ambrose, Frederick C. Chancellor, Herbert H. Knight, and William D. O. Morris; auditors, Messrs. Frederick Amery and Charles C. Wills. The association was founded as long ago as 1854, and was reorganised in 1890.

SWANSEA ASSOCIATION.

Secretary: W. H. Billings.

In February last the National Association of Operative Plasterers complained to the Swansea Master Builders' Association that a certain firm of builders, members of the Swansea Association, were employing a certain firm to do plastering. After hearing the members' explanation, which was to the effect that the plasterers' work had been given out to a master-plasterer, whose employment of men was his own affair, the association replied that their members would be supported in any action that the plasterers might take against them. The operatives replied with a threat to call our their men, and asked that the question might be discussed at a joint meeting. Such a meeting was arranged, and the plasterers then stated their objections to the master-plasterer to whom the work in question had been given. The employers' committee asked the plasterers' representatives to point out what rule had been broken by the firm of builders against whom the complaint was made. They were unable to indicate such a rule, but nevertheless reiterated their intention of withdrawing their men. The representative of the building firm in question appealed to the men to take a reasonable view of the situation. He asked that the master-plasterer should be allowed to complete the work in hand, and he would undertake that further steps should be subject to the approval of the operatives' society. The day after the meeting the firm informed the association that the master-plasterer had promised to give up the contract after finishing a certain definite portion of the work, which would be done in ten to fourteen days. This offer the plasterers refused, declaring that the contract must stop at once, otherwise the members of the plasterers' society would withdraw at one hour's notice. At an immediate meeting of the association, it was decided that if the men would not accept the very conciliatory terms that had been already offered them, matters must be left to take their course. A further joint meeting was arranged, at which the plasterers' representatives demanded that the builders' association should agree to a rule to the effect that in future no member of the association should place work with a master-plasterer who does not conform to the rules existing between the builders' association and the plasterers' society. The association declined this offer. Finally, the plasterers' society having giving indications of a more conciliatory spirit, the dispute was settled at an interview between the chairman of the builders' association and the secretary of the plasterers, at which it was agreed that the men should return to work immediately, the firm against whom the complaint was made being allowed to finish their contract.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 6. YEOVIL.—Erection of new offices at Reckleford, Yeovil, for J. B. Petter and Sons, Ltd. Names and addresses, with a deposit of £1 1s., by May 6, to John Petter and P. F. Warren, A.R.I.B.A., architects and surveyors, Union Bank Chambers, Southampton.

May 8-25. NEWCASTLE-ON-TYNE.—Enlarging and improving Wellington Quay Addison Potter council school, for the Northumberland education committee. Name and address, together with £2 2s. deposit for specification and bills of quantities, to the undersigned, not later than May 8, where also plans may be obtained. Tenders endorsed "Tender for extension of Addison Potter Council School," to the secretary by May 25.—C. Williams, secretary to the education committee, The Moothall, Newcastle-on-Tyne.

May 10. LLANELLY.—Erection of a residence and stables at Pembrey, near Llanelly for J. Walton Bishop. Names by May 10, together with deposit (cheque) £3 3s. for bill of quantities, to Arthur S. Williams, M.S.A., architect, Llandilo.

May 10. LLWYNYPIA.—Erection of 30 or more houses, together with boundarv walls and drains, for the Turberville Building Club at Pont Rhondda, Llwynypia. Plans and specifications of W. Morgan Lewis and T. Naunton Morgan, architects and surveyors, Dunraven Street, Tonypandy, and Dyffryn Chambers, Pontypridd, and also at 12, Edward Terrace, Cardiff, by appointment. Tenders to John Lewis, secretary, Maesteg House, Sherwood, Llwynypia, by noon on May 10, endorsed "Tenders for Pont Rhondda Building Club."

May 10. MAGOR, near NEWPORT, etc. (MON.).—Erection of a new council school, to accommodate 100 children at Magor, near Newport, and for a new council school, to accommodate 48 children at Whitebrook, in the Parish of Llandogo, near Monmouth, for the education committee. Plans and specifications and bills of quantities at the office of C. Dauncey, secretary, C.C. offices, Newport, Mon., on deposit of £2 2s. in the case of Magor school and of £1 1s. in the case of Whitebrook school. Tenders, in separate envelopes, for each school, to be sent to the secretary by May 10.

May 11. SOUTHEND-ON-SEA.—Erection of a school (460 places) for the Education Committee. Particulars on application to P. Brockank, architect, County Chambers, Western Road, Southend-on-Sea. Tenders to be sent in by May 11.

Plans, elevations, sections, and specification, and all information of James Heseltine, architect and surveyor, Old Castle Drawing Office, Pontefract, to whom tenders are to be sent by May 17.

May 17. NEWLANDSFIELD.—Erection of new tramway depot, Newlandsfield; execution of the following works:—1, digger, mason and brick works; 2, carpenter and joiner works; 3, cast-iron and steel works; 4, patent roof glazing; 5, slater work; 6, plumber work; 7, plaster work; 8, painter work; for the Corporation of Glasgow. Plans and specifications and forms of tender on application to James Dalrymple, general manager, 46, Bath Street, on deposit of bank draft for £2 2s. Offers, marked outside "Tramways—Tender for ———— Work," by May 17, to A. W. Myles, town clerk, City Chambers, Glasgow.

May 18. ST. ABBS, BERWICKSHIRE.—Erection of a rocket life-saving apparatus house at St. Abbs, for the Board of Trade. Copies of plan and specification and forms of tender at the coastguard station at Berwick. Tenders to the assistant secretary, Marine Department, Board of Trade, 7, Whitehall Gardens, London, S.W. by May 8, marked "L.S.A. Tenders."

May 18. COVENTRY.—Erection of outpatients' department at the Coventry and Warwickshire Hospital, for the committee.

Plans and specifications by A. Hesse'll Tiltman, F.R.I.B.A., 2, Verulam Buildings, Gray's Inn, London, W.C., and Herbert W. Chattaway, Trinity Churchyard, Coventry. Plans and specification, Trinity Churchyard, Coventry, where bills of quantities and forms of tender can be obtained upon deposit of £2 2s. Tenders, endorsed "Out-Patients' Department," by 10 a.m. on May 18, to John A. Rudd, secretary, Coventry and Warwickshire Hospital, Coventry.

May 19. CRUMPSALL (near Manchester).—Erection of a block for the accommodation of able-bodied men and other additions and alterations to the existing buildings at the workhouse at Crumpsall, for the guardians of the poor. Plans at the office of A. J. Murgatroyd, architect, 23, Strutt Street, Manchester, from whom quantities may be obtained upon deposit of £1 1s. Tenders, endorsed "Tender for Workhouse Extension," by 3 p.m., on May 19, to James MacDonald, clerk to the guardians, Poor Law Offices, New Bridge Street, Manchester.

May 20. IRVINESTOWN (IRELAND).—Structural improvement, extensive repairs, and painting of Irvinestown Church, for the select vestry of the Parish of Derryvullen North, according to specification, to be seen at the Castle Irvine School. Tenders to reach Robert Wilson, hon. secretary, Castle Irvine N. School, Irvinestown, by May 20.

May 20. SEACOMBE (Cheshire).—Construction of retort-house (except iron roof) at the Gas Works, Dock Road, Seacombe, Cheshire, for the Wallasey U.D.C. Plans and specification and bill of quantities of the engineer, J. H. Crowther, Dock Road, Seacombe, on deposit of £2 2s. Tenders, addressed to "The Chairman of the Gas and Water Committee," and endorsed "Tender for Retort-house," to be delivered by 4 p.m. on May 20, to H. W. Cook, clerk and solicitor, public offices, Egremont, Cheshire.

May 21. HAWKSTEAD, WINDERMERE.—Erection of a new billiard room at Outgate, for Humphrey L. Boddington. Particulars may be obtained on application to the architect, John Stalker, M.S.A., 57, Highgate, Kendal. Tenders to be sent in by May 21.

May 21. PORT TALBOT.—Erection of a rocket life saving apparatus house, at Port Talbot, for the Board of Trade. Plan and specification and forms of tender on application at the Harbour Master's office, Port Talbot. Tenders to the assistant secretary, Marine Department, Board of Trade, 7, Whitehall Gardens, London, S.W., by May 21, marked on the outside "L.S.A. Tenders."

May 21. CURRAHEEN, CO. KERRY.—Erection and furnishing of National School Buildings at Curraheen, for the board of public works. Plans, etc., at the district office of works, Blennerville, Tralee, and at Killarney Royal Irish Constabulary Barracks, where (and at office of H. Williams, secretary, Dublin) printed forms of tender can be had. Tenders to be sent in by May 21.

May 22. DITTON, near WIDNES.—Erection of a new elementary school for 120 scholars, at Ditton, near Widnes, for the Lancashire Education Committee. Plans and bills of quantities at the office of the county architect, Henry Littler, 16, Ribblesdale Place, Preston, by deposit of £2. Tenders before noon on May 22, to Henry Wood, 2, West Street, Prescot, Lancs.

No date. WAKEFIELD.—Erection and completion of athletic club buildings at Hemsworth Collieries, near Wakefield, for the South Kirkby, Featherstone, and Hemsworth Collieries (Limited). Bills of quantities and all particulars from Garside and Pennington, architects, Pontefract and Castleford, on deposit of £1 1s.

ENGINEERING.

May 8-14. PATELEY BRIDGE.—Construction of a concrete covered service reservoir of about 90,000 gallons capacity, together with a line of 5in. cast-iron pipe about 800 yards in length, for the R.D.C. Plans and specifications and forms of tender and other information from the engineers, Edward Wilson Dixon and Ritchie, 3, East Parade, Leeds; or from the clerk up to May 8. Tenders, endorsed "Water Eagle Level," by May 14, to Wm. Oddie, solicitor, clerk, Pateley Bridge, Yorkshire. £1 1s. deposit for quantities.

May 13. SLAITHWAITE.—Wrought-iron and engineering work in the equipment of a public abattoir at Slaithwaite, for the U.D.C. Tenders by May 13, to E. Gledhill, clerk, of whom all particulars may be obtained.

May 14. SOUTH TAWTON.—Construction of a water service reservoir and providing and laying water mains, etc., at South Zeal, Ramsley, Shelly, and Prospect, in the parish of South Tawton, according to plans prepared by H. J. Ward, A.I.S.E., for the Okehampton R.D.C. Specifications and bills of quantities on application to Mr. Ward, at whose office in Okehampton plans may be seen by appointment. Tenders by May 14, to S. Hawken, clerk to the council, Okehampton.

May 17. SOUTHAMPTON.—Erection of ferro-concrete road bridges on Hennebique's principle, for the C.C. 1, Greatbridge, three spans averaging 28ft. each, pile piers and abutments, together with a short road approach; 2, Timsbury Bridge, two 30ft. spans, pile pier and abutments, together with culverts and approach roads. Plans and specifications and conditions of contracts, and all other necessary information of W. J. Taylor, county surveyor, The Castle, Winchester. Plan and specification of each contract on deposit of £5 5s. (cheque) payable to the Hants County Council, and crossed Bank of England. Tenders, endorsed "Greatbridge" or "Timsbury Bridge," by 10 a.m. on May 17, to H. Barber, clerk to the C.C., The Castle, Winchester.

May 18. TRALEE.—Construction of a new timber viaduct and approaches thereto, in accordance with the plans and specifications prepared by the engineer, G. A. E. Hickson, M.I.C.E.I., for the Tralee and Fenit Pier and Harbour Commissioners. Plans, specification, form of tender, and contract deed, at the office of the Harbour Board, Canal Office, Tralee, and at the Board of Works (Engineer's Department), No. 6, Upper Merrion Street, Dublin. Specification, form of tender, and engineer's schedule of quantities on payment of £1 1s. Tenders by 11 a.m. on May 18, to J. Leonard, secretary, Tralee and Fenit Pier and Harbour Commissioners, Canal Office, Tralee.

May 20. NORTHWOLD.—Heating the Northwood Church on the radiator system. Estimates to be delivered by May 20, to the Rev. J. S. Barber, Sycamore House, Northwold.

May 20. SEACOMBE (Cheshire).—Construction, delivery, and erection complete of an iron or steel roof at the Gas Works, Dock Road, Seacombe, Cheshire, for the Wallasey U.D.C. Plans and specifications the engineer, J. H. Crowther, Dock Road, Seacombe. Tenders, addressed to "The Chairman of the Gas and Water Committee," and endorsed "Tender for Retort-house Roof," to be delivered by 4 p.m. on May 20, to H. W. Cook, clerk and solicitor, public offices, Egremont, Cheshire.

May 21. HAWKSHEAD, WINDERMERE.—Heating the mansion at Outgate for Humphrey L. Boddington. Particulars may be obtained on application to the architect, John Stalker, M.S.A., 57, Highgate, Kendal. Tenders to be sent in by May 21.

IRON AND STEEL.

R.I.B.A,—Report of the Council.

The report of the Council for the official year 1908-1909 was submitted at the annual general meeting of the R.I.B.A., held on Monday, May 3rd, at 9, Conduit Street. Notwithstanding the rather lengthy list of losses by death, among which we regret especially to observe the names of several well-known architects, who have rendered good service to the Institute, there has been a satisfactory increase in the membership of the R.I.B.A., which now stands at 2,278, as against 2,239 at the corresponding period of last year—to be precise, since the annual general meeting in 1908, nine Fellows eighty-two Associates, and one Hon. Associate have been elected. The Council, as we duly recorded some months ago, has decided to award the Royal Gold Medal to Dr. Arthur John Evans, in recognition of the distinguished services he has rendered to the history of architecture by his explorations in Crete, and we now offer our congratulations to the Council on the wise discrimination it has shown in thus conferring a well-deserved honour upon a very eminent savant. We regret to find that the policy of the Board of Examiners still tends to the wholesale admission of students to a profession which, as is painfully apparent, is already overcrowded to a dangerous extent. The tabulated results of the progressive examinations held during the past year are as follows:—

	Admitted.	Exempted.	Examined.	Passed.	Relegated.
Preliminary ..	335	68	267	198	69
Intermediate..	338	10	328	155	173
Final & Special	237	—	237	79	581

The total number of candidates was thus 910. The number of probationers now stands at 2,923, and of students at 961. The time is surely ripe for exacting a far more rigorous test of suitability from those desirous of entering the ranks of the profession; yet, as we have seen from the published results of the examinations held during the past year, of 335 candidates for the preliminary examination 68 were exempted, 267 examined, 198 passed, and only 69 relegated to their studies. Over and over again, in the pages of this journal, we have pointed out the absolute impossibility of ascertaining a candidate's suitability for a calling—which, beyond all others, requires qualifications of a very diverse nature—by means of any so-called test framed in the form of an elementary examination, which any public schoolboy of from 12 to 15 years of age might reasonably be expected to pass. Frankly, we think that the policy of the Council in thus enabling imperfectly equipped candidates to enter the ranks of a profession in which many very able and accomplished men are unable to earn more than a bare livelihood is detrimental alike to the welfare of the student and of the profession. It deludes many hard-working students into the belief that by their success in passing the requisite examinations they assuredly possess the requisite qualifications for future success in their chosen profession, and, in addition, it stultifies the work of many ardent reformers of to-day who are seeking to close the door of the profession to unsuitable aspirants. What is the good of closing the door of the profession to the undesirable practitioner, and throwing it open to its fullest extent to the unsuitable student? The vacancy caused by the resignation by Mr. Alexander Graham of the office of hon. secretary, after many years of arduous and distinguished service, is one of a kind that it will be extremely difficult adequately and satisfactorily to fill. Indeed, the very nature of the appointment requires qualifications of a literary and personal character with which very few architects are endowed, and it will be extremely difficult to find a worthy successor to Mr. Graham.

A Sympathetic Bequest.

Just to miss the *Prix de Rome*, or any other coveted distinction or reward, is probably a more bitter experience than that of being hopelessly beaten in the competition. *Væ victis!* is a cry that should have died out with the pagans. The more modern note of sympathy with the defeated has been sounded by a lady. At a recent meeting of the Architectural section of the Académie des Beaux-Arts, it was announced that Mlle. de Badiola has bequeathed the sum of a hundred thousand francs for investment as a capital sum, the interest on which is to be available for those young architects who, having competed for the *Prix de Rome* and obtained only the second prize, are debarred by the age limit from competing again. One would like to know the psychological history of that bequest. So much of grace and tenderness suggests the underlying romance of some dear defeat. But the consolation prize is always of practical rather than sentimental value. Defeated candidates for the *Prix de Rome* or for any other prize, have always the consolation that superior success does not invariably turn on superior merit, but may depend on many accidents of the moment or of the situation. The philosophical view, however, seldom presents itself to the disappointed competitor, whose dejection is not alleviated by the knowledge that, besides fame, he has missed substantial advantages that might mean for him the difference between success and failure in his profession. The gracious memory of Mlle. de Badiola will be gratefully cherished by many an aspiring young French architect.

Suggested Indian Museum.

A somewhat neglected aspect of the housing question was the subject of a deputation that waited on Mr. Runciman at the Board of Education on Thursday last. Lord Curzon of Kedleston, who was the leading spokesman, said that the object of the deputation was "to invite a reconsideration by the Government of their alleged intention to distribute what was popularly known as the Indian Collection at South Kensington." The collection had its origin and nucleus in the objects that had been brought together in the old East India House in Leadenhall Street, and these treasures, which had been in various ways augmented, were now accommodated in two long galleries erected for pictures, and "profoundly unsuited" for the present purpose. The deputation was inclined to ask that the collection should not be scattered, but should be housed in the new Victoria and Albert Museum. But there the accommodation was limited, and would be inadequate to the possible and desirable extension of the collection. "Do not these facts, therefore," Lord Curzon asked, with delightful modesty—he was anxious not to frighten Mr. Runciman at a time when there are so many demands on the Government—"point to a larger solution?" Passing swiftly from the interrogative to the indicative mood, Lord Curzon said that "the first thing required would be a plot of land," and "then they should put on it a building worthy of the Indian Collection." Following this graduated method of "breaking it gently," one might be allowed to bridge the yawning hiatus between the site and the building by suggesting that it would be desirable to appoint assessors and select an architect, and that in this connection a useful address is

9, Conduit Street, Hanover Square, W. Mr. Runciman was even more cautious. The difficulty was, he said, that they had no available site, and no building in which to house a great collection of that kind; but he would bring the matter under the notice of his colleagues. No doubt he will break it to them very gently, and they will make a good recovery from the shock on perceiving how much easier it is to avoid building new museums than to postpone the construction of "Dreadnoughts." This allusion is innocent of all political significance; its import being that the deputation was somewhat unlucky to catch the Government in an inauspicious mood for building anything but ships of the sea and of the air. We strongly sympathise with the proposal, and do not utterly despair of its ultimate realisation.

St. Clement Danes. One of the five new memorial windows recently unveiled by Princess Henry of Battenberg in the church of St. Clement Danes, in the Strand, commemorates Dr. Johnson, who was a worshipper in the church, and whose favourite seat is indicated by a tablet. It shows him, as the inscription relates, "surrounded by his literary friends, Goldsmith, Garrick, Burke, Boswell, and Mrs. Elizabeth Carter," who bears in her hand a volume labelled "Plato." The literary associations of the church extend much further back than the days of the "Great Cham of Literature," for here were buried Otway and Lee the dramatists, and Rymer the author of the "Fœdera." Its architectural interest is rather curious. It escaped the Great Fire, but the body of the old church was rebuilt in 1682, by Edward Pierce, under the supervision of Wren, who is commemorated in a tablet in the church as "His Majesty's Surveyor, freely and generously bestowing his great care and skill towards the contriving and building of the church." The present tower and steeple were added by Gibbs, in 1719. The old tower was low and "practicable," serving sometimes, during the Middle Ages, as a beacon with a blazing torch to guide the shipping on the Thames, and later it was mounted with a piece of ordnance that was intended "to quell the contumacious prelates and nobles who resided in and about Essex Street," and served also "as a prevention against the pirates who attacked and plundered those who frequented the river." It must have frightened more than it hurt—if it ever existed. At any rate, the legend is interesting, and is a quite characteristic reminiscence of the times when a church was half fane, half fortress, and the tower was its keep.

Mr. Carnegie has approved the plans for the Blackpool Library, towards the cost of which he is giving £15,000.

* * *

Messrs. Siemens Brothers and Co., Ltd., intimate that they have removed their offices from 12, Queen Anne's Gate and Queen Anne's Chambers, to Caxton House, Westminster, S.W.

* * *

The binding department of the Oxford University Press in Aldersgate, London, E.C., was destroyed by fire on Friday morning last, the damage done being estimated at £30,000. A fire at a timber yard at Plymouth, on Saturday last, did damage estimated at £60,000. Pieces of burning wood were blown into the ventilators of the Council schools separated by two rows of houses from the fire, and the girls' and infants' departments were completely destroyed.

ARCHITECTURAL FURNITURE

Mr. Charles Spooner, F.R.I.B.A., lecturing at the Carpenters' Hall, London Wall, E.C., remarked that the making of furniture is one of the finest of the crafts, and one of those which help to make up the art of architecture. The first things to be thought of in the making of furniture are utility, good construction, and the nature of the material to be used. Designers are too often mere draughtsmen, who make sketches of furniture in this or that style. These are handed on to the manager or foreman, to make working drawings and interpret the sketch in the best way he can. The draughtsman is too often shut up in an office, and never comes into touch with the material or with the craftsmen.

Turning to the work itself, the lecturer said that the first thing to think of was utility. Furniture, he said, was wanted, not as an ornament, but for a definite purpose, and the better it serves its purpose the more satisfactory it is. This is a consideration which is not always borne in mind by makers of furniture. For instance, a heavy piece of furniture is apt to secrete dust, and should either stand on a plinth, or on legs, so that the dust can be removed easily. Then we must think of the nature of the material and of the construction. Furniture is generally made of hard wood. Strong furniture may, however, be made of soft wood, but the shapes should be large and soft. A chest designed by Mr. W. R. Lethaby was shown, which, the lecturer remarked, was an example of an appreciative use of oak. Some of the hard woods, he continued, are of such a hard and close texture that they can only be used as veneer. This is a perfectly legitimate use of wood, provided it is used quite frankly, and as decoration only. A good plan is to surround the veneer with solid wood, so that it cannot get chipped.

All hard woods are heavy, and the lecturer expressed the opinion that it would be well if all the big things like wardrobes, etc., were provided as fixtures when the house was built. As furniture has frequently to be moved, it is subject to much strain, and it is convenient to make it in parts, which are described by the furniture makers as "carcases." There are two ways of making carcases—one is to make them of posts, rails and stiles, the openings filled with panels. This is known as a framed carcase. The other is to use boards dovetailed at the angles. This may be called a dovetailed carcase. The back of a carcase, and especially a dovetailed carcase, wants bracing. The best way would be to put diagonal braces across the corners and fill in with paneling, but this would be too expensive. The only way, therefore, is to have wide horizontal rails tenoned or dovetailed into the upright ends, and the wider the rails the stiffer the carcase.

There are certain qualities which are essential. One of these is fitness. For a thing to be satisfactory in appearance, it must not only be fit for the material of which it is made, but must look so. Another essential is good proportion. There are, however, no rules for good proportion, and the only way to learn it is to study good examples; for instance, Sir Christopher Wren's works, notably St. Paul's Cathedral and St. Stephen's, Walbrook; also the Banqueting Hall, Whitehall, by Inigo Jones. An example of good proportion in furniture was shown, namely a Dutch cabinet of the 17th century, and other excellent examples of well-proportioned furniture were illustrated, including a toilet cabinet by Chippendale, a large round dining table to seat twelve people comfortably designed by the lecturer. There were also a fine sideboard of oak, 8 ft. long, a crib designed by Mr. R. S. Lorimer, with some charming figures beautifully cut in wood (and of which the lecturer remarked that they were the only examples he knew in which the spirit and character of the carving were equal to old work), and some other examples of furniture by the lecturer and Mr. W. R. Lethaby. While ornament (provided it is good) certainly adds to the beauty of furniture, it is necessarily expensive. The kind of wood as well as the character will determine the nature of the ornament. Carved ornament on furniture ought to be in low relief. The linen-fold panel seems a good treatment, and a great deal might be done with it. Some examples were shown treated in a way very unlike folds of linen, but with an excellent result. The lecturer expressed his fondness of tracery as decoration, and thought that much might be done with it. It should, however, be used in moderation, and together with foliage, leaves, etc.

Passing on, Mr. Spooner remarked that so far he had only considered isolated pieces of furniture; but it was important to think of them in everyday use among their surroundings. In this connection several examples of interiors were shown, including rooms from the homes of the late William Morris, and Sir Edward Burne-Jones, and the various points of interest were briefly enumerated. Until modern times, he said, there was no difference between the style and character of house and church furniture. The style was the living tradition of the time, and this lasted until the classic revival in the 15th and 16th centuries. With regard to church furniture, the altar was the first and most important thing in a church; indeed, one of the few essential things. It should be plain, and at all times, except on Good Friday and Holy Saturday (when it should be stripped and bare) covered with a frontal. In height it should never be less than 3 ft. 3 in., nor more than 3 ft. 6 in.—3 ft. 4½ in. is the best height. In width, never less than 2 ft. 3 in.—3 ft. is the best. As to length, anything less than 5 ft. would be inconvenient. The foot space of the step on which it stands should be at least 3 ft. wide. Every altar should have a cross and candlesticks, and at least one frontal.

The largest piece of church furniture is the rood screen, or chancel screen, as it is sometimes called (and rightly when it does not bear a rood). In some of the Somerset and Devon churches this ran right across the church below the nave arcade arches, and so formed a chancel. A large crucifix was fixed on the centre of the screen, with figures of the Blessed Virgin Mary and St. John on either side, the whole being ornamented with colour and gold. Some splendid examples of screens in Devonshire, Lincolnshire, Wales, etc., were shown, and also two from Norfolk, with painted panels. The seats for the clergy should, he said, be fixed to the east side of the screen, and those for the choir returned to face north and south. Concluding, the lecturer said that if a man understands good design, is a master of proportion, and thoroughly understands his material, he will have no difficulty in working in any style.

DECORATIVE IRONWORK: ITS RISE AND PROGRESS.

The last of the series of lectures organised by the Carpenters' Company with the object of stimulating the spirit of craftsmanship, was delivered by Mr. Starkie Gardner. Although woodworking and metal working are sister crafts, yet there has always been a measure of antagonism between the two. In the struggle for existence the smith has encroached on the carpenter's field. He regards wood as merely something on which to fix his iron, or with which to light his fires. He would rather use doors and strong boxes of iron and no wood at all. Screens and gates, etc., originally made of wood, are made of steel, but, as time goes on, roofs, rafters, bridges, railway stations, etc., and then the entire construction of permanent buildings of iron and concrete, preclude the use of wood at all.

In mediæval days, metal working was the recreation of kings, and no other material, with the exception of ivory, was so richly worked. In those days iron was produced in small blooms, weighing only a few hundredweights, and from these the smith cut ff pieces, and while they were hot beat nd hammered them out into the required hape, and then welded them together. In he days of Edward I., stamps and dies 'ere first introduced, which could be pressed n to the hot iron, as a seal is on wax. 'lowers and leaves, etc., in relief were unk into the ends of steel punches, and hese were impressed on the iron while it 'as hot and plastic, by blows of the hamner. The effect produced was that of a ich moulding in relief.

About a century later, the vertical iron alisading, i.e., railing, came into use. This ame about through the fact that Edward I. atronised not only smith-craft, but other etal crafts as well. There are some splenid effigies of his father Henry III. and ueen Eleanor at Westminster. These ombs needed protection, and so we find e tomb of the Black Prince surrounded y vertical bars, and with six massive stanards to give strength and dignity. Soon fter this the vertical bars were sharpened ito points at their upper extremities, and ius became the prototypes of our area and arden railings. Until the reign of Queen nne the carpenter held a monopoly in reens, rails, pulpits, etc. At this time the adition of smith-craft was completely forotten, and when a door or screen was anted in iron, the smith not only carried ut the design from the 'joiner's work, but so mortised and tenoned the pieces into e another.

Edward IV. intended to have a metal onument to his memory, but no smith in ngland was capable of making it, so the order was placed abroad. It is now at Windsor, and is the most wonderful specimen of iron joinery in Europe. Both Wolsey and Henry VII. desired to eclipse all their predecessors in the magnificence of their monuments; but when Henry himself died, after despoiling Wolsey, no one cared to put up a monument to his memory. No revival of ironwork came with the introduction of Renaissance architecture into England. Nor did the introduction of Palladian architecture by Inigo Jones improve matters, for he never designed or used decorative ironwork. Then, again, the ironwork associated with the work of Wren under the Stuarts was of the plainest description. No real revival took place until the accession of William and Mary, and then it was entirely due to the influence of one man, Jean Tijou, who was a magnificent designer and craftsman. His work can be recognised with certainty by the elaborate book of designs which he produced, and also by the building accounts of Hampton Court and St. Paul's. The lecturer briefly reviewed the life of Jean Tijou, who carried out the superb screen for the fountain garden at Hampton Court, and also the three rich and still preserved gates filling the archways on the east front of the palace. The novelty of Tijou's work consists in the use of embossed leaves, masks, crowns, etc., which are in great profusion. No such work or such rich effects had ever been seen in England before. His book of designs makes it clear that he was not a practical smith, but he was a most skilled and artistic embosser. When Tijou was at his zenith, he must have needed many assistants, and the lecturer enumerated a few whom he had been able to trace. One of these in 1707 set up a forge at Derby, and for many years carried on a large trade there and in the surrounding counties. Two brothers set up in Chester and executed all the fine work to be seen in that and adjacent counties. Another was working in Bristol in 1710. The work of all is distinctive and similar, making a lavish use of acanthus leaves and rosettes. There was also contemporary with these men a smith named Thomas Robinson, who had works at Hyde Park Corner. He is first heard of as a competitor with Tijou for the work at St. Paul's. In 1711 he produced the fine screen and gates at New College, Oxford, also work at Carshalton and other places, and the gates now at Devonshire House. His gates are of different proportion from those of Tijou's school, being more lofty and transparent. He was essentially a smith with a fine sense of proportion. During the time of Tijou, and while Wren lived, the design of the work, as well as the production, was considered essentially the smith's work. The English treatment of Robinson and his school was developing rapidly when Gibbs, in his book of architecture (1727), claimed the designing of ironwork to be within the architect's domain. The gates and window grilles to the Radcliffe Library, Oxford, the screen at the Horse Guards, and grilles at the Mansion House and the Bank of England, are examples of architects' designs in ironwork. Little by little the craftsman was left out, until finally the brothers Adam designed the whole of the parts of their buildings. Had the men who succeeded them been as capable, all would have been well, but it seems that the collapse of all art in this country in Early Victorian days must be traced to the suppression of the craftsman. It must be conceded that no one is more qualified to design in the applied arts than properly trained craftsmen.

LINCOLN CATHEDRAL FROM THE CANAL.
FROM THE WATER-COLOUR BY ARTHUR C. PAYNE.

In Parliament.

By our Gallery Representative.

Royal Scottish Museum Building.

In the House of Commons, Mr. Gulland and Mr. Munro Ferguson questioned the First Commissioner of Works on a subject which has several times cropped up in Parliament during the last few years, namely, the safety of the Royal Scottish Museum buildings in Edinburgh.

Mr. Harcourt stated that he had been long aware of the danger to the Museum from the neighbouring spirit stores, and he was glad to say that after prolonged negotiations he had within the last few weeks succeeded in purchasing the site. He could not, however, obtain complete possession until Whitsunday, 1910, but as soon as possible after that date the site would be cleared.

The Dublin Law Library.

Mr. Field asked the Secretary to the Treasury whether he could state the reason why the Board of Works (Ireland) did not advertise for tenders to heat and ventilate the Law Library, Dublin; whether he was aware that the specification precluded Irish firms from tendering for the ventilation portion of the contract; whether he was aware that the Sirocco Fan, patented by a Belfast firm, was acknowledged by experts to be most suitable for this class of building; and whether he could state if it was the practice of the Board of Works in Ireland to place contracts outside of Irish contractors without giving Irish contractors the opportunity of sending in tenders.

Mr. Hobhouse in a printed reply stated:—The first part of the question has already been answered by me in reply to questions put to me. The answer to the second and fourth parts of the question is in the negative. In answer to the third part of the question, I am informed that the Sirocco Fan is a good one, but the question of what is the most suitable fan for a particular building must naturally be determined by the special circumstances of each case.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
June 1	MOLESBY ISOLATION HOSPITAL. The East and West Molesey U.D. Council invite competitive plans, with specifications for the above. Full particulars can be seen at the Council Offices, Dundee Villa, East Molesey.
June 4	COTTAGE HOSPITAL, BODMIN. Architects are invited to submit competitive designs for the above, to be erected at an approximate cost of £2,000. Premiums, £12 12s., £8 8s., and £5 5s., for the three sets of plans *which the Committee may select*. Premiums of selected Architects to merge in Commission. Site can be seen on application to Henry D. Foster, Hon. Secretary to the East Cornwall Hospital, Bodmin, from whom particulars are to be obtained.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading, Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively.
July 9	STOKE-UPON-TRENT. Additions to Town Hall including large hall to seat 3,000 people, police court, etc. Premiums of £100 and £50 for second and third designs respectively. Assessor nominated by Pres. R.I.B.A. Conditions and particulars from Jno. B. Ashwell, Town Clerk, Town Hall, Stoke-on-Trent.
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	WALLASEY U.D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Middlesbrough New Library Competition.

On the recommendation of the President of the Royal Institute of British Architects, Mr. J. S. Gibson, vice-president R.I.B.A., has been appointed assessor in the above competition.

* * *

Elementary Schools, Wombridge.

The Education Committee of the Salop County Council have accepted the design submitted in connection with the above competition by Messrs. Dickens-Lewis and Haymes, architects, Shrewsbury.

Our Plate.

Netherswell Manor.

Netherswell Manor was built by Mr. E. Guy Dawber, F.R.I.B.A., five years ago, and was illustrated in "The Architectural Review." Mr. Dawber informs us that:—"Last year and this it has been rebuilt and enlarged to three times its original size; incorporating the old work with the new additions, which spread out in all directions, and it has been so altered that it is impossible to tell where the old work ends and the new begins. Consequently the plan is of no architectural interest, as it has awkward spots and corners, which one would not do if planning the whole place afresh." This very fact, however, adds to the personal charm and picturesqueness of the house, and Mr. Dawber considers it one of his best jobs. The building is now nearing completion, Messrs. Walker and Slater, of Derby, being the contractors. The drawing is now on view at the Royal Academy.

R.I.B.A.

The Royal Gold Medal.

Dr. Arthur Evans (Royal Gold Medallist elect) has intimated that it will be impossible for him to be in London at the time fixed for the presentation—viz., Monday, the 21st June. The Council have consequently resolved to abandon the general meeting arranged for that evening, and propose that the presentation shall take place at the opening meeting of next session, which will be the first Monday in November. The President is inviting members to an "At Home" at the Institute on the 21st June, and is arranging for the occasion an exhibition of water-colour drawings by architects.

The Annual Elections.

The following nominations have been made by members in accordance with by-law 30:—

As Vice-Presidents:—Alfred Wm. Stephens Cross, M.A.Cantab. (F.); Samuel Perkins Pick (F.), Vice-President 1905-6.

As Members of Council:—Hippolyte Jean Blanc, R.S.A., F.S.A.Scot. (F.); Arthur William Brewill (F.); Max Clarke (F.); T. Edwin Cooper (F.); Charles FitzRoy Doll (F.); H. P. Burke Downing (F.); Frederic Richard Farrow (F.); Arthur Rutherford Jemmett (F.); A. Marshall Mackenzie, LL.D., A.R.S.A. (F.); Charles Edward Mallows (F.); George Ernest Nield (F.); Paul Ogden (F.); Sydney Perks, F.S.A. (F.); Charles Henry Bourne Quennell (F.); Edward Robert Robson, F.S.A. (F.); Alfred Saxon Snell (F.); Lewis Solomon (F.); Percy Burnell Tubbs (F.); William Gilmour Wilson (F.); William Woodward (F.).

As Associate-Members of Council:—Kensington Gammell (A.); Alan Edward Munby, M.A.Cantab. (A.); Herbert Winkler Wills (A.); Arthur Needham Wilson (A.).

As Assoc. Member Literature Standing Committee:—Harry Inigo Triggs (A.).

As Members of the Practice Standing Committee:—Kensington Gammell (A.); Albert Walter Moore (F.).

As Member of the Science Standing Committee:—Ernest Alexander Young (A.).

Correspondence.

The Taxation of Land Values.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Your editorial in this week's issue proves that your paper is nothing if not up to date. We wish we could say the same for the special article on the above subject. We have a vast army of men employed (or who should be so) in the building trade. It is the second largest trade in the country, and in discussing the merits of "land" taxation the author has quite overlooked the effect of "building" taxation as at present applied. Buildings are taxed 50 per cent. *ad valorem.* If a client wants £1,000 worth of building it will cost him £1,500, because, when in possession and use, he will be assessed on his £1,000 at £60 annual and £50 rateable value, which with rates at 8s. in the £, means a first charge on the £1,000 of £20 per year, or £500 capitalised at 4 per cent. That is the reason why people build only when they must. If Mr. Horsburgh and other architects and builders once get that clearly in their minds they will not look askance at any body of politicians who propose to shift that tax on to something else. To builders this question is more than finding means for "Dreadnoughts" and old age pensions, it is more even than getting cheap land for building, and that is very desirable as we all know. It is going to mean, if carried to its logical conclusion, that people who own buildings will have the privilege of doing as they like with them, pulling down, beautifying, etc., etc., without being taxed for it.

MOORE AND CRABTREE.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Ellipse of Inertia.

CARDIFF.—"ELLIPSE" writes: "Will Mr. Andrews please explain how to obtain the angle of principal axis to the line ZZ in the example of a 5in. x 3in. x ½in. unequal angle given in his book, p. 167? The formula to obtain this is not given in any of my books, and would be of much use to the writer."

Find the moments of inertia of the section about any two axes XX and YY intersecting at the centroid and at right angles to each other, and let these be I_x and I_y Next find the moment of inertia I_w about a line WW, also passing through the centroid and at 45 degrees to XX and YY.

Then if a is the angle of inclination of the principal axes to XX or YY, a is given by the relation

$$\tan 2a = \frac{I_x + I_y - 2I_w}{I_y - I_x}$$

The moments of inertia I_u and I_v about the principal axes are given by:

$$I_u = \tfrac{1}{2}\left[I_x + I_y + \frac{I_x - I_y}{\cos a}\right]$$

$$I_v = \tfrac{1}{2}\left[I_x + I_y - \frac{I_x - I_y}{\cos a}\right]$$

A.

Stress Diagram for Open Timber Roof Truss.

YORKS.—"H." writes: "The tracing enclosed [not reproduced] shows, in outline, a timber-framed roof truss. Will you inform me, through the medium of your paper, whether the "nature" of the stresses, as suggested by the arrows, has been correctly estimated, and how in a truss of this type they may be obtained graphically?"

The elevation of truss submitted is shown in Fig. 1, and in Fig. 2 is shown the nearest approximation to a frame diagram for the truss. Allowing a vertical structural load of 28lbs. per ft. sup. and a horizontal wind pressure of 42lbs. per ft. sup., the loading will be as shown, whence the load line may

set down as in Fig. 3, the reactions ob-ned, and the stress diagram completed. ie stresses may then be scaled off and irked on the frame diagram Fig. 4. The nding moments on the curved members are so shown on Fig. 4, the maximum bend-moments being obtained by multiply-the direct stress in the bar by the versine the curve. The members in direct com-ession are then calculated by the formula

$$W = \frac{F\,S}{1 + \frac{1}{a}\left(\frac{l}{d}\right)^2}$$

iere W = total safe load in cwts., F = safe id on short specimen in cwts. per sq. in. t section = 13 for oak and 6 for fir, S = tional area in sq. ins., a = constant—100 square or rectangular sections flat one d and rounded the other, l—length in hes, d = least diameter or width in inches. ie members in direct tension are calculated allowing 13 cwt. per sq. in. net section oak, and 4 cwt. per sq. in net section for . The curved members are calculated by formula

$$\frac{W}{A} + \frac{M}{Z}$$

iere W = direct tension or compression in ts., A = net sectional area in sq. in., M = ding moment in cwt.-ins., Z = section dulus in inch units. When compression the chief stress the intensity obtained by is formula must not exceed the safe stress taking the member as a strut and working by the formula

$$W = \frac{F}{1 + \frac{1}{a}\left(\frac{l}{d}\right)^2}$$

where W = safe stress per sq. in., the values of the other letters being as given before, S being omitted.

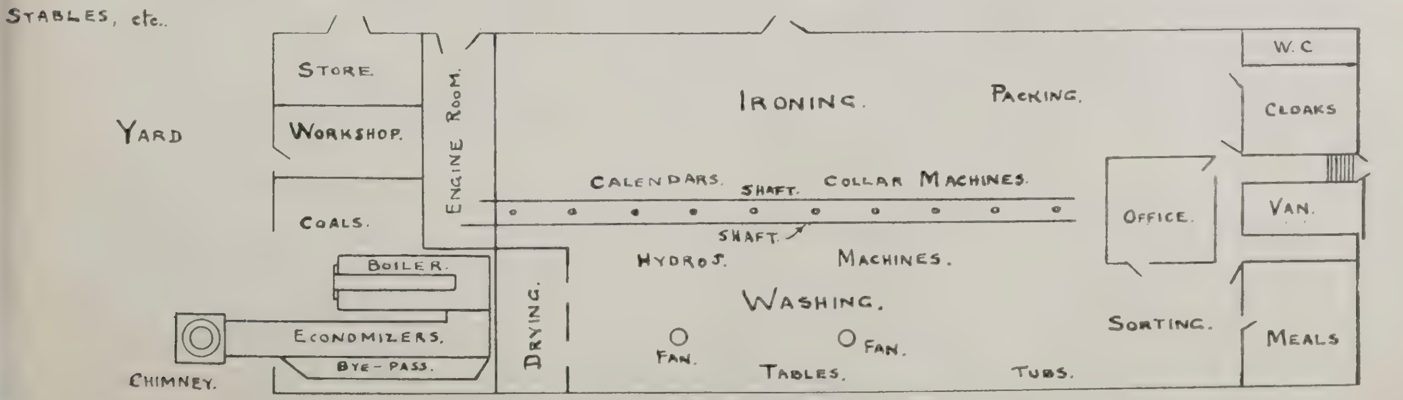
HENRY ADAMS.

Washhouses or Laundries.

BURNHAM.—In answer to "W. J. P.":—

These require extra stout roof timbers, stout walls or pilasters, if shafting be fixed to these; first-rate drains with plenty of inspection chambers, one to each machine is not too many, and one to each 12ft. straight of drain at hand tables; and all the north-east or north-west light you can get. A covered loading and unloading place for vans is also desirable, and a 5ft. glazed brick or tile dado at the washing place is the best; and concrete foundations for all machines, with concrete floors for the wash-house, and wooden floors for the rest. To remove steam from the wash-house, two fans are best, one driven by the wash-house shafting and the other by the ironing-room shafting; and the air supply to these fans comes from the drying chambers and ironing rooms. In winter the air that enters the packing and ironing room is warmed by steam pipes ere it enters the room, and the same at the sorting room, for warmed air is needed to completely remove steam from a wash-house. The drying may be by "horses," or in a room through which hot air is moved by a fan, the spent air being sent to either the wash-house or the open. The driving may be either steam or gas engine or electric motor; suction gas engine is the cheapest. As the wash-house is not always at work during the same hours as the ironing room, two engines, or fast and loose pulleys or clutches, are needed to disconnect the shafts.

As the "calenders" for ironing and drying blankets, sheets, curtains, etc., are heated by steam of from 45 to 60 lbs. pressure, a steam boiler is needed, and one "economiser" to heat the water that feeds the boiler, and perhaps a second economiser to heat the water for the washing. Economisers are batteries of vertical pipes, placed in the flue between the boiler end and the chimney, and the water is pumped through these pipes to get heated by the hot gases that leave the boiler flues. If the water be hard you may do well to collect all the rain from the roofs, and mix it with the hard water to lessen and soften the scale inside the boiler. A hot sulphur spring gives good boiler water. The chimney will be 80 or 90 ft. high and should be at least plumb inside; and if it can be larger inside as it nears the top, so much the better. (See the articles in "The Builders' Journal" on "Tall Chimney Construction," Nos. 703, 704, 705, and 707).



ILLUSTRATING REPLY TO BURNHAM.—"W.J.P."

The accompanying drawing shows the requirements for a laundry employing about 60 hands, and the Factory Act clauses as to number of closets, size of cloak-room, etc., have to be met in the spirit as well as to the letter. The large machine-making firms, such as Summerscales. Manlove Alliott, Tullis, Bradford, etc., whose addresses can be found in "The Builders' Journal" and in "Specification," will supply power and arrangement plans for a stated quantity of washing, and will fit up the laundry complete.

If you are required to adapt an existing two-storey building to a laundry, you must make the best of circumstances. You can have a vertical steam boiler to supply the wash machines and calenders, all on the ground floor with the drying perhaps also. The ironing and packing will be upstairs. A fan is required to ventilate gas-iron rooms, though the factory inspector may allow one machine in a lofty and ventilated room. This fan may in some cases blow into the drying chamber or the wash-house. If ordinary flat-irons be used, the stove has to be in a separate room or space bricked off from the ironing room itself.

The Board of Trade requires the attendant to any steam boiler to be a male over the age of 18.

If the only machines are to be gas-heated irons, the hot-water can be obtained from a heating apparatus boiler, and the clothes can be boiled in cast-iron pans each with its own fire and chimney, and containing 50 or 60 gallons of water. The steam from these can be led away by hoods above them to wooden shafts through the roof, each shaft having a lid to be closed at night. The smoke can be used in some cases to heat air for the drying room and removing steam, as can the exhaust from gas-engines of more than 25 b.h.p.

A meal-room separate from the work-rooms is required by the Act for workpeople taking meals on the premises, and a special place for cloaks, which may have to be warmed in winter to dry the cloaks. Of course, separate closets for the sexes will be provided.

The temperature at which clothes may be dried depends in part on the water, and in part on the chemical constituents of the soaps and glazes. In any case, the hotter the air the quicker the drying.

The foundations and walls of boiler seat and flues must be separate from those of the building; a 2ft. 6in. space between their walls is not too much. If the two join, the walls are likely to crack and buckle the roof. The building shown is intended to be lit by windows and skylights: and its roof to be two-peaked and hipped at the end of the laundry proper. The power end will have a separate roof, hipped or gabled as required.

INGENIOR.

Stresses in Walls.

TRING.—"A CONSTANT READER" writes: "In finding the tension and compression at each face of a wall, the formula

$$P=\frac{W}{A}\pm\frac{M}{Z}$$

is used; what does each of these letters denote, and why *plus* or *minus* $\frac{M}{Z}$?

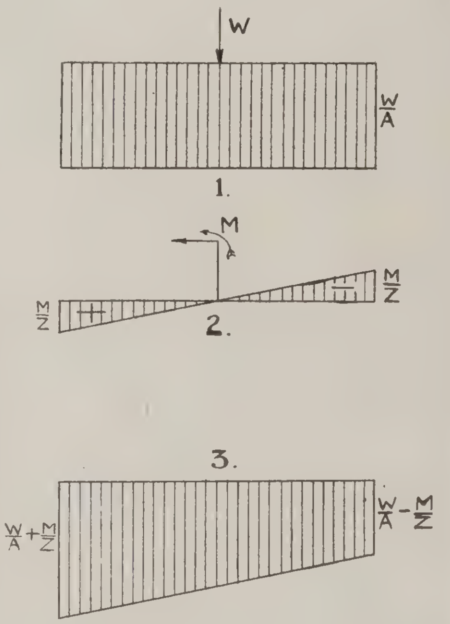
W = Weight of wall (in tons say)

A = Area of horizontal section of wall in sq. in.

M = Bending moment acting on given section of wall in inch-tons.

Z = Section modulus of wall at given section in inch units.

In the most usual case the wall is rectangular in horizontal section, and then $Z=\frac{bt^2}{6}$ where t is the thickness of the wall in inches and b is the length of the wall in inches. The value $P=\frac{W}{A}+\frac{M}{Z}$ gives the compression stress in tons per sq. in. on the compression face and the value $P=\frac{W}{A}-\frac{M}{Z}$ gives the compression stress on the tension face.



The distribution of stresses will be clear from the figure, where: (1) Shows the stress due to the weight of the wall, this being uniformly distributed; (2) shows the stress due to the bending moment due to horizontal forces, such as wind, this stress being proportional to the distance from the neutral axis as in an ordinary beam; (3) shows the combined stress due to dead weight and bending moment, this diagram being obtained by adding (1) and (2), making due allowance for sign. The *minus* sign corresponds to the tension portion of the stress due to bending moment. A very good paper by Prof. Adams on the stability of walls will be found in "The Builders' Journal" for January 27th, February 3rd and 10th, 1909.

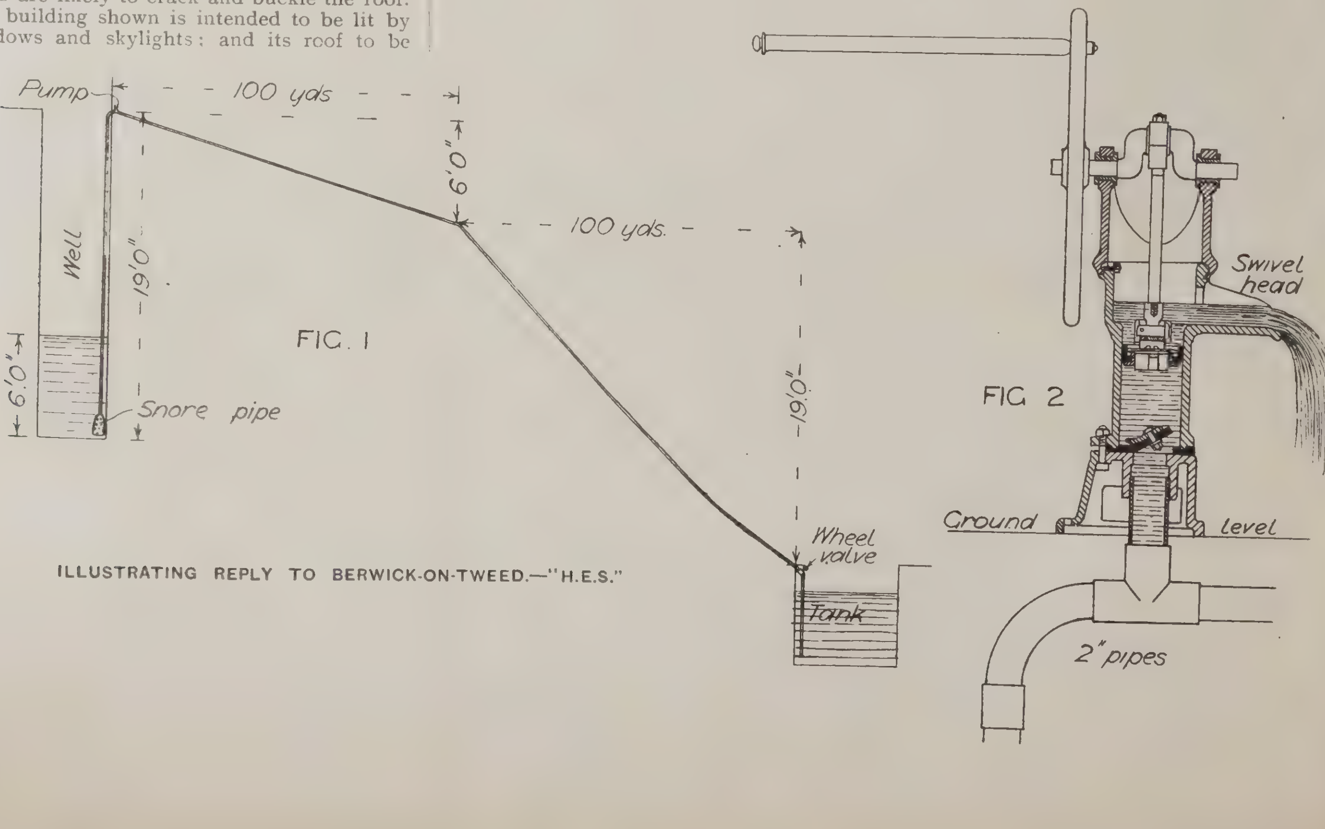
A.

Water Syphon.

BERWICK-ON-TWEED.—H.E.S. writes: "We wish to syphon water from a well to a tank by a 10in. pipe. The accompanying sketch shows the position of the well and the tank and the contour of the ground. What is the proper way of doing this, and would it work satisfactorily?"

A syphon pipe 1in. in diameter could not give more than three gallons per minute. It would require very careful workmanship, as the slightest air leak will prevent it from working, and a pump must be placed at the highest point, as shown in Fig 1. An ordinary suction pump can be applied (such as W. H. Bailey and Co.'s, of Albion Works, Salford), as in Fig. 2, but owing to the size of the foot valve, there will possibly be some difficulty in keeping it air-tight, and more frequent pumping will be necessary than if a small specially made air pump were applied. In setting the pipe to work, the wheel valve should be closed, the tank filled above the mouth of pipe, the pump worked until the water comes out of the spout, the wheel valve then opened and the pump again worked until all the air is withdrawn, the syphon should then be in working order. Air will tend to collect in the upper part of the pipe and require removal by the pump. A 2in. pipe would give about 16 gallons per minute. It will be an advantage to make the pipe from the well to the pump 2in. diameter, as shown, whatever size the remainder of the pipe may be.

HENRY ADAMS.

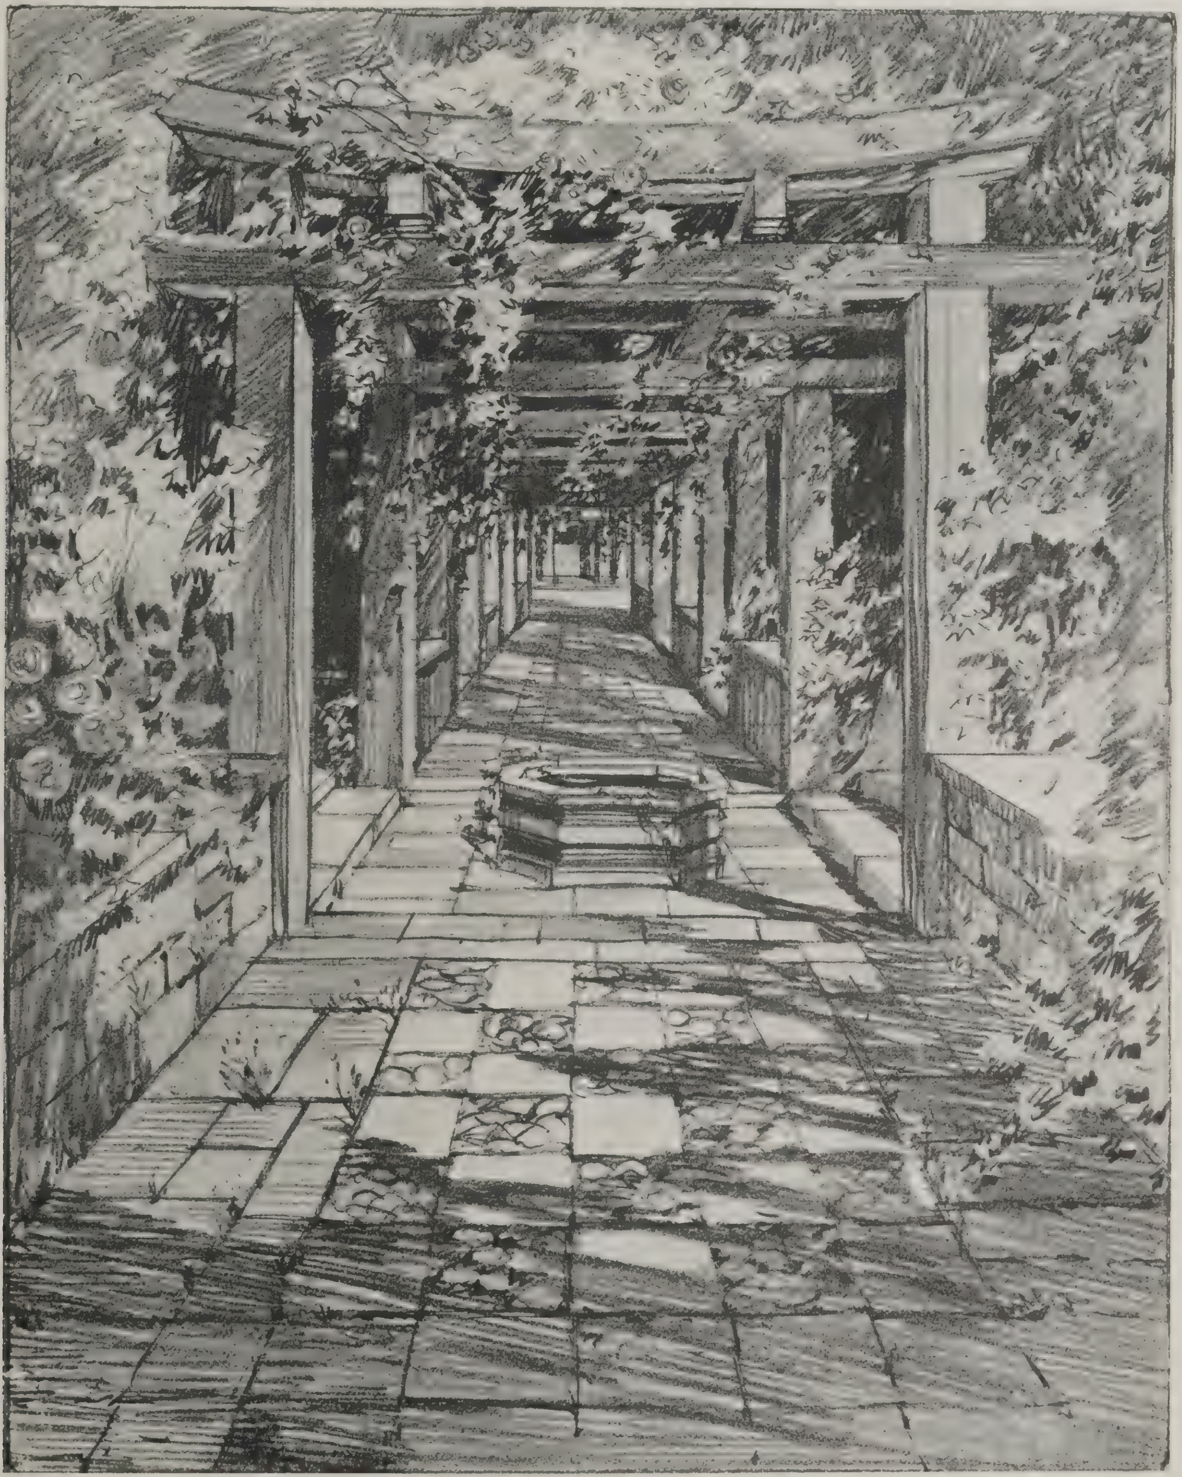


ILLUSTRATING REPLY TO BERWICK-ON-TWEED.—"H.E.S."

JAPANESE GARDEN ARCHITECTURE.

An excellent persuasive to garden design has been published by Mr. John P. White, of the Pyghtle Works, Bedford, and 134, New Bond Street, W. It takes the form of a chastely produced booklet, containing sixteen excellent half-tone engravings, of which, by courtesy of the publisher, we are able to show two examples. The joys of gardening are set forth most alluringly in a graceful introductory essay by Mr. Rowland E. Prothero, who takes for his text a passage from Abraham Cowley's Epistle to John Evelyn: "I never had any other desire so strong and so like to covetousness as that one which I have had always—that I might be master at last of a small house and large garden, with very moderate conveniences joined to them, and there dedicate the remainder of my life only to the culture of them and study of nature." This wish, as Mr. Prothero remarks, "is adapted to all sorts and conditions of men." He points out the antiquity of the gardening cult. He says that it is as old as time. It is at least as old as civilisation. The square palisaded garden was a feature of Ancient Egypt. Assimilated and developed by the Greeks, the art was inherited by the Romans. The passion is universal. English gardening was insignificant until Tudor times, and although Henry VIII. and Wolsey had their formal and architectural gardens, it was not until the spacious days of great Elizabeth that a national style was developed.

This was based on an assimilation of Italian ideas; and the spirit of the Italian garden is architectural. "Its creators," says Mr. Prothero, "were masters of the art of composition. The principle which governs the building of the house is extended to its immediate surroundings; the lines of the dwelling-place are followed in the pleasure grounds, and the domesticity of the one is linked to the natural beauty of the other." Many a noble garden was destroyed during the Civil Wars, and the art of gardening, like all the other arts of peace, was naturally neglected. With the Restoration the revival of gardening was based on the rather theatrical style of which the pictures of Watteau convey a fairly correct impression. Huge fountains and a plenitude of plaster statuary were essential features.



DESIGN FOR PERGOLA ADAPTED FROM THE JAPANESE TORII.

With William and Mary came the Dutch style, prim, precise, and puerile. In the eighteenth century topiary work was the butt of the wits. Pope and the "Spectator" girded at it until it became insufferable. Then came the Chinese style, and afterwards the Romantic school, with its vistas and prospects, and mock temples and obelisks and busts; and now we seem to be gradually evolving a new Renaissance.

SUMMER-HOUSE WITH TRELLIS SHUTTERS. ERECTED, AFTER A JAPANESE MODEL, AT OCKLEY HOUSE, BEDS. (From "Garden Design.")

To whom should we go for vital inspiration with greater assurance than to the Japanese? The Japanese have a genius for artistic or architectural gardening. There is a demand for bridges, summer-houses, etc., in the Japanese style; and it is in response to this demand that Mr. John P. White has published the interesting and handsome booklet under notice. Even as our forefathers in taking the Italians for their guides did not yield themselves up to slavish imitation, so it may be supposed those who base themselves on the Japanese style will be influenced by its spirit only, and will modify the details so as to bring them into harmony with English surroundings. It is the spirit that quickeneth, not the letter that killeth, which is observable in the original designs shown in Mr. White's booklet. These, while strongly reflecting Japanese influence, show a very sympathetic adaptation to Western environment; and how admirably they express essentials without slavish regard for details may be seen on comparing them with the Japanese work shown in the photographic reproduction of typical examples of genuine Japanese gardens and garden structures.

It is becoming increasingly apparent that the architect of to-day must reckon with a general intensification of the regard for architectural gardens. This booklet is at once an evidence of the movement and a means of accelerating it.

An illustrated account of the City of Carlisle has been published by the Corporation with a view to directing attention to the advantages which the city offers to those desirous of establishing factories or works. Many illustrations and a folding map are included.

* * *

"The Concrete Institute Transactions and Notes," Volume I. (Part I), issued from the offices of the Institute, 1, Waterloo Place, Pall Mall, S.W., contains reports of the first and second general meetings of the Institute, and gives in a series of notes much information concerning the constitution and objects of this new and vigorous organisation.

Views and Reviews.

Churches Damaged by Lightning.

Lightning and the Churches. By Alfred Hands, Fellow of the Royal Meteorological Society. London, J. W. Gray and Son, lightning conductor experts, 91, Leadenhall Street, E.C., 1s.

Before the adoption of efficient means of protection, it seemed to be the natural fate of a church to be struck by lightning; and even nowadays the average number per annum of churches in Great Britain that are struck and damaged in about twenty; and in an appendix to this excellent monograph, Mr. Hands gives a list of 244 British cathedrals, churches, and chapels reported to have been damaged from this cause between 1899 and 1908. Yet, of the 3,401 buildings that were damaged by lighting in England and Wales during eleven years (1897-1908), only about six per cent. were churches, whereas eighty-four per cent. were comparatively low structures. Mr. Hands states that while it is obvious that the lofty spires and towers of churches are objects that are very apt to be struck by lightning, yet, within certain limits, difference in height does not make the great difference in danger that might be supposed, and not all the churches struck have been conspicuously taller than the other buildings in their vicinity. This and many other points of interest are discussed very judicially in this instructive and interesting little book, which is enriched by a number of views showing the havoc wrought by lightning, and diagrams illustrating the author's deductions from data collected during many years of close investigation and patient study of a subject in which his knowledge and experience are probably unrivalled.

Fons et Origo.

Fonts and Font Covers. By Francis Bond, M.A Illustrated by 426 Photographs and Drawings. Henry Frowde, Oxford University Press, London, New York, and Toronto. Price, 12s. net.

Although two books on fonts were published sixty years ago, and although Mr. Bond is able to produce a bibliography that includes more than fifty entries, the varied interest of the subject, and the wealth of materials that the author has found awaiting examination and description, will come as a revelation even to those who knew enough to be aware that hitherto this particular branch of art and archæology had never received adequate attention. To Mr. Bond, in fact, belongs the distinction of producing the first comprehensive book on fonts and font covers, and the first attempt to give anything like a complete view of their history and evolution. When Christianity began to take root in Rome and Greece, the domestic bathrooms offered a ready means of performing the rite of baptism. Regularly constituted baptisteries of the fifth or sixth centuries, or even earlier, are still in existence at Rome, Ravenna, Istria, in the south of France, and elsewhere. In many cases the piscina or tank was below the ground level; and in demolishing the old church of St. Clements, Tours, a concrete font was found about a metre below the surface. It was cylindrical, 16in. deep and 33in. broad. As the practice of infant baptism increased, and adult baptism declined, the font began to supersede the baptistery; and the earliest type of font is tub-shaped and unmounted. Afterwards, in order that the ministrant should not have to stoop inconveniently low to the water, the font was raised on legs, and by the fourteenth century it had become usual to mount it on a tall pedestal. The Italians took to modelling their fonts in the form of a chalice, which they soon began to adorn with carving. Long after the chalice form had been adopted in our own country, Puritan zealots would wilfully smash it, and use instead a dish, basin, or pail; and during the Commonwealth the basin was pretty general. Then disappeared, no doubt, many interesting examples that, had they survived, might have enriched Mr. Bond's book. Mr. Bond, disregarding Viollet-le-Duc's despair of the possibility of classification, has arranged fonts in accordance with their external design. He divides them first into unmounted and mounted. The former may be further classified as cylindrical, rectangular, polygonal, caldrons, and block fonts; the latter, as those of which the bowl rests on several legs, and those with one leg or a pedestal.

The decoration is, of course, often symbolical, and the fonts are made of various materials—chiefly of stone; but in a chapter dealing mainly with metal fonts, it is mentioned that at Canterbury there was once a font of silver, and that Queen Elizabeth gave a golden font to Mary, Queen of Scots, and another to Charles IX. of France, each valued at £1,000. Bronze, pewter, wood, and silver-gilt have been used; and of a considerable number of lead fonts most belong to the late twelfth or early thirteenth century. A few examples are of brick. Where the bowls are of freestone, they are commonly lined with lead. In the chapter on font covers, Mr. Bond has the assistance of Mr. Frederick Charles Eden. The covers, at first only flat lids, became in time more or less elaborate in design and decoration, and, like the fonts, they often bear inscriptions. The illustrations in which the book abounds almost to lavishness, are of much architectural interest, and, studied chronologically and with due regard to locality, would probably throw considerable light on the development and progress of decorative design. In accordance with Mr. Bond's admirable practice, the book is furnished with both an index locorum and an index rerum.

An Octaval System of Counting.

There is always a *tertium quid*. If ever the decimal system overcomes the duodecimal, there will remain the octaval to reckon with, or not to reckon with, as events may prove. Mr. S. S. Buckman, F.G.S., has issued, price sixpence, through Messrs. Parker and Son, 27, Broad Street, Oxford, and Messrs. Simpkin, Marshall, Hamilton, Kent and Co., Ltd., a pamphlet entitled "An Octaval instead of a Decimal System; an essay to show the advantages of an eight-figure and the disadvantages of a ten-figure notation for money, weights and measures." It is a very ingeniously elaborated essay; but as the system involves a revised notation, and incidentally takes considerable liberties with the multiplication table, its chance of adoption in this conservative country seem to be rather remote.

THE SPECIFICATION AND INSPECTION OF TIMBER.

By J. Davies.

Abstract of a paper read before the Society of Architects by Mr. J. Davies, of "The Timber News."

(Concluded from page 332, No. 740).

Undoubtedly the old-fashioned Memel, and some of the Danzig, was very fine, mature wood, of slow growth, very sound and clean, and of great durability. But the best trees in the easily accessible forests were cut down faster than they grew, and what we get now is not quite so good. Or, to put it another way, while there may be some Danzig wood of the old-fashioned quality in the logs of to-day, its proportion is much smaller, and the waste in conversion would be prohibitive. So that there is no object in specifying this wood in preference to Swedish or Russian, so far as the latter is obtainable in the required sizes. The question then arises, "Where large sizes are required for main structural work, what is the best alternative, seeing that we do not receive imported planks larger than 12in. by 4in. from Russia or Sweden?" The answer to this is, Pitch pine, and some would include the Douglas fir, or Oregon and British Columbian pine, the merits of which we will discuss when finished with the European fir.

We spoke of

Russia and Sweden as Sources of Supply

Going into details, we may say that the important ports of shipment in Russia are Petersburg and Archangel. We receive both joiners' and carcassing stuff from each, Petersburg being usually sorted into 1st, 2nd, and 3rd, and Archangel into 1st, 2nd, 3rd, 4th, and a few fifths. The shipments can usually be distinguished by their being marked with a hammer stamp on the ends, without any paint, the Swedish being usually marked with stencilled letters in paint.

We have already referred to the Petersburg, yellow or red, as having deteriorated somewhat. It once exported some very fine deals and planks indeed. It still sends us some very good wood, and the quality is quite high enough to warrant its inclusion in specifications as ports of origin for joiners' stuff. But the merchant or builder has to allow for the presence of a number of deals which could not be utilised for the finest work, even in the best quality.

The wood from Archangel is the best of all for the most exacting kinds of indoor work. Its heartwood is less red than that of Petersburg stuff. It is very mild and easy to work, being less likely to warp than similar wood from any other part. In expatiating on its excellencies, of course, it is understood that we are speaking comparatively, seeing that the best we get from any shipper is very far from perfection. The word Archangel covers all shipping places in the White Sea, of which there are many, including Kem, Kovda, Keret, Mesane, Onega, Soroka, and Umba. There is little or nothing to choose between the various shipments, one being better this year, another next, and so on. Some of the better known marks are double eagle, OWC, MM, BB, NRS, JM, SMK, KEM, PBS, W. The first and second qualities are used for joinery, and selected thirds are also taken for similar purposes in cheap work. The thirds, and sometimes fourths, are used for carcassing.

There is a

Large Timber Industry in Finland,

and many ports send carcassing stuff, mostly of the cheaper order. There are two very useful brands shipped from Bjorneborg, BS1stSC and RF1stSO. The cheaper qualities from these shipments are very useful for ordinary timbering work, and there is another Finnish port which is worthy of some attention, as sending large quantities of very sound and usable carpenters' stuff, marked KEMI in red paint, the port of shipment also bearing this name. I emphasize this as the KEMI Company supply the London importers with numerous cargoes of this brand. It is well manufactured and shipped in good condition, as a rule. The wood is a little too strong for joinery, but is none the worse on that account for use where a load is carried. It has been tacitly accepted by many architects as a fair and reasonable standard for medium to good class work, and may perhaps be known to some of my auditors. If so, I should be glad to learn the professional opinion of it in the course of any discussion that may arise.

The Timber of Sweden and Norway.

We now come to Sweden, which has a large number of shipping districts, the better known of which are Gefle, Soderhamn, Hudekswall, Sundswall, Skelleftea, and Lulea. The shippers are numerous, and their marks are legion. The various makers sort their output into 1sts, 2nds, and 3rds, on the one hand, and 1sts, 2nds, 3rds, 4ths, and 5ths, on the other. It is worth remembering that the thirds of some shippers are no better than the fifths of others, and that in Swedish stuff particularly the nominal quality has no great significance. The best wood is very clean, perhaps more free from knots than even the best Archangel shipments, but shows more sap, while even the highest grades contain their full share of centres. Still, properly converted, the first quality Swedish wood makes finished joinery second to none, costing a little more in labour perhaps than Archangel. It is therefore quite fitly included in joinery specifications, and the thirds and fourths make tough timbering sizes, the former being about similar to KEMI. I think the harder nature of the wood makes it superior to the Archangel for stress bearing purposes. A few of the better known brands are as follows: Joinery BSSC, KHB, KAB, SKB, with their respective seconds, which, in the same order, are BC, HAB, NAS, DOM.

Leaving Sweden, we come to Norway. The wood mainly consists of planed boards, floorings, and matchings, for ordinary speculative building, and so forth.

White Deal and Red Pine.

Leaving the yellow deal, there are one or two other woods which claim passing notice. There is the white deal of commerce, *Picea excelsa*, growing within much the same limits as *Pinus sylvestris*. We receive it from Russia, Sweden, and Norway, in the form of planks, deals, and boards. It is not so durable as yellow deal, and is not used for constructional work in the South, although it is largely used, with its American cousin, Canadian and Newfoundland spruce, which it resembles, for cheap work in the North and Midlands. It does not shake so readily as yellow deal, and some of the Archangel and Petersburg shipments are very free from large knots. It is therefore used for internal fittings, etc., but has not as yet entered into the calculations of the architect. The increasing difficulty of obtaining thoroughly clean and sound yellow deal, however, may yet bring it more largely into use in situations where it is not exposed to damp or the weather. The sap in this wood is very difficult to distinguish from the heart, which is or is not a virtue, according to the point of view.

We then come to Canadian red pine (*Pinus resinosa*). This is very similar to our European yellow deal, and was regularly imported before Russian and Swedish wood drove it out of the market to a large extent. It is sometimes used as a substitute for yellow deal, and may be accepted as such without hesitation, being quite equal to it in durability. The best parcels are quite as expensive as the higher-class European imports, and are preferred by some in the belief that they do not shake in seasoning to so large an extent as the latter. When worked up, an expert would find it difficult to distinguish from yellow deal, although the difference is fairly obvious in the imported plank

This brings us to the consideration of pitch pine (*Pinus australis* and *pinus palustris*), from the eastern seaboard of the Southern States of North America. It is imported in boards, deals, planks, and logs. I need say nothing in recommendation of it for joinery purposes, except to emphasize the excellent quality of the highest grade boards. It is sold in boards up to 12ins. and 14ins. wide, practically free from knots and sap, thereby permitting the builder to turn out work creditable to himself and satisfactory to his client, which is not easy of accomplishment when the material is yellow deal. As a substitute for the Memel or Danzig fir it is now almost universally accepted by public bodies as well as private individuals, and I hope that architects will render it its due meed of recognition by specifying it, except in those rare cases where special considerations make the European fir necessary. I may say that Laslett, the author of "Timber and Timber Trees," and once Timber Inspector to the Admiralty, made exhaustive experimental comparisons between pitch pine and Danzig fir, which seem to show that there is no appreciable difference between the two.

We next come to

Oregon or British Columbia Pine,

which is, strictly speaking, a fir, being known to many as Douglas fir. The wood bears a close resemblance to pitch pine, both in the balk and when worked up. It has one or two advantages over pitch pine, inasmuch as it is imported regularly in very useful sizes, sawn into square-edged planks, 4, 5, 6, 7, and 8ins. thick, 12 to 18, and sometimes 20 to 24ins. wide, in lengths of from 12 to 40ft. These are piled under sheds in the docks, instead of being floated in the ponds, which is the usual method of storing pitch pine. The few parcels of pitch pine planks which are imported in similar dimensions do not seem to remain so sound as the Oregon pine when kept out of the water, so that the contractor, in converting roof and other timbers, has to remove the outsides from pitch pine logs, at considerable loss to himself. On the other hand, the dry Oregon pine planks minimize the waste, and the enormous dimensions of the tree permit shippers to send them practically free from sap. Against these advantages is to be set the conviction of some that Oregon pine is less durable than pitch pine. Without being dogmatic on this point, it must be admitted that the spring wood in some of the faster grown trees is somewhat soft, and scantlings converted from them would not stand alternations of wet and dry conditions so well as pitch pine. If the slower grown wood is selected, however, and it is used for internal work, many architects make no objection to its use. It is fair to set off its greater freedom from sap and shakes against the possibly superior toughness of pitch pine. It is used by a sufficiently large number of architects to warrant its inclusion in the list of merchantable alternatives to Baltic fir, and subject to the conditions named is regarded as a reasonable substitute for pitch pine. The ordinary or merchantable quality is used for constructional work, and there is a higher grade, known as select, which is worked up into joinery. There are no so-called firsts and seconds in the shipments, nor are there any well-known and authoritative marks such as can be quoted as a permanent standard. One large firm of shippers, the Hastings Saw Mill Company, mark their ordinary quality with one crown and their select with two, but the practice is not universal.

There is no difference between the Oregon and British Columbian wood, the distinction merely indicating the shipping district. Sometimes merchants possessing the British Columbian variety are inclined to consider that the better, but the arrival of a good cargo of Oregon pine usually dissipates that impression.

Joinery Timbers.

This exhausts the regular carcassing timbers. A considerable amount of Quebec yellow pine and Kauri pine is used for joinery, and gives admirable results. It may be worth while to note in passing that yellow pine (*Pinus strobus*) is largely known in America as white pine, and in England is sometimes called Weymouth pine. It is the mildest and easiest to work of all the pine family, being used by engineers for pattern-making.

Kauri pine is a New Zealand wood (*Dammara australis*). It yields magnificent planks, and is one of the very few woods which are obtainable in large dimensions quite free from pith, knots, and sap. It makes very handsome joinery, and its use is always a source of satisfaction to the contractor. It is one of the very few woods which shrink endways, or in the direction of the grain, in seasoning, but the fault can be overcome by reasonable care in conversion. This wood is not to be confounded with Karri (*Eucalyptus diversicolor*), which is a hard wood, used for paving blocks, piles, etc. It bears no resemblance to Kauri pine, but the similarity in name and the fact that it is an Australian wood sometimes cause confusion.

The foregoing references to the soft woods of commerce will, I hope, help us in agreeing upon the formulæ which we seek. But before building them up we may spend a minute in considering one or two facts which apply to soft woods generally. The first is that the quality of nearly all timber imported into England has steadily deteriorated during the last twenty years, the leading exception, viz., Kauri pine, being unfortunately a joinery and not a carpenters' wood.

Inaccessible Supplies.

No doubt there are thousands of mature and well-grown trees in the forests of Europe and America which would yield just as good timber as that which we used to receive. But the trouble is that they are, so far, inaccessible. The foreign shipper will not buy or cut down trees upon which he cannot earn a profit. When the cost of carriage rises beyond a certain figure, it becomes prohibitive, and the shipper falls back upon those forests which lie sufficiently near to the railways and rivers to permit of his getting the wood to the port of shipment at a certain price. These have already been worked, and the finest trees removed. Natural regeneration and state regulated replanting together fail to keep pace with the development of the world's demand. European countries which once dipped very little into the available Russian and Swedish supplies now compete with the United Kingdom as bidders for yellow and white deal. At this moment Italy is buying it very largely for the erection of temporary buildings in Sicily and the mainland, in consequence of the recent disastrous earthquake. The standard of comfort in the poorer countries is rising, which means that the demand for wood per head per annum is increasing. Our own Colonies import Baltic stuff for house building, finding it cheaper to do that than use their own woods, which are either too hard to work for the purpose or too valuable as exports, so that South Africa, Australia, and New Zealand are growing markets for the material we want.

Ninety Years to Wait,

Afforestation will not help us in our own generation. Although yellow deal now grows in the United Kingdom, it does not exist in really merchantable quantities or dimensions. The Royal Commission which has recently reported upon afforestation is of opinion that it can be grown here in bulk, and that scientifically planted forests will eventually produce good, clean, usable timber. But we shall have to wait about ninety years before the trees will yield cut stuff sufficiently wide and long. Meanwhile, the destructive process is going on, and the cutting of young wood in Norway and Sweden for wood pulp is further retarding the work of replenishment. Therefore, we must do the best we can with the resources at our command, and while anxious not to appear as an apologist for poor or shoddy work, I think we must take these facts into account in the specification and inspection of timber. Importers appeal to agents and shippers in vain for deals and planks which shall be free from sap, shakes, large, loose and dead knots and other defects. Money will not buy them. Timber is not a manufactured article, which a sufficiently tempting price will bring forth in perfection. It is a natural product, and the architect, builder and merchant have jointly to bemoan the fact that Nature is a wasteful woodman. The picturesque shapes which make a well-wooded landscape so attractive spell defects in the woods, from an architectural point of view. If you take a walk through Kew Gardens, or through such a well preserved section of the Sussex Weald as the Duke of Norfolk's Natural Park at Arundel, you will see some noble trees, but surprisingly few which are sufficiently straight in the stem and free from branches to produce a 20ft. plank free from pith, sap, and knots. The sap is the circulatory system of the tree. The growing stem of the tree must of necessity use twenty or thirty of the newest rings as avenues up and down which its life blood must travel. Every broken branch means a dead knot. External injuries produce rindgalls. Wind and frost cause cup shakes. Fungi induce decay.

To sum up, the wood of to-day is admittedly imperfect, and the question arises, "What measure of imperfection, if any, is permissible in timber used for contract work?" The answer to that question will determine the wording of timber specifications.

What Shall We Say about Sap ?

It is safe to say the area of a transverse section of a typical *Pinus sylvestus* will show about two-thirds heart and one-third sap. That two-thirds heart is roughly circular in shape. Cut a parallelogram from it. You have about half the area of the original section in that parallelogram, with a centre, or pith, in it. Can we afford to lose half the tree? Of course, everything depends upon the class of work in hand, and for some exceptional contracts, no doubt every particle of sap must be eliminated. But is that always necessary?

If trees are felled in the winter, when the live sap is not filling the cells, and properly seasoned, the sapwood is visible but bright, and light coloured. If trees are felled during spring and summer when the juices of the tree are circulating, the cells contain chemical combinations which are liable to decomposition or to the attacks of fungi. The sapwood of such trees becomes discoloured, turning green or blue, and is unfit for use. At best the sapwood is less durable than the heart. But if perfectly bright, and not exposed to variations of humidity in the atmosphere, it will last and take a share of the load. That is to say, it is generally assumed that a 9in. by 3in., showing one inch of bright sapwood at the edge, will be stronger than the 8in. by 3in., which would remain were the inch of sapwood removed.

So far as

Internal Joinery

is concerned in panels, mouldings, etc., where the element of strength is not important, the problem becomes largely one of appearance, or interference with decorative effect. The general practice of to-day tolerates the use of a limited proportion of bright sap for all but the very highest class of work. But very few specifying clauses contain any hint of permission for the inclusion of the smallest modicum. Here we have a difference between theory and practice which has frequently caused serious friction. Before leaving the point, let me warn all concerned against deals containing a certain kind of pink, soft, mellow-looking wood, the curve of whose annular rings shows that it was cut from a large and mature tree, and which is usually quite free from any suspicous of sap. It is over-ripe and decaying stuff, far inferior in strength to the youngest sapwood in the healthy tree.

Then What About Knots ?

The large dead knot is a source of weakness, but the live knot, firmly attached to the rings of living wood, may be regarded as playing its part in bearing stress. The small dead knot if its dimensions do not break into many of the annular rings, is a negligeable quantity so far as strength is concerned. Here again the question of disfigurement comes in, and only the class of work and the prominence of the piece of timber can determine what knots may be passed as permissible. As to centres, a sound centre is rarely objected to if completely boxed in by the surrounding wood, and is, of course, inevitably passed in the case of very large carcassing stuff. Referring to shakes, the extent and effect of any divisions in the fibres of a piece of timber are so variable as to prevent any laying down of hard and fast rules on paper respecting them, cross shakes, of course, being regarded as completely outside the pale under any circumstances. Their injurious effect depends upon their length, depth, width, and continuity. The inevitable shrinkage caused by seasoning must effect division here or there in the rings of any large scantling, and only personal examination of the piece itself, and a knowledge of the use for which it is intended can determine whether a shake is injurious.

Suggested Workable Clauses.

Putting all these considerations together, I suggest the following as workable clauses for the regulation of joiners' and carpenters' timber. Seeing that there are so many clauses of work, I should welcome any suggestion from the profession as to the provision of two or more alternative clauses, for use in accordance with the level of practical excellence required or the pecuniary resources of the individual or institution for whom the work is done:—Wood for carcassing or carpentry shall be sawn out of sound, bright, square-edged Baltic or White Sea planks, deals and battens, or Danzig fir, pitch, Oregon, or British Columbian pine of similar quality. The wood for joinery to be Baltic or White Sea yellow, equal in quality to the best Russian or Swedish shipments. All to be free from injurious open shakes, large, loose, or dead knots, or more than a small proportion of perfectly bright sap, and thoroughly seasoned.

FIRE-RESISTING CONSTRUCTION SECTION.

(MONTHLY.)

AN INEXPENSIVE FIRE-RESISTING HOSPITAL.

The King Edward VII. Hospital, Windsor, has been erected on high ground facing the Cavalry Barracks. The completed scheme provides for 100 beds, but only 40 are now being erected, besides a temporary children's ward for seven or eight cots, an out-patient department, an isolation block, and a mortuary. The main entrance is in the centre of the administration block. Opposite the front door is the entrance to the board-room, which is divided from the entrance-hall by a removable screen partition, so that, on the occasion of entertainments, the board-room and the hall can be thrown into one large room. A central corridor runs right and left of the hall, giving access to lift, matron's and secretary's rooms, and to the temporary children's ward. It is hoped before very long sufficient money will be given to enable the children's wing to be built, but for the moment the end of the administration block is being used. On the right are the resident medical officer's and the dispenser's room, also two casualty-rooms, with outside entrance, as receiving-rooms for accidents; then a passage-way giving access to the ward for twenty beds, with a good balcony at the end. Cut off, but easily accessible, is the out-patient department, with the physicians' and surgeons' rooms to right and left of the waiting-hall. The mortuary and isolation blocks are detached from the main blocks. On the first floor are the operating theatre, anæsthetic-room, sterilising-room, etc., nurses' dining and sitting rooms, and another ward for twenty beds. The kitchens, sculleries, etc., are on the top floor, with a separate staircase from outside, and two lifts for food, etc. A portion of the ground has been excavated for boilers, workshops, linen-sorting, etc. The work was commenced in December of 1907, and the hospital was ready for occupation in October. The buildings are constructed on the Frazzi system with steel framework, the building by-laws of the district having been altered by special permission of the Local Government Board to permit of this method of building. It is the same as that used at the National Sanatorium at Benenden, in Kent, designed by the same architect, Mr. A. William West, of Lyall Street, S.W., the cost being about half of what it would have been if executed in brickwork in the usual way. The important features of the Frazzi system of construction consist in the use of a steel frame of considerably lighter design than that usually adopted in "Skeleton" construction, and in the building of the external walls with Frazzi hollow terra-cotta slabs of only 3ins. in thickness, which not only are satisfactory from all hygienic points of view, but form rigid walls of great strength, capable of carrying weight. They are at the same time less than one-tenth the weight of a 14in. brick wall. The slabs are rough cast externally and plastered internally, forming walls of a total thickness of 4¼ins. only, and their heat conductivity is immensely less than that of concrete. All the internal partitions and many of the floors are also formed of Frazzi slabs, and the construction chimneys and ventilating flues is carried out with Frazzi casing and fireclay flue linings. The erection was carried out by the Frazzi Fireproof Construction, Ltd., of Essex Wharf, Whitechapel, E., the builders' work (joinery, framing, fittings, etc.) being done by local contractors.

REINFORCED CONCRETE CONSTRUCTION: DESIGN, QUANTITIES AND PRACTICE.

By Moritz Kahn.

Short abstract of a paper read at a general meeting of the Quantity Surveyors' Association, on April 28th.

Of late the use of reinforced concrete has become so extensive in building construction that quantity surveyors should have a general knowledge of the subject, if indeed not a specialist one.

The objects of this paper are, first to induce discussion on the principles of reinforced concrete construction, and, secondly, to indicate the method of measuring and pricing this type of work.

Comparative Costs.

It is erroneous to say that reinforced concrete will always prove the cheapest method of construction. There are instances where it is not so cheap. Middle-sized and small residential buildings, small manufacturing buildings, and the ordinary one-storey type of building will show very little saving when reinforced concrete is used in their construction. A low retaining wall 6ft. high would be cheaper in brick than in reinforced concrete, inasmuch as it would require a comparatively thin brick wall to withstand the strain; but a retaining wall over 10ft. high could easily be constructed in reinforced concrete cheaper than in brick. Isolated girders and roof trusses high in the air will invariably prove cheaper in steel than in reinforced concrete; but a steel structure, after having been built, will always require a certain amount of upkeep, and the maintenance charges thus entailed will have considerable influence on the total cost. In brief, though the material under discussion may not always be the cheapest in first cost, it is generally the most economical when all things are taken into consideration, such as the additional safeguard against fires, with a corresponding efficiency in one's plant, the saving in fire insurance premiums, and the reduction in maintenance charges.

Materials and Transit.

One of the reasons for the popularity of reinforced concrete lies in the fact that the constituents from which it is made can easily be obtained in almost any locality. In every part of England there are cement mills, and it is never necessary to look far for sand and crushed stone or ballast. These materials being found near the site produce a considerable decrease in the freight charges of building materials. The only remaining constituent which need be brought any distance is the reinforcing steel; this, however, will only be about 20 per cent. of the weight of material required in an ordinary steel structure, and the freight will be correspondingly reduced.

In the

Selection of Materials

the question is often asked whether preference should be given to crushed stone or ballast. Engineers are wont to object to the use of the latter, on the ground that the surfaces are generally round and too smooth. It has often been demonstrated that round, smooth ballast gives just as strong a concrete as crushed stone. This statement might be

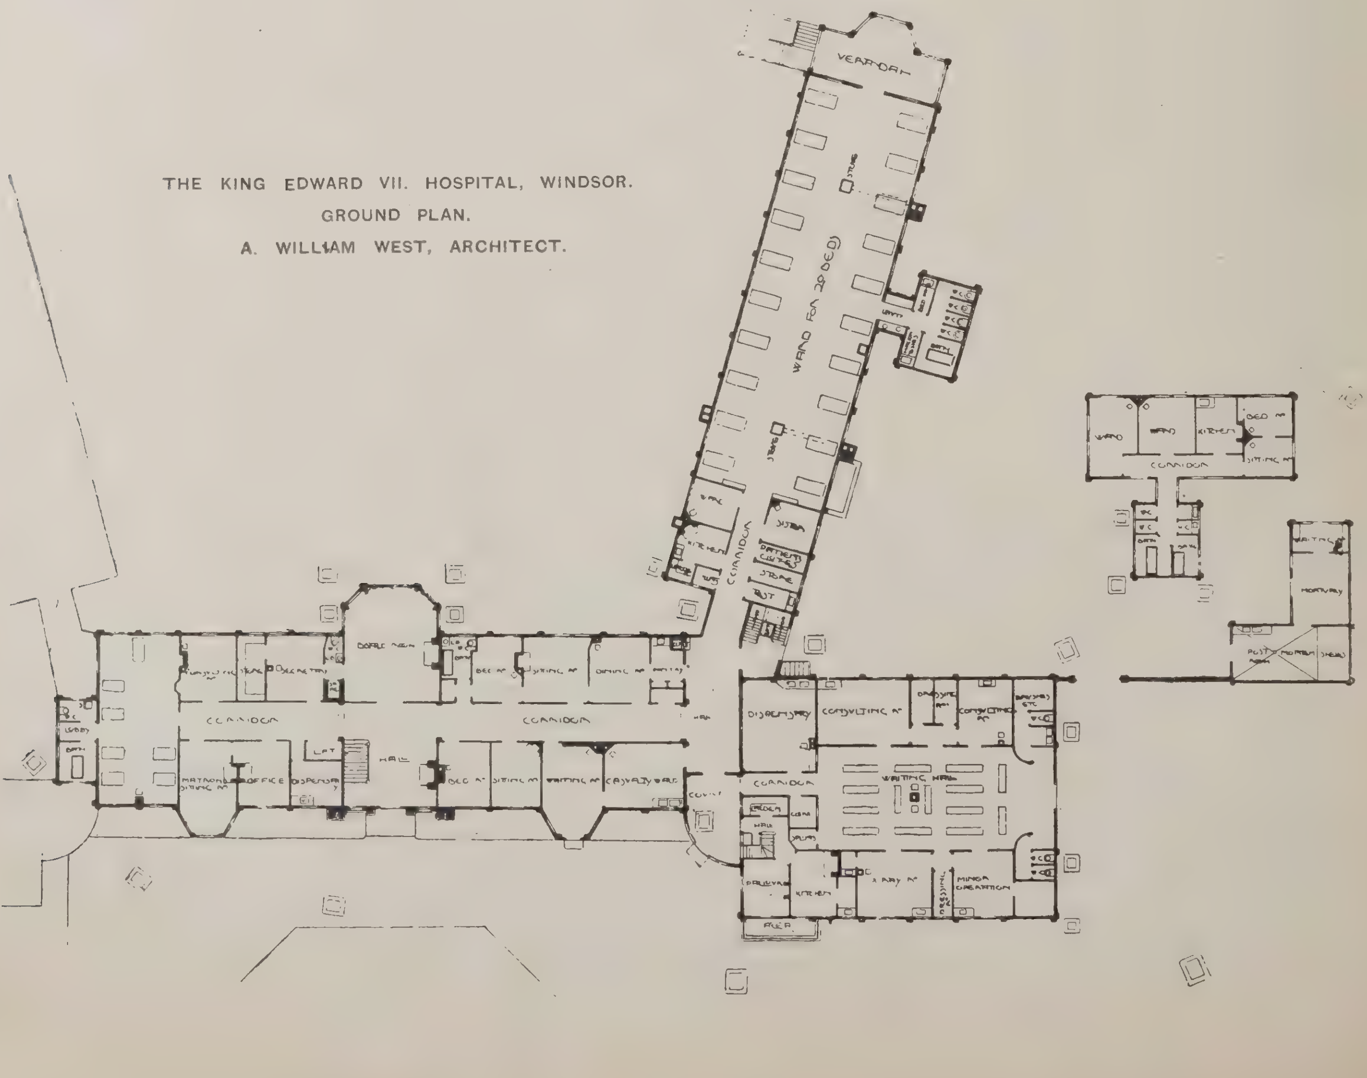
qualified by the fact that in the early stages, say at the end of two weeks, crushed stone concrete will be found to be a little stronger than ballast concrete, but at the end of 30 days ballast concrete is just as strong as stone concrete, and from that time on its strength begins to surpass it.

Ballast as a Fire-resisting Material.

Ballast is often considered unsatisfactory as a fire-resisting material. At a fire test made recently, it was found that ballast concrete would not stand the ordeal, but the ballast used in that test was uncrushed, and portions of it were of considerable size. Large stones when heated to a certain temperature will burst, owing to the internal strains exerted therein, but small stones heated to the same degree will not disintegrate. If the ballast used in that test had either been crushed, or screened to pass a ¾in. mesh, the floor slab in question would have successfully withstood the test. A similar test was made by the author for the New York City Fire Department in 1904, using crushed ballast concrete, with satisfactory results.

Mixing, Hand and Machine.

The use of a good batch machine mixer is advisable on every large construction. When the concrete is mixed by hand it is turned from six to eight times, but a machine mixer turns it at least twenty times in a much shorter period, and at a considerable saving in expense. In truth, a good machine mixer should actually be specified, provided the size of the construction and amount of concrete to be mixed warrant the expense of installing such a plant. In general, it will be found that in all constructions involving a



THE KING EDWARD VII. HOSPITAL, WINDSOR.
GROUND PLAN.
A. WILLIAM WEST, ARCHITECT.

quantity less than 400 or 500 cub. yards the concrete will be more economically mixed by hand than by machine, but in larger constructions the reverse is true.

Stresses and Strains.

That concrete is incapable of resisting all the shearing strains, and all internal tensile strains resulting therefrom, is now generally recognised, and in proper designing provision is made for overcoming all internal strains, whether they occur at the end of a beam, in the web, or at the centre of the beam in the bottom flange.

Theory of Reinforcement.

In a beam uniformly loaded, the maximum tensile strain on the steel will occur at the centre of the span, where the bending moment is greatest. At the same time, the maximum shearing strains on such a beam will occur near the points of support. The ultimate resisting value for concrete to shear is about 300lb. per square inch, and if the total shearing strain on any plane exceeds 300 times the area of that plane failure is bound to occur therein. Concrete being weak in tension, the various particles will fail in directions parallel to the lines of principal tensile stress, and the plane formed by the failure of these particles will be in the lines of principal compressive stress. Reinforcement could be adopted, which would embody small rods curving along the lines of principal tensile stress. A beam thus reinforced would be constructed with a minimum amount of material for the maximum strength, but such a system of reinforcement would necessitate the use of a multitude of small rods.

Measurement and Pricing.

Having given a brief account of the principles underlying reinforced concrete construction, and having described the Hennebique, Coignet, and Kahn systems, the lecturer passed on to the subject of measurement and pricing. The quantities of a reinforced concrete construction should be taken out in considerable detail. The cost of concrete in different portions of the structure varies considerably, and it is therefore desirable to know the yardage of concrete separately in footings, foundations, walls, columns, beams, girders, decking slab, and so forth.

The Cost of Centering

varies in a similar manner. This should be measured up separately by the superficial area of the surface coming in contact with the concrete, namely, for walls, columns, beams, girders, decking slab, and so forth. Thus, walls are measured both sides, without deducting doors and windows, as it is usual to let the form work run straight across these, unless it is impossible on account of mouldings, in which case the framing of the opening will cost as much as the form work omitted. Columns and beams should be measured by their girth, and decking slab by the horizontal measurements. No deductions should be made for the loss of area by the intersection of beams and girders, and small openings in the floor should not be deducted. Anything as large as an elevator or staircase opening is usually deducted.

Extra labour involved in belt courses, moulding, cornices, and so forth, should be measured by the lineal foot, giving the girth of same. All special features of exterior treatment should be carefully noted.

The steelwork should be taken off in lbs., and again, the amounts used in the various constructions should be kept separately.

The Question of Finish.

The greatest source of contention in reinforced concrete construction lies in the question of finish of the work, and therefore great care should be taken to specify the kind of finish required, and accurately measure to the surface area of the various kinds. If no particular finish is included in the contract for the reinforced concrete work, there should be a clause to the effect that all such work is to be left free from the centring. The upper surface of floors can either have a granolithic finish, screeded surface, or surface left from the spade. If either of the first two is required, the yardage should be measured. There is, of course, no extra charge for leaving the floors with a spade finish.

(To be concluded.)

R.I.B.A. EXAMINATIONS.

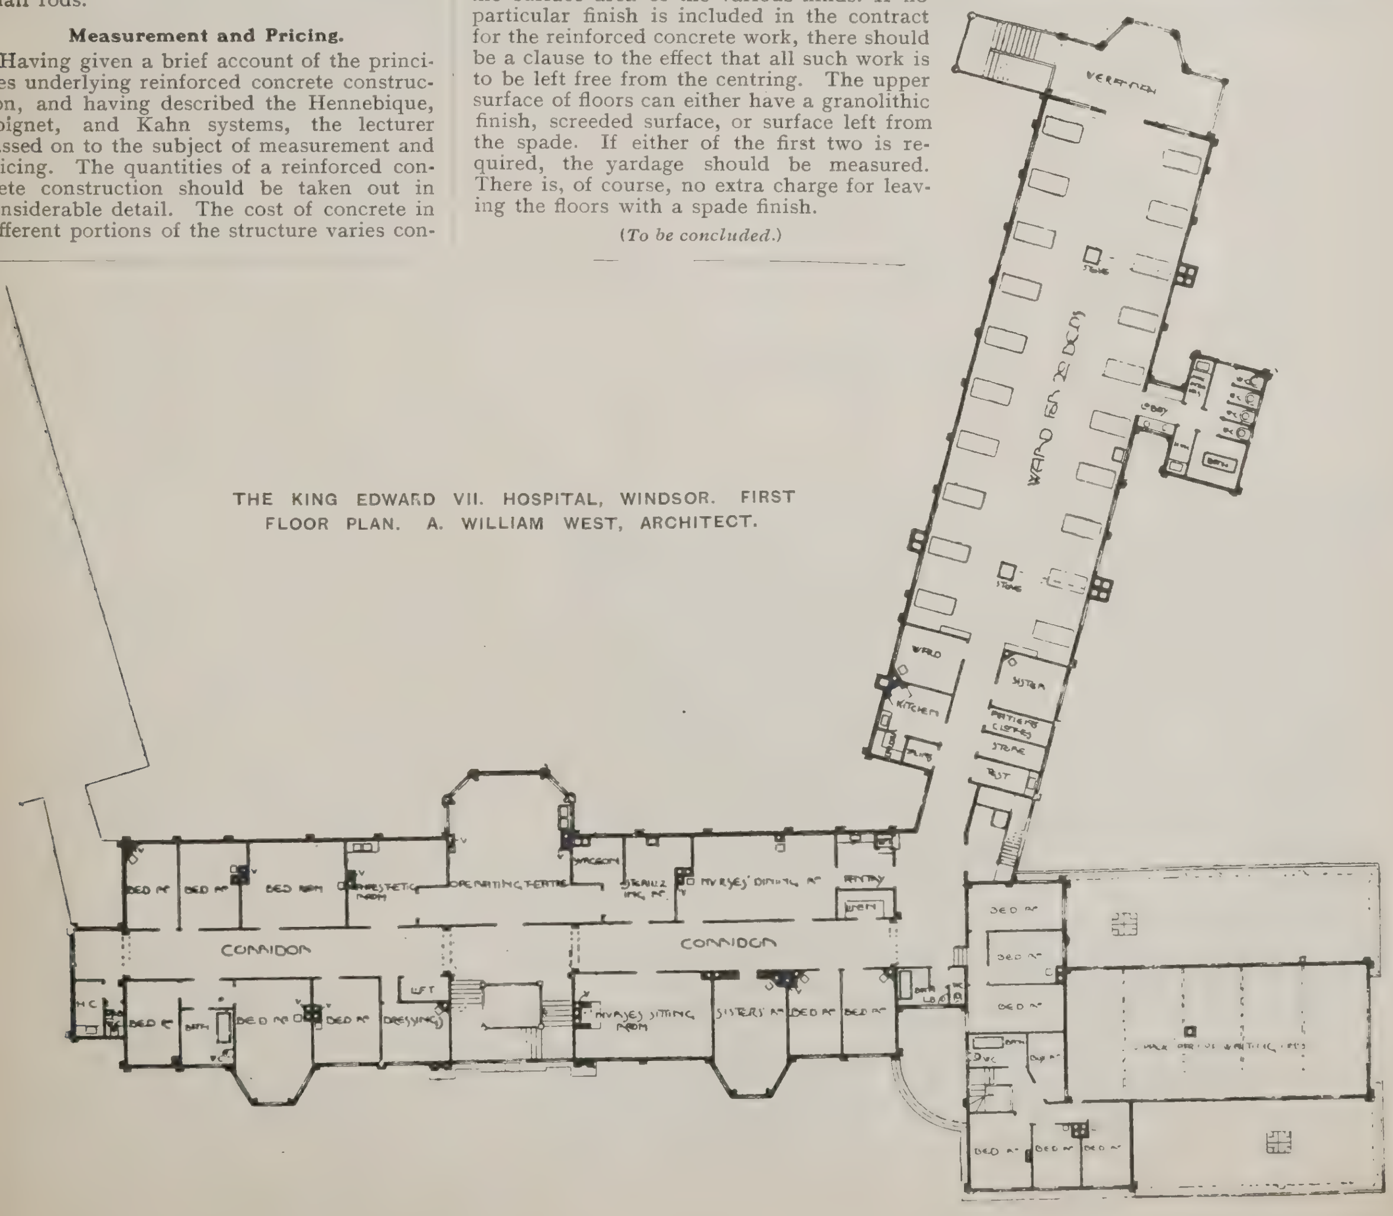
The report of the R.I.B.A. Board of Education includes a statement to the effect that the following modifications in the intermediate and final examinations will come into operation this year:—

The Intermediate.—The following specific subjects will be omitted from this examination in future:—1, Classic Ornament. 2, the Characteristic Mouldings and Ornament of each Period of English Architecture. from A.D. 1000 to 1550, with their application. 3, the Orders of Greek and Roman Architecture; their Origin, Development, and Application. 4, Outlines of the History of Mediæval and Renaissance Architecture in Europe.

Instead of the above, two papers will be set on (1) the General History of Architecture; and (2) the Purpose of Architectural Features in Relation to Buildings in which they occur. Answers to be accompanied by explanatory sketches.

The Final and Special.—The following specific subjects will be omitted from the examinations in future:—Subject II., the Principal Styles of Architecture: their Features, Mouldings, and Ornament. (1), the Characteristic Mouldings, etc., of the Special style selected by the student; (2), the Characteristic Mouldings, etc., of the Principal Styles of Architecture.

Instead of the above the following papers will be set:—*Morning*—The Principles of Architecture: their Theory and Application. Illustrated by drawings, *Afternoon*—A written thesis. Illustrated by sketches.



THE KING EDWARD VII. HOSPITAL, WINDSOR. FIRST FLOOR PLAN. A. WILLIAM WEST, ARCHITECT.

THE KING EDWARD VII. HOSPITAL, WINDSOR. VIEW FROM THE REAR. A. WILLIAM WEST, ARCHITECT.

The amended report of the diploma in Architecture Syndicate at Cambridge University was considered by a committee of the Board, who suggested certain modifications therein, and on the recommendation of the Board, the Council of the Institute forwarded the said suggestions to the Syndicate.

TESTS AT THE KLEINE EXHIBIT, OLYMPIA.

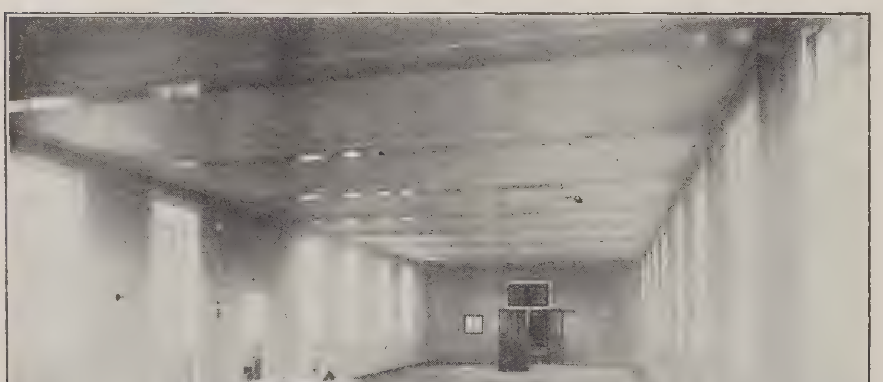
On Monday, the 3rd May, before breaking up their exhibit at the Building Exhibition, The Kleine Patent Fire Resisting Flooring Syndicate, Limited, gave an interesting demonstration showing the effect of heavy loads falling from a height on their floor.

As the floor in question had only been constructed twenty days and had not attained its full strength, and, moreover, was of a very light type, the object of the demonstration was not to show under what load the floor would remain unbroken, but was to show the effect of a heavy weight falling on to, or through, the floor. A stone weighing 90lbs. was dropped from a height of 10ft. in to the centre of the floor measuring 20ft. by 12ft.—the clear span between girders being the latter dimension. After repeated falls on the same spot—about 15ins. square—a hole was knocked through the floor, the stone remaining suspended on the tension bands. Similarly, a round iron shot weighing 30lbs. was dropped from a height of 18ft. on another part of the floor, the effect being much the same as in the case of the falling stone.

Against the side of the floor, consisting of one of the 9 by 4 girders into which the floor was built, a fine glass measuring tube was placed, between an upright wooden support, so that the least thrust or pressure on the steelwork would break the glass. There was also an ordinary hen's egg laid on the concrete surface of the floor a few feet from the spot on which the large stone was dropped, so that the least vibration would crack the egg.

On examining the structure after the test it was found that every portion of the floor except the small spaces on which the weights had fallen, was quite unharmed, and neither the glass tube nor the shell of the egg showed any fracture. It was thus proved to the entire satisfaction of the architects, engineers, and other gentlemen who were present at the demonstration, that even under great shocks from heavy loads falling through a Kleine floor, no harm would be done to any part of the building except the actual small area of floor on which the load had fallen. Particularly noteworthy was the absolute cohesion of the cement mortar joints in which the iron tension bands are embedded.

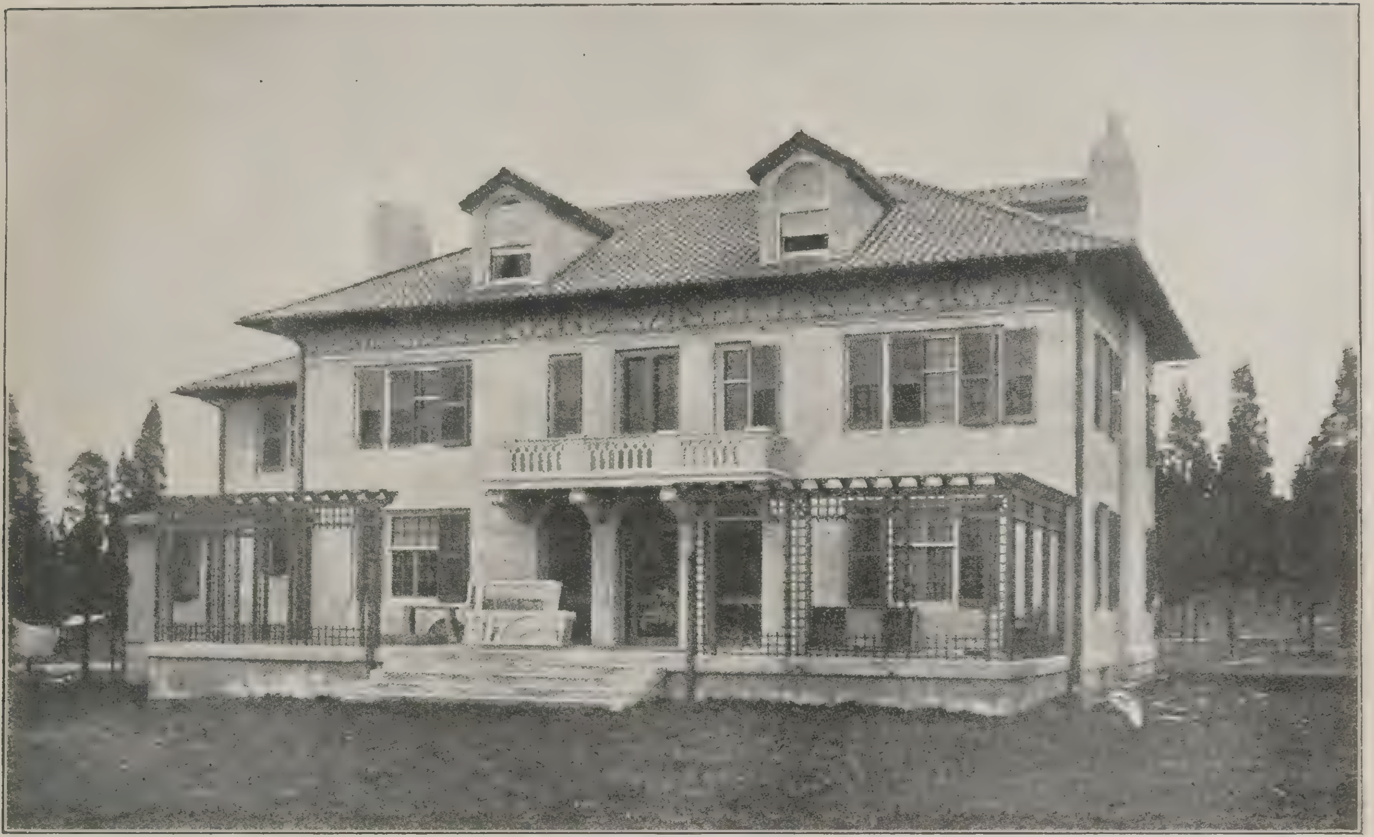
Although comparatively green after twenty days, not a sign of severance or loosening of the joints was to be seen anywhere, even in close proximity to those parts of the floor on which the weights had fallen.



THE KING EDWARD VII. HOSPITAL, WINDSOR, INTERIOR FIRST FLOOR WARD. A. WILLIAM WEST, ARCHITECT.

FIREPROOFING THE DWELLING.

A writer in the "Architectural Record," of New York—Mr. A. C. David—passes in philosophical review the causes that have led up to "The Advent of the Fireproofed Dwelling" in America, where people are beginning to prefer a well-made and non-inflammable house to one that is ill-built and at the mercy of every occasional fire. His article heralds the hollow-tile system of construction, which has sprung into sudden popularity in America, and is by no means unfamiliar in our own country. The cheap dwelling is going out of fashion. While the country was still young and growing rapidly, and economic conditions were swiftly changing, the American had no regard for permanency in his buildings. When as yet social conditions were fluctuating, he could not feel sure that he would continue long in the same city and in the same habits, and he felt still less assurance that his heirs would succeed to any fixed set of conditions. He built for present and pressing needs, and took no thought for the morrow. The insurance bills and the fire losses were enormous; but it would have been hazardous to build more substantial structures that might speedily lose their economic value through incalculable developments, and their æsthetic interest by the growth of taste. This unsettlement naturally affected business buildings, as well as dwellings. But it did not long outlast the construction of the railways, whose routes determined the sites of cities, and whose structures set an example of more substantial methods of building. Greater social and industrial stability led to greater stability in the building.



FIRE-RESISTING HOUSE, CEDARHURST, LONG ISLAND, U.S.A. LOUIS BOYNTON, ARCHITECT.

The "Skyscraper" Stimulates Fireproofing

The much-abused skyscraper turned men's minds to the very earnest consideration of means and methods of fireproofing. These tall buildings being so enormously expensive, it became necessary that they should be rendered as far as possible non-inflammable. For this and for other reasons the substantial fireproof building is becoming for the American business man the economical form of construction.

Domestic Fireproofing.

In the domestic buildings of America, as in those of Great Britain and elsewhere, too little consideration is given to fireproofing precautions. In the instances in which this point has been studied, the motive has usually been the safeguarding of rare furniture, pictures, and similar treasures. Still, the number of wealthy Americans who, while they could abundantly afford to have their houses as nearly perfect as science and art can make them, prefer to have cheap dwellings, "which are not even of slow-burning construction," is extraordinarily large.

Timber Dwindles.

A change of view, however, has been, during the past few years, plainly observable. In part it has been compulsory. Timber of all kinds has grown rapidly more scarce and more costly; so that the difference in cost between the old-style timber-constructed dwelling and the up-to-date fire-resisting structure is rapidly losing its force as a dominating factor in the choice of system. "Of course," says Mr. David, "a wooden house still remains the type of building whose initial expense is least burdensome; but in certain cases a man could figure that a fire-proofed building might be actually cheaper in the end. He could figure that in the course of a decade he would save enough in the cost of insurance, in the cost of repairs, and in the absence of deterioration, more than to compensate him for the larger initial expense. The consequence is that of late year a number of small fireproofed dwellings have been erected, costing from 5,000 to 15,000 dollars; and the number is constantly increasing."

FIRE-RESISTING HOUSE, BOGOTA, NEW JERSEY, U.S.A.
SQUIRES AND WAYNKOOP, ARCHITECTS.

A By-product of the Fireproofing Industry.

This extension of fireproofing methods to small houses is explained as being a sort of by-product of the fireproofing industry. "The enormous demand during periods of business prosperity and expansion has resulted in the building of vast plants for the manufacture of the different kinds of fireproofing materials—in particular, such materials as hollow tile and cement. These plants are employed to the limit of their productivity as long as business is active; but during a period of inactivity their owners are in very much the same situation as the owners of a steel-rail plant. They find it very hard, under such circumstances, to keep their machinery working; and they have naturally been seeking some source of consumption which might prove to be more permanent. The only possible source of a more continuous demand is that which might be developed among the builders of residences. Of course, the number of dwellings erected in a prosperous period is larger than the number erected during a period of business depression; but the population of the country increases steadily, and the variations in the demand for the materials entering into residence construction are slighter than those entering into the construction of large business buildings. The tile and cement manufacturers have, consequently, been willing to make sacrifices and to spend money in order to increase the use of fireproofing materials in domestic building; and their efforts have been attended with a certain measure of success.

All over the country

Hollow-tile and Cement Houses

are being erected in larger numbers than ever before, and the movement has only begun. There can be no doubt that the small as well as the large fire-resisting dwelling is destined to become a common type of building." It would be vain to speculate whether or not we in this country are likely to follow America's example with regard to the smaller buildings as readily as we have followed it with respect to the larger. At present the by-laws are prohibitive; but they are not likely to remain perpetually in force; but we are inclined to think that, even were this barrier removed, the old system of construction would still remain in favour, and would not be likely to see very radical changes.

Origin of Hollow-tiled Houses.

The hollow-tiled houses that have recently become so popular in America call for serious consideration. Hollow tile was, says Mr. David, manufactured originally for the purpose of affording protection for the steel framework of a modern skyscraper. Its use in ordinary construction is quite recent. It is easily and economically laid, and affords a rough surface to which plaster will adhere without the assistance of lathing. But, the larger the house, the greater the necessity for inserting cement beams and piers; and even in small houses hollow-tile construction involves the use of a good deal of cement. Nevertheless, the use of tile for the walls, and to a smaller extent for the floors of dwellings, has been an immense advantage to the cause of fire-resisting construction. "It has made possible," says Mr. David, "the partial or complete fireproofing of many residences which for one reason or another could not have been built of concrete. It involves a simple but sound method of construction, which can easily be mastered by the ordinary builder; and while it demands a higher and more careful standard of workmanship than a frame house, it does not call for the same sort of expert knowledge as does thoroughly good cement construction; . . . and in course of time the method of construction it involves will become still further diversified, simplified, and cheapened."

Structural Aspects of the New System.

The hollow-tiled house, then, is the fireproof dwelling whose advent Mr. David acclaims. His article is followed, in the same magazine, by Mr. H. W. Frohne's observations on "Some Structural Aspects of the Fireproofed Dwelling," in which the author begins at once with the admission that the hollow-tiled dwelling costs from ten to twenty-five per cent. more to build than a house of similar size built in the ordinary way. He points out, however, that whereas with the ordinary type of house the insurance rate is high, the life is short, and the cost of repairs is heavy, the hollow-tiled

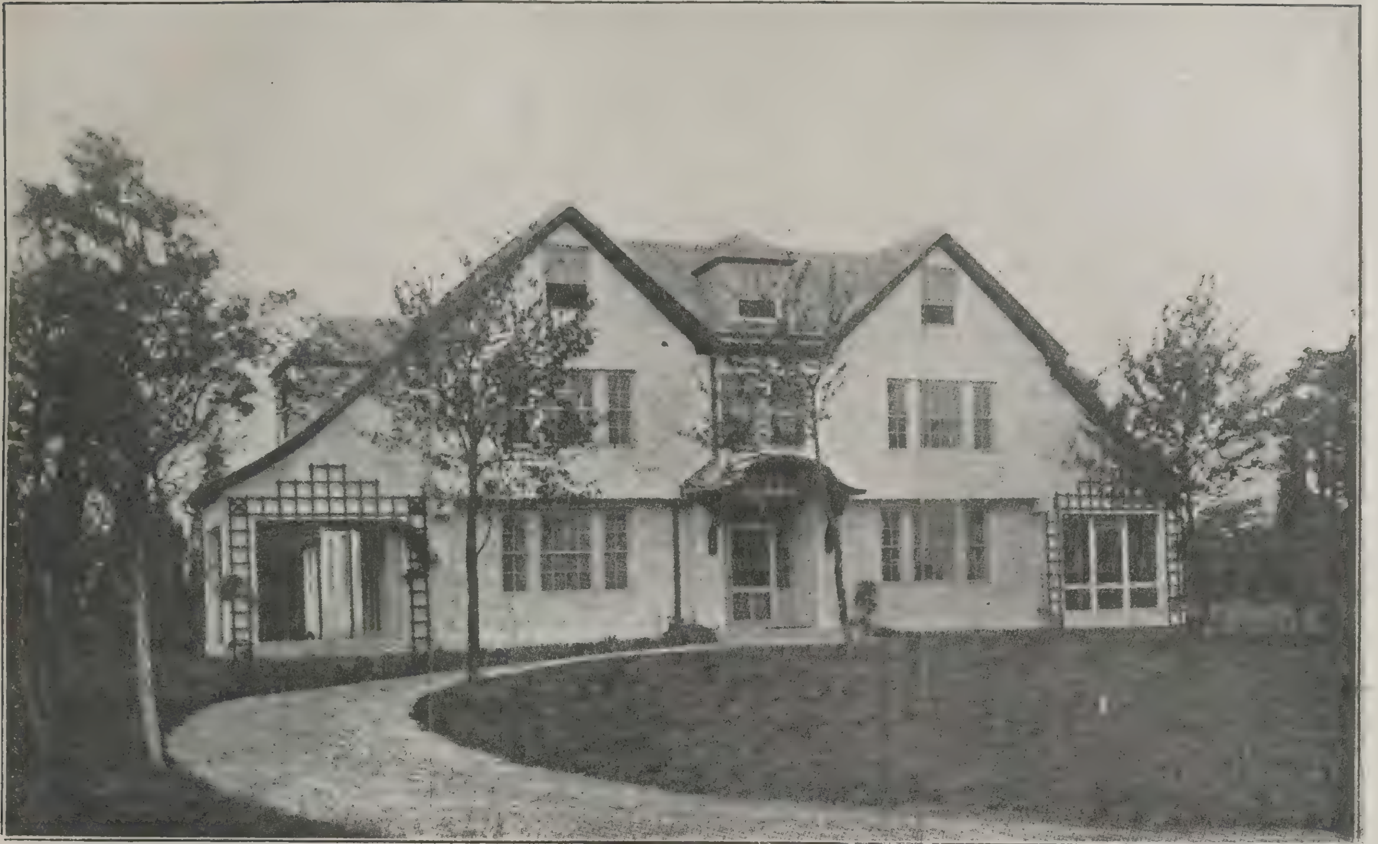
SECOND FLOOR PLAN



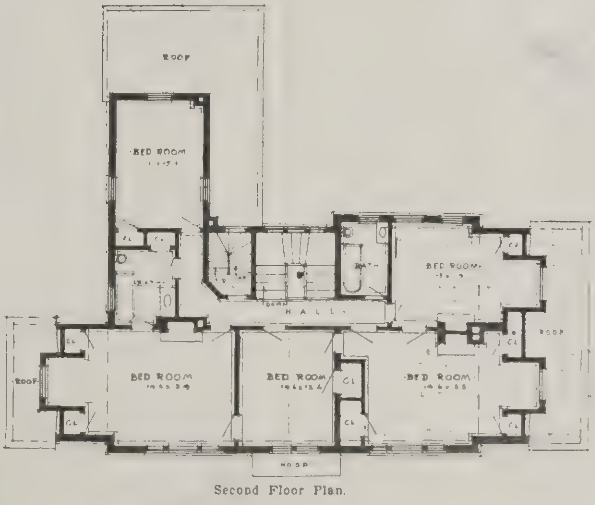
FIRE-RESISTING HOUSE (NO. 2) CEDARHURST, LONG ISLAND, U.S.A. — LOUIS BOYNTON, ARCHITECT.

would hardly need to be insured at all,' is practically everlasting, and costs little or nothing for maintenance in good repair.

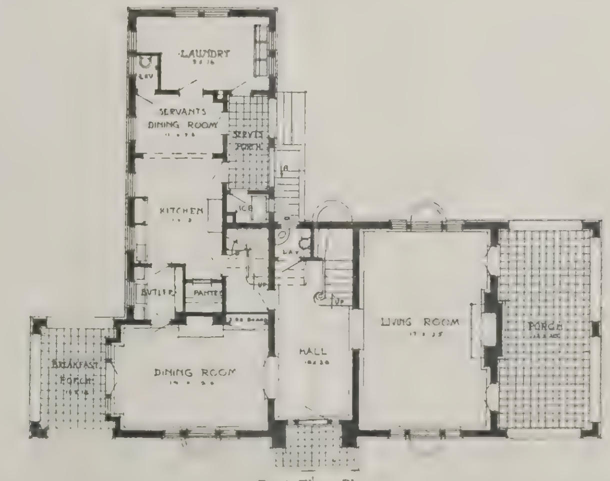
The Method of Construction.

Mr. Frohne illustrates a number of hollow-tiled houses, of which three examples are here shown; and he thus explains the method of construction: "Rows of hollow-tile, with alternating beams of concrete, containing at the bottom one or sometimes two very slender steel rods (generally one ⅜in., ½in., or ⅝in. rod in each beam is necessary), form the floors, while the hollow tiles, laid in Portland cement, constitute the walls; thinner hollow tile blocks, similarly laid, serve as the interior dividing walls or partitions. Under ordinary conditions the floors and walls are built of the same size tiles. These tiles are burned under a temperature of about 2,500 degrees Fahr. Those most commonly used in walls are about 8ins. deep, 12ins. wide, and 12ins. high, and, on experimental tests, have been found to possess a crushing strength along their height of more than 3,200lb. to the square inch of material in the cross-section, which allows for a very generous factor of safety in the walls and floors where they are used. Walls and floors so built are accordingly 8ins. thick, in addition to the thickness, in the case of walls, of half an inch of plaster for the inside, and an inch or more of cement for outside protection from the weather. The floors are then plastered on the under side with about half an inch of plaster, as is the inside of the walls; and the upper side of the floor may be treated as preferred."

The cost of roof construction for the fire-proof dwelling is admittedly heavy, as it may involve the use of reinforced concrete rafters; and of course the ordinary roof is not highly fire-resisting. But the roof problem is engaging the earnest attention of inventive brains, and its solution is probably only a question of time. The future of the system depends largely on the degree to which its cost can be reduced. It is quite possible that in this respect the experts in hollow tile construction who are already doing a brisk business in our own country may be able to show our American cousins a good lead.



Second Floor Plan.



First Floor Plan

FIRE-RESISTING HOUSE (NO. 2) CEDARHURST, LONG ISLAND, U.S.A. LOUIS BOYNTON ARCHITECT

BRITISH URALITE CO.'S FIRE-RESISTING PRODUCTS.

By invitation of the British Uralite Co., Ltd., a representative of this journal visited their works at Higham, Kent, on Wednesday last, when a party of Royal Engineers, about thirty in number, were conducted round the works, and had the various processes explained to them by Mr. C. R. Hoare (chairman), Mr. Davidson (managing director), and various heads of departments.

The basis of the British Uralite Company's products is asbestos. This, it was explained, is a mineral fibre composed of neutral and practically infusible silicates of lime and magnesia. Glossy as silk, and often as finely fibrous, this mineral can yet resist the attacks of extremely high temperatures, and show not the least sign of fusion or any other kind of damage. Nor is it affected by the strongest acids.

It was a Russian engineer officer who, perceiving how useful a building material could be made from asbestos, hit upon the happy idea of adapting millboard-making machinery to the manufacture of sheets of asbestos. Much of the plant, therefore, is reminiscent of the paper-mill. The asbestos, like the raw material for paper-making, has first to be freed, by means of an air-blast process, from all traces of rock and other foreign matter. It is then placed in a "beating and mixing engine," in which it is disintegrated and beaten to a sludge. The sludge or pulp is fed into a receiving trough at one end of the modified type of millboard-making machine, and, carried along an "endless" webbing, under and over several cylinders, it at last emerges in the form of a limp and plastic asbestos sheet. The material has taken shape and substance, but it is not yet Uralite. It must pass through many processes, from which it must finally emerge rigid and flawless.

The machine can produce 700 sheets of Uralite, 6ft. by 3ft., ⅛in. thick, in eight hours; but the finished product will not be allowed to leave the works until it has matured for six months. The sheets, after undergoing a series of elaborately graded stoving operations, are steeped alternately in solutions of sodium silicate and calcium chloride, with the effect that silicate of lime is deposited in the interstices of the fibres, stiffening the material into a rigid sheet, while approximating, chemically to the composition of the asbestos itself. Uralite is therefore, it will be seen, a purely mineral material, of homogeneous composition, and therefore not subject to decay, fibrous in structure, and therefore tough and strong, and, in its nature and essence, eminently fire-resisting.

Uralite is in no way affected by gases, acid fumes, or damp, and has therefore been adopted in chemical and explosive works, foundries, breweries, and similar buildings, as well as in hospitals, where its hygienic character is well recognised. Messrs. Reckitt and Sons, Ltd., the starch, blue, and blacklead manufacturers, have fitted a large quanitity of Uralite for the ceilings, etc., of the new packing-rooms at their Hull works, in full confidence that it will prove here (as it has proved in recorded instances) an effective means of confining any fire within the limits of the room in which it may happen to start; and with the same object, they have lined staircases and goods hoists with this material.

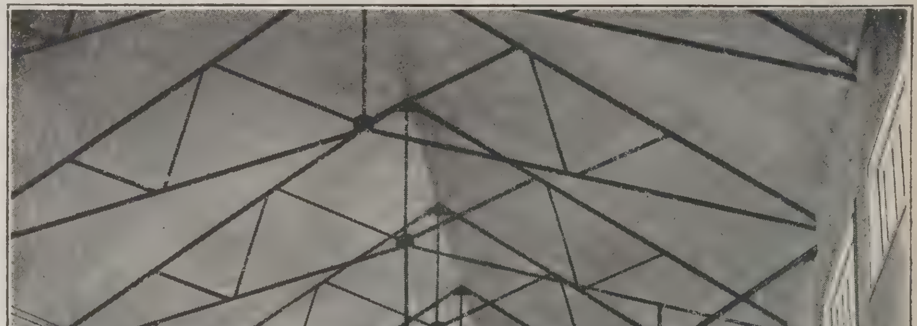
Large malt-kilns at Burton-on-Trent, Dublin, Glasgow, and elsewhere, have been lined with Uralite, which not only reduces the fire risk to a minimum, but prevents condensation, and is proof against sulphur fumes.

Uralite roofing has been used in all parts of the world, its lightness (1lb. to the square foot) and its immunity from breakage rendering it an ideal material for shipment and general conveyance, while its resistance to heat, its non-conductivity, and defiance of the ravages of insects make it peculiarly suitable for the tropics. It is manufactured in large sheets (up to 6ft. by 3ft.) for use on the Colonial system; also in large or small diamond tiles; and in most of the usual slate sizes.

The Uralite fireproof doors, of which two illustrations are here given, are, however, of three several types. The warehouse door is built up of two thicknesses of wood (cross-grained), with one thickness of Uralite between, and both faces and all edges covered with two thicknesses of Uralite. The armoured door is similar in construction to the ordinary armoured door, with the important addition of a layer of Uralite between the wood foundation and the steel sheeting. The door designated "Uralite ordinary" has panels formed of a double thickness of Uralite; the whole area of the door, including the edges, being similarly protected. The warehouse door has successfully undergone a severe test by the British Fire Prevention Committee, who reported that, although a temperature of 1,780 degs. Fahr. had been reached, "the outer thickness of Uralite was not damaged." Doors protected with this material form part of the company's fire-testing hut at their works, and have endured unscathed many a fierce fire. At a test in this hut on Wednesday last, a wooden box lined with Uralite was kept in a fierce flame for half an hour, and yet its contents—sulphur, paraffin wax, and thin lead, a sheet of paper, and a cotton handkerchief—were in no way affected.

Uralite Asbestone, an improved form of asbestos cement sheet, manufactured by the British Uralite Co., is also an excellent fire-resisting material. It may be used for outside walls, as well as for interior partitions, ceilings, roofing, etc.; and, like Uralite, it is easily and rapidly fixed, is light and durable, and can be painted or papered immediately after erection. The firm's London offices are at 16, St. Helen's Place, E.C.

THE WAREHOUSE AND THE ORDINARY TYPES OF URALITE FIRE-RESISTING DOORS.



BALLOON SHED AT THE ARMY BALLOON FACTORY, ALDERSHOT. LINED WITH URALITE SHEETS.

Federation News.

BRISTOL ASSOCIATION.

Secretary: A. J. Pitt.

The Bristol Association annual dinner was held on March 30th at the Royal Hotel, under the presidency of Mr. Frank N. Cowlin, who had the pleasure of seeing nearly 100 present, including Mr. E. J. Brown (president of the National Federation), Alderman H. W. Twiggs (chairman of the Bristol Docks Committee), Mr. F. Chown (vice-president of the Bristol Association), Mr. Mowbray A. Green (president of the Bristol Society of Architects), etc., etc.

Mr. Charles Long (Bath) proposed the toast of "The City and Port of Bristol."

Alderman H. W. Twiggs, in replying, said that while the building trade had to deplore depression in their industry, he thought that the Dock Committee had done something to help them in the spending of the large sums of money they had on construction works during the past seven years. He was delighted to know that members of their own trade, not content with carrying on their operations at home, had gone across the seas, and he was glad to know that their president was now engaged in carrying out a very big contract in Jamaica.

Councillor G. H. Oatley also responded to the toast.

Mr. G. H. Perrin, in proposing the toast of "The National Federation of Building Trade Employers of Great Britain and Ireland," said that perhaps he owed the honour to the fact that he had for some time past taken a prominent part in the work of the associations connected with the timber trade, and having held the office of vice-president of the Timber Trade Federation of the United Kingdom. The National Federation of Building Trade Employers, he noted, represented a most important industry, which employed, with one exception, more labour than any other industry in the land. He understood that the Federation was subdivided into no fewer than thirteen sections; and he observed, in the list of their hon. vice-presidents, honoured names in the trade. Their organisation he looked upon as excellent and practically perfect so far as it went, but there was room for expansion. In glancing over their annual report he was struck with the multiplicity of subjects that had engaged the attention of the Council of their Federation. The union was one of strength and of inestimable value, in his judgment, not only to themselves as masters, but for the benefit of the vast number of employees engaged in the trade. It was apparent to anyone that without such an organisation as theirs, many wild schemes would be thrust upon individual members of their trade and districts that would materially damage both masters and men; but with such knowledge and influence as they possessed in the Federation they were able to repel such attacks. It was distressing to learn that there were not enough apprentices being made for future requirements of many sections of their business—masons, bricklayers, slaters, tilers, plasterers and painters. He was glad to note that carpenters and joiners were not included in this category; but the wood was wanted after the bricks and mortar. What were the youths of to-day doing? He feared they all knew too well that they were sportsmen first, and not workers and patriots, as they ought to be. Their Council had worked against the Eight Hours Bill, and they expressed regret that party consideration of votes had been placed higher than that of the industrial welfare and prosperity of the nation. He noticed that the fair-wage clauses in contracts had received attention by their Council, owing to the activity of labour representatives on public bodies. He also observed that they were making efforts to secure the adoption of the Federation form of contract, but he was sorry that the R.I.B.A. did not see their way to support it.

The President, in reply, said he was sorry that Mr. White, their excellent National Secretary, was unable to be present with them, for he had done splendid work for the Federation, and would be able to tell them something of what it had accomplished. He wished that such associations as Bristol could be distributed throughout the land, for there were parts in a terribly neglected condition, through the fault of those who lived in those districts. There were large builders who came to London and took advantage of the organisation there, and yet never contributed to their funds. That was a shame. If all the associations were as loyal as Bristol, the Federation would be a tremendous success, for Bristol was second to London only. They were glad that the relations between the masters and the workmen continued in a satisfactory state. The Conciliation Board had done good work although the decisions were sometimes against the employers. They, however, set their faces dead against the employees' view as regarded piecework, and they claimed to have a free hand in the matter. There was the question of the Anti-Sweating Bill which was being brought forward in Parliament. It was started with regard to the clothing industry, but there were proposals that it should apply to other trades in the country. It would be necessary for the Federation to watch carefully and see that their rights were not interfered with. The Federation had adopted an official organ, and he hoped that all members of the Federation would do everything in their power to support and recommend the journal, because from it they could and did reap benefit. They asked their friends the architects also to support the journal. He wanted all the members who had the power to influence advertisements to exercise it in favour of the journal.

Councillor A. Dowling, in proposing the toast of "Architects, Engineers, and Surveyors," spoke of the need of more attention being paid to the study of architecture, and a more liberal education in regard to it. If that were done there would be a bigger demand for better work, and they would have better buildings designed. That was a study where they could find much to appreciate, for they saw before them history re-enacted. In the profession of the architect there must be no make-believes, no make-shifts. He honestly believed that the shadow was behind them in regard to trade. There were indications within the last few months that they had seen the worst in connection with their trade, and in that revival the profession of architect was bound up.

Mr. Mowbray Green (president of the Bristol Society of Architects) and Councillor Frank Wills replied.

Mr. R. F. Read proposed the toast of "Kindred Associations."

Alderman J. Curle (president of the Bristol Trades Council), in reply, said for the last thirty years there had not been a serious dispute in the building trade in Bristol. He was glad that they got on so amicably, and with the Conciliation Board established, there were great hopes for the future. There was nothing to be gained by strikes, and he hoped they would get along without them in the future. He thought they could do so if they sat down and reasoned things out as they ought to do.

Mr. Henry Alsop (president of the Bristol Furnishers Chamber of Trade) also responded.

Mr. W. H. Brown proposed the toast of "The Bristol Master Builders' Association."

The President, in reply, said he was glad to say that their relations with the architects were far better than they had ever been before. They had a really good form of contract, and arbitration cases between architects and builders in Bristol were almost unknown. The employment of a professional quantity surveyor to take out the quantities and settle the accounts had contributed greatly to that happy result. The same happy condition of affairs reigned as regards their employees. They appreciated very much the presence of Mr. Curle, who represented the employees. He did not think that there had been a single dispute in the Bristol building trade. They had a set of working rules which were a model that had been accepted in many towns in the country.

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES ASSOCIATION.

Secretary: James Cameron.

The monthly meeting of the executive of the above association was held in the Building Trades Exchange, 61, Lothian Road, Edinburgh, on April 29th, when there was a good attendance of members, presided over by Mr. David Mekie, president, who was congratulated on his election to the Edinburgh School Board. After the minutes were read, reports on the state of trade were given which showed that there was a seasonable improvement, but trade generally was still very quiet. The only new job reported was the addition to the General Post Office.

As regards priced schedules being sent in along with the tenders, some further discussion took place, and the matter was ultimately remitted to the committee, who are meantime attending to the drawing up of a new constitution to see that a rule is incorporated in the constitution that no priced schedules are to be sent in along with offers in future.

A member stated that a firm of surveyors, in sending him a schedule, had inserted the rate per hour that he, the contractor, was to be allowed for days' jobbing work in connection with the contract. This is unusual, and the meeting strongly resented the innovation. The matter will come up again.

The Secretary gave a report on the half-yearly meeting of the Scottish Building Trades Federation, and the delegates attending along with him were thanked for their presence at that meeting.

A specimen of the telephone card proposed to be issued by the association was submitted by the secretary, who explained generally the lines that he purposed following, and the matter was left in his hands to carry out.

The annual excursion has been fixed to take place in June, and a committee was appointed to make the necessary arrangements.

Scottish Building Trades Federation.

The half-yearly meeting of the executive of the Scottish Building Trades Federation was held in the Royal British Hotel, Perth, on Friday, April 23rd. Delegates were present from Aberdeen, Dundee, Inverness, Kilmarnock, Perth, Edinburgh, and Leith, and Mr. James Leslie, builder, Aberdeen, presided. After the minutes had been read, a welcome was extended to the gentlemen attending from Perth, in whose district the local association is at a very low ebb. Reports on the state of trade were submitted by the secretary, from which it appeared that the building trade throughout Scotland is still in a depressed state.

The secretary reported that the Glasgow Employers' Council had not yet joined the Federation. The secretary, Mr. Cameron, was instructed to endeavour to attend a meeting of the Glasgow Employers' Council, and lay the claims of the Scottish Federation before that body.

At this stage the delegates from Perth spoke as to the conditions obtaining in their district. Mr. Robert Brand, junior, Perth, stated that it was practically useless to attempt to stir up interest amongst the local contractors at the present time, but he informed the meeting that before the winter months came, he along with one or two interested members would do all they could to have their association resuscitated, and asked that the Perth association's name might be retained on the list of the affiliated associations. This request was unanimously granted, and the chairman expressed the hope that Mr. Brand's expectations would be fully realised.

The proposal to adopt a National Crest was brought forward by the secretary, who submitted a sketch of a crest, which was unanimously approved, and will come up for confirmation at the annual meeting, which is to be held in Inverness on September 10th next.

The secretary was also instructed to bring forward a report as to the progress being made by the various associations who had adopted the intertrading rule.

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES ASSOCIATION.

Annual Report.

In submitting the thirty-seventh annual report of the Edinburgh, Leith, and District Association, regret was expressed that the past year had shown practically no improvement in the building trade. It is believed, however, that the works in connection with Rosyth Naval Base and the new barracks at Redford will tend to ease matters, and in the year 1909 an improvement in the state of trade is confidently looked for.

Notwithstanding the dull state of trade, the executive have found much to demand their attention. Thirty meetings were held during the year, and matters of much importance were dealt with. The executive meetings have been well attended throughout the year.

According to the constitution, the following gentlemen retire from the executive, and are not eligible for re-election until the expiry of one year, viz.: Messrs. Alexander Macdonald, James Millain, John M. Scott, and Charles Taylor.

A firm were threatened with legal proceedings by the Operative Joiners' Society on behalf of three of their members, who alleged that country money was due to them for working on a certain job. The whole facts were reported to the executive by the firm concerned; the executive decided that the position they had taken up in resisting the claim was quite justified, and they agreed to support the firm in any action that might be raised. The matter was placed in the hands of the secretary, and as a result of his intimation to the agents acting for the operatives' union, nothing further was heard of the claim.

In January, 1908, intimation was given to the operative bricklayers that the wages were to be reduced from 9½d. per hour to 9d. Two conferences were held between delegates from the operatives and the association, but nothing definite was settled, and, in face of the working agreement, the men went on strike. After being on strike for more than a month, they asked for another conference, which was granted, and at that meeting it was agreed to remit the matter to arbitration, as provided for under the rules. The arbiter mutually agreed on was Mr. W. T. Oldrieve, of H.M. Office of Works, before whom evidence was led from both sides. On June 8th he issued his award that the wages were to remain unaltered.

With respect to the masons, the relations between the employers and men remain unchanged. The wages throughout the year have remained at 8½d. per hour; and the wages of the plumbers have remained at the old rate of 9d. per hour.

Correspondence on the mode of measuring plumbers' work has passed during the year between the surveyors' society and the association secretary, but the surveyors have not, so far, intimated what they purpose doing in the matter.

The Edinburgh and Leith Corporations Gas Commissioners, in the work they have to contract out, insist on the schedules being sent in with the offers. This is a practice that is directly against what is recognised as the general practice of this Association, and if it were allowed to creep in, members would be placed in an unenviable position. During the past year, representations were made to the Gas Commissioners, who were requested to return the schedules of unsuccessful contractors, but this request was not complied with. The Association will require to come to some definite understanding not to send in schedules along with the offers in future. Another matter on which the Master Plumbers have a just complaint is the practice of the Edinburgh and Leith Gas Commissioners doing plumber work themselves. In connection with their alterations at Waterloo Place, the Commissioners supplied the material and employed the labour. No schedules were issued to the Edinburgh and Leith plumbers inviting tenders for the plumber work on the Waterloo Place job, while all the other works for the job were scheduled and tenders invited. The Gas Commissioners were approached in the matter, but they refrained from answering the questions raised in the correspondence. At the request of the Operative Plumbers' Society, the matter has been under consideration by a joint committee appointed by the Master Plumbers and the operatives, with a view to joint action being taken to safeguard the interests, not only of the employers, but of the operatives as well.

During the past year the Secretary has been in communication with the Lord Dean of Guild and the Town Clerk, with regard to the proposed new building regulations. A provisional order was drafted, and sent to the Town Council, and was remitted by them to a sub-committee for attention. The executive have asked to be allowed to consider the proposed new regulations and give an expression of opinion thereon before the committee make their report.

The new scaffolding regulations proposed by the Home Office have been dropped, in view of the pressure of other Parliamentary business, but the matter will not be lost sight of by the Executive.

Two delegates from the Association, Messrs. Simon Slater and David McKie, attended a conference in connection with the proposed Educational Bureau. Much good was expected to come out of that conference, but so far, nothing has emerged.

The Miners' Eight Hours' Bill was considered by the Executive, and a petition was sent to Parliament petitioning against it.

It was with extreme regret that the Executive learned of the death of Mr. John Sutherland, retired builder, who, for 23 years, acted as secretary and treasurer of this Association. He was the first secretary appointed when the Association was constituted on 1st December, 1871, and he held office until 14th February, 1895. A resolution of sympathy was sent to his widow.

The annual meeting of the Scottish Building Trades Federation was held in Aberdeen on September 18th last, when a fairly large number of representatives were present. There were five representatives attending from this Association.

The Glasgow Associations have not yet joined forces with the Federation, but it is hoped that ultimately they will do so.

The "Builders' Journal" has been appointed the sole official organ for the National Federation of Great Britain and Ireland. It is a first-class trade paper, with much readable and useful information in it. Several members have subscribed for the paper, and have expressed their satisfaction with it.

The annual excursion took place on 2nd July, to Loch Long and Loch Lomond, and was well attended. The annual dinner was held on 10th December, when a company of about 80 were present, presided over by Mr. McKie.

The Executive are of opinion that the present jobbing price lists for mason, joiner, and plumber work should be revised and brought down to date. It is several years now since they were last revised.

As a result of the circulars sent out to the trade in November last, the membership has been materially increased, and now stands at 110. All trades connected with the building trade are now admitted to membership, and provision will require to be made for the constitution being altered to meet the new circumstances.

The two annual scholarships in the architecture section of the Edinburgh College of Art have been awarded to Mr. James Robb and Mr. Robert H. Craig. Mr. Robb has been trained in the office of Messrs. Sydney Mitchell and Wilson, and Mr. Craig in the office of the Edinburgh City Architect. The scholarships are of the value of about £30 and are tenable for six months.

Trade and Craft.

Cox's Air Gas System.

The Machine Gas, Ltd. (Cox's Air Gas System), 180, Arlington Road, N.W., gave last week a special demonstration of their system of gas production which, briefly described, consists in the carburetting of air with a small non-condensable proportion of petrol vapour. The machine in which this process is effected consists of a small hot-air engine (operated by the gas which it produces), gas-holder, carburettor, and blower mounted on an iron stand. The gas, which is conveyed through pipes in the ordinary way, gives a brilliant light, and the apparatus is extremely compact, being 36ins. by 15ins. over all, and other sizes in proportion. The mixture is non-explosive, so that an escape of gas is unattended by danger. The system is of the greatest possible utility in places where ordinary gas is unavailable. The firm publish many convincing testimonials as to the satisfaction it is giving in a variety of services; and a long list of installations includes, for the Government, the Royal Artillery Lines at Lydd Camp, Kent, where 10,000ft. of piping has been used, distributing 2,000 cubic feet of gas per hour. Pamphlets and full particulars are obtainable at the address given above.

Coming Events.

Wednesday, May 12.

Junior Institution of Engineers, Royal United Service Institution, Whitehall.—Mr. T. S. F. Gibson, Assoc.M.Inst.C.E., on "The Construction of Coin-Freed Mechanism as Applied to Gas Meters," 7.30.

Thursday, May 13.

Paint and Varnish Society, St. Bride's Institute, London, E.C.—Mr. J. Cruickshank Smith, B.Sc., on "The Physics of a Pigment," 8 p.m.

Society of Architects.—Mr. G. Topham Forrest, M.S.A., on "Secondary Day Schools, their Planning and Equipment," 8 p.m.

Saturday, May 15.

Society of Architects.—Sketching Party to St. Albans, under direction of Mr. C. H. Ashdown.

Tuesday, May 18.

National Federation of Building Trade Employers.—Annual Meeting of the Northern Conciliation Board, at Leeds, 2.30 p.m.

Insurance.

Subscribers to "The Builders' Journal" are entitled to a Free Insurance for £500. Every subscriber should apply for this, sending a postcard with the name of the newsagent with whom the order has been placed. Subscribers can also obtain a General Accident and Sickness Insurance (the "Lighthouse" policy) at a reduced premium, which includes the Annual Subscription to this Journal. A pamphlet giving full particulars can be obtained free on application.

Free £500 Accident Insurance Coupons have been sent to the following:

A.A.R. (Bowes Park), A.H. (Runcorn), A.H.D. (Newport, Mon.), C.H.S. (Manchester), A.W. (Nottingham). S.G.B. (Coventry), J.W. (Blaina), J.H.F. (Bingley), T.P. (Retford), W.P.P. (Leeds), W.A.V. (Bath), C.F. (Edenbridge), L.D.P. (Largs), W.J.W. (Southend), C.G. (Newcastle), R.T.R. (Coatbridge), B.W. (Cheltenham), I.P.J. (Cardiff), E.F. (Hull), A.G.A. (Redditch), H.J.S. (Redditch).

We regret to record the death of Mr. Thomas Yeomans, who had for many years past carried on the trade of a builder at Redditch. Mr. Yeomans, who was very much respected by his colleagues, had been a member of the Redditch Association since its formation. A letter of condolence and sympathy has been sent, on behalf of the Association, to the family of Mr. Yeomans, and as a last token of esteem, the Association were represented at the funeral, and a wreath was sent by the Association.

THE ADJUSTABLE SHELVING AND METAL CONSTRUCTION

COMPANY, LIMITED.

Manufacturers of

Patent Steel Constructional Work,

AND

Steel or Wood Fittings,

For Stores, Warehouses, Libraries, etc.,

WITH

Fixed or Adjustable Shelving

(Patented all over the world.)

Leading Features of our Adjustable Shelving.

Easy and rapid adjusting of the shelves, even when fully loaded.

Greatest economy of space, the usual supports being dispensed with, the sideplates only require sufficient clearance to prevent chafing.

Free access of air and light, owing to the absence of the usual partitions. No corners where dust can collect. Pleasing appearance.

Contents visible at a glance. Erection and dismantling perfectly simple, only a spanner and screwdriver required.

Interchangeability of all parts. Great saving in time and cost when removal is necessary.

Our stacks are suitable for Shops, Warehouses, etc., as well as Libraries, Archives, etc.

Complete Space-Saving installations for Libraries, both Public and Private, Government and Insurance Offices, Banks, etc.; Museums, Collections, etc.; Shops, Warehouses, Showrooms and Book Stores, Business Houses and Factories.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 14—June 1. MORPETH.—Extending and improving Morpeth pupil teacher centre, in order to adapt the premises for use as a secondary school, for the Northumberland Education Committee. Name and address, together with a deposit of £2 2s. for specification and bills of quantities, to C. Williams, secretary to the education committee, The Moothall, Newcastle-on-Tyne, to whom tenders, endorsed "Tender for Morpeth Secondary School," must be sent. Applications for quantities by May 14.

May 15. RAMSEY, HUNTS.—Erection of an isolation hospital at Ramsey, for the U.D.C. Names to P. S. Bennett, surveyor, Ramsey, Hunts., by May 15.

May 15. HAMSTALL RIDWARE (near RUGELEY).—Erection and completion of a new council school for 82 children at Hamstall Ridware, for the Staffordshire Education Committee. Applications, accompanied by deposit of £1 1s., by May 15, to Graham Balfour, director of education, county education offices, Stafford.

May 17. MIDDLESTOWN.—All trades in the erection of three houses at Middlestown, for the Co-operative Society, Limited. Plans and specifications at the society's office. Tenders to be sent in by May 17.

May 17. OUTLANE, NEAR HUDDERSFIELD.—Erection of four dwelling houses at the Mount. Plans, etc., of J. Berry, architect and surveyor, 3, Market Place, Huddersfield, where tenders are to be delivered.

May 17. POOLE.—Erection of a pair of semi-detached cottages at the Corfe Mullen pumping station, for the corporation. Drawings and specification, etc., at the waterworks department, Municipal Buildings, Poole.

May 17. LYDIARD (WILTS).—Enlargement of chapel and erection of class-room at Lydiard. Plans and specifications with W. J. Morse, Lydiard Green, Purton, Wilts. Tenders to J. J. Webb, Lydiard, Purton, Wilts, by May 17.

May 17. BIRKENHEAD.—Repairs, etc., at the poor law offices, Conway Street, Birkenhead, for the guardians. Forms of tender, with specification, of John Carter, clerk, poor law offices, Birkenhead, to whom tenders, endorsed "Tender for repairs," must be delivered by May 17. Fair wages clause.

May 17. WICK.—Mason work in erection of new higher grade school at West Banks. Schedules from School Board's architects, D. and J. R. M'Millan, 105, Crown Street, Aberdeen. Plans and specification may be examined at office of the clerk, D. W. Georgson, Wick, to whom offers must be sent.

May 17. NORTH SEATON.—Erection of additions to the isolation hospital near North Seaton station, for the Ashington U.D.C. Plans and specifications and full particulars from the surveyor, Alexander Wood, Council Chambers, Ashington. Tenders, marked "Hospital," by May 17, to Charles Alderson, clerk to the D.C., Bridge Street, Morpeth.

May 17. LONDON.—Enclosing and roofing-in the depot in Walmer Road, Notting Hill, W., for the corporation of Kensington. Plans and specifications and further particulars at the Borough Engineer's Department, town hall, Kensington. Tenders, endorsed "Tender for Works at Walmer Road Depot," to Wm. Chambers Leete, town clerk, town hall, Kensington. Fair wages clause.

May 17. GLASGOW.—Construction of a goods shed, about 718ft. long by 57½ft. wide, on Springfield Quay, south side of Glasgow Harbour, for the trustees of the Clyde Navigation. Drawings and specification, schedule of quantities, and form of tender, of the trustees' engineer, at his office at Robertson Street. Tenders, marked "Tender for Shed at Springfield Quay," by May 17, to T. R. Mackenzie, general manager and secretary, 16, Robertson Street, Glasgow.

May 18. LANCASTER.—Tiling and joiner's works in connection with the renovation of butchers' shops in the market, for the corporation. Quantities and particulars of J. C. Mount, borough surveyor. Tenders to T. Cann Hughes, town clerk, town hall, Lancaster.

May 18. HIGHWEEK.—Alterations to and painting, papering, etc., Brookhill House, Highweek, for the Newton Abbot Union. Plans and specifications of the architect, Saml. Segar, 26, Union Street, Newton Abbot. Tenders to F. Horner, clerk to the guardians, union offices, Newton Abbot.

May 18. COCKFIELD.—Erection of new school for about 210 children, for the Durham C.C. Plans, specification, and general conditions of contract, and bills of quantities, of F. E. Coates, Shire Hall, Durham. Tenders by May 18, to A. J. Dawson, clerk to the education committee, Shire Hall, Durham.

May 18. BRADFORD.—1. Alterations to conveniences; 2, repairs to roof; 3, painting on roof, Kirkgate Market, for the Corporation. Drawings, conditions of contract, quantities, specification, and forms of tender of city architect, Whitaker Buildings, Brewery Street, Bradford. Fair contracts clause. Tenders not later than 9 a.m. May 18.

May 18. ALDERSHOT.—Supplying a tile dado and matchboarding at the sewage pumping station, and certain repairs, painting, etc., at the sewage works, manager's cottage, Ash Road, for the U.D.C. Specifications and full particulars at the surveyor's offices. Tenders to be sent to W. E. Foster, clerk, clerk's department, Municipal Buildings, Grosvenor Road, Aldershot.

May 18. DURHAM.—Erection of new council schools at Haverton Hill and Dunston; alterations at Washington Biddick Council School, for the C.C. Plans, specifications, and general conditions, and bills of quantities as follows:—Haverton Hill School (for about 900 children), W. Rushworth, Shire Hall, Durham. Dunston (Glebe Estate) Council School (for about 800 children), J. Potts and Son, architects, 57, John Street, Sunderland. Washington Biddick Council School (plans and specifications only), F. E. Coates, Shire Hall, Durham. Tenders (endorsed with name of school), by May 18, to A. J. Dawson, clerk to the education committee, Shire Hall, Durham.

May 19. GLANAMMAN, CARN.—Erection of Congregational Chapel and schoolroom. Plans and specifications may be seen at office of H. Herbert, architect, Ammanford. Tenders to T. Thomas, Council schools, Glanamman.

Registration and the R.I.B.A. Election.

In view of the favourable opinion on the subject of registration which has been recently shown to exist in the architectural profession as a whole, several of the provincial societies in alliance with the R.I.B.A. have resolved to support the efforts of the Institute Members' Club to obtain a return of such a representation on the Council of the R.I.B.A. as shall reflect the opinion of the majority of members of the Institute on this important question. At a meeting of the Leicester and Leicestershire Society of Architects recently called for the express purpose of conferring "on the subject of the forthcoming elections to the Executive of the Royal Institute of British Architects," it was unanimously decided to support the candidature of the registrationists, and many other provincial societies are rendering equally loyal and useful service.

The Divorce of the Arts.

The A.A. Members' dinner was chiefly remarkable for an interpellation on the divorce of the Arts. It is not a new subject, and in the hands of a speaker with less verve than Sir William Richmond, would have excited no more than mild academic interest. Last Wednesday evening Sir William was followed with close and undivided attention, which may have been indicative of a desire among architects and painters to join hands once more. Or this respectful attention may have been due only to eloquence following a good meal. At present the painters are rather in the position of the music hall artiste who is offered a part in the legitimate drama. The latter carries a more recognised status, but the man becomes one of a crowd, each individual engaged in adding a quota to produce the complete work of art. In the "halls" no one divides the limelight with him, and providing he "catches on," there are possibilities of "starring" and big salaries, which are sore temptations. Sir William's advice to take young sculptors and painters and train them up within the rigid lines of architecture sounds at the present moment like a counsel of perfection. Architects are finding it hard enough to make a living themselves let alone aiding the sculptor and painter. At present the clients, as the Americans say, "Won't stand for it." And it is the difficulty of persuading clients to "stand for it" in the matter of decorative painting and sculpture that makes Sir William's rosy future in the arts seem to us like a very beautiful dream.

Academic Study.

At the same function, and in proposing the toast of "The Guests," to which Sir William Richmond replied, Sir A. Brumwell Thomas introduced a topic which can well be commended to the attention of our educationists. He pleaded for a higher course at the A.A. School for the purpose of academic study. They educated men up to a point and then left them—the point being, presumably, that which enables them to take the A.R.I.B.A. qualification and a place in the profession. Sir Brumwell Thomas proposed this course—which might be a diploma course—to absorb the enthusiasm of numbers of budding architects and create a national enthusiasm for architecture among the public. The idea seems a very excellent one if the enthusiastic students are to hand, and this extra course of study might well be devoted to the Grand Manner. We suffer largely at the present day from pettiness in architecture—pettiness of conception, pettiness of scale, pettiness of detail. And that is because our men have never been taught properly to face a big thing. As Mr. George remarked at the same meeting:—"We want something beyond the answering of economic requirements."

The Budget and Land Values.

In the closured debate on the Budget proposals with regard to the taxation of land values, in the House of Commons last Wednesday, the most important speech was undoubtedly that of Mr. Harold Cox, who made some strong points against the Government proposals. At the outset, he made, it is true, a deplorably banal reference when, in pointing out the fundamental difference between land and other property—namely, that a man who owned a piece of land was liable to the risk of having that land taken from him because the public required it—he added, "whereas a man owning pictures or a pair of trousers was not liable to have them taken from him." He pointed out very cogently the enormous difficulty of ascertaining —or, rather, of fairly assessing—the value of land. The expenditure on the attempt might amount in the aggregate to hundreds of thousands of pounds; the costs of the landlord in defending himself against the valuer would be great, and there was likely to be a stupendous amount of litigation. What, he asked, was to prevent the evasion of the tax on undeveloped land by putting up some rough-and-ready sheds and shanties, and claiming that the land was no longer undeveloped? Mr. Cox stated that he had received a letter from master builders of Bradford pointing out that it was the usual practice in that town for builders to purchase the freehold of land for the express purpose of erecting buildings upon it. Land, therefore, was the raw material of their industry. Would the Chancellor of the Exchequer impose a tax on this raw material, and thus inflict an injury on a class that was by no means wealthy? While the tax would almost compel owners of beautiful open spaces—like Holland Park, for instance—to cover them with bricks and mortar, municipal authorities—including the London County Council—who are the worst holders-back of land, are to be exempted. As to the housing aspect of the question, it seemed absurd, in face of the countless empty houses around London, to talk of developing land in order to provide more dwellings. He thought it a grave injustice to reverse the principle upon which all civilised countries had hitherto proceeded—the principle that land was interchangeable with all other forms of wealth. Mr. Lyttelton declared that land taxes would check the growth of garden suburbs, and nobody but the lawyers and surveyors would reap any benefit. Supposing a man invested a large sum in land, laid out roads, etc., and then for some unforeseen reason the neighbourhood did not develop. The man found himself burdened for years with heavy charges for capitalisation, and would have to prove to some Excise officer that he had no unearned increment. Mr. Lloyd George, in reply, deprecated criticisms on a Bill which had not been introduced, and of which the terms were not known, and in particular he repudiated the suggestion that anything in the Bill would be injurious to garden cities or other amenities. Then, again, the Government proposed to exempt all expenditure by a landowner on property with a view to making it fit for building. Very poor land, he said, is used for housing purposes —land at 4s. or 5s. an acre is let for the purpose of building houses for workmen. As a rule, a ground rent of about £2 a house is expected, and the acre of land that used to produce about 5s. an acre is now producing about £50 an acre, and more. Was it too much to ask the owner to pay a halfpenny in the pound on that improved value towards a pension for the worn-out worker? It will be seen that the reply of the Chancellor of the Exchequer to his critics was somewhat rhetorical; but so also were the speeches of his opponents; and builders, who have such serious interests at stake, must feel considerable impatience with the purely gladiatorial displays on both sides that marked the course of a most unsatisfactory debate, which, after degenerating into something that was very like a wrangle, came to a lame and impotent conclusion by the enforcement of the closure.

Architectural Copyright. The question of architectural copyright is again being discussed with considerable vigour, in view of the belief that the matter is about to be thoroughly investigated by a Committee of the House of Commons. Those who urge that a building is as much a work of art as a painting or a statue, and is therefore as much entitled to the protection afforded by the law of copyright, hardly seem to appreciate the practical difficulties of the problem. Effective protection for the architect might act in restraint of building and against the public interest; and ineffective protection is not worth while. In the former case, much valuable educational influence would be lost, as the young architect would be afraid to study the best work of the best men, lest he should reproduce colourable imitations of it, and thus render himself liable to pains and penalties. Cases in which the copyright of pictures has been vindicated have often resulted in an order for the destruction of the entire pirated issue, or that it shall be handed over to the author of the original. That a similar restitution should be made in the case of a pirated building may be a grotesquely Gilbertian idea, but it will perhaps serve to indicate that there are important differences of incidence as between buildings and pictures or books or music. The principle of the existing law of copyright is mainly concerned with wholesale reduplication, to the detriment and loss of the original author. Some approach to wholesale reduplication is found in the case of small dwellings that are constructed in hundreds from designs for a single pair. This is obviously unfair to the architect, and it would be well if some means could be found of reserving to him a kind of royalty in each repetition; and this royalty, while insufficient to increase at all materially the cost of building, would be a welcome addition to the income of the architect, and it would imply his power of veto, which would enable him to prevent his designs being perverted or caricatured, or carried out in an objectionable environment. This, however, very obviously involves a certain degree of restraint of trade; and this consideration, perhaps emphasized and exaggerated, might conceivably be fatal to the hopes of those who are seeking protection. Then, again, the architect who has conceived a gem of domestic work, should be spared the annoyance of seeing it repeated, perhaps with deplorable variations, in inferior materials, on an unsuitable site; but he has no remedy either for his injured feelings or for the unfair enjoyment by another man of the fruits of his ability—a man who perhaps underbids him. Here again the plausible allegation of "public interest" would probably outweigh the advocacy of the private interests of the architect, who, even supposing copyright were granted, would usually find it an exceedingly difficult task to establish a charge of plagiarism. In indicating some of the difficulties that stand in the way of copyright in architecture, we have no desire to throw cold water on the proposal; which we think ought not to be modelled quite closely on existing copyright laws, but should be modified to meet the special circumstances of the case; and therein lies the chief difficulty of the problem. We understand that the matter is being taken up very seriously by the Berne Convention, and in that case the problem is considerably complicated by international considerations, and British interests should be very closely watched.

R.I.B.A. SUPPLEMENTAL CHARTER.

A special general meeting was held on Monday evening last to consider the proposals of the Council of the R.I.B.A. for the revision of the by-laws under the new Supplemental Charter. With regard to the latter document, which has now received the Royal approval, its most important feature has reference to the election of the new class of members known as Licentiates, who are defined as "architects who have attained the age of 35 years and either (a) have been engaged as principals for at least five successive years in the practice of architecture, or (b) have been engaged for at least ten successive years in the practice or the study of architecture. But unless determined by resolution of a general meeting of the Royal Institute, confirmed at a subsequent general meeting, held not less than seven nor more than twenty-eight days after the former meeting, no person shall be elected as a Licentiate after the expiration of twelve months from the date of the coming into force of the first by-laws relating to Licentiates." The following clause (2), relates to the admission of Fellows:

"After the date of this Our Charter no person shall, save as hereinafter provided, be admitted a Fellow of the Royal Institute unless he shall at the time of admission be either (a) an Associate of the Royal Institute or a person who has passed an examination qualifying for admission to the class of Associates, or (b), a Licentiate who has passed such examination or examinations as may from time to time be prescribed by the Council as a qualification for the admission of Licentiates to the class of Fellows. Provided, however, that the Council shall have power to elect and admit as a Fellow any architect who shall have attained the age of thirty years and shall have been engaged as a principal for at least seven successive years in the practice of architecture as to whom the Council may resolve that it is desirable to elect and admit him as a Fellow."

Clause IV. authorises the Council to deal with the question of professional education in the following terms:—"Subject to the by-laws for the time being the Council shall formulate, and from time to time alter and amend, a scheme or curriculum for education in architecture, and may appoint, in relation thereto, such boards or committees (whether or not consisting wholly of members of the Royal Institute) as may from time to time be prescribed by by-laws, and the Council may apply the funds of the Royal Institute in making provision for and furthering and developing any such scheme or curriculum, and in providing for lectures or teaching, and for the holding of examinations in accordance therewith, and for granting certificates in connection therewith, and (subject to such exemptions as may be allowed by or in accordance with the by-laws) no person shall in or after the year One thousand nine hundred and thirteen become entitled to admission to the final examination for Associateship of the Royal Institute unless he shall have passed through a course of study under, or in accordance with, such scheme or curriculum, and shall have passed such examinations in relation to the subjects comprised in that course of study as shall from time to time be prescribed by or in accordance with the by-laws." Among the proposed amendments to the by-laws a change occurs in the method of election to membership of the R.I.B.A., it now being required that a candidate shall be supported by twelve Fellows and Associates, of whom not less than seven shall be Fellows. Clause 26 directs that Diplomas and Certificates shall be granted to every Fellow, Associate, and Licentiate who is entitled thereto. Clause 27 concerns the *personnel* of the Council, in future it is to consist of not more than forty members, namely, the President, four Vice-Presidents, an Honorary Secretary, eighteen Fellows as members of Council, and four Associates as Associate members of Council. In addition there are to be two Past-Presidents of the Royal Institute, the Presidents of the three societies within the United Kingdom in alliance with the Royal Institute, "which on the 31st December of the year preceding the election contain the largest number of members of the Royal Institute," and the Presidents of six other of the societies within the United Kingdom in alliance with the Royal Institute selected in rotation. Important amendments were proposed with regard to Education and Examination in Architecture, in regard to which Clause 44 reads as follows, viz.:—"The Council shall annually appoint a Board of Education to deal with the education of pupils in architecture, and to conduct such examinations as are required by the Royal Institute under the provisions of any Act of Parliament or of the charters and by-laws. The Board shall not exceed fifteen in number and shall consist of such subscribing members of the Royal Institute and such other persons as the Council may invite, including representatives of such teaching institutions as have accepted, or may accept, the scheme of the Council."

It is also provided that the Council may "on the advice of the Board, appoint examiners and visitors in the United Kingdom or in any Dominion, Colony, or Dependency of the British Crown, and shall make such regulations in respect of their appointment and in regard to the payment of fees and expenses as they may from time to time determine."

As a condition precedent to the final examination, it is enacted that (after 1913) every candidate for the Associateship, before presenting himself for the final examination, shall have either (a) passed through the course prescribed under the scheme adopted by the Council as above, or (b) proved to the satisfaction of the Board of Education that he has been otherwise properly trained as an architect. Finally, the forms of declaration to be signed on election to membership of the Institute by (1) Fellows, (2) Associates, and (3) Licentiates, have been very carefully and judiciously amended.

THE SOCIETY OF ARCHITECTS

Travelling Studentship, 1909.

Twenty-five sets of designs have been received in competition for the Travelling Studentship, which is of the value of £25, and carries with it the silver medal of the society. The subject set this year was a secondary school, the details of materials and cost being left to the competitors. The council have awarded the studentship to Mr. Chas. H. Hudson, of 12, Almeida Street, Islington, N., an assistant in the office of Mr. A. W. Roques, M.S.A., 10, Basinghall Street, E.C., and in view of the high merit of some of the designs and the number of competitors, they have awarded a special prize of the value of £10 to Mr. G. Ll. Evans, 29, Bridge Avenue Mansions, Hammersmith, W., an assistant in the office of Mr. Arthur W. Sheppard, A.R.I.B.A., 43, Chancery Lane, W.C. The drawings will be on view at the society's premises, Staple Inn Building, Holborn, W.C., for one week, commencing June 7th, when admission will be free. Afterwards they will be exhibited in various provincial centres.

THE A.A. DINNER.

The Architectural Association members' dinner took place in the Georgian Hall of the Gaiety Restaurant, on Wednesday last, the president, Mr. Walter Cave, occupying the chair. Amongst those present were Sir William Richmond, R.A., Sir A. Brumwell Thomas, Messrs. Ernest George, T. G. Jackson, R.A., Reginald Blomfield, A.R.A., E. A. Abbey, R.A., Solomon J. Solomon, R.A., H. Greville Montgomery, M.P., W. H. Seth-Smith, E. Guy Dawber, H. T. Buckland, J. A. Marshall, John Murray, Henry Tanner (president-elect), Gerald C. Horsley, R. Frank Atkinson, H. P. G. Maule, Stanley Hamp, Maurice E. Webb, A. Needham Wilson, G. B. Carvill, C. Wontmer Smith, Arthur Keen, Ian MacAlister (secretary R.I.B.A.), A. H. Ryan-Tenison, Ellis Marsland, G. Northover, T. Frank Green, T. L. Dale, Herbert Batsford, G. E. Bond (President, Society of Architects), A. D. W. Pollock (Master of the Plumbers' Company), H. C. Cole (President, Surveyors' Institution Junior meetings), A. Fincham (President, Clerk of Works Association), and many others.

Mr. T. G. Jackson, R.A., in proposing the toast of "The Architectural Association," spoke of the great interest he had always taken in the Association which, at one time, was the only body undertaking the systematic training of architects. It put teaching before examination; and he thought that that was specially commendable, for the idea that examination and education were the same thing was a fallacy. Examinations were falling into discredit very generally. At the Universities they were constantly spoken of with disrespect, and Fellowships at Oxford and Cambridge were given as a rule to men who were thought deserving of them. When Sir William Richmond and he had the honour of belonging to the Council which reorganised the Royal College of Arts, they decided, as the first thing, that a student should not be examined, but that a certificate should be given as the result of a general review of the work of a whole year. Examinations frequently enabled an inferior man to get through by a chance, while a superior man was unlucky and did not show what he was capable of. Mr. Jackson made some observations on the value of sketching and studying, and said it was their greatest pleasure as artists that the means of getting their livelihood should be also a means of getting pleasure. He related a story told by Mr. Briton Riviere. A distinguished artist came upon a young man painting a landscape. After looking at his work and commending him, he asked him what he made by his work in the course of a year. "Oh, about £150 altogether," said the young man. "£1,150!" said the great artist, "that is not a bad sum." "£150, not £1,150," corrected the young man. "But," said the great artist, "there is £1,000 for the pleasure of doing the work; I always put it down at that in my accounts, and I congratulate you upon a fair income."

Mr. Cave, in reply, thanked Mr. Jackson for the double honour of being present that night and for sending his son to their schools, which he thought was a great compliment. The schools were going strong, and he thought they were turning out as many architects as they ought; some might think too many. Their greatest difficulty was to provide an education suitable for a very varied class of men. There were men who came to them with a public school or university education, equipped with the power of learning; and others, younger men, full of enthusiasm, but without the same faculty of acquiring knowledge. This problem had the earnest consideration of Mr. Maule, their headmaster. They were also considering methods of finding out as soon as possible whether a man was fitted for the profession, and, in the case of a man who was not, letting him know in good time that he had better start at something else. The president then referred to the extinction of the building debt, the altered arrangements regarding the "Sketch Book" which, in future, would be in the hands of Messrs. G. C. Horsley, Theodore Fyfe, and Curtis Green, and paid a tribute to Mr. Lewis, who for eighteen years had carried on the work in connection with it. The remarkable growth of the atheletic club during his term of office would, he hoped, induce everyone connected with Association to be present at the annual sports to be held at Stamford Bridge on June 5th, and it was interesting to note the large number—about half the day school—who were in the Territorials. In conclusion, the President thanked the Councils who had worked with him during his years of office, and the staff with Mr. Driver at their head. Though he thought it was a relief to relinquish the responsibilities, yet when the time came he felt a certain regret. Passing the chair was passing a step in one's professional life. He commended Mr. Henry Tanner, the new president, to them; he was well-known to everyone; he had been an active member for six years, holding office in various posts. No one was better qualified to take up the work and carry it on properly. The Association would be in the best hands, and he wished it all success under Mr. Tanner.

Mr. Henry Tanner, in proposing the toast of "The Royal Institute of British Architects," coupled with the name of Mr. Ernest George, its president, said the relations between the Association and the Institute had always been most cordial. The Institute had shown a parental interest by moral support, and what was perhaps more important, by financial support. The annual donation from the Institute had been very helpful, especially while they were labouring under the incubus of the building debt. The Institute had helped them with the "Sketch Book," and with the Architectural Museum. Though this list seemed formidable, he was bound to say that if the Institute gave them money they gave the Institute men. They could see the number of Association men, not only in the Institute membership, but in high positions in the Institute. Mr. Tanner referred to the wide interests of the Institute and the important and valuable work which it did, and later referred to its excellent financial condition, having £26,000 of invested funds. He hoped they would soon spend that and more on erecting new premises to house the Institute—not forgetting, however, to save a little for the Architectural Association. No doubt he was suggesting trouble for some unlucky architect who got the job of designing the building; it was trouble enough to

ENTRANCE TO THE NEW CHARLOTTENBURGER BRIDGE, BERLIN. — A RECENT EXAMPLE OF GERMAN CIVIC ARCHITECTURE.

deal with the ordinary client, but he could not imagine what it must be when the client was an Association of Architects. He recommended the successful architect to consult Mr. Leonard Stokes.

Mr. Ernest George referred to the bond of sympathy between the Association and the Institute, and congratulated the students on the fine opportunities of a good training that they now possessed—training of a character which was unknown when their elders were young. There was nothing of the kind when he was a pupil. Then they would enter the Royal Academy as students for the fun of competing for medals, but there was no Architectural School. There were lectures—lectures from exponents of Gothic or exponents of Classic, these being two strongly divided camps. It was not, he thought, until Mr. Phené Spiers returned from Paris that the idea of a teaching school was acted upon. He hoped, however, that teaching would not entirely supersede apprenticeship for the old method of entering an office and dealing with practical work from the outset was always profitable. The construction of a farmhouse taught as much architecture as the construction of a temple. He thought it desirable to study those larger views, for the English ones were generally small; we wanted something more than the answering of economic requirements.

Sir Brumwell Thomas proposed "The Guests," coupled with the name of Sir William Richmond. He thought that future generations of mosaic workers would have reason to be grateful to Sir William for the patience and the care in preparing his colour treatment for the tremendous problem involved in the decoration of St. Paul's. His skill, patience, and many years of his artistic life had been devoted to this, one of the most important works of modern times. Sir William might truly say with that great forerunner of the Renaissance, Leonardo da Vinci, "Thou, oh God, dost sell to us all good things at the price of labour." Mr. T. G. Jackson brought the gift of scholarship to the practice of architecture. He had created an enormous number of collegiate and ecclesiastical works, both within and without his University of Oxford, which had given great pleasure to his admirers. The President of the Institute was always welcome to them. Mr. Abbey, in his early career an accomplished illustrator in black and white, had developed into a great decorative painter. The only criticism that he had to make was that his large decorative schemes, such as the wonderful "Quest of the Holy Grail," all seemed to go across the Atlantic. He hoped that might be remedied. Mr. Solomon had painted a long list of ideal pictures, commencing with "Cassandra," and "Niobe," and perhaps the greatest of many "Samsons." This year he had a portrait in the Academy of the Prime Minister, who told Mr. Solomon that he had taught him the virtue of immobility. He hoped if Mr. Solomon ever painted a portrait of the Chancellor of the Exchequer he would instruct him in the same virtue—at least, when preparing budgets. Professor Blomfield was one of the authorities on Education in Architecture, and would permit him to mention one point in connection with architectural education that they might well adopt. He hoped it would be possible to institute a course—it might be a diploma course—for men who were anxious—and there were a number of men in the Association who were anxious—to go on with academic study. They pursued a course of education up to a point and then left them to their own devices. By this further course he thought they would benefit by the enthusiasm of these men, and create also a more national enthusiasm for architecture. They had with them also Mr. Montgomery, who when he was not working for the general benefit of the British nation, was assisting the interests of that portion of it engaged in architecture and the building trades by his excellent Exhibition. There were a number of others—all of them heartily welcome. It was the age of pageants; his was a sort of pageant, and many of the characters were old friends and distinguished artists with a common aim in the pursuit of truth and beauty.

Sir William Richmond said some of the other distinguished artists around him should have been asked to reply to this toast; but the opportunity had been afforded him to say something that he would like to say. He had had, probably, opportunities of travelling around the world which they had not, and they might not know that one of the great points of ancient architecture was, it was invariably coloured. He would like to tell them of some of the examples of coloured architecture he had seen in ancient works and with his own eyes. In the city of Salamis, destroyed 300 years B.C., he had seen colour so beautiful—so gray, so blue, so black, and so brown—that while not interfering with the structural outlines of the architecture, it seemed to have performed the act of embracing with the sky. He had seen colour in Athens on the Propylea and the Parthenon; he had seen in Egypt, in the tombs, never intended to be seen again by mortal man, colour applied to architecture and to sculpture with exquisite results. Until a certain period in the history of architecture there was no building in our good country of England that did not receive colour upon the majority of its surfaces. Non-coloured architecture was entirely a modern one—absolutely a modern one. And why? The Arts had become divorced. The painter said, "I will stand on my own legs; I will put my picture in frame; I am *facile princeps*; I will have nothing to do with an inferior art." And the architect had retorted, "I am the structure; I do not want coloured eyes or coloured hair or anything else upon me. I am the skeleton, and I will be that and nothing else." What was wanted—architects desired it as well as painters—was an absolute coalition among themselves—the architects, the sculptors, and the painters. After all, architects were the masters of the three arts, and the movement must come from them. If they desired to make the best of buildings something like that must be done. "You are young," continued Sir William, "I am old—I will give you advice. If you want a piece of sculpture do not get it because it is cheap. If you cannot afford to pay a good price for carving a capital do not carve it at all. If you cannot afford to pay the price for a good piece of decorative painting, do not go to a firm. Those firms who turn out things *ad nauseam*—absolutely *ad nauseam*—are the very devil. Architects have matters in the very palms of their hands. Seek out young sculptors, seek out young painters, train them according to your will within your rigid lines. Appeal to them sympathetically. Do not treat them as slaves; give them, not license, but liberty under your restraint, and in time to come you will have educated a school of art combining architecture, sculpture, and painting, as good as anything the world has ever seen. In that way and in that way alone, we may have again a great National art in this country, such as existed in Italy, France, and Greece—which will exist here if we unite our energies."

The first annual dinner of the past and present pupils of Messrs. Parry, Blake and Parry, is announced to be held at the Criterion Restaurant, W., on Thursday, May 27th.

* * *

Messrs. Hampton and Sons, in conjunction with Messrs. Humbert Flint, will offer for sale at the Mart on June 14th, an extensive area of building land at Stanmore, within 10 miles of London, containing approximately about 800 acres. It comprises the Bentley Priory, Stanmore Park, woodlands, and the Manor House estates, and carries a present rent-roll of about £10,000 per annum. Portions of the property have already been developed. The whole will be put up with an "upset" price of £275,000, but if not sold as a whole, the income-producing portions, ground rents, etc., will be offered in 70 lots.

ARCHITECTURAL COMPETITIONS: SOME SUGGESTED REFORMS.

By T. Faulkner Shepheard.

Abstract of a paper read before the Liverpool Architectual Society,

The Waste of Effort.

One of the most eminent architects of the present day is reported to have said that he went into eighty competitions before winning one, but that he learnt something from every one of them. But, after all, the aim of competitions is not mainly educational. However, one cannot help thinking, in looking over most exhibitions of competition drawings, that a great deal of the work is waste. One sees scheme after scheme that is absolutely impossible from the first drawn line. Even the paper is wasted. I should say that in most competitions sixty per cent. of the schemes can be deleted at the assessor's first careful scrutiny of the plans. All these schemes are probably elaborately and very well drawn out to ⅛in. scale, possibly a large ½in. detail and perspective sketch—all waste: a great deal of it perhaps not the fault of the competitors; it may be due to misleading conditions, or of a bad start leading unconsciously on to further error. It is nevertheless waste work, and much of it avoidable waste.

How long can the profession as a whole stand the expense of it all? The number of competitors increases with each succeeding competition. Drawings seems to get more and more elaborate, to catch the assessor's eye; and so we go on. There must be an end to this making of useless drawings.

The Cost to the Profession

in a year must be enormous—out of all proportion to the remuneration at stake. Take a typical case of, say, a job to cost £10,000, with 100 competitors. Each set of drawings must, at a very low estimate, cost £10. This is a cost to the profession of £1,000. The winner gets £500 after he has done all the usual work involved, such as working drawings, detail drawings, specifications, supervision, etc., etc., for which alone his £500 is not over-adequate pay. How long are we going to stand it? For we, the architects, must be the people to rectify it. The general public have not the least idea of the amount of labour involved. They do not know; and if they did, why should they bother their heads about it as long as we complacently acquiesce?

Why should there not be a

Preliminary or Selective Competition

for all works in open competition, or, for that matter, for all competitions, such preliminary competition to comprise plans to 1-16th scale—*plans only*, or at any rate no more than plans and diagram sections showing heights of floors; no elevations whatever. If you allow elevations at all in preliminary competitions they must be done as well as may be, and that therefore labour is not saved, but additional labour is involved, for some of the work is done twice over. I consider 1-16th scale drawings quite enough to enable the assessor to judge finally of a design, especially if they are, as is generally the case, supplemented with a detail. From these plans a percentage would be chosen for the final competition. This is no new scheme. I know it has been used several times. But why should it not be adopted in all cases? After all, the plan is of first importance. If the plan is bad, of what use are the most beautiful elevations?

Of course I know that each competitor in the preliminary will have to scheme out his elevations—probably to draw out a great part of them; but he will not have to make

Elaborate Show Drawings

of them, and so a good deal of labour will be saved. Let the chosen few elaborate their drawings as much as they like. If a scheme is worth illustrating, it is worth illustrating well; but if not, why illustrate it? If the plan is really a good one, and the scheme well thought out, a good architec-

THE NEW CHARLOTTENBURGER BRIDGE, BERLIN. A RECENT EXAMPLE OF GERMAN CIVIC ARCHITECTURE.

tural design is always possible, given some ability on the part of the author. Of course plans of nearly equal merit would be chosen from the preliminary. The number chosen need only be limited by merit; and the assessor will be saved the heartburning effect of a fine piece of architecture with an impossible plan.

Essays Towards Betterment.

A great deal is being done by various architectural societies towards bettering the system on which competitions are conducted. But the societies would have greater power still for the furtherance of the good of the profession in every way, and for the furtherance of our art, if they were backed by the whole of the members of the profession. Much, however, has been already done; assessors have been appointed in cases where the promoters of competitions had originally not intended to employ them. It is quite unnecessary to dwell on the importance of this point; one has but to think of how difficult it must be for a layman to grasp the meaning of drawings, and how far even an architect can be lead astray by tricky draughtsmanship and showy perspectives, to decide instantly that it is absolutely essential to appoint a trained man to assess a competition. But we want to insist on more than that; and that is, that this assessor shall be appointed from the outset, and shall be employed to assist in drawing up the conditions of the competition. I understand that the Liverpool and Manchester Societies have jointly in hand the preparation of model conditions—a very excellent scheme; which should be of great help to assessors, and to promoters of competitions generally. At present the conditions in many cases are obviously not drawn up by anyone having adequate knowledge of the data required by architects in order that they may compete on an equal footing. In fact, the winner in many cases is the man who happens to select the right part of them to override or to ignore; while much waste labour and much heartburning are caused to the unsuccessful competitors who have done their best to abide scrupulously by the conditions laid down.

The Indispensable Assessor.

What I have said applies more particularly to advertised competitions. In smaller matters, it is more difficult to insist on the point. Take a man who wants a house built. He does not know whom to employ, but comes to the conclusion he will ask four or five architects to send him designs. He thinks he knows what sort of a house he requires, and that he is quite well able to choose for himself. Here again we come to the same difficulty of the layman's grasp of drawings. It would surely be very much fairer to the competitors if he had some skilled adviser to help him in his choice, and very much fairer to himself, probably, if he only knew it, and to the public who happen to pass by after the house is built. The observation applies to many cases—shops and their fronts, office buildings, even warehouses—but how persuade this man of the fact?—especially as it means his spending so many guineas of his hard cash to get such advice. Could not this form of advice be given by the Society free of charge—say, the Council and officers of the Society to form a body of advisory honorary assessors to take it in turn to give skilled advice in such cases? Work thus distributed would not be found very heavy; and I think that the practice, as it became more generally known, would be a great boon to the profession and to the public generally.

The Jury Method.

And now I come to the vexed question of assessors. There is a great deal of difference of opinion as to whether there shall be one assessor or more than one appointed. I think that—certainly for larger works—more fairness can be obtained by the jury method; each jury including one or more architects, while, if necessary, experts in other lines could be called in to assist the one who has drawn up the conditions to arrive at his final decision as to the best scheme submitted. I know that, so far, the jury system has not always been conspicuously successful; but I think that failure has been mainly due to the improper composition of the jury. Why should not such a jury be chosen from the number of the actual competitors themselves? Who can know better than they the actual difficulties of the problem in hand? Why, then, not use their knowledge? Let them be chosen by vote by the competitors sending in designs; the number of the jury being in proportion to the number of entries, say a jurv of four in the case of 20 entries, of six for 50, of eight for 100, and of 10 for 150; the jury to meet together to adjudicate with, say, a representative of the promoters of the competition, and if need be an expert (such as, say, a medical expert in the case of a hospital), under the chairmanship of the paid assessor who organises the competition. It would be easy to choose this jury. Every competitor could have a list of the names sent to him, upon which he could mark off the required number, the list so marked to be enclosed with his design when sending in. The paid assessor would of course prepare everything for the meeting, have the designs conveniently arranged, and do all checking of cubes and prices required, etc., etc., so that no time should be needlessly wasted. I do not see how any one of this jury could unfairly push his own design; for even if he had the temerity to try to do so, he would have all the other competitors to deal with. That any unfairness could creep in through collusion is utterly incredible, and almost impossible. And even if it could not be expected of all of them to recognize and praise merit in a design not of their own making, at least they would be able, and I daresay not unwilling, to point out defects; and so, if nothing better, we should have a number of devil's advocates upon the board, who, by a system of exclusion, might conceivably arrive at a very satisfactory result. The idea seems to be worth some consideration; I have heard it discussed a good deal privately, but should much like to hear a more general opinion on the matter. Personally, I think that with a carefully considered system of voting, with a different number of marks for 1st, 2nd, and 3rd places, such a system might cure most of the drawbacks of the present system of assessment.

Some Minor Points.

Just a word on one or two other small points. As to premiums. Why should the premium be merged in an architect's commission? I take it that premiums are intended as some sort of recognition of the extra labour involved. If so, then why not pay them? Or if it is thought too much to give the winner both the job and the premium, why not give the money to the 2nd, 3rd, and 4th men placed? At present, say, premiums of £100, £50, and £25 are offered, a total of £175. The £100—more than half the sum—is really never paid, except when the work is not proceeded with. And here let me say that corporations and committees are perhaps rather apt to rush into a competition before making sufficiently sure that the work will be proceeded with; and abortive competitions surely involve a scandalous waste of the profession's time, or, if I must not grumble at that, then a scandalous waste of their money as ratepayers.

Another small point is

The Question of Deposits.

I think it only reasonable that the promoters of competitions should require some guarantee of the bona-fides of an applicant, and the practice of demanding a small deposit represents a very workable method; such deposit to be refunded if the conditions are returned in a stated time, or upon the receipt of a genuine set of drawings. But I read of a case the other day in which the promoters had refused to refund the deposit. Surely it is rather much to demand a fee to look at the conditions just to see whether they are reasonable. This is an abuse about which we must grumble, and, if need be, kick.

Competitions give a splendid chance to real merit, if only they are properly conducted. It is of no use to sit tight and say that although things are bad they might be worse. If we quietly acquiesce they will speedily get worse. Look how much more prevalent it is now not to offer any premiums as recognition of extra labour. If we go on competing under such conditions, the natural assumption is that such premiums are not necessary. Then, again, you find schools offered for competition with 4 per cent. down as the architect's commission—a thing that is absolutely against all our articles of association, to say nothing of the poorness of the pay. The public do not know the amount of work a scheme entails, and the more extra work they find we will put up with, the greater will become the burden they will impose upon us.

Views and Reviews.

Ruined and Deserted Churches.

Ruined and Deserted Churches. By Lucy Elizabeth Beedham. London: Elliot Stock, 62, Paternoster Row, E.C. Large crown 8vo, cloth gilt. 105 pages, illustrated, price 5s.

The author holds the faith that "the works of man, especially his architectural triumphs, are most beautiful in old age and decay." Whether or not this proposition is sound—and the case obviously admits of argument and disputation—it is certainly what a churchman would call "comfortable doctrine" for the author and her readers, for it makes for sympathy with the subject. But the pictures in the book hardly support it. They are well enough chosen for the illustration of the subject, but from our point of view they do not strongly support the theory. Such admiration as they extort from us is mingled with pathetic regrets for their ruination, and occasionally with contempt for the vandals who have turned them to base uses. On the other hand, there is consolation in observing that in many instances in which a beautiful fabric has unavoidably fallen into ruins, the fragments have been lovingly and reverently preserved. The ruined churches are not all utterly deserted; and that the deserted churches are not all ruined, many an unappreciated preacher could testify. Many a venerable church or chapel of the Norman period has been turned into a barn, especially in Cambridgeshire. The author has made good use of the historical and legendary associations that cling to old buildings, nor has she failed to appreciate the architectural interest inherent in the subject.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
June 1	MOLESEY ISOLATION HOSPITAL. The East and West Molesey U.D. Council invite competitive plans, with specifications for the above. Full particulars can be seen at the Council Offices, Dundee Villa, East Molesey.
June 4	COTTAGE HOSPITAL, BODMIN. Architects are invited to submit competitive designs for the above, to be erected at an approximate cost of £2,000. Premiums, £12 12s., £8 8s., and £5 5s., for the three sets of plans *which the Committee may select.* Premiums of selected Architects to merge in Commission. Site can be seen on application to Henry D. Foster, Hon. Secretary to the East Cornwall Hospital, Bodmin, from whom particulars are to be obtained.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading, Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively.
July 9	STOKE-UPON-TRENT. Additions to Town Hall including large hall to seat 3,000 people, police court, etc. Premiums of £100 and £50 for second and third designs respectively. Assessor nominated by Pres. R.I.B.A. Conditions and particulars from Jno. B. Ashwell, Town Clerk, Town Hall, Stoke-on-Trent,
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	WALLASEY U.D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Grimsby Town Hall Extension.

The R.I.B.A. having intimated to the Corporation that if an assessor was not appointed before the competition drawings were sent in they must advise their members not to compete, the Corporation have appointed Sir William Alfred Gelder, F.R.I.B.A., of Hull, to that position.

Rivelin Valley, Sheffield, Competition.

The report of Alderman Styring, Messrs. William Terrey, Edward Holmes, Assoc.M.Inst.C.E., E. M. Gibbs, F.R.I.B.A., and P. Marshall, the committee of assessors appointed in the above competition, has been presented to the Corporation Water Committee. The competition, limited to architects practising within 30 miles of Sheffield, was for laying out the estate here belonging to the Corporation. Only 11 designs were received, the first premium of 20 guineas being awarded to Messrs. J. Creswick, Brameld and Son, of York Street, Sheffield; and the second premium of 10 guineas to Mr. James Miller, A.R.I.B.A., of Smalldale, Bradwell. The assessors state: "We have endeavoured to bear in mind the desirability of preserving the natural beauty of the entire valley, interfering as little as possible therewith, consistent with the development of the remainder of the estate for building purposes; the laying out of the main roads in such a manner as to afford the best connection with the existing main roads; the practicability of such roads as regards gradients and easy access; and the ultimate commercial development of the estate.

"It is evident that the competitors have given a good deal of thought and time to the consideration of the plans, although, generally speaking, the competitors have not in any single plan given effect to the whole of the general principles referred to, and consequently there is no particular design we can recommend the committee to adopt as indicating the best manner in which the estate may be developed; but would suggest that an endeavour be made to combine the best features of several of the designs sent in."

New Academy, Hamilton.

The Glasgow Institute of Architects has intimated to the Hamilton School Board that if the Board do not give further effect to the recommendations of the Institute, the members will be advised to abstain from participating in the competition for the new academy, which is to cost £30,000. The Board has agreed to appoint a professional assessor, and to fix at once the fees of the architect, but decline to publish the name of the assessor until the competitive plans have been delivered.

Secondary Schools, Shrewsbury.

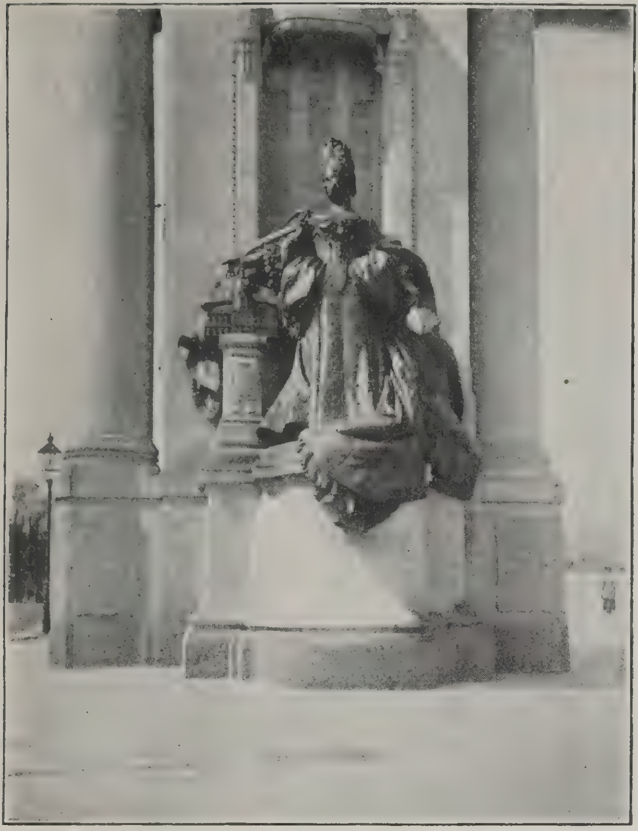
In this limited competition, which was assessed by Mr. Henry T. Hare, F.R.I.B.A., the plans prepared by Messrs. Frank H. Shayler and James A. Swan, joint architects, were placed first. The schools are to provide accommodation for 200 boys and 200 girls, and the cost is estimated at £15,000.

Middlesbrough New Public Library.

At the recent meeting of the Free Library Committee it was reported that the assessor commenced his inspection of the designs submitted on Thursday last. 202 sets of plans have been received, and arrangements are being made to put them on exhibition in the town hall.

Elementary School, Aberbeeg, Mon.

The education committee of the Abertillery Urban District Council are advertising for the submission of competitive plans for an elementary school to be built on the Ty'r Graig site near Aberbeeg, providing accommodation for 320 infants on the ground floor, and 430 boys and girls (mixed) on the first floor, together with an estimate of the cost of carrying out the scheme. "They also" (we quote from the official advertisement) "invite tenders for the provision of the necessary plans, specifications, estimates, and bills of quantities, and the supervision of the works. The lowest or any tender not necessarily accepted, and no premium will be paid for the competitive plans, unless the tender accompanying the successful plan (if any) prove to be prohibitive, in which case the committee will reserve the right of using the plan on payment of a premium of 10 guineas. A plan of the site may be seen, and, if desired, copied, on application to the secretary. Tenders and plans, sealed and endorsed, to be in the hands of the undersigned by Wednesday, June 3rd, 1909." We have seen many unusual announcements concerning competitions, but this is the most extraordinary we



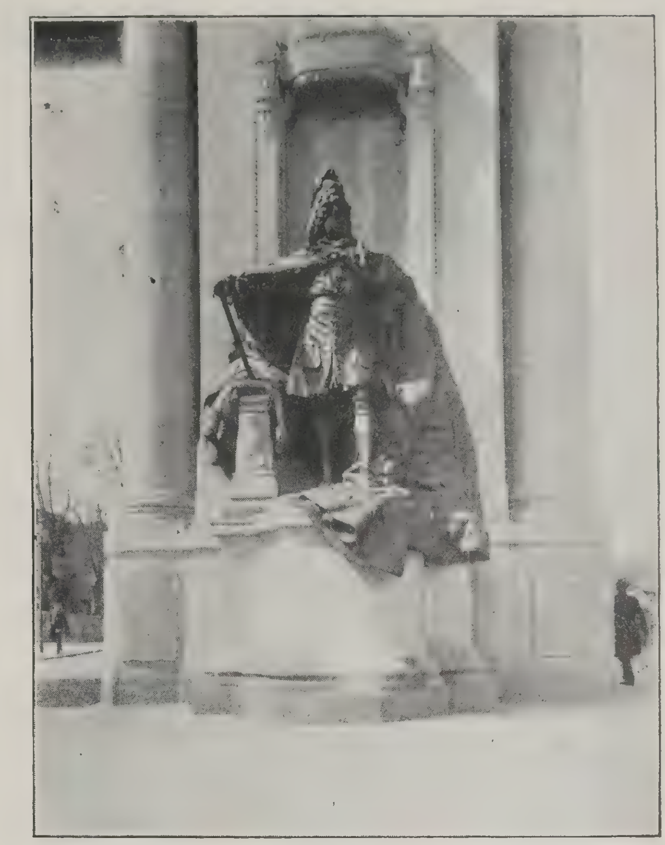


Photo: Topical.

Statue in bronze of Queen Sophie Charlotte, wife of Frederick I.

Statue in bronze of King Frederick I. of Prussia, Founder of Charlottenburg.

THE NEW CHARLOTTENBURGER BRIDGE, BERLIN: A RECENT EXAMPLE OF GERMAN CIVIC ARCHITECTURE.

have ever read. The terms of this advertisement are so unusual, not to say obscure, that we hesitate to comment upon them, lest it turn out that we are labouring under some misapprehension as to their import. We take it that the successful architect is to receive no premium for plans unless the accompanying tender happens to exceed the committee's unstated limit; but we do not understand this mixing of the several functions of the architect and the contractor. Is it a local custom? What is the nature of the tender required? We should like to be assured that there is no attempt to set up a competition among architects as to the amount of their fees.

Royal Southern Hospital, Liverpool.—New Out-Patients' Department.

Messrs. Haigh and Thompson, who were recently placed first in the above-named competition, take exception to part of a sentence in our issue of May 28th, which they think is open to misconstruction:—" . . ., though whether the significant clause in the conditions requesting the architect to state his fee in the report accompanying his work was the determining factor, we hesitate to say." We are informed by them that the usual fees are charged, viz., 5 per cent. for the architectural work, and 2½ per cent. for quantities. An independent quantity surveyor has been appointed.

The passage of which the words quoted form part, comments solely on the apparently restraining influence which this particular clause in the conditions seemed to exercise on all the elevations; it was purely general, and had no reference to any particular competitor or to the fees stated in the reports accompanying the designs.

In view of the Daylight Saving Bill it is interesting to note that Messrs. George Wragge, Ltd., art metal workers, etc., of Salford, have adopted the system in their works, with the general approval of the workmen concerned. The directors and staff, recognising the advantages, have also resolved to adopt the scheme in the offices.

In Parliament.

By our Gallery Representative.

Imports of Joinery.

In the House of Commons, Mr. Tennant, secretary to the Board of Trade, has informed Mr. Tyson Wilson that the value of imports of "house frames, fittings, and joiners' work" into the United Kingdom from foreign countries was in 1906 £251,590, in 1907 £200,126, and in 1908 £191,996. From British possessions the imports were in 1906 £21,359, in 1907 £24,470, and in 1908 £17,636. Those figures include the imports of doors, windows, and other framed work.

Crown Royalties on Slates.

Mr. Hobhouse, secretary to the Treasury, in reply to a question by Mr. Ellis Davis, stated that the Crown royalties on slates were in nearly all cases charged in the form of a percentage on the sums realised by the sale of the slates. Consequently they rose and fell with the fluctuations of the market, and when prices were low lessees got the benefit of an automatic reduction. The whole question of the royalties on the principal Crown quarries in Carnarvonshire was very carefully and thoroughly gone into by the Commissioner of Woods five years ago, at the request of the lessees. The case of each quarry was considered and dealt with on its own merits; considerable concessions were made, and the lessees united in expressing their appreciation of the fair spirit in which their applications had been met.

THE BEACHCROFT RESERVOIR.

Sir Melvill Beachcroft is immortalised. A reservoir has been called by his name. He thus gets a monument which, if not "more enduring than brass," is at least not so "unstable as water." The reservoir thus distinguished is that at Honor Oak, in south-east London. It is notable among its kind as being "the largest ever constructed at one time and under one contract." Also the clay for the sixteen millions of bricks employed in its construction was dug from its own bowels; the reservoir, 824ft. long between the walls, with a maximum width of 587ft., occupying an area of about 14½ acres. Sir Melvill, therefore, is the godfather, as it were, of no mean reservoir. It is certainly not an ignoble, and it need not be an altogether hopelessly prosaic way of perpetuating a name. Springs, wells, fountains, streams, being ceaseless sources of inspiration to poet, painter, and sculptor, are intimately associated with imaginative conceits and legendary lore. But the reservoir is a more practical and perhaps more forcible appeal. It stores the means of cleanliness and health and energy of many forms of life itself; and Sir Melvill Beachcroft, as ex-chairman of the Water Board, and as present chairman of the London County Council, and as a scholar of refined tastes, is in a position to appreciate both the utilitarian and the not unromantic aspects of the well-deserved compliment that has been paid him, as the representative of a family that, as Mr. E. B. Barnard, M.P., observed at the inaugural ceremony of the reservoir, has been for three centuries actively interested in the government of London. "It had been," said Mr. Barnard, "an hereditary tradition of the family to give the best they had unstintingly for the public service: and no member of the family had done it with greater generosity, prestige, or success than Sir Melvill Beachcroft."

Mr. Wm. Nicholson, of the firm of Messrs. Wm. Nicholson and Sons, Ltd., contractors, of Hunslet, has been adopted as the Conservative candidate for South Leeds. Mr. Nicholson was born in 1865, is the son of the late Mr. Wm. Nicholson, of Belmont, Hunslet, and a grandson of the late Mr. Wm. Nicholson, of Burley Grange, Leeds. He has already represented the ratepayers as a member of the City Council, and done valuable work as chairman of the Highways Committee. Two years ago he was president of the National Federation of Building Trades Employers of Great Britain and Ireland.

SECONDARY SCHOOLS: THEIR PLANNING AND EQUIPMENT.

By G. Topham Forrest, M.S.A., Architect to the Northumberland Education Committee.

Abstract of a paper read before the Society of Architects, May 13th.

A little over a year ago, Mr. Forrest read before the Society of Architects a paper on the Planning of Elementary Schools, dealing with the subject from the standpoint of Part III. of the Education Act of 1902. On the present occasion he dealt with Part II. of that Act, where it is enacted that local education authorities shall consider the educational needs of their areas and take such steps as seem to be desirable to supply or aid the supply of education other than elementary.

The time has now come when secondary schools are receiving due attention, and the present appears to be a good opportunity for the consideration of the various matters connected with the planning and erection of these buildings.

Preliminary Data.

In most competitions for secondary schools, and where work is entrusted to architects in private practice, fully drawn up rules and regulations are now invariably issued by local education authorities, and intending competitors are informed as to the methods of classification, the sub-divisions of classes and questions of organization, so that the architect before commencing with his plans has a clear idea of the conditions under which education is carried on under the authority to whom the plans have to be submitted. He can study, therefore, very closely the question of routine and organisation in that particular district, which is (needless to state) of the utmost importance in securing the best possible plan.

Matters relating to the size of cloakrooms, the amount of hanging space necessary for each scholar, the number of closets required, etc., have already received their quota of discussion and need not be repeated here. These and similar matters are dealt with fully in the building rules issued by the Board of Education. These rules should always constitute the architect's *vade mecum*, although committing them to memory must be regarded only as a means to the end, as efficiency can only be acquired by practical every-day experience.

The term "secondary school" is of wide application, and covers educational institutions of very different aim and type. It is applied to the city grammar school, the city high school, the modern commercial or technical school, and the residential school. Strictly, the name should be confined to those schools which educate pupils who have passed the primary or preparatory stage, and whose age is approximately thirteen to eighteen. But the majority of secondary schools have preparatory departments and undertake the education of the young from the age of seven.

Secondary schools are divided into two classes (1) Residential or Boarding Schools, (2) Day Schools. In the former, for a considerable part of the year, the school performs the double function of a school and house; and in the latter (which is the subject of this paper), the school merely shares with the home in the process and responsibility of education.

Always avoid a long narrow site. One approximately a square is more acceptable for a school, for it should be remembered that ample space on all sides of the building is necessary.

Type of School Favoured.

Whether a new scondary school shall be a school for boys or girls only, or a mixed or dual school, is a matter for the educationist to decide, and depends to a large extent upon the population of the district and the provision already existing.

Accommodation and General Principles to be Observed in Planning.

Generally speaking, a secondary school can be commenced with a minimum of accommodation, viz., classrooms, hall, science and preparation rooms; and such things as cookery and manual training rooms, gymnasium, art rooms, etc., can be added afterwards.

In small secondary schools, it is sometimes arranged that one science room is made sufficient for the whole of the science teaching in the school; but for a secondary school of any size, at least a chemical laboratory, a physical laboratory, lecture room, preparation room, and dark room are required.

In some English counties a new system of arrangement has recently been tried with great success. Some directors of education do not agree with the system of taking theoretical work at one time and practical work at another. They believe that the students get a more thorough grasp of their subject by combining the two parts in one lesson. This system is working well, I understand, and the science teachers after trying it like it. With this view all the science benches are so arranged for the students, and are made so that they serve as tables for taking their notes, the students using stools to sit on during the theoretical portion of the lesson, and during the practical work placing the stools under the benches. Whether sinks and reagents are required to each bench depends upon the extent of the chemistry course, but in ordinary secondary schools it has been found sufficient to have these on the side benches only.

The physical laboratory can be adapted for electrical work if the requirements of the school need it. In boys' schools, magnetism, electricity, and mechanics are generally taken in this room; and in girls' schools botany, as well as the ordinary physics course. A good balance room should always be provided, and fitted with slate benches set perfectly level for balance work.

A preparation room is required, with easy access to both physical and chemical laboratories. This should be fitted with a good sink, shelves for reagents, and either a separate draught chamber or access to one of the draught chambers in the chemical laboratory.

With regard to the art room, excellent results in lighting can be obtained by adopting the principle of the ridge-and-furrow roof where it has not been possible to get a direct north aspect.

As to cookery rooms, these should be large and airy, preferably at the top of the building. Good scullery accommodation is also required.

The manual teaching room is better on the ground floor, or isolated, owing to the noise. Practically no fittings are required beyond benches, tool racks, and work cupboards.

In girls' schools, three changing rooms are required, one for the mistress, one for the girls, and one for the other teachers. The girls' room should be planned contiguous to the cloakroom, so that they can change their garments after playing hockey, etc. Arrangements should be made for swimming baths when money will permit. The head mistress's private room, cloakroom, lavatory, and changing room should be *en suite*.

Hot water to lavatories should always be supplied from the kitchen fireplace, and a hot cupboard to dry clothes should never be omitted. Lead flats if possible should be used for growing plants.

With regard to a room for needlework, if the school curriculum is so arranged that there is always needlework in hand, a special room should be set apart for cutting out and drafting, and fitted with long tables on trestles; but very often this subject is taken in the dining room, and many lady principals are of opinion that a geography room is more important than a room for needlework, fitted up with places for maps and apparatus. Note that an optical lantern must always form part of the equipment of this room.

In dual schools, be sure to keep departments common to both sexes in the centre of the building, thus obviating overlapping.

With reference to the classrooms, the sixth-form room should always adjoin the library, and should have direct access to the room. In some schools, the two rooms are divided by a folding partition, thus allowing them to be thrown into one. Where a gymnasium is provided, it should have a gallery for scholars; and if the gymnasium is situated outside, it is best to make the changing rooms sufficiently large and easy of access from the playing fields.

Assembly Hall.

It is always desirable to have a principal entrance for the general use of the school entering direct into the assembly hall for public functions, etc. This section is usually set apart for the office, head master's or head mistress's room, committee room, etc. With regard to the assembly hall itself, it is not desirable that it should form a passage way. This point is important. The hall should be ample enough to seat the whole of the pupils, with a good margin to allow of sufficient seating accommodation for prize-giving and entertainments, etc. Six square feet per pupil should be taken as the minimum allowance, and any further space will prove of great advantage. If the hall is used as the gymnasium, provision should be made for the storage of chairs. Side lighting should be in all cases the rule, as it makes the question of ventilation much easier. One end of the hall should be wainscoted so as to allow of names being painted on, and so prevent those horrible wall boards so often seen.

Science Rooms.

No special rule can be laid down for fitting up the science rooms of secondary schools, as the size and character of the school must be very carefully considered in determining the requirements, but there are certain general principles to be observed in laboratory planning, and a neglect of these may lead to the production of a laboratory apparently perfect on a cursory examination, yet so defective that to conduct ordinary work therein is a matter of considerable difficulty.

First and foremost, laboratories should be capable of expansion and modification. (2) Fittings should be so disposed round the room as to minimise the unavoidable movement of pupils. (3) The arrangement of benches, etc., should ensure ease of supervision on the part of the instructor, and (5) The storage accommodation should be ample, and wall space should be left for additional fixtures.

These five considerations should be constantly kept in view, and no fitting should be introduced which to any great extent tends to subvert them. With regard to the general structural nature of the rooms, the laboratories should be lofty, and either top lighted or the side windows so planned that the sill is at least 6ft. from the floor. By this means no wall space is wasted, and the light is better diffused. The walls should be wood panelled to a height of 6ft. to enable all apparatus to be easily fixed and easily moved. Glazed tiles or bricks, though admirable as far as light and ease of cleaning are concerned, are a disadvantage when change of fittings is required. It is perhaps superfluous to remark upon the necessity for perfect rigidity of the flooring, the ordinary system of joists and flooring boards being quite inadequate.

Chemical Laboratory—General Arrangement.

The main desideratum in a chemical laboratory is plenty of room for the students to work. The working benches are either single or double, but single benches have the advantage that all students face the same way, and so are under better supervision, but they are very extravagant as regards space. Wall benches are bad, and should in all cases be avoided, only when space is extremely limited should they be employed. They obliterate all the wall space and leave no room for cupboards and other fittings. Gangways between benches where students work should not be less than 6ft. For a single row 4ft. will suffice. Each student will require a minimum bench space of 3ft. 6ins. by 2ft.

A considerable space should be left clear in front of the demonstrator's table so as to afford room for the students to assemble to receive collectively any remarks from their demonstrator. It is always a decided advantage if perfect symmetry can be secured as an aid in securing the orderly issue and disposal of apparatus and reagents, and reduces the need for movement in the laboratory. In the accompanying sketch the bench sinks are common to four students, and provide precisely similar accommodation for all. Again, the fume closets for general use are symmetrically disposed, so that each student would know which he is expected to use.

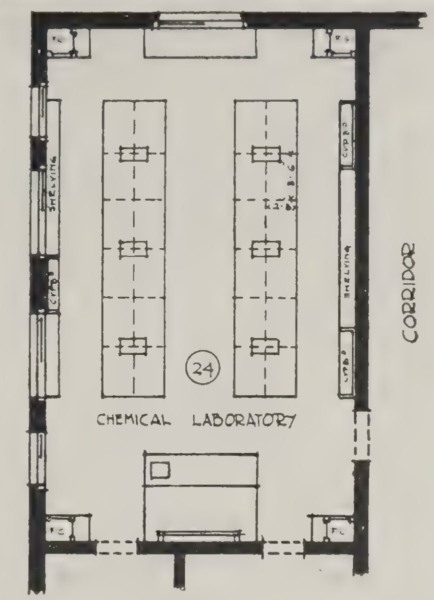
For the same reason reagent shelves other than those on the benches should be placed symmetrically about the room, and not all collected into one position, so that no student has to move far to secure any reagent that may be required.

Before the best method of fitting up the benches can be determined, it is necessary to know to what degree the chemical teaching is to be carried. For instance, a very simple form of bench would suffice for a school where few of the pupils would proceed to analysis. At one school I know of they have benches with a plain top arranged for four students; and while a gas jet is supplied to each pupil, there is one tap for water and a sink placed at each end which serves for two pupils. There is no partition in the centre (this form being out of date), but a row of white glazed tiles on which to stand bottles. This arrangement is suitable for elementary work, but would hardly be sufficient for a school where there were advanced pupils.

With regard to the detail for bench fittings, each pair of students should have at hand one water nozzle, fixed about 2ft. above the level of the sink, one side nozzle for filter, pumps, etc., one nozzle for condensers, two gas nozzles, terminals for electric current, one balance in a solid and well-made case, one receptacle for rubbish (broken glass, etc.), and space for bottle. If reagent shelves are used on benches, all gas nozzles, electricity terminals, etc., should be recessed under the shelves, raising them on a wood fillet from the bench level. The working space is thus entirely unencumbered, and glass apparatus is not liable to be broken by being pushed against a projecting gas nozzle. In planning the lockers beneath the benches, regard should be paid to the maximum number of classes likely to use the laboratory. With regard to the drainage, the V-shaped trough is the most satisfactory. This may be made of 1 or 1¼in. red deal boards joined so as to form a V trough about 6ins. deep, and having projecting fillets to prevent splashing. The trough is thoroughly caulked with a mixture of pitch and tar put on hot. This trough collects the drainage from the sinks, and delivers it into a sludge box. The overflow from the sludge box is delivered into a similar trough laid in a chase in the floor, which conveys it to the downspout outside. The gas pipes should be of ample bore, and the pressure good, otherwise when many burners are in use at the same time the supply will not be sufficient.

Physical Laboratory.

The main desideratum in the physical laboratory is a table free from vibration and of sufficient width to allow of a student being able to place his apparatus in the proper position. The narrow single bench which many prefer in a chemical laboratory should be avoided. Separate tables suitable for four students should be used, say 8 ft. by 4 ft. It is always advisable to leave the bench tops unencumbered. With this object in view, gas taps, etc., should be placed in a row at the ends of the tables, and all tables should be fitted with cupboards underneath. It is not necessary to lay on a water supply to the students' benches; two wall sinks with heaters and drainage boards will as a rule be sufficient. Every physical laboratory should contain a large stock of small drawers, say 12in. by 3in., for the purpose of storing the innumerable small appliances in constant use. Lever handles to the doors of the cupboards should be used, as the ordinary piece of hardware is often difficult to unfasten, and leads to shaking, and perhaps injury to sensitive apparatus within the cupboard. All cupboards should have flat tops and glazed doors.



Lecture Room.

The lecture room should be readily accessible from both the chemical and physical laboratories. A space should always be left at the back of the room for a lantern stand, and another on the right on the lecture table for the use of a lantern in optical work. It is a good plan to fit the front of the lecture table with glazed cupboards. If the "Kelvin" sliding blackboard is used, see that the pulley wheels are of large diameter. The small ones in common use render the board difficult to move. The electric service employed for adapting the electricity from the supply mains to experimental purposes is all-important, and requires careful consideration from every point of view before the plant is laid down and wiring fixed. It is important that the wires should be accessible, and not embedded in the walls. The electric service, however, is of too wide a scope to deal with in this paper.

Desks.

The single desk is the type recommended in the case of secondary schools, and most of the single desks have lockers, though this is not insisted upon. Three different sizes are generally obtained, to allow of pupils of different heights and ages. Adjustable desks with complicated mechanism are not as a rule found to work satisfactorily. In one high school for girls the seats or chairs varied in size to suit the desks, and were all separate and not attached to the desks in any way. Some people object to this, but at this particular school the head mistress liked the pupils to be able to move their chairs and sometimes have them close to the desk and sometimes further away from the desk. She also found it a great convenience to be able to take all the chairs from the classrooms to the hall, when that room was required for a concert or large meeting. The gymnastic mistress went round at the beginning of each term to see that each girl had a desk and chair of the right height. Whatever system is adopted, special care should always be paid to securing desks of practical construction, and to their satisfactory placing in the classrooms, inasmuch as the order and discipline in a school are very materially dependent thereon.

Ventilation and Heating.

As the ventilation of a building or school is such a complex question, it is not advisable to discuss the question in a general paper of this description. Whether mechanical or natural ventilation is most suitable is largely a matter of opinion, as there are many strong advocates of both systems. Of course there are always schools in which the introduction of mechanical ventilation is quite unnecessary. Except in the heart of large cities, secondary schools for both boys and girls are generally situated in the outskirts, or at all events in the better quarters where nearly always large open spaces can be easily obtained. In these schools it is not really required. Further you have in these schools some 25 to 30 pupils only in a classroom with a much larger cubic content per child than in the case of an elementary school. All this goes to help the ventilation, and renders it less necessary to resort to mechanical means.

The choice of an efficient heating system for a school is always a difficult matter, but experience has taught that all things being equal there is nothing to surpass the ordinary low-pressure hot water system, provided the radiating surface is properly calculated and allowed for. I have never yet seen a properly installed low-pressure heating installation fail, or give the least trouble. Consequently, I have adopted this system almost without exception, on account of its economy and efficiency. I am of opinion that the architect should invariably get out his own heating scheme with detailed specification.

Artificial Lighting.

In secondary schools situated in large towns liable to fog, and where work is carried on in the afternoon or evening, the question of artificial lighting becomes one of great importance. Now that the medical inspection of school children has become compulsory it behoves the school architect to see that the doctor shall have no good reason for tracing cases of visual fatigue to defects in the lighting of the school premises.

Up till quite recently it is surprising how relatively small an amount of consideration has been given to the problem of artificial illumination in schools. The general question as to whether gas or electricity is the more suitable illuminant for a school is a large one, but the lecturer prefers incandescent gas.

The even distribution of light is the underlying principle which governs the correct application of artificial illumination. This is essentially so in schemes of interior lighting. To attain this end, endeavour should be made to follow as far as possible the distribution and characteristics of daylight illumination, namely, downward and oblique direction, steadiness of the light, and broad diffusion in order to avoid sharp and deep shadows—not, however, seeking to eliminate shadows entirely, as these by forming contrasts are helpful and materially assist the eye in its judgment of the form of objects.

In all forms of artificial illumination, the intrinsic luminosity or the intensity of the brightness of the luminous surface should be kept as low as possible, or in other words the surface from which the light emanates should be as large as possible because—(1) The strain on the eye will be as small as possible; (2) the shadows will not be deep, and the difference between light and shade will be reasonable.

Eminent lighting authorities lay down the rule that the maximum allowable luminosity should be below five candles per sq. in. of illuminating surface. Obviously this means that some method of diffusing the light, either by means of shades or globes, should be adopted wherever the radiant is directly in the field of vision, so that the diffusing surface may be within the limits of a comfortable working intensity.

The amount of gas consumed by an inverted burner should be always carefully adjusted, so as to get the best results, and if the pressure of gas in the street mains is a varying one; either a volumetric governor of the size necessary to pass the requisite amount of gas should be fitted on each burner, or a pressure governor should be fixed on the meter. In some districts the pressure in the street mains varies as much as 50 per cent., so that without some governing arrangement it is manifestly impossible for the burner to give its best and most economic results.

General Principles.

In concluding, I may be pardoned if I lay stress on the necessity of designing schools from within rather than from without. To sacrifice the interior so as to get an external effect is insincerity in architecture. It may mean inconvenience to those who use the building, and often results in insanitary conditions prejudicial to body and mind.

Appropriateness in design is the correct aim in art, and this arises where the design is the natural outcome of the purpose for which the building is intended. The present-day public elementary council school, clean and excellent as it is, if somewhat bare, offers quite sufficient contrast to the homes from which most of the children come, and is therefore well adapted to give them a start on the road to a higher standard of living; but to children, especially girls, accustomed to the refinements of a cultivated home, plain utilitarianism in the erection of a building is likely to present a forlorn and forbidding appearance; although it may and indeed does cost more to make a handsome building, there ought to be set against this the fact that refined and artistic surroundings have a high educational value. Therefore the necessity for a due observance of strict simplicity and practical utility in their erection should not and must not prevent the endeavour being made to render the school as a whole, and the several rooms in particular, pleasing to the eye both in form and appearance, whereby there will be called up in the minds of both teachers and scholars agreeable and pleasurable sensations, which may in a measure contribute to exercise a stimulating and exhilarating influence on their faculty of taste and artistic sense. So much is spent nowadays on teaching art directly that some allowance might be made for influences of this kind which are none the less strong because imbibed unconsciously.

Buildings in Progress and Completed.

ABOYNE.—The new church shortly to be opened here is estimated to have cost £14,000. Messrs. Fryers and Penman are the architects.

CRAIL.—The foundation stone of a new Presbyterian Church has just been laid. Mr. J. Cairns is the architect.

DUBLIN.—Another Carnegie library, absorbing a sum of about £10,000, is now in course of erection. The building, from designs by Mr. Charles J. McCarthy, is in the Georgian or eighteenth century style, and has a frontage of 100ft., and a depth of 84ft.

ELAN VALLEY.—A new school, erected by the Birmingham Corporation, has been formally opened. The building consists of an assembly hall to seat 200, with three class-rooms, cloak-rooms, etc. A feature of the building is the reinforced concrete water tank contained in and forming part of the tower. This supplies the school with water, and is capable of temporarily supplying the village in case of emergency. The contractors were Messrs. Henry Lovatt, of Wolverhampton, and in addition to the school buildings their contract included permanent workshops, offices, and cottages. These are in connection with the Birmingham Water Supply Works. All the buildings are constructed of local stone rubble, with dressings of Yorkshire grit-stone. Messrs. Buckland and Haywood-Farmer, of Norwich Union Chambers, Congreve Street, Birmingham, are the architects.

FARNWORTH.—The new Town Hall just opened, which, together with the land and furnishings, has cost £11,341, has been erected from the designs of Mr. W. J. Lomax.

HUCKNALL.—Swimming baths from the designs of Mr. Fred Rowntree, F.R.I.B.A., of London, have been opened here. Messrs. J. A. Munks and Son are the builders.

LONDON, E.C.—A sum of £135,000 has been already expended upon the new post-office building in Newgate Street, and it is anticipated that another £100,000 worth of work will be done during the present financial year. After this, a further sum of £77,000 will still be required. The new power station at Blackfriars, upon which nearly £50,000 has been spent, will, it is hoped, be completed this year. Progress is being made with the construction of the new branch post office at South Kensington, the new Western District post office, and the enlargement of the Western District parcel office and telephone exchange. A new post office is to be built at Blackheath, and new sorting offices at South Lambeth, Stoke Newington, and New Southgate.

LONDON, E.C.—The new building of the Northern Assurance Company (Limited), the site of which has a superficial area of approximately 9,000ft., has been erected at the junction of Coleman Street, Moorgate Street, and Lothbury, and is faced with Aberdeen granite. It is of melancholy interest to note that both the original architects—Mr. E. W. Mountford and Mr. E. A. Gruning—died while the work was in progress. Their places were taken by Mr. F. Dare Clapham and Mr. H. Alexander Pelly respectively.

LONDON, W.C.—Extensive alterations to the Hipprodrome, including the construction of a sliding stage, which will be double the size of the present one, will, it is stated, necessitate the discontinuance of performances until August Bank Holiday.

NOTTINGHAM.—It is believed that a great improvement will be effected by the erection of a large building to be known as "Westminster Chambers," upon a site fronting Upper Parliament Street, Wollaton Street, and Theatre Quadrant. The building, of which Mr. A. Harrison Goodall is the architect and Mr. G. A. Pillatt the prospective builder, is to be in the modern Renaissance style.

PETERHEAD.—The estimated cost of the new post office building, designed by Mr. James Watt, is £5,000.

KNOWLE.—The Bishop of Clifton recently laid the foundation stone of a new church to be erected here. The site has involved an outlay of £600, and the edifice itself, designed by Messrs. Pugin and Pugin, of London and Liverpool, will probably cost (exclusive of benching) another £4,500. Messrs. Stephens, Bastow and Co., of Bristol, are the builders.

PONTYPRIDD.—The new Y.M.C.A. building now in course of erection is estimated to cost £12,000. The design is by Mr. Vernon Hodge, the winner of the competition which was open to all practising architects in the country.

RENFREW.—A new asylum is now being erected at Dykebar, from the designs of Mr. T. G. Abercrombie. It comprises ten main blocks of buildings, and is estimated to accommodate about 300 patients. The cost will be close on £100,000.

SUDLEY.—The new church now in course of erection here will cost £7,500, and is to accommodate about 700 worshippers.

WEMYSS.—The foundation stone of the hospital now being erected at Denveath was recently laid by Lady Eva Wemyss. The hospital, which is a memorial to the late Captain R. J. E. Wemyss, is to cost about £6,000.

Our Plate.

House at London Road, Chelmsford.

This house has been built on an angle site for Mr. F. H. Crittall, J.P., the idea of the place being that it should be very easily worked with a small staff of servants, so that it can be at any time shut up and left. The owner was very largely responsible for the general arrangement of the plan. There are only three fireplaces in the house besides the kitchener, and these have been installed more for appearance sake than for real utility, as the house is heated by hot water radiators. The servants sleep downstairs on the ground floor, and have their own bath-room, etc. Externally the walls are faced with rough-cast and the roof covered with hand-made tiles. The woodwork, both inside and out, is finished with two coats of Carbolineum. Internally the detail is of the very simplest. Mr. Jesse Gowers, of Chelmsford, was the builder. The casements and metal lathing came from the Crittall Manufacturing Co.; the heating and sanitary work were executed by Messrs. Crittall and Winterton; and the electric light fittings by Mr. Amer Fenn.

A NEW THEORY OF PLANS.

By Max Judge.

The philosophers, if they believe in anything, at least believe in relations between hings. For some of them the relation whereby the things related manage to exist, is the only real thing. Relation, too, dominates the unphilosophical mind in many of ts processes; witness the fascination of any old thing, and, more to our immediate purpose, any old house, which sets up an unconscious rumination on its associations with those who have in the past used its echoing rooms and rambling corridors. There the associations—the relations with quite unknown persons it may be—have become the real thing. Without going so far as the philosophy implied above, we can at least say that without this fascination the house would have no particular meaning to us.

It does not require that the actual history of the house in question shall be known—the mind at once creates movement to correspond with what is based on movement. It will create romance to fill romantic positions, and t will not be lacking in imagination appropriate to the ins and outs of any old town or country mansion. In other words, what we have been trying to suggest is that it is the very *plan* of a house which creates the relations with its inhabitants, which in their turn give the place its meaning to us.

That is the explanation of many peculiar effects wrought by old haunts upon hypersensitive minds.

We shall discover on reflection that all this follows from the simple fact that it is the two-dimensional diagram (the plan) which is all that is necessary to suggest our normal movements. We may look on the front of an old-time mansion without receiving any of he impressions derived from a tour of the several floors. All the elevation can do is o take into account our third dimension of height, and as the staircase is the only instance of our moving through *two* planes at once (of which all the essentials can be represented on the plan), an elevation fails o give us any relation with those connected with it. It is only the plan that can do hat. An elevation is at the most the exernal expression of a series of superimposed plans and the most successful elevation is rightly adjudged to the one that manages o give most expression to those plans. It equires some special known fact to give individuality to a window, for instance, in elevation—that blood-stained aperture in Whitehall, let us take, and that only gives us he one moment of the scene, no movements before or after.

Virtually, in fact, we only follow our movements through two dimensions (one plane), which accounts for the reason that a map or plan has so much interest, telling us practically all that we want to know. The mind can go over the ground on paper exactly as the feet go over it in reality.

We might assume that it is the third dimenion, about which we seem so indifferent, hat gives us our existence, and that we are n theory a two-dimensional being at every point of our body, from head to foot. We ould go further, and assume that a four-dimensional body would be one normally moving through three dimensions, and that all bodies in fact must have *one* dimension more than they can fully appreciate.

It is, of course, chiefly gravitation that preludes our being concerned with *heights* in ur every-day movements. We are literally rawling on the floor all the time, and graviation goes a long way towards cancelling he prerogative of a third dimension. We ever leave the earth—the plan. A doorway nly concerns us as to the possibility of our etting through it—the concern of the two-dimensional body at the floor level. A window similarly is the concern of the two-imensional body at the eye-level.

We live in the inside of cubes, and even hat is too wide an interpretation of our mitations. We live on the bottoms of the nterior of those cubes, and the five sides are here for convenience, comfort or safety. And thus follows the absoluteness of the plan. It is the actual thing reduced to its essentials. A house erecting does not alter in relation to ourselves from the moment when the lines of the foundations are dug to the completion of each floor (each complete plan) in succession.

To sum up this brief speculation, a map or plan in theory is to us exactly what a map or plan in practice would be to a two-dimensional body. For such it would be an actual model, and in the case of our own movements a model is no more helpful to the understanding of them. Even when we consider the case of the map, where the abstract plan becomes more irregular and difficult to follow, it is possible by means of contours and shading to give a more faithful idea of a hilly country than in an actual relief map, where in order that the heights may be appreciated at all the vertical scale has to be absurdly exaggerated! Some people never seem to be able "to understand a plan," and it is hopeless to expect them to extract half the meaning from a map. But there is no difference between the two in principle.

GERMAN TOWN-PLANNING: LESSONS OF THE RECENT TOUR.

By T. Alwyn Lloyd and H. Colin Allen.

Now that the subject of town-planning is becoming one of considerable interest to us in England, the recent visit of a large party of professional men, members of town councils and others, to Germany, to study the question, came at an opportune time.

Cologne, Dusseldorf, Frankfort-on-Main, and Wiesbaden were visited in the order named, and some members of the party extended the tour so as to include such mediæval cities as Wurzburg, Rothenburg-on-Tauber, and Nuremberg in Bavaria.

The municipal authorities in the various towns received the party officially, and went to considerable trouble in every case to make the tour of inspection as profitable as possible, by affording special facilities for investigation.

Cologne.

With nearly half-a-million inhabitants, this is one of the most important industrial centres in Germany and the chief town of the Rhenish provinces.

The development of Cologne is typical of the thorough methods of town planning in Germany. The centre of the city has been almost entirely re-modelled, the old lines of fortification razed, and broad avenues made in their place. The suburbs have been laid out on a definite plan, and the main thoroughfares constructed well ahead of requirements. In this way the needs of a future population can be intelligently anticipated; in England we usually begin to think about the development of the suburbs when building has actually extended out to that point.

Cologne, for building purposes, is divided into various zones, and limitations are put both upon the height and the area covered by buildings within the zone. Thus in one zone twenty-five per cent. of the plot must be left unbuilt on, and four storey buildings are permitted—in another, there must be fifty per cent. open space, and only two storeys are allowed. As the building areas extend outwards from the centre of the city, the amount of open space round them increases. At the same time, the centre is very well provided with boulevards, tree-planted and grass-verged, and open squares, pleasantly interspersed with green spaces. These squares were particularly noticeable round the old churches in the city, and in many cases streets leading up to the churches and public buildings have been opened up, so as to afford better views of them from the adjoining district.

On the other hand, the position of the Dom (or Cathedral) is not very happy, and there is a lack of enclosure in the adjoining "places." Several proposals have been made for joining up the cathedral more to its surroundings, but its great height makes this somewhat difficult; the placing of the new central station in the immediate vicinity has not tended to assist the general grouping.

Much of the planning in Cologne is in the style of the earlier German architects, mostly straight roads, with diagonal ones, and squares at intervals. Whole districts outside the old town have been laid out in more or less geometrical shapes. This method is now recognised there as being out of date, and in the newer districts curved roads are used to a much greater extent, and great care is taken not to get awkwardly-shaped intersections of roads.

Dusseldorf.

Though situated in what is the "Black Country" of Germany, Dusseldorf, on account of its far-sighted policy of town planning, and improvement is one of the pleasantest towns imaginable. Its business men, instead of leaving it when the day's work is done, reside there and take an active part in the life of the town.

The old town, of which there are several interesting remains, was situated near the Rhine, but most of the town is quite modern, and on that account there have been fewer obstacles to encounter than in many of the other German examples, where the old fortifications have hampered a completely satisfactory development.

There are several widths of streets, according to the uses to be made of them, and the height of the surrounding buildings is largely governed by these widths.

The principal streets in the centre of the city are wide and imposing looking; many of them have double rows of trees and ample grass plots.

One of the principal promenades, known as the König's Allee, is some 250ft. wide, and of considerable length. It contains what is practically a continuous strip of park, down the centre of the road, which has a stream running through and bridges over at points where intersecting streets cross.

Dusseldorf contains a number of important public buildings, which have been placed to great advantage on the river front or in open positions in the town. Even such a utilitarian structure as the railway station has been carefully designed, and its position in the centre of the town well thought out in relation to adjoining streets and buildings.

Factories and workshops are only allowed in certain districts reserved for that purpose; they are not permitted in any district from which the prevailing winds would blow the smoke over the town.

Some of our English manufacturing centres might with much advantage to the inhabitants make regulations in the same direction.

Frankfort.

Frankfort was formerly a mercantile city, and one of considerable antiquity, but during the last forty years, its industrial development has been very rapid, and at the present time there are a large number of manufactories of all kinds there. Its great problem now is that of housing the rapidly increasing industrial population.

The city has gone in for purchase of land on a large scale. One example of this will serve to show the important bearing this is likely to have on future development. Some years ago, a large tract of more than a thousand acres of land was purchased near the river; it has been planned out as practically a new industrial town, consisting of harbour works, wharves, factories, workshops, and workmen's dwellings.

These are, moreover, placed in the positions best suited to their requirements, and the houses kept quite separate from the business quarter, with plenty of open space surrounding them. The whole scheme is joined up to the central parts of Frankfort by new, wide thoroughfares.

Having purchased the land well ahead of actual requirements, the municipality obtained it on reasonable terms, and is likely to make a profit on the transaction, in addition to having this large district properly planned and developed. Sites are now being leased or sold for factories and houses—the use to be made of each plot of ground being specified by the authorities in each case, and great improvements in the trade of the city are anticipated.

Frankfort has special regulations with regard to widths and construction of streets, which are classed as "thoroughfares," "promenades," or "ordinary roads," as the case may be. There are fine ring roads round the centre of the city, following the uneven lines of the old fortifications. It is interesting to note also that all new streets are laid out by the municipality and not by private builders.

There is a special local law connected with the planning of the suburbs. Most of the land adjoining the city was held by a number of individual owners, whose awkwardly-shaped plots would not work in well with the town extension plan. By the provisions of this law, the land is all "pooled" together and after roads have been planned, and the whole district re-arranged, it is distributed again among the landowners in its original proportions.

In Bavaria.

The extension of the tour took the party into the kingdom of Bavaria, where the following towns were visited:—Wurzburg, Rothenburg and Nuremberg.

In each of these the same cordial welcome awaited the visitors as had greeted them in Prussia, and the authorities did all in their power to explain the special features of each town.

At Wurzburg and Nuremberg, the problem has been a dual one—that of preserving an old town and at the same time, extending and re-arranging it to the requirements of modern industrial development.

At Rothenburg, the interest lay in the fact that a splendid example of mediæval town planning has been preserved, practically in its entirety.

Wurzburg.

Although it has had a most eventful history as the seat of a long line of prince-bishops, who ruled the surrounding country for several hundred years, Wurzburg has not been content to rely only on its past glories.

To-day, it is a progressive city, with an increasing population, considerable manufactories and an important university.

The interest of the plan lies in the skilful manner in which the new town has been connected up to the old, without the sacrifice of any of the distinctive features of the latter. The fortifications existed until 1866, since when the space they occupied has been laid out as gardens and plantations, which form a very pleasant adjunct to the town, and round which many of the University and public buildings have been grouped.

The new town has been well planned, and some of the suburbs are as good examples of the modern methods of town planning as were seen in Germany.

In the town extension plan, provision has been made for future industrial growth, and here again factories have been relegated to the districts from which the prevailing winds will not cause the smoke to be blown over the city.

The huge Residenz Platz is one of the most important points in the town, and from this avenues of trees and public gardens stretch out in one direction, and the main streets down to the river Main in the other. The station approach is also an imposing entrance to the town.

Rothenburg-on-Tauber.

In many ways, Rothenburg must be one of the most interesting old cities in Europe, and the way in which it has been preserved is typical of the care exercised in Germany over towns old and new.

It is an almost perfect example of a walled-in city of the Middle Ages, and is surrounded by high walls, towers, moats and gateways—a relic of the far-off times when the only consideration in town planning was that of defence against attack.

There are very few new buildings inside the walls, and only a few scattered houses outside, so that nearly all the energies of the officials are spent in preserving the old buildings in the best possible way.

Nuremberg.

Nuremberg has had to deal with the same problems as Wurzburg, only on a larger scale. Its population is now about four times as great as it was in 1870, and it is one of the chief industrial centres in South Germany.

Here, instead of destroying the old fortifications, their walls and towers have been retained and playgrounds made of the moats. The numerous old bridges crossing the river Pegnitz in different parts are also characteristic features of the old town.

When the modern industrial development commenced about forty years ago, town planning became a necessity, we are told, and the extension of the city was arranged for in good time.

Certain laws were decreed as to widths of streets and heights of buildings, and later on, to prevent the perpetuation of the usual type of attached street frontages, a more open system of building was adopted. A certain amount of ground between buildings had to be left unbuilt on. The area of this open space is governed by the height of the surrounding buildings and the width of the street.

A district in the east of the city has been allocated for villa building, on account of its favourable position, and factories are not allowed there. In other districts nearer the centre of the city, flats up to four storeys and basement are allowed, and, a little further out, only flats of three storeys.

It should be mentioned that in Nuremberg, as in other German towns, high buildings are the rule, and anything like our two storey cottage property is almost unheard of in the towns.

The streets vary in width from about 30ft. for side streets to 100ft. for main thoroughfares.

Building in the vicinity of historical parts of the old town is subject to special regulations, and where street frontages have to be altered for town improvements, great care is taken in dealing with the old buildings.

A committee of taste, consisting of five of the best architects, act as judges of all designs for new buildings or re-building in the city.

One of the few German garden-city schemes of small houses, spaced out generously, is to be seen a few miles outside Nuremberg. It is a colony of railway workers, on land belonging to the State, and the houses have been built partly by the State direct and partly by a tenants' society.

BANK OF SPEYER AND CO., BASLE, SWITZERLAND. CHARLES F. MEWES, ARCHITECT.

Correspondence.

Against Back-to-back Houses and Block Dwellings.

To the Editor of The Builders' Journal.

Sir,—I am grateful for your remonstrance against the perpetuation of back-to-back dwellings, and I think that this opposition ought to be extended to certain other classes of industrial dwellings that, I contend, are objectionable from the social, moral, and sanitary point of view.

Let me just briefly indicate the main features of some typical back-to-back houses. Some of which I have personal knowledge are built in blocks of eight houses, four in one street, and four in another, back to back, the net area of a house being, as a rule, about 15ft. by 16ft. At the end of each block there is an enclosed yard, running from street to street, and containing four w.c.'s and two ashpits for the eight houses. The washing is usually done in the basement, and the clothes are hung out in the street to dry, often to the accompaniment of rude remarks from onlookers. And does the arrangement of the sanitary conveniences conduce to delicacy and refinement?

Next as to block dwellings I have visited many in most of the large towns of England and Scotland, and I have invariably found that the moment you get inside of these large buildings you become aware of a sickly and depressing atmosphere, caused by the massing together of so many human beings under one roof. A common entrance and a common stairway to the corridors, off which the various tenements are contained, and w.c.'s serving for more than one family, do not, to say the least of it, make for comfort, leaving decency out of the question.

If land could be secured at agricultural value, plus ten per cent. for compulsory sale to local authorities, cottages for the working classes could, I am convinced, be built for £200 each, inclusive of all charges, and they could be of 16ft. frontage, with a living-room 13ft. by 14ft., a kitchen 13ft. by 10ft., a good concreted yard of not less than 200 superficial feet clear area, and a due observance of decency and privacy in the provision of sanitary conveniences.—Yours truly,

York. A Builder.

The Taxation of Land Values.

To the Editor of The Builders' Journal.

Sir,—I take it that you would prefer this question discussed from the practical or business point of view. I will endeavour to give you the ideas of a person unprejudiced by political passion.

I submit that owners of undeveloped land should be entitled to whole or partial exemption in the following cases:—

(1) "When the non-development of the land is not injurious or disadvantageous to the community." I doubt whether in all districts it is desirable to throw more land into the market than is at present there. It would tend to over-production of houses; and though it might be advantageous to ruin some landlords, to ruin all without substituting something for the landlord and tenant situation would be absurd.

(2) "When the owner can prove that he is developing at a reasonable rate." Surely, if an owner sets out an estate, divides it up on a reasonable plan, makes roads, and builds houses, and offers to sell or let at a reasonable rate, he should be entitled to some sort of exemption, or at least to more consideration than the owner who does nothing. Are garden cities and garden suburbs to be taxed on the whole of their venture at the rate of ½ per cent. on the selling value in plots? This might be a small matter to an estate from one-half to three-quarters developed, but to one just laid out it must mean ruin.

(3) "When the owner can prove that he is not in a position to develop, and offers to sell at a fair market price." It is surely an injustice that a man should be taxed on what produces nothing, and on what he is willing to dispose of at a reasonable price. The inventors of this scheme do not seem to be aware that there are places where the value of undeveloped land is stationary or dropping through no fault of the owners, and that there are persons who have become owners who, from financial or other reasons, are quite unable to develop.

As to the capital charge of 20 per cent. on the supposition that all increases in value of land, except such as the owner has made by levelling, sewering, and roadmaking, are due to the community at large or, as "The Daily Chronicle" puts it, "only the value that the people produce will be taxed," this is a mistaken notion in very many cases. Take Hindhead; the price of land 20 years ago was something like £15 an acre. It is now anything from £400 to £1,000 an acre. This is due to the efforts of the people who have built houses, laid out grounds, and advertised it, to the doctors who have written up the climate, to the artists who have praised the views, and to the discovery that a high gravel soil is the thing to live on, and to fashion. Where, however, in a near neighbourhood "the people" have congregated, although the land is just as convenient and the views are the same, the land is not of equal value, showing that in some cases the proximity of "the people" may have a lowering effect on the value of land.

The increased value of land is due to many things; what in one district will increase the value will in another lower it. The increase in the knowledge of sanitation and building amenities will improve one district and spoil another. Fashion will do the same. The residence of one countess, two eminent scientists, a popular author, and a fashionable doctor have been known to raise the land value hundreds of pounds an acre, whereas a cemetery, or workmen's dwellings, or a lunatic asylum will have the reverse effect. How can one tax such things fairly? Further, is compensation to be paid on depreciation as well as on taxation claimed on improvement? And is the countess or the doctor to have the largest share? As to the practical results of the taxation, I can only speak of districts which I know. I do not think there will be a slump in prices. Speculators will be reluctant to buy in anything but small lots for which they can see immediate prospects of development. Present large owners will hang on in the hope of better times. Weak holders may be encouraged to develop where otherwise they would have waited; and development under these circumstances generally means a drop in the standard of building. Well-ordered schemes will be more unusual, and the chaos and abomination of the jerry builder will flourish. On the whole I would have this part of the Budget passed. There is a cult or religion whose war cry is "Taxation of land values," which desires to reduce the income tax to nothing, to relieve all buildings and improvements of rates, to turn towns into gardens and marshes into fertile fields; in fact, to cure all ills; and there is nothing like a little practical experimenting to knock holes in fallacies based on theory.

An Onlooker.

To the Editor of The Builders' Journal.

Sir,—It is a pity that Messrs. Moore and Crabtree did not carry their actuarial investigations in the above matter a little further. They would then have discovered that even were Henry George's scheme adopted in its entirety, and land rated 20s. in the pound, it would still be impossible to relieve buildings altogether, as they suggest. Could this be done, however, one result, as Mr. Harold Cox pointed out in the "Nineteenth Century," would be that Chatsworth, for example, would be rated on a little more than the agricultural value of the land, while the consequent deficiency in the yield of the rate would require to be drawn from the neighbouring farmers! Messrs. Moore and Crabtree appear to anticipate a boom in the building trade as a result of a tax on land values, but I can affirm from actual experience that the Budget proposals have already put an end to some promising schemes of development by making it practically impossible to arrange the finance. Land is no longer regarded as a sound security by the banks and insurance companies, and I only wish I could see good ground for dissenting from their views. There will be a rude awakening for the dwellers in the fools' paradise of the land taxers should the proposals of the Government become law, for the first result will be an immediate calling in of mortgages all over the country, and this in itself will make for anything but the boom that Messrs. Moore and Crabtree so joyfully anticipate.

Alfred C. Houston, A.R.I.B.A.

London.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructural, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Building Line Question.

Essex.—H. J. K. writes: "Where a building line is described as 8ft. from the road, and no other information is given as to the building line, when depth is very limited, which of the following may project in front of that line, and which may not?:—(1) Eaves verges and the like, (2) a timber bay to one floor only, carried on wood brackets or stone corbel, (3) a timber bay to ground floor only, on a brick retaining wall, (4) a timber bay on brick retaining wall carried up both floors to same height as building, (5) a brick or stone bay to ground floor only, (6) ditto to first floor (full height of building), (7) a brick porch."

It is very unusual for so bare a description to be given of any building line, and I should imagine that if you consult your conveyance or the original sale particulars of your property, you will find a clearer statement of the facts. However, taking your question as it stands, I should say that it is certain that numbers (2), (3), (4), (5), (6), and (7) must all be kept within the building line. I should not myself consider number (1) as an infringement of the building restriction. F.S.I.

Use of Terms Fir and Deal.

Portsmouth.—Student writes: "Upon what system are the terms Fir and Deal used in specifying and quantity surveying in a London office? Here are a few extracts from Leaning's Quantities:—Fir framed-in roofs; 2in. deal in firrings; 2½in. × ¾in. deal battens; fir wrought cleats; deal wrought fence; fir proper door frames; sashes and frames in deal; framings in deal; fir framed and wrought all round. Without doubt the first two would be same quality material, and you will see that in another case a frame when mentioned with the sash is deal, but by itself is referred to as fir. Would the fence be of same quality if described 'fir wrought fence?'"

The terms, "fir" and "deal" have various significations. Among quantity surveyors, fir is generally used to express any pine or fir wood used in the rough—that is, with sawn faces only—while deal is used to express the same material when wrought; for example, "fir rough carriages," "deal wrought shelves," with the exception that scantling stuff, like beams or roof timbers, if wrought, has the labour measured separately, and described as "wrought face or fir." Perhaps the distinction arises from material cut out of boards taking the name deal, and that cut out of quartering or larger stuff taking the name fir. Then, again, "deal" is the term used for boards 3in. thick and 9in. wide, as distinguished from "planks," which are 11in. wide; or "battens," which are 7in.; or narrow battens," which are 4in. or 4½in. wide, whatever may be the thickness. The examples given by querist show the varied use of the terms that one may meet with, and the above notes give the nearest explanation that one can arrive at, and it is really of little consequence whether any particular item is described as deal or fir.

HENRY ADAMS.

Columbia Fir.

BRADFORD.—H. F. writes: "I should be obliged if any of your readers would be good enough to state the disadvantages (if any) of Columbia fir as compared with best quality Baltic or Archangel red wood for joiners' work."

The writer has no knowledge of "Columbia fir." There are various woods shipped at Quebec and other Canadian ports that may come from British Columbia, including the *Pinus rubra* or red pine, *Pinus strobus* or white pine, *picea alba* and *P. nigra* or white and black spruce. The red pine is a clean, sound timber, with distinct annual rings and a reddish colour, very like pitch pine, the best being stamped M or I on the end of the log; the white pine is the patternmakers' wood, and only suitable in joinery for panels; the spruce fir is close and straight-grained, but not strong and with small hard knots; sap wood and heart-wood are alike in appearance.

HENRY ADAMS.

Books on Factory and Workshop Construction.

WALMER.—W. G. W. writes: "I shall esteem it a favour if you will kindly recommend a book dealing with the planning and construction generally of modern workshops, factories, etc."

The following books on the subject can be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C.:—"The Design of Steel Mill Buildings, and the Calculation of Stresses in Framed Structures," by M. S. Ketchum, C.E. With 200 illustrations; large 8vo., 16s. net. Although dealing chiefly with mill buildings, much of the matter will apply equally well to all classes of steel-frame construction. "The Design of Walls, Bins and Grain Elevators," by M. S. Ketchum, C.E., with 238 illustrations; large 8vo., 16s. net. This work presents a systematic analysis of the stresses due to granular materials, together with a discussion of the principles of design, and the details of structures which contain such materials. "Modern Machine Shops, their Construction, Equipment and Management," by O. E. Perrigo. With 200 illustrations of plans, details of construction and fittings, etc.; 4to, 21s. net. The following works might also be of service as indicating requirements: "Factory Organisation," by Henry Spencer, which deals with the commercial organisation of engineering factories. With 92 illustrations, 221 pages, 8vo, cloth, 10s. 6d. net. "Management of Small Engineering Workshops," by A. H. Barker, price 7s. 6d. net.

Use of Party Wall.

PLYMOUTH.—PARTY WALLS writes: "An old terrace house has been pulled down preparatory to rebuilding. The old purlins and floor trimmers took bearings on divisional walls, and walls were plugged to receive plastering battens for the house that has been demolished. Would these facts imply a right to re-use the divisional wall in a similar way, and to cut and pin new chimney breasts and cross walls to same, and also to raise up the divisional walls for the proposed new premises?"

It is impossible to give an opinion upon a party wall question such as this without a personal inspection. The wall may be a party wall or it may belong wholly to one side or the other. The support for timbers having existed over twenty years, an easement for them may have been acquired, even if the wall belong wholly to the adjoining owner; but how far this will enable new work to be attached to the wall is a legal question which the writer cannot determine.

HENRY ADAMS.

Stamping Agreements.

PLYMOUTH.—BUNGALOW writes: "What value stamp is necessary to make binding an offer to take and become tenant of a villa?"

A sixpenny stamp is often put upon a letter embodying the terms of a contract; and this can be done in your case by taking it to the local post-office. I should, however, strongly recommend you to have a simply worded agreement drawn up for a tenancy of this description, even if it goes no further than to name the rent, dates when payable, and notice required to terminate the tenancy; this document will need a stamp according to the following scale:—If the rent be under £5 per annum, 6d.; under £10, 1s.; under £15, 1s. 6d.; under £20, 2s.; under £25, 2s. 6d.; under £50, 5s.; under £75, 7s. 6d.; under £100, 10s.; and for every £50 more rental, an additional stamp of 5s. is required. These stamps must be impressed by the Inland Revenue authorities within fourteen days of the date of the agreement.

F.S.I.

Drainage of Slaughter-houses.

SUSSEX.—B. writes: "Plans have been deposited with a local authority for two joint slaughter houses and stables under one roof, with fastening-pens adjoining, all constructed of 9in. brickwork and impervious floors. The district is undrained, and a system of drainage to cesspools and soak-aways arranged. There are no houses within 100ft. The slaughter houses are quite separate, with good through ventilation. Can the authority object because there is no drainage? or on what grounds do they refuse to pass the plans?"

The "Public Health Acts" contain very strong provisions as to slaughter-houses, and they must all be licensed by the local sanitary authorities; this provision making it competent for that authority (acting under the advice of their medical officer of health) to insist on very stringent conditions indeed if they so choose. In the case you cite, I should certainly say that the weak point is the "soak-away" part of the scheme, and I should imagine that no local authority would be justified in allowing slaughter-houses to be built unless there were (1) efficient means of flushing them down, (2) a proper cesspool to receive the washings, and (3) adequate apparatus for emptying it.

F.S.I.

Medicated, Electric, and Turkish Baths.

BRADFORD.—BATHER writes: "Kindly tell me where the most up-to-date medicated electric and Turkish baths are to be seen in the country. Also, what different baths are usually put in in the medicated and electric departments."

Good examples of Turkish baths are to be found in London and many provincial cities. Of those in the metropolis, the Turkish baths in Northumberland Avenue are well planned and constructed, and more recent examples are to be seen in two well-equipped Turkish bath establishments in Jermyn Street. Several of the recently erected fashionable hotels in London have Turkish and other baths attached. Many of the larger of the various hydropathic establishments throughout the United Kingdom contain (in addition to Turkish and Russian baths) a number of small rooms fitted with the necessary appliances for wave, sitz, needle, and douche baths, and others are arranged for the inhalation of pine vapour or for a course of electric and medicated baths such as pine-extract, sulphur, iodine, etc. Local directories should be consulted for addresses.

Measuring Masonry and Brickwork.

MANCHESTER.—ARCH writes: "In measuring the piece of masonry shown in the accompanying sketch [not reproduced], how would the sunk circular face be taken? In measuring a brick arch, built of the same kind of brick as the wall, cut by the bricklayer to radius, should it be taken as extra labour only, measured face and soffit?"

The piece of masonry sketched being part of a moulded arch will have radial joints, so that the part marked with the widths of 10ins., 8ins., and 4ins., will be measured as "sunk work in beds and joints," not as sunk circular face. The girth of a moulding is taken the full zig-zag measurement as shown by the red line in the querist's sketch. A brick arch built of the same bricks as the wall is measured in first with the ordinary brickwork, and then as "extra only to arches (described) labour and waste," measuring face and soffit and billing per foot super.

HENRY ADAMS.

Cracks in Building.

KENT.—H. P. writes: "What is the remedy for cracks that have appeared in new roughcast on an old building?"

The mortar in the walls has probably perished through damp, and before the roughcast was put on the walls should have been allowed to dry as much as possible; that is, the roughcast should have been put on towards the end of the dry season, merely moistening the face sufficiently to secure adhesion. The interior should then have been left bare for at least twelve months, to let the moisture further evaporate before the inside plastering was put on. The cracks in the roughcast should be pointed up or filled with neat cement grout, but the cracks at the sides of the openings indicate a general instability which can only be remedied by ¾in. tie rods right through the building with screwed ends, nuts, and washer plates on the outside. These should be at right angles to each other, and just under the floors would probably be the most convenient place for them.

HENRY ADAMS.

Protecting Underside of Floor Exposed to Steam.

LONDON, W.C.—S. T. N. writes: "It is proposed to add a storey over a steam boiling and dyeing shop, the new floor to be composed of steel joists and wooden joists covered with 1¼in. grooved and tongued flooring. The underside of the new floor will always be exposed to the action of large quantities of steam constantly arising from the open boiling and dyeing pans. How can the new steel and wood joists be protected from damage by steam? Would fibrous plaster slabs 1in. thick screwed to the underside of joists, and finished with one coat of 'Sirapite' plaster, be effective? Would 'Bitumastic' solution protect the steelwork sufficiently without any casing? Expensive methods are out of question."

The thickness of the slabs need not be great, as it is moisture rather than heat that requires to be excluded. "Uralite" sheets painted over would be light, and probably more effective than fibrous plaster, as a lining to the underside of the wood joists. "Bitumastic" solution, or "Siderosthen," or other modern iron coating, would no doubt afford fair protection to the steel joists, but it would be better to case them in to save the condensation that would be caused during changes of temperature.

HENRY ADAMS.

A bronze plaque to the memory of the Belgian architect M. Paul Hankar (1859-1901) has been affixed to his house, 71, Rue Desacqz, Brussels, and the committee appointed to deal with the funds (amounting to 4,500 francs) that have been publicly subscribed with the object of establishing a memorial to M. Hankar, have decided to devote the balance of the money to founding a triennial prize for competition among architects who are either past or present students of the Académie Royal des Beaux Arts, Brussels.

QUANTITY SURVEYORS' ASSOCIATION.

Annual Dinner.

Nearly a hundred and fifty gentlemen sat down at the annual dinner of the Quantity Surveyors' Association held at the Criterion Restaurant on Wednesday evening, May 5th. The chair was occupied by Mr. Arnold E. Harris, J.P., F.S.I., this year's president of the Association.

The Chairman having proposed the toast of "The King,"

Mr. H. H. Bartlett gave the toast of "The Quantity Surveyors' Association." One of the objects of the Association, he said, was to have its members made responsible for the quantities; he thought that was a great thing, but it was a particularly great thing to the builder, while it must be a great thing to the architect as well as to the employer, because he must know that the articles were there and perfectly accurate.

The President, replying to the toast, said that it seemed to him, with regard to the surveyors' profession, that it was attended with some difficulties; it did not do much to foster science; it did not do much for literature. On that last subject of literature he was afraid that however well drawn up a bill of quantities might be, it could hardly be termed literature. There was one word, however, they were very fond of using, and that was the word "ditto," which hardly, however, commended them to literature. Without that term every surveyor, and he thought every builder, would look upon a set of quantities as a delusion and a snare. Their labour was shorn of the encouragement which the labour of the architect and the builder had, and was the encouragement which came from the consciousness that the work done would be a beauty and a joy for ever. But what were they? (the quantity surveyors). To put it concisely, they might consider that they were just oil, oiling the machinery which the architect and the builder worked out. But although they might be only temporary expedients, he (the speaker) thought they were of some use, practical use—to the three parties concerned in the bill—the owner, the architect, and the builder. By their efforts the owner was assured that he was only paying for value which he had obtained; the architect they hoped they were chiefly helpful to. It was said that two heads were better than one, and probably when they brought their critical faculties to bear on the drawings and specifications of the architect, they might be able to draw attention to the wants of even the best set of drawings. As to the builder, it must save him a world of trouble and anxiety to have set before him quantities free from ambiguity and free from all sporting ideals. Of course, the quantity surveyor was not recognised by all building owners, but it was being recognised by public bodies—many of whom were taking up the position of appointing their own quantity surveyors—that the quantity surveyor was necessary. Whether or not this increased recognition by public bodies was accompanied by increased remuneration he was not prepared to discuss. On that point he thought he might be allowed to enter a protest against a custom which prevailed in some cases, of inviting competitive quotations for quantities. It was not to the public interest that work of such an important character should be, as it were, put up to auction. The inevitable result must be that the work would get into the hands of incompetent men, and the public would suffer thereby. Of course they were bound to admit that in an ideal state of society—which he was afraid was far distant—they would not be wanted. At present, at any rate, they had important duties to discharge—important to all concerned with building. That Association had set out with the very laudable object of seeing that these duties were properly and adequately discharged; they should be discharged with skill, with science, with accuracy, and with discretion. Any profession which set before itself these principles was bound to endure and prosper. That gathering showed that however young their Association was it was pushing forward; it was not founded in any antagonism to the Surveyors' Institute; but they felt that they should have a separate Association for quantity surveyors. Let them both flourish.

Mr. S. Chatfeild Clarke, F.S.I. (London), one of the vice-presidents of the Quantity Surveyors' Association, next proposed the toast of "The Architects." Anyone, he said, who had watched the architectural output for the last twenty-five years could not fail to be struck by the great improvement in the designs of both public and private buildings during that period. The only science that had not yet been fully mastered was that of ventilation, and he thought there was a fortune in store for the man who would invent a system of ventilation which would not stifle people or create a draught. The speaker went on to advocate hearty co-operation between architects and surveyors, while he emphasised the president's point as to the danger of advertising for tenders for quantity surveyors. In this regard Mr. Clarke asked the architects to, on every available opportunity, point out to public bodies the probable harm that lurked behind such a system.

The toast having been honoured, Mr. T. J. Bailey, F.R.I.B.A., said, in reply, that whatever might be said for or against the architecture of the day, there was one thing to be proud of, and that was that the modern buildings in this London of theirs, such as the Houses of Parliament, had been proclaimed by no less eminent a critic than the late Sir Richard Temple to be the finest in the world. They could only hope that the new County Council hall would be worthy to rank with the Houses of Parliament. Dealing with the work of the quantity surveyor, Mr. Bailey said it would be impossible for architects to arrive at proper estimates and proper arrangements were it not for the intermediation of the quantity surveyor, and he was sorry to say that that assistance was not adequately acknowledged. Continuing, the speaker humorously said that in his opinion the happiest time of an architect's life was about a fortnight after the quantity surveyor has had the drawings. He came with the inevitable query sheet; he said, "You have done this, and you have done that; what do you mean?"

The next toast on the list was that of "The Contractors." It was proposed by Mr. H. T. A. Chidgey, London, vice-president of the Quantity Surveyors' Association, who advocated closer co-operation between the three branches of the building trade.

Mr. W. F. Wallis, president of the Institute of Builders, replied. Personally, he said, if he had his choice, he would prefer to be an architect rather than a builder or quantity surveyor, for he thought that one of the greatest pleasures in life was to be able to look on a great building and think that its construction was the outcome of his own ability. Secondly, he wished to belong to the quantity surveyors; they held a kind of silent position, but on the other hand he thought they had this advantage, that they did not stand so much to be shot at as either the builder or the architect.

Mr. C. A. Kennett proposed the toast of "The Visitors," coupled with the name of Mr. A. A. Hudson.

Mr. Hudson, in replying, made reference to the recent Budget, and especially to the portion of it having reference to the question of land values. To his mind the question of land values was the most serious thing that had ever been put before the country, and most serious of all to the building trade. Let them see what was going to take place! He did not mind about taxation for the time being—that was the halfpenny in the £—but the matter they had to deal with was that when the land was transferred—whether it be developed or undeveloped—they had to part with one-fifth to the Government, which was a sort of sleeping partner, and took one-fifth of the profits while sharing none of the losses. He did not believe that any trade in the country would carry on its business on such lines. What he desired to call their attention to was this. The building trade, they must remember, was kept on foot and was fostered by those who had money; the builder or the architect could not do without the financier. What was going to be the effect of the taxation of land values? To his mind, it would be that the banker or the mortgagee would say that he wanted something better in the way of security. At the present time, with the depression in the building trade and the depression in the value of building land, many people had advanced money on mortgage when the security was very small indeed. If once they found that the security was good enough to meet the loan, and they were going to have one-fifth taken away by the sleeping partner, it would be a very different matter. He viewed this as a very serious matter. It would not stop there, but would go on affecting the different classes until at length it reached the working man. In his work as arbitrator for the Board of Trade, Mr. Hudson said, he knew of instances where the building trade was now only one-third of what it was four years ago.

The health of the hon. secretary (Mr. Cross) having been drunk, the proceedings terminated.

ARCHITECTS' CHARGES IN AMERICA.

In a circular recently issued by the American Institute of Architects, whose offices are at the Octagon, Washington, D.C. (secretary, Mr. Glenn Brown), it is observed that while the remuneration of the architect has not advanced during the past forty years, the cost of production, office expenses, and draughtsmen's salaries, have nearly doubled. Proper equipment requires a longer preparation and a more thorough education, and the responsibility of the architect has been enormously increased by the requirements of the modern structure with its engineering, mechanical, and electrical equipment. The old charge of five per cent. continued in vogue for forty years.

The profession for many years has known that it was not being adequately remunerated for its services, and for a number of years the conventions have considered the advisability and necessity of increasing the architect's fees. At the convention in Washington, December 15th to 17th, 1908, a new schedule was unanimously adopted, changing the minimum rate from five to six per cent., and making a number of minor modifications.

The following is the new schedule mentioned in the circular:—

The American Institute of Architects: Professional Practice of Architects and Schedule of Proper Minimum Charges.

1. The architect's professional services consist of the necessary conferences, the preparation of preliminary studies, working drawings, specifications, large scale and full size detail drawings, and of the general direction and supervision of the work, for which, except as hereinafter mentioned, the minimum charge, based upon the total cost* of the work complete is six per cent.

2. On residential work, on alterations to existing buildings, on monuments, furniture, decorative and cabinet work and landscape architecture, it is proper to make a higher charge than above indicated.

3. The architect is entitled to compensation for articles purchased under his direction, even though not designed by him.

4. If an operation is conducted under separate contracts, rather than under a

---

*The total cost is to be interpreted as the cost of all materials and labour necessary to complete the work plus contractors' profits and expenses, as such cost would be if all materials were new and all labour fully paid, at market prices current when the work was obtained.

general contract, it is proper to charge a special fee in addition to the charges mentioned elsewhere in this schedule.

5. Where the architect is not otherwise retained, consultation fees for professional advice are to be paid in proportion to the importance of the questions involved and services rendered.

6. Where heating, ventilating, mechanical, structural, electrical, and sanitary problems are of such a nature as to require the services of a specialist, the owner is to pay for such services. Chemical and mechanical tests and surveys, when required, are to be paid for by the owner.

7. Necessary travelling expenses are to be paid by the owner.

8. If, after a definite scheme has been approved, changes in drawings, specifications, or other documents are required by the owner; or if the architect be put to extra labour or expense by the delinquency or insolvency of a contractor, the architect shall be paid for such additional services and expense.

9. Payments to the architect are due as his work progresses in the following order: Upon completion of the preliminary studies, one-fifth of the entire fee; upon completion of specifications and general working drawings (exclusive of details), two-fifths additional, the remainder being due from time to time in proportion to the amount of service rendered. Until an actual estimate is received, charges are based upon the proposed cost of the work, and payments received are on account of the entire fee.

10. In case of the abandonment or suspension of the work, the basis of settlement is to be as follows: For preliminary studies, a fee in accordance with the character and magnitude of the work; for preliminary studies, specifications, and general working drawings (exclusive of details), three-fifths of the fee for complete services.

11. The supervision of an architect (as distinguished from the continuous personal superintendence which may be secured by the employment of a clerk-of-the-works or superintendent of construction) means such inspection by the architect or his deputy, of work in studios and shops or a building or other work in process of erection, completion, or alteration, as he finds necessary to ascertain whether it is being executed in general conformity with his drawings and specifications or directions. He has authority to reject any part of the work which does not so conform, and to order its removal and reconstruction. He has authority to act in emergencies that may arise in the course of construction, to order necessary changes, and to define the intent and meaning of the drawings and specifications. On operations where a clerk-of-the-works or superintendent of construction is required, the architect shall employ such assistance at the owner's expense.

12. Drawings and specifications, as instruments of service, are the property of the architect.

As revised at the Washington Convention, December 15th—17th, 1908.

GLENN BROWN, Secretary,
The Octagon, Washington, D.C.

The subject was commented upon in a leader which appeared on p. 428 of our issue of May 5th.

Societies' Reports.

Northampton Architectural Excursions Club.

About 30 members visited Spratton Church on May 1st. The building was erected about the end of the 12th century, and exhibits traces of many periods from late Norman to 15th century work. The Rev. R. M. Sergeantson, F.S.A., president of the club, conducted the party.

Sheffield Society of Architects and Surveyors.

At the annual general meeting held on Thursday last, the ballot for officers for the ensuing session resulted as follows:—President, Mr. W. J. Hale; vice-president, Mr. J. B. Mitchell Withers; treasurer, Mr. F. Fowler; hon. secretary, Mr. J. R. Wigfull; council, Messrs. H. Coverdale, C. B. Flockton, H. L. Paterson, A. E. Turnell, A. F. Watson, E. Winder, W. G. Buck, C. F. Innocent, and H. I. Potter. The past presidents are also members of the council.

Institution of Municipal Engineers.

At a meeting of the members resident in the home counties district (northern division), which includes Bedford, Buckingham, Essex, Herts., and Middlesex, held during the Building Exhibition, Mr. Henry C. Adams, A.M.I.C.E., A.M.I.M.E., A.M.I.E.E., consulting engineer, of 60, Queen Victoria Street, E.C., was elected chairman of the district committee and a member of the Council of the Institution. Mr. Bernard Partridge, surveyor's office, Walthamstow U.D.C., was elected honorary secretary, and an executive sub-committee was appointed.

Birmingham Clerks of Works and Builders' Foremen's Association.

At the Midland Institute on Wednesday, May 5, Mr. Wm. Henman, F.R.I.B.A. (of Messrs. Henman and Cooper), delivered to the members of the above Association a lecture on "The principles involved in reinforced concrete structures." The lecture was illustrated by models and sketches, Mr. Henman being the inventor of several systems of reinforcement which are largely used in the construction of beams, lintels, and floors.

Mr. Henman pointed out that there were still some persons who seemed to think that concrete would stand any weight, or any amount of heat, and that it might be made of any rubbish in any slipshod manner. But it was becoming increasingly necessary to study the subject scientifically.

The strength of concrete depends greatly upon the cleanliness of the aggregates as well as upon proper grading and careful mixing with the best qualities only of cement, with perfectly clean water; the mixture being allowed to set slowly, and kept damp and cool during the process. After pointing out how easily concrete could be spoiled by neglect of these precautions, the lecturer expressed his confidence in the future of reinforced concrete building.

Edinburgh Architectural Association.

The Edinburgh Architectural Association have paid a Saturday afternoon visit to Kirkcaldy. On arrival at the station, a special tram-car conveyed the party to Ravenscraig Castle. Mr. John Watson, F.R.I.B.A., who acted as leader, explained that the castle had been founded by James II. shortly before his death in 1460. On leaving the castle, the party walked through the grounds to the ruins of St. Serf's Church, Dysart, dedicated in 1245. Sir Michael B. Nairn, Bart., who accompanied the party, received a vote of thanks, on the motion of Mr. E. C. H. Maidman, architect, for his kind permission to visit the buildings. The afternoon's outing was concluded with a visit to several houses of the 16th and 17th centuries in the town of Dysart.

Liverpool Architectural Society.

The annual report of the Council of the Liverpool Architectural Society for the official year 1908-9, being the sixty-first session, shows that the membership consists of fifty-four Fellows and seventy-seven Associates, as compared with fifty-six Fellows and sixty-nine Associates at the close of the immediately preceding session. There are three Hon. Fellows (an increase of one), nine Hon. Associates, and twenty-eight Students (an increase of five).

The Council regret to record the death (as recorded in this journal at the time), which occurred on January 31st last, at his residence, Broughton, Chester, of Mr. Edward Augustus Lyle Ould, F.R.I.B.A., who had been a member of the Society since 1886, and president in 1899 and 1900.

It is recorded that during the year the Council have been approached by the Manchester Society of Architects with a view to concerted action between the two societies with respect to architectural competitions. The Council, recognising the value of the work upon which the Manchester Society has been engaged, and with a view to benefiting by the greater influence to be obtained by co-operation, have appointed a competitions committee to take action in the cases of competitions, more especially those belonging to the county of Lancaster, in which, in the judgment of the committee the general conditions may appear to be unsatisfactory. In conjunction with the Manchester Society, a definite form of conditions of competition has been drafted. It is hoped by this united action to bring about the general adoption of an equitable and carefully worded form of conditions, "free from objectionable clauses such as are frequently inserted, often through ignorance on the part of the promoters."

The President (Mr. T. E. Eccles, F.R.I.B.A.) has been a frequent attendant at the council meetings of the Royal Institute of British Architects, and his experience suggests that some new method of representation is desirable in order that the architectural thought of the country may be presented with due weight when matters of general professional interest have to be dealt with.

The Council have been approached by certain master builders' associations with the request that whenever possible members of the Society should cause to be included in their bills of quantities a sum of money to cover the cost of attendance upon specialists, there being no means of fairly estimating the value of the attendance which may be required. The Council is of opinion that the request is a fair and reasonable one, and recommend its adoption by the members of the Society.

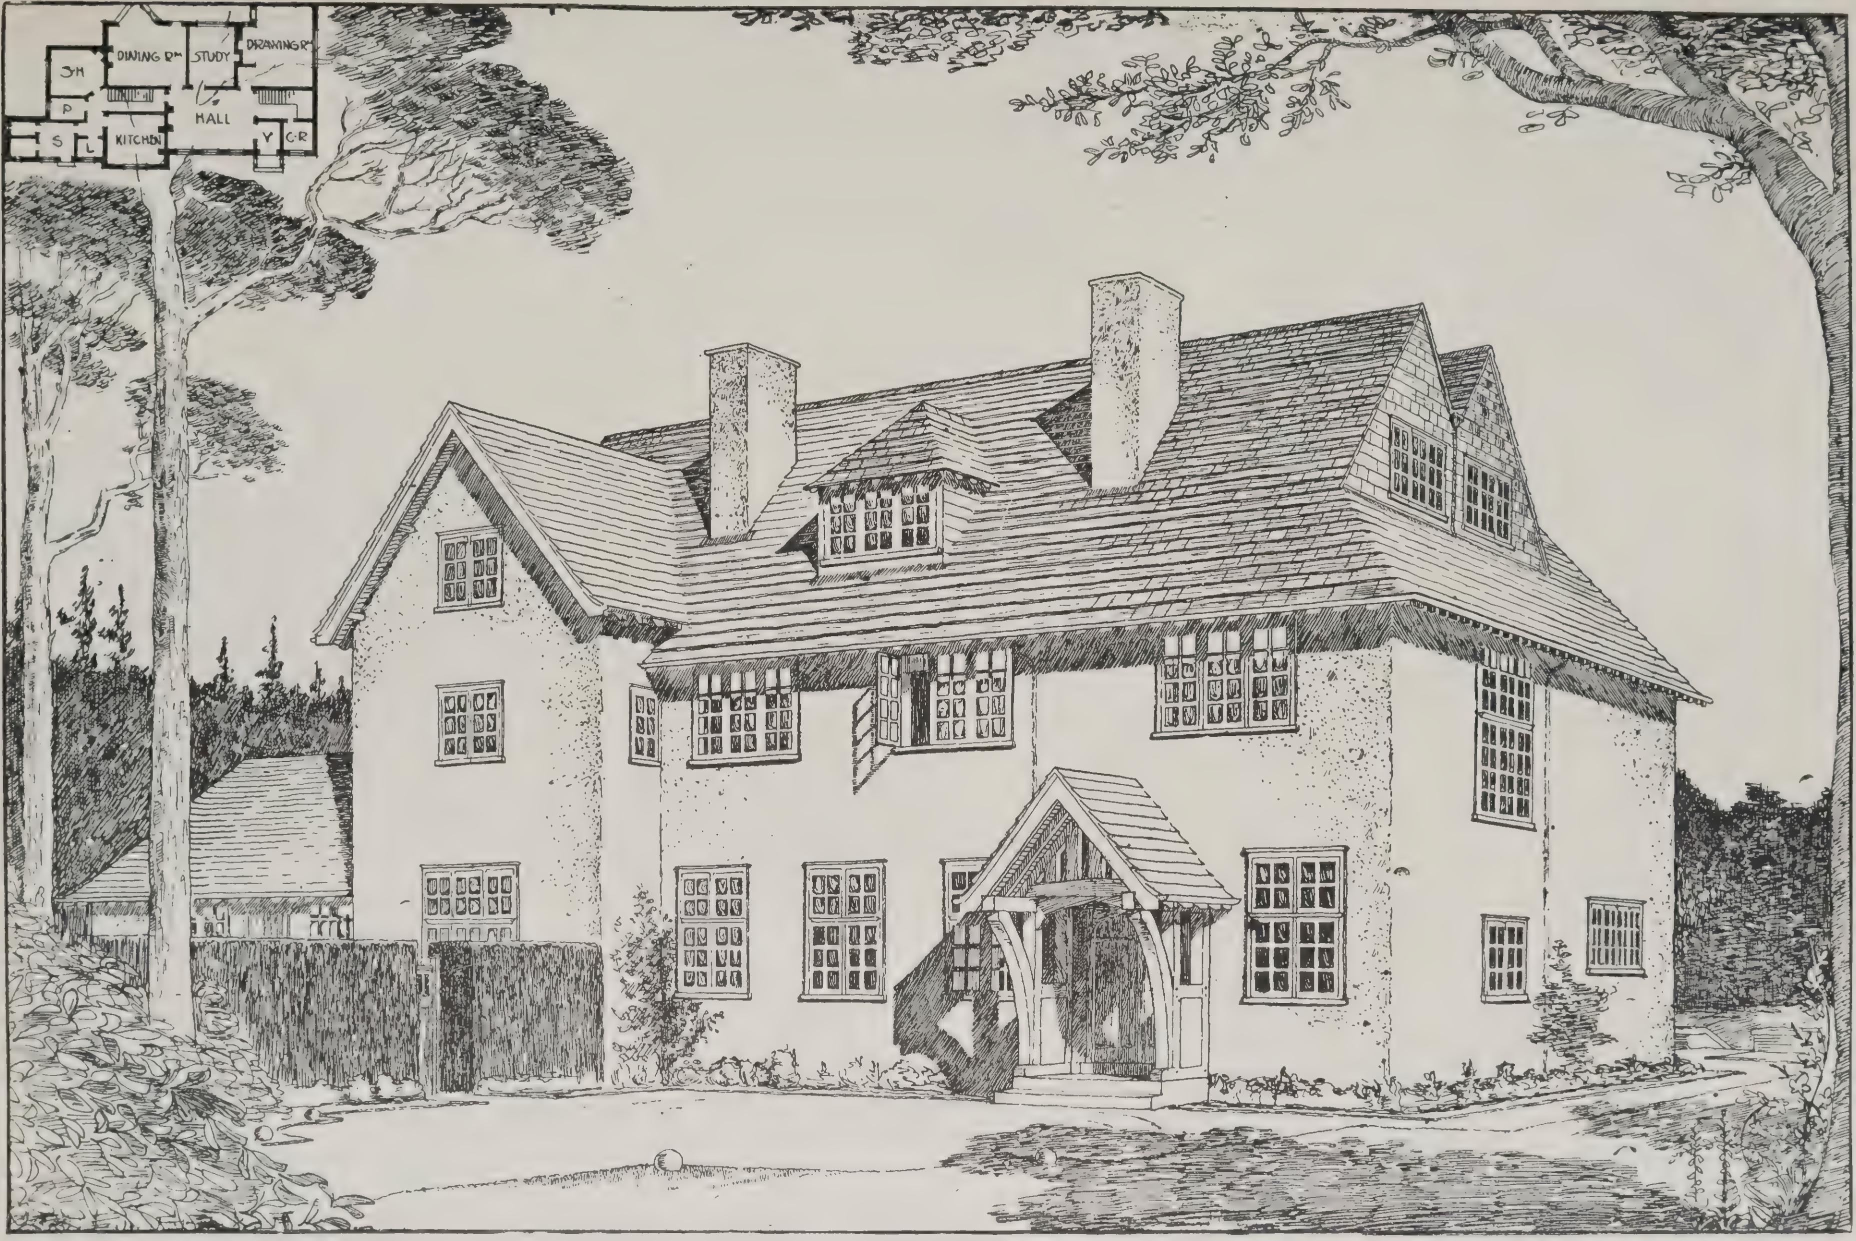
The Liverpool School of Architecture has been recently visited by the president of the Royal Institute of Architects of Ireland, who was seeking information with a view to the establishment of greater educational facilities in Dublin. It is remarked that interest in the work of the School has been enhanced by the generosity of Mr. W. H. Lever, M.P., in contributing £1,000 per annum for three years for the promotion of the study of town planning, and a capital sum of £500 for the promotion of research, and the consequent creation of the new Chair of Civic Design and Landscape Architecture, and the appointment of Mr. Stanley Davenport Adshead, F.R.I.B.A., as Associate Professor. Liverpool is thus becoming an important centre of architectural thought.

Gloucestershire Architectural Association.

A monthly meeting of the Gloucestershire Architectural Association was held at the Northgate Mansions, Gloucester, the President (Mr. H. W. Chatters) being in the chair. Others present included Messrs. W. B. Wood, M. H. Medland, F. W. Waller, G. P. Milnes, T. Malvern, H. A. Dancey, J. F. Trew, J. G. Crisp, E. A. Pryer, E. J. Dolman, H. Gardner, H. S. Davis, N. H. Waller, D. R. Lyne, and T. Overbury (hon. secretary). An address was given by the President on "The Architectural Outlook," in which many points of great importance to the profession were considered in detail. The long and continued unemployment in the building trades, trades unions, "builder-architects," the compulsory registration of architects, pupilage, architectural education, and many legal points were dealt with by Mr. Chatters, and gave rise to an animated discussion, in which most of the members joined. At the conclusion a hearty vote of thanks was accorded to the President for his address.

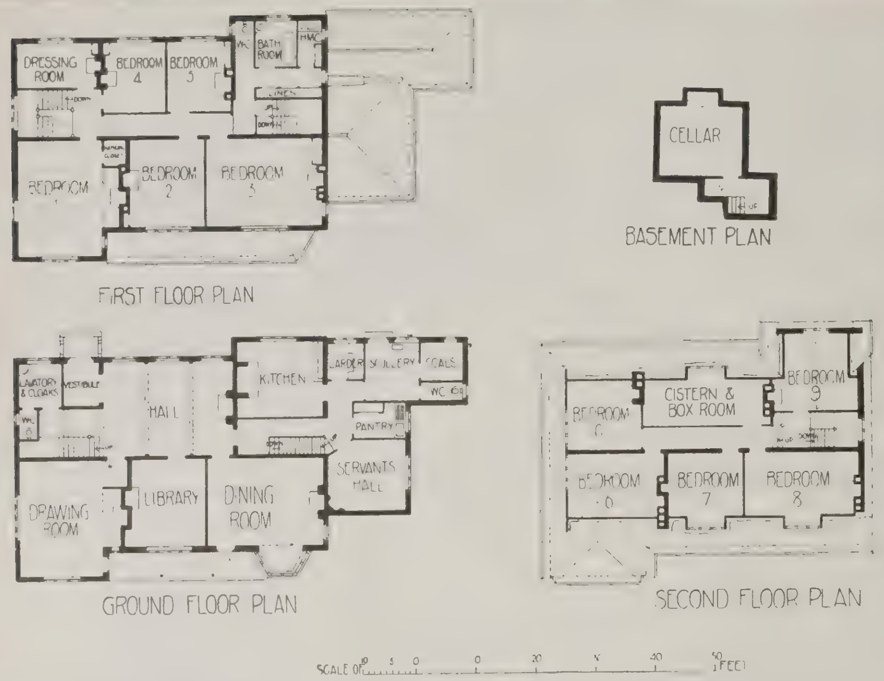
Surveyors' Institution.

At the Surveyors' Institution, Mr. A. B. Howes, barrister-at-law, in a paper on "Quantity Surveyors: a review of their legal position," quoted Mr. Justice Morris's definition of a quantity surveyor as "a person whose business consists in taking out in detail the measurements and quantities from plans prepared by an architect for the purpose of enabling builders to calculate the amounts for which they would execute the



HOUSE AT BINTON PARK, FARNHAM, SURREY. ARTHUR J. STEDMAN. ARCHITECT.

This house is situate on a site adjoining and overlooking the Farnham Golf Links, and the surrounding extensive views, in a district where pine trees are abundant. The walls are finished externally with white rough-cast, and the roof covered with Tilberthwaite green slates; the joinery work is painted a dark green. An ingle nook is formed in the drawing-room and bedroom above. The hall is spacious, with arched ribs and storey posts, the ceiling being formed between the joists. The joinery generally is of a very plain character, with fastenings and fittings of hand-made wrought ironwork. The building was erected by Messrs. Tompsett and Co., of Farnham. For plans see next page.



HOUSE AT BINTON PARK, FARNHAM, SURREY. ARTHUR J. STEDMAN, ARCHITECT.

plans." Mr. Howes summarized the relationship between the different parties to a building contract as follows:—(1) As between owner and quantity surveyor, there is a contract of service, either direct or through the agency of the architect, and there seems to be a warranty not of absolute, but of reasonable accuracy. When an architect has been instructed to obtain tenders entitling the architect to employ a surveyor, and no tender is accepted, the building owner is liable to the surveyor for the price of the work done under the implied authority of the owner to the architect; but if the owner has accepted a tender with a builder in good faith for the execution of the work, the owner has discharged his duty to the quantity surveyor and is not liable for his charges. (2) As between builder and building owner, as a general rule there is no warranty of the accuracy of the bills of quantities, but when the quantities form part of the contract, anything necessary to carry out the work, but not included in the quantities, will be an extra. (3) As between quantity surveyor and builder, there is no liability for negligence in preparing quantities, since there is no privity of contract between the parties; but where there is fraud or misrepresentation the surveyor is liable. Unless the builder checks the quantities, he must take the risk of mistakes in them. When once a builder's tender is accepted, and he has received payment from the building owner, part of which is for the purpose of paying the surveyor, the builder is liable to pay the surveyor. (4) As between builder and architect, the latter has no liability as to quantities unless some contract exists between him and the builder in reference to their accuracy. (5) As between quantity surveyor and architect, there is no liability, since the architect employs the surveyor as the agent of the building owner and not on his own account.

Northern Architectural Association.

The report of the Council for the fiftieth session of this Association shows that the members at the end of 1908 numbered 84, the associates 86, and the students 83; total 253, as compared with a total of 248 for the year immediately preceding. An interesting sketch of the history of the Association, which was founded in 1858, was given by Mr. G. T. Brown, F.R.I.B.A., the president, in his address at the commemoration of the fiftieth anniversary of the Association. Of the twenty-seven founders, four are living. A gift of £1,000 by Mr. Glover enabled the Association to acquire its own premises at 6, Higham Place, Newcastle-on-Tyne; and the same gentleman gave a further sum of £500 for the educational work of the Association. The hon. secretary is Mr. C. S. Errington, A.R.I.B.A.

Devon and Exeter Architectural Society.

A "Journal of Proceedings" of this society, which was instituted in 1887, and has Exeter for its centre, and Devonshire and Cornwall for its province, and is, of course, in alliance with the R.I.B.A., includes a list of office-bearers and council for 1909, the council's annual report, and summaries of the papers read before the society during 1908, an account of its proceedings during the year, lists of members (48), associate members (13), etc., and a catalogue of the society's library. The papers read include "Some Modern Applications of the Orders," by Mr. C. J. Tait, F.R.I.B.A., of Exeter; "Some Peculiarities in the Construction of Hollow Walls," by Mr. T. A. Andrews; and "Hospital Planning and Construction," by Mr. J. C. Southcombe, of Barnstaple. The president for 1909 is Mr. W. H. May, M.S.A., of Plymouth; vice-president, Mr. C. Cole, M.S.A., of Exeter; hon. secretary, Mr. Allan J. Pinn, A.R.I.B.A., 5, Bedford Circus, Exeter.

Coming Events.

Thursday, May 20.

JUNIOR INSTITUTION OF ENGINEERS, ROYAL UNITED SERVICE INSTITUTION, WHITEHALL.—Mr. C. A. Smith, B.Sc., on "Ductile Materials under Stress," 7.30 p.m.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 19. LIVERPOOL.—Warehouse for Messrs. Watson and Coomber, Paradise Street. Names, accompanied by cheque for one guinea (returnable on receipt of tender), to T. W. Cubbon, architect, 54, Hamilton Street, Birkenhead, before noon on date named.

May 19—June 14. BIRMINGHAM.—Erection of superstructure of buildings in extension of council house, for the corporation. Names and addresses to the architects, H. V. Ashley and Winton Newman, 14, Gray's Inn Square, London, W.C., by May 19, enclosing deposit of £10 10s. Drawings, etc., on and after May 31, at the offices of the architects, and of the joint quantity surveyors, Anthony Rowse, King's Court, 117, Colmore Row, Birmingham, and Hugh Watkins, 13, Gray's Inn Square, London, W.C., and bills of quantities will be sent. Tenders, endorsed, "Council House Extension (Second Contract)," by noon on June 4, to E. V. Hiley, town clerk, Council House, Birmingham. Fair wages clause.

May 24. MOLDGREEN.—Two dwelling houses. Names to James H. Hall, architect, Market Buildings, Market Street, Huddersfield, before date given.

May 27. ASHFORD (KENT).—Supply and delivery of 380 cubic yards (more or less) of unbroken Kentish ragstone, and 400 cubic yards (more or less) of coarse gravel or pit flints, for the U.D.C. Further information of William Terrill, surveyor, 5, North Street, Ashford, Kent, to whom tenders (with samples) are to be sent.

May 29. WAKEFIELD.—Supply and delivery at Wakefield of granite or Whinstone macadam and slag, grit stone and granite setts, pitch, creosote oil, and stone flags, for the corporation. Form of tender, etc., from the city surveyor. Tenders must be sent to W. W. Greenhalgh, town clerk.

June 1. HORBURY.—Making up Manor Road, for the U.D.C. Drawings, etc., on deposit of £1 1s. with J. H. Drew, engineer and surveyor, town hall, Horbury. Tenders to T. Barker, clerk to the council, town hall, Horbury.

MISCELLANEOUS.

May 24. ARBROATH.—Supplying cast-iron and fireclay pipes, coals, bricks, lime, cement, brass-work, oils, pavement, kerb, channel, and setts, from June 1 1909, to May 31, 1910. Schedules of quantities and all information of P. C. Smith, burgh engineer, burgh engineer's office, Arbroath. Tenders to be lodged with W. K. Macdonald, town clerk, Arbroath.

May 25. LONDON.—Supply and delivery of glass and plywood tablets and taper blocks, for the L.C.C. Full particulars on application to G. L. Gomme, clerk to the L.C.C., County Hall, Spring Gardens, S.W.

May 26. MEMBURY.—Concreting the watercourse through the village of Membury, for the R.D.C. Specification on application to G. A. Millard, district surveyor. Tenders to be sent to Cecil Forward, clerk, Axminster.

No Date. WEMBLEY PARK, MIDDLESEX.—Supplying about 200 yards of 6ft. close pale oak fencing, about 50 yards ditto, 3ft. 6ins., and about 56 yards 3ft. 6in. gun picket ditto. Applications, accompanied by deposit of 10s., to D. B. Hedderwick, architect, 38, Great James Street, Bedford Row, W.C.

THE
Federated Employers' Insurance Association, Ltd.

HEAD OFFICES:
8, King Street, MANCHESTER.

Non-Tariff—Founded by Builders.

THIS ASSOCIATION GUARANTEES THE DUE PERFORMANCE OF CONTRACTS and invites enquiries from Contractors in matters incident thereto. Negotiations tend to prompt and effective arrangements.

BUILDERS' RISKS so far as WORKMEN'S COMPENSATION AND PUBLIC LIABILITY are concerned form special features in connection with the Association's operations. Moderate Rates and equitable conditions apply.

FIRE, PERSONAL ACCIDENT AND ILLNESS, and miscellaneous Insurances are transacted.

Submit enquiries.

Federation Secretaries are invited to apply for an Agency.

GEO. L. DREW,
General Manager and Secretary.
Telephone: 5948 Manchester.
Telegraph: "Federated, Manchester."

Appointments Wanted.

The charge for Advertisements under this heading 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ABLE Junior Assistant desires post in small office south of Midlands; working drawings, details, help quantities; good draughtsman and tracer; excellent references; salary 22s. per week.—Architect, 36, Devonshire Road, Cambridge.

ACADEMY (Royal) exhibitor prepares perspectives on moderate terms; specimens sent; also designs, plans from rough sketches, drawings, tracings, competition work, etc.—Box 4983, Builders' Journal Office.

ADVERTISER, with six years' practical experience and a knowledge of bookkeeping and office routine, desires situation in builder's or estate agent's office.—C. J. Mounter, 24, Hillfield Road, West Hampstead, N.W. 5028

A "B.B.B."—The British Business Bureau (Architects). 140, Fleet Street, E.C., can recommend several first-class assistants. Particulars free on application. No fees. 5066

ADVERTISER, (30), seeks situation in Drawing Office; rapid tracer, colourist, good printer; used to making tracings for reproduction. Experience gained in architects' offices.—Box 5057, Builders' Journal Office.

ARCHITECT. Surveyor and Constructional Engineer fully qualified, seeks engagement, 15 years' experience, moderate salary; would represent good constructional firm.—Box 5063, Office of the Builders' Journal.

ADVERTISER seeks position as junior assistant, 3½ years' experience; excellent draughtsman, surveying, levelling, book-keeping, general office routine; highest testimonials; low salary.—Box 5045, Builders' Journal Office.

AN experienced young architect, with small connection, desires position or work at own office; prolific designer and rapid draughtsman; specifications, etc.—"C.," 24, Hainthorpe Road, West Norwood, S.E. 5026

AN Architect's Assistant desires re-engagement; town or country; neat and quick draughtsman; thoroughly capable; moderate salary.—M. P., 358, New Cross Road, S.E.

APPOINTMENT as Improver (19), just completed three years' articles with architect; good draughtsman, tracer, etc.; excellent testimonials; moderate salary.—J.S.C., 10, Almeric Road, Clapham Common. 4993

ARCHITECT'S Assistant desires re-engagement in a good London office; eight years' experience; good references; experience in competition work.—B. E. Atkinson, jun., 14, Rosslyn Hill, Hampstead, N.W. 5018

ARCHITECT'S Assistant (27), good draughtsman and colourist; contract drawings, designs, details, perspectives, surveys; travelling studentship winner; specimens.—H. C. S., 65, Grove Road, Norwich 5025

ARCHITECT'S Assistant (24), disengaged; Inter. R.I.B.A., 6½ years' varied experience, town and country; working drawings, details, and perspectives; levelling, reinforced concrete details; assist with quantities.—Riches, 35, Culverden Road, Balham, S.W. 5013

ARCHITECT'S Assistant (23), 6½ years' experience; excellent draughtsman, working drawings, details, specifications, surveying; assist with quantities; first-class references.—H.B., 23, Springfield Road, Bury St. Edmunds. 5001

ARCHITECT'S and Surveyor's Assistant (25), 9 years' London experience; working drawings, designs, specifications, supervision, etc.; land surveying, and assist with quantities; prizeman and medallist.—W., 20, Holmewood Road, Streatham Hill, S.W. 4992

ARCHITECT'S Assistant (23), excellent draughtsman, desires re-engagement; six years' first-class experience; contract, detail and competition drawings, specifications, perspectives (exhibitor at Royal Academy); prizeman for architectural design; highest references; moderate terms.—F.E.T., 10, Cobham Road, Kingston-on-Thames. 5015

ARCHITECT, 32, qualified, seeks any position where his services would be available; energetic; disengaged; mod. salary.—Box 5006, Builders' Journal Office.

ARCHITECT'S Assistant, nine years' experience; bronze and silver medallist; acted clerk of works; perspective, details, etc.; assist on quantities.—French, 23, Port Street, S.W.

ARCHITECT'S Assistant seeks engagement; 14 years' experience; plans, details, specifications, quantities, surveying, dilapidations, and levelling; excellent references.—C. G., "Brooklyn," Leas Road, Guildford.

ARCHITECT'S Assistant disengaged, good allround; design, construction, specification, supervision, dilapidations, surveying, etc.; excellent testimonials.—H., "Bowood," Heronsgate, Ricksmansworth, Herts.

ARCHITECT'S Assistant (24), eight years' experience; chiefly schools; intermediate R.I.B.A., first-class design, construction, architecture, ornament; folio of drawings sent for approval.—Vivian S. Whitaker, Barcroft, Bromsgrove, Worcester. Salary 49s.

ARCHITECT'S Assistant (23), capable draughtsman; good constructionalist; would go on trial for permanency; town or country; temporary work 35s.—H. J. W. E., 1, St. Dunstan's Road, Hanwell, W.

ARCHITECT'S Assistant seeks engagement; good draughtsman; working drawings, details, surveying, levelling, and quantities; eight years' experience.—Owen, "Meadowside," New Queen Street, Chesterfield.

ARCHITECT'S Competent Assistant desires engagement; many years' practical experience; designs, details, specifications, superintendence, surveying; two guineas.—Arch, 23, Lavenham Road, Wandsworth, S.W.

ARCHITECT and Surveyor's junior assistant (22), 4½ years' experience, desires re-engagement; neat and expeditious draughtsman; working drawings, surveying and levelling.—Williams, "Brynderwen," Pontyclun, Glam.

A.R.I.B.A., disengaged shortly, London training; chief and senior assistant in leading provincial offices; expert designer, and experienced in all branches.—A. G., "Beverley," Yardley Wood Road, Moseley, Birmingham.

ARCHITECT'S Assistant (22), desires re-engagement in London office; contract drawings, details, surveys, double scholarship holder; Stage III. Building Construction.—Smeed, 24, West Ham Lane, Stratford, E. 5050

ARCHITECT, prepares designs, working drawings, specifications, on moderate terms; assistance rendered, town or country.—Box 5,036, Builders' Journal Office.

ARCHITECT'S Junior Assistant (20), 4½ years' experience, West End and country offices; working drawings, details, perspectives, competitions, general office routine; excellent draughtsman and tracer. Highest references; salary 25s.—G. W. S., 26, Cowley Road, Ilford, Essex. 5056

BUILDER'S Clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 5037

BUILDER'S Book-keeper, 9 years' excellent reference from present employer. All books, double entry, prime costs, accounts, trading and profit and loss accounts, etc.—Box 5049, Builders' Journal Office.

BUILDER'S Assistant (30), wants position with large provincial builder, accurate surveyor and estimator; extensive experience with architects' settlement and accounts has revised present temporary employers' routine, and obtains accurate and immediate information on all matters; gives entire satisfaction.—Malpas, Much Hadham, Herts. 5071

BUILDER'S and Contractor's Assistant (29), thirteen year's experience, all branches, including roads and sewers, asphalting, etc.; plans, specifications, quantities and accounts, shorthand, and typewriting.—Box 5069, Builders' Journal Office.

CLERK (24), requires situation in building trade; 7 years' commercial experience; 4 years' in building trade; bookkeeping, correspondence, and general routine; excellent references; moderate salary for prospects.—Box 5068, Builders' Journal Office.

CARPENTER, and French polisher wants situation, young, capable workman, good refs.; moderate wage.—C.P., 21, Redstone Road, Redhill, Surrey. 4989

CLERK of Works, shortly disengaged, well up in all trades; levelling and surveying; best references; abstainer.—R. E., 3, Oakfield Road, Stroud Green, London, N. 5052

DRAUGHTSMAN (26), home or abroad, neat, quick tracer and colourist, working drawings from rough sketches, bookkeeping and general office routine; foreign experience.—H.W., 64, Crofton Road, Camberwell, S.E. 5003

ENGINEER, 29, disengaged; exp. in designs, detail, drawings, calculations, quantities, structural steelwork, fireproofing, reinforced concrete, bridges, buildings.—Box No. 4991, Builders' Journal Office.

ENGINEER, mechanic, desiring change, requires permanent situation on staff, official or private; thorough all-round general experience; married.—J.G., 86, Bathurst Gardens, Willesden, N.W. 5011

GRAINING wanted, piecework; distance no object; best work only.—C. Monk, Oakdene, Parkfield Road, Willesden, N.W. 4951

JUNIOR (20), 4 years' experience, good draughtsman, quick and accurate leveller and surveyor, building, sewerage, water supply, abstracting, billing quantities, typewriting, shorthand; salary no object.—S.F.H., 16, Dodington, Whitchurch, Salop. 5032

JUNIOR Assistant, disengaged; good knowledge of domestic architecture.—Reply, J. R. F., 248, Sandycombe Road, Kew Gardens, S.W. 5031

MASONRY, manager or foreman, machinery and all details, all classes of masonry work; London and country experience; terms moderate.—G.B., 38, Napier Road, Tottenham, London. 4975

FRENCHMAN, Architectural Draughtsman, having an office at Rouen (France) is willing to accept representation of English articles used in building.—Write Ledicn, 39, Petherton Road, Highbury, London, N.

SHOP-FITTING, or high-class joinery, advertiser (38), seeks situation as foreman in shop-fitting or high-class joinery works; can take full control; 9 years' references; abstainer.—Box No. 5007, Builders' Journal Office.

SIGNWRITER, Grainer and Decorator, good; fill up time, Paint, Paper; 10 years' reference; permanency, or estate; can take charge.—B.B., 58, Moffatt Road, Thornton Heath. 5070

TYPEWRITING, tracing, shorthand, good class work, requiring intelligence and accuracy, can be undertaken in spare time by architect's clerk.—Address, "Typist," 2, Marsham Street, Westminster. 5043

YOUTH wants situation, surveyor's or builder's office; four years' experience; working up quantities, measuring up, good draughtsman; scholarship holder; excellent testimonial.—J. R. O., 233, Essex Road, N. 5017

Appointments Vacant.

ARCHITECT requires temporary Assistant early in June. Must be experienced in finishing competition drawings, public buildings.—Apply, stating salary, to Box 5065, Builders' Journal Office.

FIRST-CLASS mould maker, for artificial stone works required, and to act as foreman; joiner preferred; good wages, house and garden, and permanent situation to the right man; apply, stating wages and experience, to Edwin J. Pearce and Co., De Montfort Chambers, Horsefair Street, Leicester. 5039

REQUIRED, experienced working manager, one prepared to invest in a small paying brick works in Carmarthenshire.—Apply first, Thomas, 71, Moy Road, Cardiff. 5042

WANTED, in country builder's office, (Somerset), competent and confidential clerk, married man preferred; permanency to suitable man. Apply, stating wages and references, to Box 5038, Builders' Journal Office.

WANTED: Builder's Clerk, young man; state age, experience, and wage wanted; copies of testimonials only, which will not be returned.—Box 5051, Builders' Journal Office.

NORTHAMPTONSHIRE COUNTY COUNCIL EDUCATION COMMITTEE.

An Assistant will shortly be appointed in the Education Surveyor's Department. He must be a good draughtsman, and accustomed to inspect and report on work in progress. Experience in an architect's or a Surveyor's office is essential.

The salary offered is £120, rising by £5 increments to £150 per annum.

Forms of application may be obtained from the undersigned, and must be returned not later than Saturday, May 8, 1909.

J. L. HOLLAND,
Secretary of Education.
County Education Offices,
Northampton. 4998

WANTED.—Two smart young men for travelling Lancashire and Yorkshire, to sell high-class, widely advertised specialities used in the building trade. Knowledge of and connection in, the Varnish and Enamel trade a desideratum, but not absolutely necessary. Good opening for really live travellers.—Apply Box 5058, Builders Journal Office.

YOUTH wanted for Engineer's drawing office; accustomed to handling drawings.—Apply, stating age, experience, salary required, to Box 5064, Builders' Journal Office.

May 26, 1909. Volume 29. No. 746.

THE BUILDERS' JOURNAL
AND ARCHITECTURAL ENGINEER.

Playing at Town Planning. The latest American invention is a joyous new round game for architects. The Committee on Entertainment of the Rhode Island Chapter of the American Institute of Architects arranged among its members a town-planning competition. The idea in itself involves no great amount of stress or strain on the native genius for inventiveness. The novelty (if any; and we rather suspect the existence of some prior claims) consists in the conditions of the competition. "About ten days before the date of the meeting, the committee sent out to all members of the chapter a blue-print, showing a plot of land near Merino, upon which it was assumed that a model village should be built. The idea was that upon the plateau, overlooking a valley on three sides, houses would be needed for mill-workers employed in manufactories situated in the valley at the right. The conditions given were very few: those members desiring to compete were required to trace the survey, transfer it to a drawing-board, and bring the latter, with the necessary drawing instruments and materials, to the meeting; a general block plan of the village was to be shown, at a scale of 60ft. to the inch, while on the margin of the drawing plans and perspectives of the various types of houses used were to be included. Rendering could be in any medium. The men competing were free to make any preliminary sketches in studying the problem, but none of this material was to be brought to the meeting." The time allowed was an hour and ten minutes; and at the end of that time the real ordeal for the competitors began. "Each competitor was then required to explain his solution of the problem, amid the freest discussion and comment by the jury." The competitors are to be congratulated on their pluck in thus offering themselves as victims to the lash, or to a hardly less painful endurance of embarrassing compliments, or to the dull dolour that ensues upon insipid neutrality. The designs, as shown reduced in an American contemporary, do not, at first sight, appear to yield much inspiration with respect to the problems of town-planning. They look more like designs for church windows and prison doors. This momentary illusion arises from the symmetry of the plans, the lay-out being in almost every instance painfully prim, the houses looking like a regiment of soldiers standing stiffly at attention. If one thought that when town-planning became universal, all the civilised world would look like that, one would rather it never came to pass. But of course town-planning is not going to be merely formal and mechanical, a mere product of set-square and compass. It may degenerate into that if it is not wisely and artistically ordered and influenced. But between stiff formality and chaotic anarchy there is wide scope for artistic amenity. It is mainly with the object of insisting on this point that we have ventured to refer to the otherwise unimportant *ludes* or interludes of the Rhode Island Chapter of the American Institute of Architects.

The Smoke Nuisance. Sir William Richmond treated last week's meeting of the R.I.B.A. to a further racy instalment of his ceaseless diatribe against the smoke nuisance. It is marvellous with how much of freshness he contrives to invest each new variation on an old theme. At the R.I.B.A. meeting he naturally laid stress on the æsthetic aspect of the question. Smoke not merely blackens but corrodes, not only defiles but destroys. It is therefore the arch enemy of the architect, so that Sir William's subject was perfectly relevant to the R.I.B.A. meeting. The existing law against "black smoke" is, it seems, rendered almost inoperative by the very serious difficulty of proving that such a thing as black smoke really exists at all, and the still greater difficulty of proving the blackness in any given case, since "whether or not it looks black depends on the tone and colour of the sky, and on the position in relation to the sun at various times of the day." That culpability or innocence should thus be made to depend on mere appearance is an odd commentary on the wisdom with which our laws are framed. Surely it should not be difficult to prove by some simple scientific test whether or not any particular emanation of smoke is innocent or injurious, without laying undue stress on the elusive question of colour. It is the factories that most arouse Sir William's righteous indignation. When they have been conquered, it will, he thinks, be time enough to turn to the consideration of domestic smoke. He is not relentlessly uncompromising. He thinks the open fire "a grand institution," and waxes poetic in its praise—"There is no goddess of Olympus more snug, more given to good-fellowship, than Hestia," and there are grates and fuel that are virtually smokeless. It was perhaps this admirable touch of human tenderness that won over on the spot so distinguished a recruit as Sir Aston Webb. All things considered, it seems probable that the aid of the Institute in a movement that, influentially supported, may do so much for the health and beauty of our now smoke-infested towns, will not have been invoked in vain.

The Copyright Question. Last week we dealt somewhat tentatively with the problem of architectural copyright. Our attitude on this important question has been rather misconstrued. Because we ventured to foreshadow some of the difficulties that are pretty sure to be raised and emphasized by opponents of the movement, it has been in some quarters inferred that we also oppose it. That conclusion is decidedly a *non-sequitur*. It is certainly not a fair inference from the general tone and trend of our note, in which the desirability of protecting the architect's interests was distinctly affirmed. The denial of his right to property in his own creations is, we are convinced, a great hardship and a crying injustice. We are aware of many specific instances of gross cases of piracy, and we cannot but sympathise with the victims. That a remedy is both desirable and practicable is, we think, shown conclusively in the very terse and temperate statement of the case for copyright which is published in another column of the present issue, and we have reason to hope that the remedy will not be long withheld.

Iona, Exeter, and Cologne. A pamphlet that has just been issued by the trustees of Iona Cathedral records that the choir, south aisle and sacristy, transepts, and tower have been re-roofed, and are now in use for worship. This work has exhausted the funds, and a further appeal is made for contributions to enable the trustees to proceed with the roofing of the nave. Mr. P. Macgregor Chalmers, of Glasgow, has been appointed architect to the trustees, and at his suggestion the plans that he has prepared for the completion of the work have been submitted for consideration to Mr. William Leiper, R.S.A., F.R.I.B.A. In the circumstances, it would be futile to reiterate the protests already lodged against an undertaking that, in our opinion, was unsatisfactory in its inception, and could hardly prove otherwise in its execution. Sir W. B. Richmond, as chairman of a committee appointed by the Society for the Protection of Ancient Buildings to report on Exeter Cathedral, writes a strong remonstrance against the work that is being done to the west front.

In particular, he protests against the renewal of the niche and canopy work, which was "of the finest white stone, admirably sculptured, and with expressions of delicacy and finish that claim for the work the highest place in mediæval craftsmanship," and he complains that "a few weeks ago, when the cathedral was visited again, hardly any of the fourteenth-century canopies were left." Possibly some reply to these strictures will be forthcoming. In the meantime we refrain from comment. With regard to the cathedral of Cologne, it is satisfactory to learn from the report of the surveying architect. that there are no fundamental defects, the "main frame" —an expression that oddly recalls a much more modern type of building—being thoroughly sound and safe. Nevertheless, the necessary repairs required are so extensive that their cost is estimated, with vague vastness, at "many millions of marks." It looks very formidable, even when we remember that a German mark is only of about the value of an English shilling.

L.C.C. School Architecture. The Education Committee of the London County Council have wisely recommended the continuance of the Architect's (Education) Department as a separate entity, instead of putting it under the control of the Council's Superintending Architect. In favour of the latter course it had been argued that thus the Education Committee would be in closer touch with the Building Act Committee; that the Education Committee could work in unison with the other committees; that greater elasticity of staff would be possible, so that the minor officials could be employed on other work when not engaged on that of the Education Committee; and that the assistant architect, being free from such responsibility of administration as would be borne by the superintendent architect, would be able to give more attention to the technical side of the work. The Education Committee, on the other hand, urge that the volume and special character of the work are of sufficient importance to justify the formation of a separate department; that applicants of a better type would apply for an independent post; that an independent chief officer would be able to re-organise his department on his own lines, and to devote "unfettered investigation and study" to the problems of educational architecture; that an architect with the rank of chief officer would carry greater weight in representing the Education Committee when dealing with the Board of Education and other bodies; that such an independent officer, being *ipso facto* an eminent specialist in educational architecture, will be able to impart special training to his subordinate staff; that the superintending architect would be overburdened with work; and that it would be an advantage to have an independent chief educational architect who would be directly responsible to the Education Committee. This is all very good so far as it goes; but the strong insistence on independence seems to be seriously discounted by the last on the long list of arguments. Why not go a step further in the matter of independence, and adopt the more liberal view that the design of County Council schools, primary and secondary, should be thrown open to competition? This policy need not interfere with the appointment of a permanent official. He, however, would have quite enough to do in formulating requirements, and in giving the Council the benefit of his advice as a consultant. In this capacity he would surely earn his "£800 a year, rising by annual increments of £50 to £1,000 a year," without being called upon to design the work. The question of re-organisation having been raised, now is the time to protest against a perpetuation of a system that condemns London to endure the necessary monotony of scores of schools all bearing the impress of one man's mind. They would be wearisome by reiteration if they were as dignified as the Parthenon, or as beautiful as Santa Sophia; being what they are, the London public schools, good as they may be when taken separately, are, in the aggregate, rather too much of a good thing. This is no disparagement to their architect. No man, in the circumstances, could have done better; few could have done so well. But if we are to have variety of elevation, we must have plurality of architects.

A Triple Alliance. Holland County Council wants an architect, surveyor, and estate agent: not three "separate, well-defined, and individual" functionaries, but some Admirable Crichton who, like the hero of the ballad by George Colman the Younger, will be equal to feeling "like three single gentlemen rolled into one." For these are by no means empty titles. The "person appointed" to these high dignities will not merely "be called County Architect, Surveyor, and Estate Agent." He will be It, or Them. He is expected to "discharge all the duties now incident or hereafter to become incident to the Office" —the trinary, triple, or triune Office, that is. He will make plans for all new schools and other buildings required in the County of the Parts of Holland, or for alterations or additions, prepare estimates, draw up specifications and quantities, superintend erection and repairs, and so forth. He will survey and make plans of all the small holdings in the county, and "from time to time visit the same and see that all farm houses, farm buildings, gates, fences, etc., are properly repaired and maintained, the ditches properly cleaned out, and the farms cultivated in accordance with the tenants' agreements." "If so required from time to time, he will inspect all main roads and county bridges, and report to the committee if the same are in proper order and repair." If they are not, will he not report? He will "collect all rents of small holdings or allotments worked by the County Council, and pay the same to the County Treasurer, and pay any outgoings the Small Holdings Committee may require, and be responsible for keeping all registers and books of account in connection with such rents." The salary will be £250 per annum, to include all travelling expenses; inclusiveness of all kinds being apparently a distinctive "note" of the Council of the Parts of Holland. Without suggesting that these Hollanders are guilty of the "fault of the Dutch," which, according to Canning, is "giving too little and asking too much," we cannot away with the unheroic spectacle they conjure up of an "architect" collecting rents and seeing that the ditches are properly cleaned out; and, seeing that the "person appointed," and to "be called County Architect, Surveyor, and Estate Agent," is to discharge duties "hereafter to become incident to the Office," there is no certainty that the Council draws the line at ditches. If time is found to hang heavily on the hands of the "person appointed," it will no doubt be found quite easy to provide him with a variety of other interesting little odd jobs.

SMOKE—THE ENEMY OF BUILDINGS.

By Sir Wm. R. Richmond, K.C.B., R.A., Hon. R.I.B.A.

Brief abstract of a paper read before the Royal Institute of British Architects, May 17th.

Smoke and its products, acids, etc., are detrimental to buildings as well as to all hard or delicate surfaces upon which they are deposited. From the purely æsthetic side of the question there can be no doubt that a deposit of black upon surfaces which are intended by their designers to appear white contradicts the commonsense of all our designs. White shadows and black faces constitute an absurdity even to the tyro, and how much more galling must it be to you when you see your elaborate mouldings and ornaments screaming an ugly lie. It appears to me to be sentimental rubbish which even for one moment defends the colour of that portion of the west front of St. Paul's which has been made a black and unintelligible mass, wholly contradicting Wren's scheme. Gloom is certainly not dignity, nor do dirt and blackness constitute nobility of aspect or add to any historical memories, save those which a firm Legislature ought long ago to have tackled. The black condition of the outside of so many of our public buildings and priceless works of art in architecture is not a thing to be proud of for a moment, but rather to be ashamed of, in that the inertness of public opinion and the insensitive attitude of governing and public bodies which have continued and do continue to delay, not only to legislate firmly, but to see also that their legislation is put in action. Until we have cleaned London from the smoke of factories which do come under the Act, it is useless to attempt to tackle the domestic chimneys.

Remissness of Authorities.

What we have to do is to frame the clause in the Public Health Act in such a way that prosecution is made easy and not difficult, and that could be done by the elimination of the word "black" from the clause, substituting instead "all or any." The London County Council has had this change of wording before it for some little time, accepting a deputation from the Coal Smoke Abatement Society which was listened to with marked attention. I believe that if this Institute would frame and pass a resolution in accordance with the proposed change in the wording of the clause, and send it to the Parliamentary Committee of the L.C.C., the Councillors on that Committee would be strongly influenced to pass the revision of the word in the clause. Continued expression of public opinion, especially that which is in embodiment hammering at it, is the only way to persuade public bodies to act firmly and promptly. The Local Government Board is steadily remiss in sustaining or supporting the execution of Acts of Parliament in their relations to this Act.

Dirt Destructive and Costly.

One is bound to fear that on a question of æsthetics the abolition of smoke would take a long time to effect, but once prove to the purely commercial mind that his pockets are lighter for it and he will immediately change the tone of his argument. The cost in hard cash to every individual in London arising from dirt caused by smoke, and smoke alone, is prodigious; the destruction it evokes is terrible. Even what appear to be hermetically sealed cases do not keep it out. Many a time have I glazed, and as I thought finally pasted-in the glass in a frame, pasted the backing board, and imagined that I had conquered the invasion, when to my disgust, perhaps only a few months after the operation has been completed, I have found the inside of the glass blackened with fine soot powder, and the drawing irreparably damaged. To all pictures soot is a deadly enemy, even when dry, the deposit left by one "black" being an essential oil so powerful in its corrosive elements that a solvent which would remove the stain, however slight, would have to be strong enough to destroy varnish and paint. The fact was told to my father by Faraday during the sitting of a Royal Commission when the removal of the pictures in the National Gallery to South Kensington was in contemplation; I think the Commission sat in 1860, since which time we know that South Kensington is now almost as deeply clouded by dirt and smoke as Trafalgar Square, and there, in South Kensington, are treasures for which the Government has paid hard cash, still unprotected by a little manly legislation, a legislation which would *not* injure but benefit all classes, including the manufacturer-offenders, because all smoke is waste fuel.

One of the greatest fallacies is, surely, that stringent laws concerning cleanliness may damage trades. Dirt obliges extra labour, and extra labour is expensive. The gas companies might suffer, but what are these among so many? One of the ridiculous travesties of commonsense is the fact that the electric light stations in London have been, and some of them are, the chief offenders, creating darkness to produce light! The tram electric stations also are terrible producers of black smoke. From one in this neighbourhood I have seen the smoke travel on the atmosphere for at least a mile. The Local Government Board declines to take action, though by law it is commanded to do so in default of the district authorities. The alteration in the wording of the Act would render it easy for magistrates to convict. Under its present reading it is difficult to prove black smoke to exist at all. Whether or not it looks black depends on the tone and colour of the sky, and on the position in relation to the sun at various times of the day. I do not like to venture to state the numbers of buckets of black water removed from my mosaics and windows in St. Paul's, nor the quantity of black sediment left at the bottom of the pails after the water had lain still awhile; it was astonishing and exasperating. Now, if this smoke is a nuisance—and as to that there can be no doubt whatever, nor that in a large measure it can be removed—it is a national question. It is harmful to every building: stone, marble, iron, steel, copper, bronze, even gold is injured by it. Precious fabrics must be kept under glass, and even then they are not immune from damage; it destroys in time the surface of oil pictures; it has injured and still goes on injuring the precious marbles in the British Museum and South Kensington. The sulphuric acid contained in each smut is a poison of great strength; it will rot copper wire in time; cords, string even of strong hemp, are eaten into, and many are the pictures which have fallen from walls, the accident being due to nothing but the rotting of copper wires or cords through the action upon them of sulphuric acid.

Co-operative Heating.

Before we begin to make an attack on household smoke, let us set the law in motion as it now stands, and use all our endeavours, public and private; yet it will be well to bear in mind that there are grates and there is fuel which are practically smokeless. It is too much to suppose, and undesirable also, to look forward to the German stove heating in our houses—that I, for one, hope will never come. The open fire is a grand institution, and there is no goddess of Olympus more snug, more given to good fellowship than Hestia; still, for general heating of a modern detached house, has the holocaust no recommendations? Gentle diffused warmth reaching, say, from 58 degrees to 60 degrees over the entire house would indeed add to comfort and probably also to health; then the open fire would be just a great luxury, and for it wood might be used in place of coal. I suppose afforestation is a coming thing, anyhow it ought to be; in that case ere long wood should be cheap. And how infinitely more pleasant is the heat it promotes, and absolutely innoxious its gas is as well as its ash, than coal gives off. I wish, and I am by no means alone in wishing, that the poorer classes would combine in tenements, even in streets, and have one cookery place in a given area, and further that all workmen's houses or rows of such were provided with heat as they are now provided with gas or even electric light. All these items in time, if tried now in some district or districts, might become customary. Then we should have begun at the right end for the diminution of smoke from private dwellings. It is no use to legislate till something has been offered equally pleasant with the open fire; but that might come to be regarded as a luxury more than a necessity, if some system of combination or system of general heating were devised and promoted.

I suggest that the Institute should forward a memorandum to the London County Council, praying that in the clause in the Public Health Act of 1891 relating to smoke the work "black" shall be omitted, or, if not, the "black," "and all other smoke," be inserted. This change of a word or short part of a sentence would enable magistrates to know where they are with the law. Plaintiffs would then only have to prove a nuisance, and not have to prove its colour—an almost impossible thing to do.

Photo: Topical.

THE PROGRESS OF THE CAMPANILE OF ST. MARK, VENICE.
This recent photograph shows the present height of the Campanile, and the movable scaffold which is raised as the work proceeds.

Discussion.

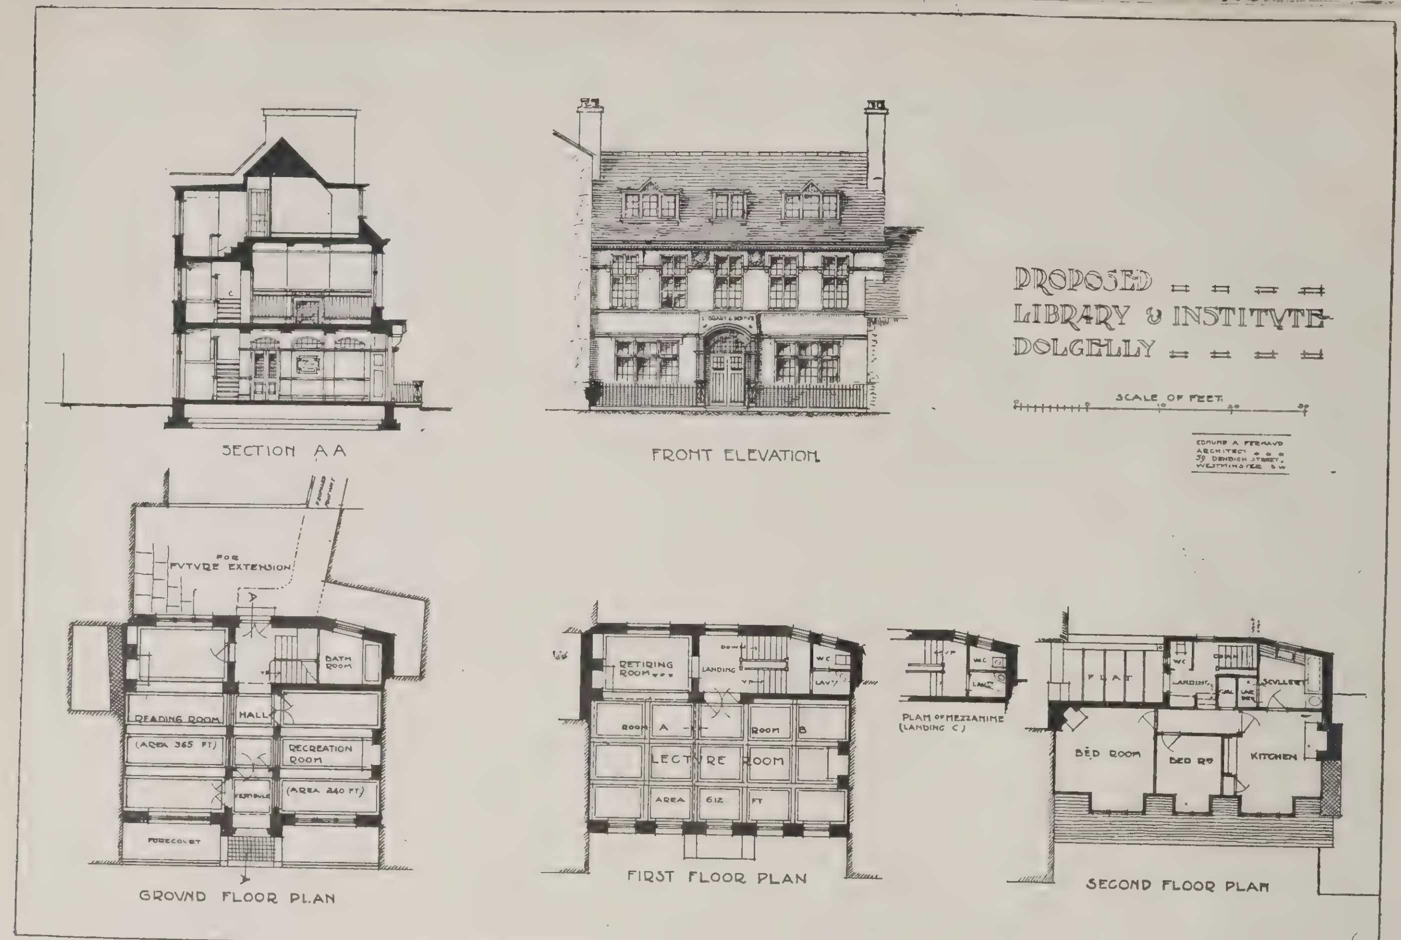
Mr. Des Voeux, in proposing a vote of thanks to Sir William Richmond, observed that the part that the small household chimney played in the smoke nuisance was by no means insignificant, and its importance should not be underrated. Last year—in the middle of June—he had stood upon a housetop in Maida Vale and had had this fact brought forcibly home to him. Stretching away beneath him on into the far distance he saw hundreds of houses, each emitting volumes of grimy smoke. Above, two enormous black clouds were rapidly forming, and when these clouds met, and were joined by the ascending smoke, the familiar London fog was formed. No large factories were in view, there being only the innumerable small chimneys to which he had referred to cause the ensuing fog which had been sufficiently dense to blacken all Westminster. Smoke, too, would travel sometimes thirty or forty miles before dropping. There were, he said, 500,000 gas stoves in daily use in London alone, and he believed the adoption of gas cooking to be the prime factor in solving the smoke problem. If the proposal of Sir William Richmond were adopted, and a letter were sent by the Institute advocating the desired course of action, he believed that the only barrier to a satisfactory arrangement from their point of view would be the L.C.C. Finance Committee, which doubtless would negative the proposal on the ground of expense. If the Institute would only adopt the suggestion he was confident that another step would be taken towards the settlement of a question now in the balance.

Mr. Paul Waterhouse, in seconding the vote of thanks, said that their grateful acknowledgments were due to Sir William for taking such an active part in the movement. It was hardly an artistic subject, and Sir William, occupying as he did such a unique position in the world of art, conferred a great boon upon them by joining in the protest. The utter indifference manifested by the public was doubtless due to the fact that they were a long-suffering race, believing that fogs came as a visitation from heaven. Architects in particular were apt to be too tolerant of the nuisance. Their chief anxiety when designing a building to be erected in London was how it would look when dirty. The usual attitude was that the annoyance was one to be met and not to be removed; but he for one did not belong to this school of thought, and had much pleasure in supporting a motion for delivering a little push to the County Council.

Sir Aston Webb, in supporting the vote of thanks, remarked that he had adopted coal gas for cooking and other purposes in his house after seeing with what success it had been used in the house of Mr. Ernest George. The only drawback, so far as he could see, was that a gas fire refused to be poked. It was his custom at one time to visit a church over whose chancel arch had been placed a very fine fresco. Owing to the accumulation of dirt, it was considered best to remove this fresco and to substitute a mosaic. But the change was of no avail, for the mosaic ultimately arrived at the same condition as its predecessor. He had not taken great interest in the work of the Smoke Abatement Society, but after listening to Sir William's forcible discourse he felt that he must become a member, and add his name to the list of subscribers. The support of such an influential body as the R.I.B.A. was bound to have good effect on the movement.

Mr. Ernest George remarked that many advantages could be claimed for the use of coal gas for heating and cooking. It was, in particular, a great convenience to be able to turn it on and off at will, and it was virtually sootless.

Sir William Richmond, in reply, observed that the co-operation of the Institute was greatly to be desired. They would be amazed if they knew the number of anonymous letters he had received as the result of his strenuous warfare against smoke, some even threatening his life. With regard to the smoke nuisance, Paris was in a plight very similar to that of London. Venice, also, was



PROPOSED LIBRARY AND INSTITUTE, DOLGELLY.

This design was selected in competition some time ago. The problem to be solved was to design a building suitable to its requirements for a very limited amount of money. Local rubble is used for the walling which is finished externally in cement. The roof is covered with green local slates. The stairs are in teak, and the rooms on ground floor have wood-block flooring. The hall is tiled. The lecture room, with retiring room, can be divided into two large rooms by means of folding partitions. The building is set back owing to street improvements. The architect is Mr. Edmund A. Fermaud, of 59, Denbigh Street, Westminster, S.W.

in a lamentable condition; and, while there, he had had the honour of dining with the King of Italy, who had asked him to write a letter to the press protesting against the general feeling of apathy. This he had done, but he knew not its effect. Cairo, and also Japan, were suffering from the dread invasion. Smoke abatement, therefore, was by no means a purely English question, but was of universal incidence.

CHURCH BUILDING ETHICS AND ÆSTHETICS.

By Edward Warren, F.S.A.

Abstract of an address delivered by Mr. Edward Warren, F.S.A., at the Annual Court of the Incorporated Church Building Society, May 21st.

Honest Soundness of Structure.

Amongst the very large number of plans representing schemes for new churches, or the enlargement or alteration of existing ones, old or modern, the percentage which we find it possible (always to our very great pleasure) to approve absolutely, is small, but I think I may fairly say that we do find an increasing tendency to accept and obey the main constructional requirements of our society, and to endorse the spirit as well as the letter of those instructions. The number, however, is still large, which is sent to us, showing not only ignorance of the society's requirements, but of the ordinary practical needs of a church and a sad lack of perception of the befitting attributes in honest soundness of structure, simple excellence of materials, and quiet dignity of effect.

A Misguided Desire to Smarten.

It is frequently painful to us [the society's Honorary Consultative Committee of Architects] to have to consider schemes for the building of churches, whose submission to our judgment is in itself a proof of slender financial resources, which seem to aim rather at a certain Cockney splendour than at the sober and restrained adequacy which is barely attainable within the limits of the possible expenditure. It is, perhaps, more than ever painful to minds trained in the study and love of ancient architecture, and attuned to its serene sincerities, to have to sit in judgment upon plans, generally well meant, which nevertheless portend the woeful mishandling of some quiet, delightful old country church, to which time and weather have imparted an irreplaceable beauty, and in which the direct and simple alterations and naive additions of successive generations have furnished to all who can read them, instructive pages in the history of our church and our country. There is often, alas! evidence of a misguided desire to smarten, to Cockneyfy, or, if I may use the expression, to "suburbanise" the old grey churches of our quiet country-sides, by the ruthless application of smart and imitative workmanship, in cheap materials, for the sober and humble old fittings and furnishings of our simple-minded predecessors. It is bad enough that a brand-new building dedicated to the worship of God should present the thin, hard lines, the cheap symbolism, the thoughtless, joyless travesties of ancient and beautiful things, but it is worse —indeed, to many of us it is heartrending— to witness the perversion of a quiet and lovable old church to the common standard of modern ecclesiastical smartness.

Essentials of Right Building.

The brand-new must be brand-new, of course, and there is nothing wrong about newness. It has, indeed, a distinctive charm of its own; and when a new building is thoughtfully and skilfully planned, proportionate, dignified, substantial, and strong, it is a thing to be glad of, wholesome all round, the honest outcome of an honest purpose. But where, as is often the case, it is necessary to add to an ancient church—a thing which, I believe you will agree with me, should only be done under the stress of sheer necessity—I feel that the inevitable newness of the addition requires, in order to do no hurt to the old structure, more care and thought, perhaps more skill than unhampered new building on a new site, and I think it is generally only in simple directness of purpose and frank declaration of the addition as such, in the use of materials of local origin where possible, or at any rate of kindred nature and assimilable in time to those of the old building, as well as in avoidance of sham antiquation or mere detail-copying of the original building, that harm is avoidable. See that your walls are comfortably thick, a little over the minimum requirements of this society wherever possible, that your piers and arches are strong and simple, and that your roof-timbers and roof-covering are substantial and sound. Forego all adornment, leave tracery out of windows, have chairs instead of pews, avoid all cusping and crocketing, carving, or ornament of any kind, but have the building sound and solid, and, above all, seek sincerity of structure rather than ingenuity. Such would be my exhortation to clergy and architects alike.

The Dignity of Space.

In new churches in most cases submitted to us the elimination of mere ornament would usually make possible better, thicker-walled, and more substantial buildings, and aften the provision of more ample space. I am struck by the, as I think, extremely regrettable tendency so generally displayed to fit a church closely to the mere seating accommodation demanded by local conditions, allowing for unseated floor spaces the merest exiguity of passage-ways. This is very different on the Continent, where a much greater sense of the dignity of space appears

to obtain in the planning of churches. There is sheer satisfaction to the eyes and, indeed, actual beauty in the proportionate distribution of enclosed space, and, while perhaps it may not be possible for us to increase our minimum requirements in that direction, I suggest that we might accompany their statement in our rules by a suggestion as to the extreme desirability of more ample spaces.

For Beauty and Fitness of Design.

In conclusion—and I believe that on this head I may safely speak for the Committee of Consulting Architects of this Society—I feel that our work would be more useful, and the influence of this society upon ecclesiastical architecture greatly strengthened and improved, if more power and wider discretion were given us in recommending for grants, in respect to the architectural character of designs submitted to us as well as in regard to mere structural sufficiency. Might it not, for instance, be possible to have recognised classes or categories to which, in our criticisms, we could assign the various plans in accordance with their general merits, and which might influence the Executive Committee in its decision as to grants? We should like to be able to feel that our grants conveyed æsthetic as well as merely practical approval, and that, if possible, a sort of bonus were bestowed upon unusually excellent and harmonious designs. If it is not possible, in view of our unfortunately narrow financial limitations, to make an increased money award to architectural excellence, we might at least devise some system of "starring," so to speak, designs especially approved by the honorary consulting architects. In this way it would soon get to be felt that where the plans for a new church, or for an addition were starred by the Incorporated Church Building Society, the promoters would have leverage for an especial appeal, the value of our grant would be morally increased, a deserving architect would receive express recognition, and your consulting architects would have the gratification of conveying especial approval and of feeling that the society was doing its best to secure beauty and fitness of design as well as soundness of structure and convenience of plan. It is generally admitted that a marked and most hopeful advance has been made within the last few years in secular building, but, as my colleague Mr. Prior so ably pointed out to you when addressing the annual general court a year or two ago, the building of churches has scarcely shown corresponding advance—a sad admission, as we shall all feel.

The Need for Dignified and Beautiful Churches.

Time was when the church was the high centre of all artistic activities, the inspiring source of artistry in every craft. Time was when her buildings were the supreme emotional expression of the creative fervour of the land. We can hardly hope, I fear in this age, when the building instinct inherent in man is dulled by the myriad competing interests of our complex life, to restore that state of things, but we can, and this society more potently perhaps than any other organisation, bear our testimony to the need for dignity and beauty in the buildings of the Church, which is especially great in these days amidst the mean and sordid surroundings of industrial neighbourhoods where, if anywhere, an approach to ideals of beauty, an oasis of refreshment to tired minds and monotonous lives, should be found in the parish church.

Our Plate.

The twelve houses shown in our plate have been built to form a square in Hampstead Way, Hampstead Garden Suburb, N. The accommodation in each house consists of two sitting rooms and offices on the ground floor; on the first floor six of the houses have five bedrooms, and six four bedrooms, together with bathrooms, etc. The materials used are unpicked red Osta bricks, red roofing tiles, and rough-cast finished to a cream tint, while the woodwork is broken white with green doors. There is a common garden, arranged on simple formal lines with summer-house and sundial in the square, while each house has its private garden at the back, and also has the use of a tennis court on a portion of the property. The houses were built by Messrs. W. Moss and Son, Ltd., of Loughborough and Hampstead, as a private venture, and are for sale. The architect was Mr. Geoffry Lucas, A.R.I.B.A., of 14, Hart Street, W.C., and Hitchin, Herts.

THE CASE FOR ARCHITECTURAL COPYRIGHT

The advocates of architectural copyright maintain that the demand is based on (1) reason and equity; (2) on the general wish of architects of all nations; (3) on the necessity in this country as shown by the abuses to which absence of such protection gives rise; and (4) demonstrable proof of the practicability of giving effect to legislative enactment on the subject.

(1) Without question, architecture is a fine art, and original conceptions in it should be accorded the same protection as those in the other fine arts. The architect, like the sculp-

This house, erected about two years ago, has numerous additions and improvements not shown in the drawing; among the additions to the scheme are a forecourt, a sunk kitchen yard, and stables and yard. Old materials have been used for the roofing and for the brickwork where showing. The house has thirteen bedrooms.

tor, may reasonably demand protection for the creations of his mind and art, "intellectual property" which, in justice, should be inalienable. It is surely not right that his original work should with impunity be reproduced by others for their own benefit.

(2) The International Congress of Architects, at Paris, in 1878, passed unanimously a resolution demanding protection for works of architecture: and the resolution has been reaffirmed by subsequent conferences at Paris (1878, 1889, and 1900), Brussels (1897), Madrid (1904), London (1906), and Vienna (1908); and similar resolutions have been passed at Congresses of the International Association of Art and Letters held at Paris, Madrid, Neuchâtel, Milan, Barcelona, Antwerp, Berne, Turin, Liège, Mayence, and in other places; and the architects of France, Germany, Holland, Belgium, Spain, Italy, Denmark, and Sweden, have petitioned their respective Governments for recognition of architectural copyright.

(3) The anomalous position of the architect with respect to his creations was brought into strong relief by the decision in *Gibbon* v. *Pease,* which was tried in King's Bench Division before Mr. Justice Ridley on November 15th, 1904. In this case the plaintiff claimed the delivery of contract drawings and specifications from the defendant, whom plaintiff had employed as architect of the work to which the drawings applied. For the plaintiff it was contended that he as building owner was entitled to possession of the drawings he had employed defendant to make for him, such drawings being made part of the contract. For the defence it was contended that the purpose of the drawings was to enable the architect to see that the buildings were constructed in accordance with the approved design, and evidence was offered in proof of the custom that the drawings and specifications were the property of the architect. This evidence was not admitted, his lordship holding, in accordance with the precedent in *Ebdy* v. *McGowan,* that, failing an express contract to the contrary, the drawings belonged to the employer. This decision was upheld on appeal, March 24th, 1905. Hence anyone who commissions an architect to make drawings may claim possession of them as his own property, and may make any use he likes of them. That many persons are taking full advantage of this position there is abundant evidence. In particular, designs for cottages and villas have been reproduced wholesale, without the consent of the designer; and the close copying of the plans, elevations, and details of much larger buildings is not unknown. The claim for relief from this injustice is merely right and reasonable. There appears to be no essential difference between the procedure of the sculptor, whose work is protected, and that of the architect, whose work is unprotected. The sculptor, like the architect, designs work of which the manual execution is largely delegated. This is of necessity the case. The sculptor cannot be expected, for instance, to cast his own bronze. Neither can the architect be expected to dig his own foundations or tile his own roofs. But in neither case does the delegation of such labour vitiate the claim to authorship, and it can therefore be justly claimed that the architect, like the sculptor, is entitled to protection for work of which the inception is his. In each case it is the work of the brain, not the work of the hands, for which protection is sought. In the one case it is justly given, in the other case it is unjustly withheld.

(4) It is not apprehended that there would be any greater practical difficulty in affording protection to architecture than has arisen with respect to sculpture. A carefully drafted Bill, while affording due protection against flagrant acts of piracy, could not seriously embarrass *bona-fide* designers of buildings. As to the question of penalty, precedents occur with respect to infringement of rights of light, etc., in which injunction, damages, or demolition may be adjudicated; but such heavy penalties would hardly be inflicted except where the piracy was shown to be detailed, wilful, and deliberate. It is believed that no difficulty is experienced in administering the law as to architectural copyright in France and Belgium. In the former country the principle is of old standing, an architect having claimed and received protection in 1855; while architects and sculptors were, in the law of March 11th, 1902, specificially benefiting by the artistic copyright law of 1793.

It is believed, therefore, that all that is needed in order to secure an Act establishing architectural copyright in this country also is a clear representation of the injustice under which architects are labouring in this respect, and an influential demand that the injustice shall be removed by legislative enactment.

THE INSTITUTE MEMBERS' CLUB.

The monthly meeting of the above will be held in the smoking-room of the R.I.B.A. on Thursday next, 27th May, 1909, at 6 o'clock p.m.—K. GAMMELL, Hon. Sec.

Messrs. Cecil R. Pincent, A.R.I.B.A., and Hugh Townshend Morgan have removed from 29, Great George Street, to 37, Berners Street, W.

* * *

Mr. W. A. Forsyth, F.R.I.B.A., and Mr. H. P. G. Maule, F.R.I.B.A., have removed from 16, Great Marlborough Street, to 309, Oxford Street, W. (near Hanover Square). Telephone 3623 P. O. Mayfair.

* * *

The condition of Cologne Cathedral is reported by its surveying architect as being in many respects exceedingly unsatisfactory. The main fabric is "thoroughly sound," but the repairs required are estimated to cost many millions of marks.

* * *

Mr. Edward Good, of Riseholme, Yorks, who has died after a somewhat protracted period of declining health, was formerly a member of the firm of Edward Good and Sons, contractors, Hull, and had been president of the Hull Master Builders' Association and also of the Yorkshire Federation. His funeral was attended by officers of those associations.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
June 1	MOLESEY ISOLATION HOSPITAL. The East and West Molesey U.D. Council invite competitive plans, with specifications for the above. Full particulars can be seen at the Council Offices, Dundee Villa, East Molesey.
June 4	COTTAGE HOSPITAL, BODMIN. Architects are invited to submit competitive designs for the above, to be erected at an approximate cost of £2,000. Premiums, £12 12s., £8 8s., and £5 5s., for the three sets of plans *which the Committee may select.* Premiums of selected Architects to merge in Commission. Site can be seen on application to Henry D. Foster, Hon. Secretary to the East Cornwall Hospital, Bodmin, from whom particulars are to be obtained.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading. Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively.
June 24	NEW PUBLIC BUILDINGS, BURSLEM. The Architect whose design is placed first by the Assessor will be appointed to carry out the work. Premiums of £100 and £75 to authors of second and third designs, respectively, Conditions and plan of site from F. Bettany, Borough Surveyor. Deposit, £2 2s., returnable on receipt of *bona fide* design.
July 9	STOKE-UPON-TRENT. Additions to Town Hall including large hall to seat 3,000 people, police court, etc. Premiums of £100 and £50 for second and third designs respectively. Assessor nominated by Pres. R.I.B.A. Conditions and particulars from Jno. B. Ashwell, Town Clerk, Town Hall, Stoke-on-Trent,
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	WALLASEY U.D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £1, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

New Library, Middlesbrough.

Mr. J. S. Gibson, vice-president R.I.B.A., the assessor in this competition, has made his award as follows:—1, Messrs. Russell and Cooper, FF.R.I.B.A., 11, Gray's Inn Square, London; 2, Mr. G. H. Wenyon, M.S.A., 194, Wolverhampton Street, Dudley, and Chas. H. Potter, 20, Cross Street, Manchester, joint architects; 3, Messrs. Cooper and Slater, 13, Richmond Terrace, Blackburn. The exhibition of the designs in the Town Hall Crypt, Middlesbrough, closes to-night, at 8 p.m.

Rhos-on-Sea Congregational Church.

Mr. John B. Gass, A.R.I.B.A., of Messrs. Bradshaw and Gass, the assessor for the above competition, has awarded the first place to Messrs. J. M. Porter and Elcock, of Colwyn Bay; Mr. Arthur Hewitt, Llandudno, receiving the premium of £10 awarded for second place.

Correspondence.

Bridges of Reinforced Concrete.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Probably many of your readers will be interested in the remarkable test to destruction of the bridge built for the Dusseldorf Exhibition. The test was carried out in the presence of a large assemblage of German engineers and others, who were eager to view the experiment on an actual traffic bridge that had been in daily use since 1902, and was to be destroyed on account of town alterations demanding its removal.

The bridge had a clear span of 30 metres (say, about 98½ft.), a breadth of about 9.14 metres (31ft. roughly), and a central height of only 2 metres (6½ft.). Thus the ratio of rise to span was 1-15th (really 1-14th), or otherwise an extremely flat arch, which was hinged with granite pivot blocks at centre and springings. The arch ring thickness was, at centre, 25ins.; at springings, 27½ ins.; at the haunches, 33.46 ins. The foundations construction was difficult, being through made up soil, and thus the foundation bed was 5 metres (16.40ft.) below ground level at the lowest point. The arch ring mixture was 1.4.4., whilst against the exterior granite hinge faces a special "fat" mixture of 1.3.3 (fine stone) was placed to "cushion" the pressures as transmitted from concrete to granite, and *vice versa* at the centre. The hinge joints were covered with zinc sliding plates and asphalt sheeting. A load test over the arch of a 27 metric-ton steam-roller and a live load of 450 kgs. per q.m. (per sq. metre) was distributed to give greatest stresses in the arch ring; with resultant central deflection of 1,235 millimetres and a horizontal "push-out" or outward displacement of only 0.6775 millimetres. Other measurements were taken along the arch ring with great care. The architectural features were obtained by two coloured facing mixtures, and the embellishments were executed in artificial stone, finished in situ with mason dressing. The bridge was designed and carried out by the Herrn Dyckeroff and Widmann, of Biebrich-am-Rhein.

The loading was placed so as to induce the most dangerous stresses in the arch ring. After certain recorded loads had been placed on the "ring," the loading, having been steadily increased till at 225 tons (metric) the first crack appeared (this was early on the second morning), was continued from 7 o'clock in the morning till 6 o'clock in the evening, by which time the load on the ring was 325 tons (metric), with the bridge still intact.

In the course of a few weeks the actual downfall was only made possible by the application of strong explosives, and even then was difficult, thus proving convincingly the enormous resisting capacity of "proper" concrete when mixed in the truly conscientious manner typical of the German practice. "Hinge blocks," it may be mentioned, are also made of artificial stone (cement concrete with fine aggregates), and as a typical example I should like to cite those that were used in the Lenne bridge, by Halden (a street bridge). The stones (hinge) were cast in hard plaster forms, accurately gauged to the varying radii, and the mixture (machine mixed) was 1.2.2., and they were "seasoned" about 100 days old before using. To eliminate possible inaccuracies of the hinge surfaces, there was also placed between the contact faces a 2 mm. lead sheet sandwiched between two .08 mm. brass sheets to reduce or diminish the friction. The radii of the central hinge faces was two metres or 200 centimetres and 313 centimetres respectively, and, as usual, they were jacked or pressed together to attain thorough uniform contact before the last sections were concreted in. The latest practice since the accident to the Maximilian Bridge, where one of the steel hinge faces slid from its opposite bearing bed, and had to be jacked back, is to safeguard the hinge joint by means of short iron or steel dowel pins, and this method is used, for example, in the well-known Isar bridge at Grunwald. It seems that the springing hinges can be placed more towards the centre with advantage, thus lessening the theoretical span. Among the many notable three-hinged arched constructions, the Germans regard with great pride the wonderful Steyr river bridge, which has a ratio of rise to span of only 1-16th, with, of course, a considerable ever-present pressure on the abutments. This is a pin hinge type, with 18 hinges connecting six rows of the usual lattice reinforcement peculiar to the Melan system.

JAMES A. SMYTH.

The Taxation of Land Values.

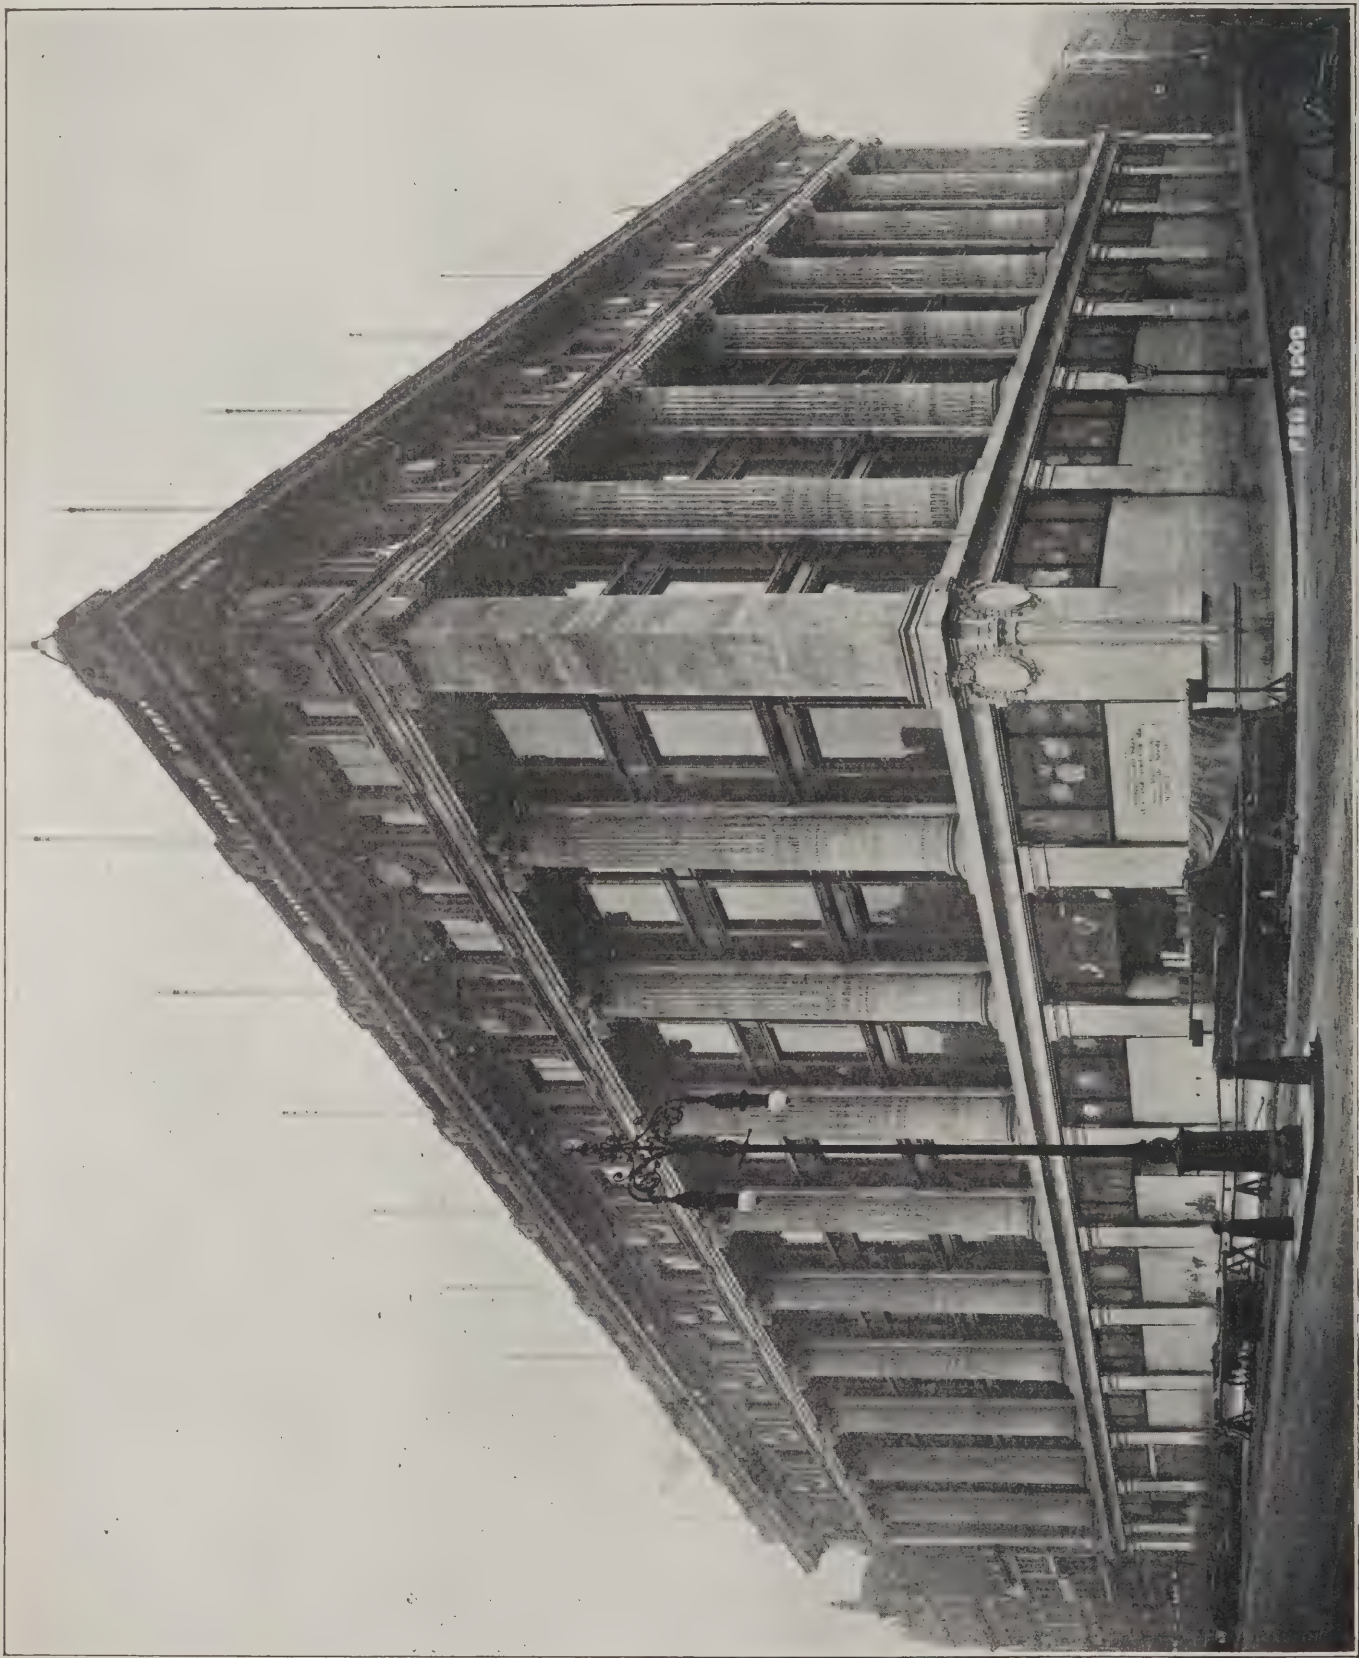
"An Onlooker" draws our attention to the last sentences of his letter which appeared in our issue of the 19th instant, which, he says, are not quite clear, and should read: "The taxation of land values" is the shibboleth of a cult or religion with the belief that this nostrum would reduce the income tax to nothing, relieve all buildings of rates, turn towns into gardens, and marshes and wastes into fertile fields. There is nothing like a little practical experimenting to knock holes in fallacies based on theory.

With respect to the taxation of land values, we have received from the British Constitution Association, 23, Charing Cross, S.W., a circular in which are printed the terms of the resolutions that have been passed in opposition to the Budget proposals. The first resolution is in general terms; in the second it is especially proposed that a committee shall be appointed to present a memorial urging the Government to withdraw the land-taxation proposals, such committee to consist of one representative from the Surveyors' Institute, the Society of Architects, the Estate Agents' Institute, etc. All professional, trade, or other organisations are invited to appoint four representatives to attend the adjourned meeting of the Conference, which will be held to consider the reply of the Government to the memorial.

[*Editorial Note.*—We are somewhat surprised that we have not received more letters on a subject that is fraught with such great possibilities, either for good or evil, to the building trade in general. By those who favour this form of taxation it is asserted that the imposition will tend to greater prosperity in the building trade; but builders appear to be equally divided in opinion on the matter. Those correspondents who were so anxious, a few months ago, for us to open our columns for letters on the subject, have not, so far, responded to the opportunity now afforded to them.]

THE SELFRIDGE STORE, OXFORD STREET.

This fine new building, of which a general view appears on the next page, and of which some further constructional details are given in this issue, is a drapery and dry goods store situated on a site of about one acre on the north side of Oxford Street, midway between Bond Street and the Marble Arch. It has frontages to Oxford Street, Duke Street, and Somerset Street, the first-named being about 215ft. long. There are three basements, the lowest one being used for heating, electric light, artesian well, motor rooms, etc. The sub-basement is occupied by stockrooms for the various departments, and the first basement is partly used for sale purposes, and partly for despatch and staff accommodation. The ground, first, second,



THE SELFRIDGE STORE, LONDON. A BUILDING THAT HAS SET A NEW SCALE IN OXFORD STREET. R. FRANK ATKINSON, F.R.I.B.A., ARCHITECT.

and third floors, are all sale rooms for various departments of the business. On the third floor will also be found the reception rooms, national rooms, post office, rail and steamship ticket office, and theatrical booking office, etc. The fourth floor is used throughout as a restaurant with kitchen, offices, smoke-room, etc., and a spacious roof garden is provided with access from the restaurant. There are nine passenger and two goods lifts, electrically worked, and a gravity package conveyor from the upper floors to the despatch room in the basement. There are also six staircases, comprising 4,000ft. of reinforced concrete staircase, 3,000ft. of landings, and 2,000 moulded beams and stringers, designed and erected by Henry Johnson and Sons. The building has taken about twelve months to complete, and has required in its construction about 3½ million bricks, 45,000 cub. ft. of Portland stone, 3,000 tons of steel, and 25,000 yards of concrete floors. The general contractors were Waring and White, Ltd., and the architect is Mr. R. Frank Atkinson, F.R.I.B.A.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable: and it must be understood that both question and reply will, as a rule, be published in these columns.

Books on Steel Towers.

DEVONPORT.—STOKE writes: "Will you kindly give me particulars of a book on stresses in steel towers such as water towers, etc.?"

There are very few books known to the writer which deal in particular with the stresses in steel towers. "Towers and Tanks for Waterworks," by J. N. Hazlehurst (Wiley and Sons, New York, or Chapman and Hall, Ltd., London, 10s. 6d. nett), will probably give the information desired. A.

French Polishing.

WOODSIDE.—R.A.B. writes: "I want to do some French polishing, and should feel obliged if you would give me some information on the subject."

It would take at least three of our pages to describe the process at such length as to be of practical service to you. There are several good practical books from which you can get full directions, for example, "French Polishing" (Cassell), 6d.; also a book of the same title published by Crosby Lockwood, at 1s. 6d., and another by the same firm, entitled, "A Practical Guide to French Polishing," at 2s. 6d. J.

Assignment of Property.

WALES. W. H. S.—In answer to your questions I regret that I cannot understand this query. Was the first-mentioned assignment by way of a lease or a conveyance of the freehold? Was it executed by the first mortgagee? What is the compensation for? Is it an awarded amount for damage done to the assigned part of the property, or is it merely by way of rent under a lease? What do you mean by the "estate agent"? Is he a receiver of rents and profits employed by the house-owner? I may say that unless the mortgagees are in possession, they can claim no part of the annual rentals of the premises, and the second mortgagee only comes in after the first one is satisfied. If you can clearly state the case, I will endeavour to answer your questions, but I can now only advise the estate agent to hold the money until some one of the claimants proves his right to it by legal action. F.S.I.

An Analysis to Find CO_2.

LONDON, S.E.—A. E. B. writes: "What is the best method of ascertaining the amount of carbon dioxide in the atmosphere? Is Pettenkofer's the best?"

Pettenkofer's method is not usual with chemists, and is seldom taught by them. In fact, the chemistry professor at each university has his own way, and the way to choose is that which you can do most easily and accurately. Any method requires some skill in the use of chemical appliances; and this is best acquired in the laboratory of a technical school. As the present sessions are virtually at an end, you may obtain help from a chemical or photographic friend. These two methods will perhaps meet your needs:—(1) Slowly force (by means of water) the sample air from its bottle (of known volume) through a series of U tubes containing caustic potash—the increase in weight of the tubes when all the sample air has been forced through them is the weight of carbon dioxide in the sample. CO_2 is twenty-two times the weight of hydrogen (the lightest element and the standard unit); oxygen is sixteen times the weight. For most accuracy the air should be dried by passing it through two U tubes that contain strong sulphuric acid, at the beginning of the caustic potash series, and through another two at the end. The latter two must be weighed with caustic potash tubes, as any water they contain will have to come out of those. (2) Take the samples in flasks containing when corked 400 cubic centimetres; into these pour 20 cubic centimetres of saturated lime-water; cork up again, and then shake furiously until the lime-water becomes turbid—you may have to shake the flask for ten minutes. The time needed to turn the lime-water turbid is a measure together with the amount of turbidness of the quantity of CO_2 in the sample. The chemical equation is

$$C_a\ O_2\ H_2 + CO_2 = C_a\ CO_3 + H_2O.$$

The water in the lime-water takes no part in the action, although it occupies space in the bottle, and for this reason the amount of CO_2 in the sample cannot be found by this method, which is only a quick way of learning whether there be an excess of CO_2 in the air. Saturated lime-water does not become turbid until it has absorbed 1-84th of its bulk of CO_2; and with the sizes of flask and dose recommended the quantity of CO_2 in the air sample is about 0.006, or 0.002 parts in excess. INGENIOR.

Green Paints Fading.

WANDSWORTH.—R. A. asks: "Does green paint fade or perish quicker at the seaside than in town; and if so, is there anything that can be added to the colour to give it greater permanency?"

Sea air is very destructive to most paints, and certain greens, such as Brunswick, fade under the most favourable circumstances, and would be likely to "fly" quicker when at the seaside than elsewhere. Nothing can be added to the colour to prevent this, although a coat of varnish over the paint will assist materially; but this is expensive for ordinary work. As noted in these columns recently, permanent greens may be purchased at a slightly increased cost, and in the case under notice these should be used. Messrs. Mander Bros., of Wolverhampton, make a beautiful series of permanent pigments, named "Suffield greens." Messrs. W. R. Todd and Son, of Hull, have recently brought out a new permanent green of brilliant hue; and Messrs. Thos. Fewster and Sons, Hull, have a good colour called "Holly green." Try these, but do not mix with white lead; choose the particular tint which satisfies your requirement. There are scores of them, and every big colour manufacturer makes many. Pay a good price for a first-class permanent green, and you will find there will be no fading, even when the colours are exposed to sea air. Should it be necessary to lighten a green, use zinc oxide. J.

Continuing Offence.

BIRKENHEAD.—W. G. writes: "What is a continuing offence? A is fined by the justices for (1) erecting a building without notice or plan, (2) erecting a building not built of brick, etc., (3) encroaching on air space in rear. The town clerk afterwards sends a threatening letter to B, stating that 'unless the buildings are removed within fourteen days proceedings will be instituted against yourself in respect of the continuing offence of allowing the buildings to remain erected contrary to the by-laws.' Is this a continuing offence?"

A "continuing offence" is one which cannot be purged by the mere payment of a fine or other penalty inflicted upon conviction before a court. The cause of the offence must be removed, or it will continue legally to be an offence, and further penalties can be enforced. If you refer to your copy of the local by-laws, you will probably find it stated (near the end) that for a continuing offence "every person who shall offend" (not in this case "every person who shall erect") shall be liable to a penalty of one pound per day; and you will no doubt further find that power is also taken by which buildings erected contrary to the by-laws may be summarily removed. I am of opinion that unless the retention of these buildings is of vital importance to B's property, it would be cheaper to remove them than to risk the result of legal proceedings. It is quite possible that the transference of the owner's interest in the property from A to B may protect B (see the case "Corporation of Blackpool v. Johnson," in the King's Bench, March 26th, 1902); but a great deal depends on B's ignorance of the proceedings against A, and the date when those proceedings were instituted, and I much doubt if the "game is worth the candle." F.S.I.

Rights of Adjoining Owner.

NORFOLK.—S. writes: "The accompanying rough sketch [not reproduced] shows adjoining properties, in one of which a shop-front has been fitted. The owner of the other now asks for compensation. The plans were passed by the rural district council."

The adjoining owner has no right whatever to any money compensation in such a case. If, however, your lease forbids the erection of a shop or lays down a "building line" which you have violated by your projecting windows, he may apply to the freeholder, asking that you should be compelled to comply with the conditions of your lease. So far as the rural district council is concerned, the matter is ended. B should have complained to them before the plans were approved. In any case, he does not appear to have suffered any appreciable damage.

Joists to Carry Angle Bay and Turret.

PRESTON.—F. C. G. writes: "Enclosed I send rough tracings of proposed stone corbelling for a bay window and turret at the angle of a building, and I should be obliged if you could give me some advice as to the best manner of coursing and jointing, and the size of stones to make a sound job. Will it be necessary to cramp and dowel the joints or to anchor the bottom stones down with iron straps, considering the splayed brickwork does not go above 2nd floor level? I have indicated in blue dotted lines rolled steel joists, which may be built into brickwork and assist the carrying of the angles of brickwork. Will this be necessary to form tie and cantilever?"

The section of bay is shown in Fig. 1, plan on first floor in Fig. 2, and plan on second floor in Fig. 3. The load on each of the two top joists will be approximately 3.25 tons, and assuming that two-thirds of this will be sup-

ILLUSTRATING REPLY TO "PRESTON.—F.C.G."

ported at the end, the maximum bending moment on the cantilever portion of the joist$=\frac{2}{3}\times 3.25\times 6\times 12=156$ ton-in. Allowing 10 tons per sq. in., the section modulus should be $\frac{156}{10}=15.6$in. units, requiring a (B.S.B. 10) 6in. by 5in. by 25lbs. rolled steel joist in each direction tailed 6ft. back into wall, which must be solid, and have proper stone template. The load on each of the two lower joists will be, say, 3.3 tons, which may be taken as all supported at the ends to allow for contingencies, and the maximum bending moment$=3.3\times 6\times 12=237.6$ ton-in. Allowing 10 tons per sq. in., the section modulus$=\frac{237.6}{10}=23.76$ in. units requiring a (B.S.B. 14) 8in. by 6in. by 35lbs. rolled steel joist in each direction tailed 6ft. into wall as before. Figs. 4 and 5 show the method of getting a firm hold on the stonework by the joists. The stone corbelling should be shored up while building, and the angle cleats on end of girders should be let in the stone and well grouted with cement to make a solid connection. No back straps will be needed, but the stones should all be cramped together and have bed dowels properly fitted.

HENRY ADAMS.

York, Beverley, and Howden.

LOCKWOOD.—L. S. writes: "Is there at York, Beverley, or Howden, any work suitable for measuring for 'testimonies of study' for the R.I.B.A. Final?"

An abundance of material for study and measurement occurs at either of the places named. At York, a bay of the Minster nave or choir might be measured, or, if less is desired to be attempted, one of the fine tombs, say, Archbishop Bowet's or Archbishop Walter de Grey's, might be done. The Chapter House would also be an excellent subject. One of the smaller churches, such as Holy Trinity, Micklegate, might be completely measured, or a good set of drawings of either of the three ancient gateways, Bootham Bar, Micklegate Bar, or Walmgate Bar, would be suitable. In Renaissance work, the Assembly Rooms by Burlington or Kent, or the County Court House by Carr, would be worth recording. At Beverley, either the Minster or St. Mary's Church would provide an amplitude of subjects. Of the former, the "Percy shrine," a portion of the stalls, or the back of the altar screen could be measured, at the latter the south porch would be suitable. Howden Church and Chapter House would also both be excellent for the purpose. G.

Convalescent Homes.

WIMBLEDON.—T. S. writes: "Please name a good book dealing with convalescent homes, or any papers which have been read on the subject. Please mention an up-to-date convalescent home that might be visited."

I am not aware of any books dealing with the design of convalescent homes, or of any papers which have been read during recent years upon the subject. The principles to be followed, however, are not widely different from those of sanatoria, upon which a considerable amount has been published recently (see, for instance, the competitive essays prepared at the inception of the scheme for the King's Sanatorium). There are two good convalescent homes in connection with London hospitals at Swanley, Kent, and one in connection with the Mount Vernon Hospital, Hampstead, is at Northwood, Middlesex. Permission to visit could no doubt be obtained from the medical superintendent. Plans of the King's Sanatorium appeared in the "Architectural Review," Vol. XIX. G.

Sketching Tour in Derbyshire, Cheshire, or Shropshire.

DOUGLAS.—G. A. K. writes: "I purpose going for a sketching tour in Derbyshire, Cheshire, or Shropshire. Can you give me any information as to which of these counties, and what particular part thereof, would be most suitable? I believe there are many buildings of interest on the route from Shrewsbury to Ludlow."

The route you propose should provide plenty of material for a good sketching tour. On the way from Shrewsbury, Acton Burnell (Early English church and castle) should be visited, also Church Stretton and Stokesay (castle 13th century, with fine Elizabethan gatehouse), Stanton Lacey (Norman church), and Bromfield. At Ludlow, see Lane's Hospital, the Reader's House, Ludford House, and Dodmore Farm (near). Return by Cleobury Mortimer, Bridgnorth (Bishop Percy's House), Much Wenlock (Abbot's house), diverge to Buildwas, thence by Wroxeter to Shrewsbury. In Shrewsbury itself the old houses in Butcher's Row and High Street, and the Court House should not be missed. A good tour could alternately be arranged in the northern part of Derbyshire, where within a ten-mile radius of Chesterfield may be seen Haddon Hall, Hardwick Hall, Bolsover Castle (1613), Barlborough Hall (1583), Eyam Hall, and Chatsworth, possibly less picturesque than the timberwork of Shropshire, but of more architectural interest. If Ashbourne is passed, the fine church, with its interesting monuments, should be seen. In north-east Cheshire, around Macclesfield, Congleton, Alderley, and Bramhall is a quantity of interesting half-timberwork, of which Moreton Old Hall is a typical specimen. See an interesting article in the "Architectural Review," Vol. II., p. 275, and also consult "Old Cottages and Farmhouses in Shropshire, Herefordshire, and Cheshire," by Jas. Parkinson and E. A. Ould, published by B. T. Batsford. G.

Societies' Reports.

The Liverpool Architectural Society.

The annual general meeting of the Liverpool Architectural Society was held at the society's rooms, 13, Harrington Street.

After the minutes of the last annual general meeting had been read and passed, and Mr. J. A. Harrison, A.R.I.B.A., elected an associate of the society, the annual report of the council for the official year 1908-9 was considered at some length.

Mr. Alfred Culshaw, F.R.I.B.A., expressed his regret at the council's action, taken in concert with the Manchester Society of Architects, in forming a competitions committee to inquire into the conditions of competitions, with a view to securing their alteration, should they appear unsatisfactory to the committee. This course, he stated, had been pursued without the cognisance of the council of the Royal Institute of British Architects, which had merely received an irregular notification afterwards. The whole business was calculated to give the council of the Institute a quite incorrect impression of the society's intentions.

In reply, Mr. E. P. Hinde, A.R.I.B.A., urged that the society's council were entirely justified in allying themselves with the Manchester Society in the appointment of a separate competitions committee apart from that of the Institute. This action had not been taken in opposition to the Institute, but rather with a view to facilitating its work, and on that ground alone the Institute would certainly be disposed to overlook whatever unintentional irregularity in the manner of notification might have occurred. It was frequently impossible for the competitions committee of the Institute to deal satisfactorily with provincial competitions, both on account of the essentially metropolitan character of the committee, and the difficulty of obtaining immediate decisions at short notice on urgent questions, through the length of time involved in the necessary formalities of procedure.

Moreover, the committee formed had already done good work: their representations to a certain corporation, in the case of a competition, had resulted in the issue of new conditions.

The meeting then proceeded to the election of officers and council for the ensuing year, Mr. T. E. Eccles, F.R.I.B.A., being re-elected president, Mr. E. P. Hinde, A.R.I.B.A., and Professor H. Reilly, M.A., F.R.I.B.A., vice-presidents, Mr. G. W. Fraser, A.R.I.B.A., and Mr. Ernest C. Aldridge, honorary secretaries, and Mr. C. W. Grayson, A.R.I.B.A., and Mr. C. W. Harris, A.R.I.B.A., honorary auditors. The following members were appointed to the council:—Fellows: Mr. W. G. Dobie, A.R.I.B.A., Mr. J. Dod, Mr. R. Holt, Mr. M. T. Reade, Mr. P. C. Thicknesse, F.R.I.B.A., Mr. A. Thorneley, F.R.I.B.A., and Mr. W. E. Willink, M.A., F.R.I.B.A. Associates: Mr. L. P. Abercrombie and Mr. A. R. Keighley, A.R.I.B.A.

The proceedings, as usual, terminated with an address from the president, in which he reviewed the chief events of both local and general interest in the architectural world, making special reference to Mr. Lever's creation of a chair of Civic Design in the University of Liverpool, and the appointment of Mr. Stanley D. Adshead, F.R.I.B.A., to the Associate Professorship. He wished to emphasise the fact of the appointment not being merely an academic affair. The committee responsible for the selection of Mr. Adshead was thoroughly representative of all interests, and included amongst its members such men as Mr. Brodie, the city engineer, and Mr. T. Shelmerdine, the corporation architect.

After referring to the absence of Professor Reilly in the United States, where he is engaged in investigation both as to the formation of schools of town-planning and as to the methods employed in the laying out of cities, Mr. Eccles passed to more general matters.

It was daily becoming more necessary, he urged, for the modern architect to keep closely in touch with recent developments, both in methods of construction and in material. In this connection the Building Trades Exhibition furnished great evidence of the strides lately made in these directions, and could not fail to impress those fortunate enough to be able to study them personally. Turning to the Institute's proposals with regard to provincial representation on the council, Mr. Eccles expressed his entire dissatisfaction with their provisions. He pointed out that by limiting the number of deputies from the provinces to the presidents in office of the three largest county societies, provincial representation would be hopelessly inadequate, and the arrangement would act with particular injustice in the case of Ireland, which upon such a basis of representation could never hope to have any voice in the decisions of the council. Moreover, the essentially metropolitan character of the latter was preserved by the non-existence of any concerted action amongst provincial societies to secure the promotion of their interests. However, he was happy to be able to state that certain improvements in this condition of affairs had already been effected. The Liverpool and Manchester Societies had of late been working very amicably together, and in consequence had been enabled to take effective action in the important matter of competitions.

Finally, it was a matter for congratulation that the attendance at the society's meetings had been uniformly good. The very high level of the papers with which they had been favoured during the past year was undoubtedly in no small measure due to the assiduous discrimination of the society's secretaries, to whom he desired to tender the sincerest thanks. In conclusion, Mr. Eccles referred, with unaffected regret, to the death of Mr. Ould, in whose office he had at one time been a pupil, and who will be well known to our readers as one of the chief authorities on half-timbered work in England.

Society of Architects.

A party organised by the students of the Society of Architects visited St. Albans on Saturday week. Mr. Edmunds, the local member of the society, was kind enough to make all arrangements on the spot, and to obtain the services of Mr. Ashdown, F.G.S., a high authority on the architecture and antiquities of St. Albans, and author of the very successful Pageant of 1907. Mr. Ashdown delivered a short discourse on the history of the abbey from earliest times to the restoration by Lord Grimthorpe. The party was then conducted round the chapels, sanctuary, and nave. A vote of thanks was accorded to Mr. Ashdown, and the members of the party settled down to sketching. At tea it was announced that the President of the society had offered a prize of three guineas to the student producing the best work on this and subsequent sketching expeditions. Visits to places of interest will take place on June 19th, July 17th, and September 11th, 1909. During the winter months, a students' night will be held at the Society of Architects, when sketches will be exhibited, and Mr. Bond's prize awarded.

Edinburgh Architectural Association.

Members of the Edinburgh Architectural Association visited Borthwick Church and Borthwick Castle, the latter through the kindness of Mr. Henry Borthwick, who took the party over the ancient building. It was built by the first Lord Borthwick in 1430, was partly destroyed by Cromwell in 1650, but again inhabited till about 1740, from when it stood in ruins till it was restored partly in 1892 by the late Mr. John Borthwick and completed by the present occupant.

NEW OFFICES, No. 1, LLOYD'S AVENUE, E.C.

These photographic illustrations represent two views of the new offices of Messrs. Sola and Aznar, No. 1, Lloyd's Avenue, E.C., erected by Messrs. Colls and Trollope from the designs of Messrs. Chatterton and Couch, AA.R.I.B.A. As often happens in City work the clients required a large office area (about 66ft. by 60ft.) divided by means of glazed screens into a suite of offices. There are about 370ft. run of 2in. Tobasco mahogany partitions forming a large general office, eleven smaller ones for the various departments, an entrance lobby, and a book store. Some of the screens are of the full height from floor to ceiling, while others do not exceed 7ft. 9ins. in height. The capping of the lower screens forms an intermediate rail for the higher ones, and the glazing above and below this level is of sheet and Flemish glass respectively. In the general office and one of the smaller offices are enquiry openings communicating with the entrance lobby, which have carved heads—as may be seen in one of the photographs. The offices were in occupation seven weeks after the date on which the architects received their instructions.

Proposed New Buildings.

CARDIFF.—The Building Committee of the Cardiff Guardians are discussing the question of temporary accommodation at the Ely Workhouse.

COVENTRY.—The City Council are considering sites for the new Municipal Buildings and for a new elementary school in Narrow Lane.

LEICESTER.—A L.G. Board enquiry has been held regarding a loan of £6,000 for the erection of public baths in Knighton Fields Road, Alyestone.

LIVERPOOL.—A L.G. Board enquiry has been held regarding a loan for the provision of a public washhouse in Netherfield Road, North.

A L.G. Board enquiry has been held regarding a loan of £18.590 to purchase a site for public baths on the east side of the Dock Board offices.

The Bishop of Liverpool's Fund has received a donation of £10.000 towards the erection of a church in that diocese.

LONDON, S.W.—The Managers of the Cancer Hospital, Fulham Road, are appealing for funds either to erect a new hospital containing about 50 beds within a reasonable distance from London at a cost of £23,000, or to erect a new wing at the hospital to contain about 36 beds at an estimated cost of £13,000.

The Imperial College of Science and Technology have received a donation of £50,000, from the Goldsmiths' Company, towards the extension of the department of engineering.

LONDON.—Among the proposed new works recommended for the consent of the London County Council at its meeting on Tuesday last were the following:—Erection of a building on the western side of Balham High Road, Wandsworth, to abut also upon the southern side of Marius Road, on the application of Mr. A. C. Thomas, on behalf of the Temperance Billiard Halls, Limited. Erection of a house on the north-eastern side of Champion Hill, Dulwich, on the application of Mr. G. Le Morris. Erection of four buildings on the western side of Princes Square, Stepney, at less than the prescribed distance from the centre of the roadway of the street, on the application of Mr. E. C. Gough, on behalf of Mr. J. Blum.

LUTON, KENT.—The Chatham Town Council are purchasing a site for new schools here.

NOTTINGHAM.—Official sanction has been accorded to the Guardians for spending £7,000 to add a new wing to the workhouse. This institution was built only six years ago at a cost of £250,000.

SALFORD.—It has been resolved to build an annexe to the Town Hall at an estimated cost of £16,476, furnishing and extras amounting to £3,500 more.

TORQUAY.—The plans of the borough surveyor, Mr. H. A. Garrett, for the Pavilion and the new Town Hall have been approved. The Pavilion is estimated to cost from £15,000 to £20,000, including furnishing, and the Town Hall about £22,000. It is expected that the latter work will be commenced first.

Buildings in Progress and Completed.

APPLEDORE.—A new tower is being erected to the Parish Church of St. Mary. Mr. John J. Smith, A.R.I.B.A., of Bideford, is the architect.

ARBROATH.—Messrs. G. and R. Cousins, of Edinburgh, are the successful contractors for the rebuilding of Arbroath Station. The work is estimated to cost from £40,000 to £50,000 and to last two years.

BARNSTAPLE.—For the erection of the new secondary school, the tender of Messrs. Pollard and Co., of Taunton, for £9,263, has been accepted.

CARLTON.—A new school has been erected in Standhill Road at a cost of £3,700.

DUBLIN.—New premises for Messrs. Thomas Dockrell and Co., in South Great George Street, have been completed from the designs of Messrs. Kaye, Parry and Ross.

GLASGOW.—A new hotel, the Great Eastern, with 400 bedrooms, has been erected in Duke Street. The architect is Mr. Neil C. Duff, of Wellington Street.

HARROGATE.—Tenders for the extension of the Royal Baths have been let as follows: Mason's work, Kershaw and Hill, Harrogate, £2,685 6s.; joiner, Rhodes Bros., Shipley, £627; plumber and glazier, Braithwaite and Co., Harrogate, £199; slater, T. Rayner, Harrogate, £220 5s. 6d.; plasterer, A. Calverley, Harrogate, £624; painter, Decorative Supply Co., Harrogate, £126 10s.

LEEDS.—The nave of the new Church of St. Edmund, Roundhay, has been completed from the designs of Messrs. Carby, Hall and Dalby, of Leeds. The cost of the whole work will be between £10,000 and £11,000.

LLANDRINDOD WELLS.—The Radnor County Buildings have just been opened. The County Surveyor was the architect.

LOCHGELLY.—The new Municipal Buildings, erected from the designs of Messrs. A. Scobie and Son, Dunfermline, at a cost of about £2,500, have been formally opened.

LONDON.—The new Victoria and Albert Museum buildings are to be opened by the King, accompanied by the Queen, on Saturday, June 26, at 12 noon.

RICHMOND, SURREY.—A new secondary school for girls has been erected at Parkshot. Messrs. Jarvis and Richards, London, were the architects, and Messrs. Soole and Son, of Richmond, the builders.

RUGBY.—The King will open, on July 3rd, the new Speech Room at Rugby School, which has been built as a memorial to Archbishop Temple. The building is of brick with stone dressings, and the roof is covered with green Westmorland slates. It will seat 1,100 people, and has cost about £13,000. Mr. T. G. Jackson, R.A., is the architect.

STRATFORD, ESSEX. — New Sunday schools in connection with the Conference Hall, have been opened. They will accommodate about 600 scholars, and were designed by Messrs. George Baines and Son, architects, 5, Clements Inn, Strand, W.C., and carried out by Mr. J. W. Jerram, East Ham, under contract at £1,930.

WATFORD.—A tender for the Leavesden Road Baptist Church and Institute has been accepted. The block is designed in a free treatment of late Gothic. The facings are in pressed red bricks and the dressings in Bath stone. The church will accommodate about 700 persons. The architects, whose design was selected in a recent competition, are Messrs. George Baines and Son, 5, Clement's Inn, Strand, W.C. The contract, which amounts to £4,150, is let to Messrs. Brightman and Son, of Watford.

WOLVERHAMPTON.—The tender of Mr. Henry Lovatt, Wolverhampton, at £9,205, has been accepted by the Town Council for the erection and completion of a new second class swimming bath. The tender was not the lowest, but the time required was stated to be the shortest.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

The Economy of Reinforced Concrete.

We must expect some misunderstanding as to the features of reinforced concrete because the method of construction is novel to the majority of architects and engineers. Therefore, it is not surprising to find a good deal of misconception in respect to the economy of the construction. There seems to be a general belief that reinforced concrete is claimed by its advocates as more economical than any other form of construction for every conceivable purpose. That is of course erroneous. Reinforced concrete is economical in its proper place. It is not always so cheap as other construction of a permanent character, though sometimes it may be even cheaper in first cost than a temporary construction. It has its limitations like everything else.

Rival Specialists.

Naturally the specialists in steel are pleased to be able to score a point occasionally against the reinforced concrete specialist by proving that for some particular work the more usual construction in steel joists and concrete works out cheaper than a reinforced concrete structure, while the brickmaker is pleased to be able to acclaim brick walls for many situations as cheaper than plain or reinforced concrete walls. Such testimony is partisan evidence, but yet the profession is often misled by it. We cannot assert definitely yet what are the limitations in the various methods of construction; for some time to come we must collect and gain practical experience by comparing the several solutions offered to our problems. The difficulty is complicated by the fact that theory and practice in the older methods of construction are changing. For instance, we have steel frame construction, which when logically designed is a very economical method. In such steel frame buildings reinforced concrete can often be used economically only for floor slabs, because main beams and columns of the combination material do not show any saving. On the other hand the building may be of such a form and such a nature that reinforced concrete is the most economical construction. In asking for competitive tenders there are very often hampering conditions, many which are dictated by effete by-laws. The comparison is not then quite fair.

Incidental Economies.

Wherever possible a free hand should be given the specialist designer to introduce all the incidental and contributing economies in other directions, just the framing and floor, say. For instance, with both steel frame and reinforced concrete frame construction, the walls and partitions can be reduced in thickness. By reinforcing the brickwork we can also reduce the thickness and transmit the loads direct to supports without providing beams and foundations all the way along them. Then the main foundations can be altered. The whole matter is an engineering problem, and the engineer should be fettered as little as possible by the architect in his endeavour to find the most economical solution. In using the word economy, too, we must remember that true economy is not always the smallest first cost.

Life and Efficiency.

The life and efficiency of the structure must be considered. It is quite unfair to compare light timber floors that are not fireproof with reinforced concrete floors. In small structures, such as houses, very often we cannot usefully employ reinforced concrete, though we may find advantage in adopting the analogous construction of reinforced brickwork. Where floors are required to be fire-resisting our experience is that usually reinforced concrete construction can show considerable reduction in first cost with equal, if not superior, efficiency to other materials; steel joists, beams and stanchions and cast-iron columns may, however, often prove more economical than similar members in reinforced concrete, and *vice versa*. Perhaps the most striking economies offered by reinforced concrete are in engineering structures. In foundations, retaining walls, bridges, etc., great savings have been effected, and in many places too, pipes, water mains, sewers, and piling, have been economically constructed in reinforced concrete.

Specific Instances.

If specific instances are wished for we may cite the new General Post Office buildings, which were stated in Parliament to show a saving of about 20 per cent. by the adoption of reinforced concrete, not over the whole building, but only that part where it was used in substitution for the ordinary construction. That is perhaps exceptional, though we know of cases where the saving was even greater. So much for building; now in regard to engineering. A very interesting case has recently occurred as showing the economy often to be effected by reinforced concrete, namely, at Waterford. It is proposed to construction a new bridge over the River Suir, and the Waterford Bridge Commissioners recommended the adoption of a steel girder bridge, estimated to cost £97,000. This was increased by the cost of erecting a temporary bridge £10,000, by law expenses £500, engineering £4,000, and resident engineer and inspectors £3,000, the total working out at £114,500. The contributory authorities, namely, the Borough of Waterford, the County of Kilkenny, South Tipperary, Waterford County, County Wexford, North Tipperary, Queen's County, and County Carlow, all appealed against this decision to the Judicial Committee of the Privy Council, and their approval succeeded.

Mr. Gordon, K.C., stating the case on behalf of the county borough of Waterford, said that all the petitioners objected to the excessive expense of the proposed bridge, and the plans of it. South Tipperary and County Wexford objected to a temporary bridge, while the city of Waterford felt that a temporary bridge was necessary. The commissioners had reported in favour of the erection of a new bridge, the cost of which was £97,000, a figure which was increased by additional items of expenditure to £114,500. What the city of Waterford wanted was a ferro-concrete bridge with six spans, each 47ft. 10ins., at a cost of £47,000, which meant a considerable saving as regards original outlay, and also a substantial saving in the rates to be paid by the contributing areas. Then a steel-girder bridge would have to be painted every three years at a cost of £800, while the cost of painting a ferro-concrete bridge would probably not exceed £100. As between the two classes of bridges Waterford stood to lose or win about £900 a year.

Expert Testimony.

After hearing a considerable amount of evidence on both sides, including that from Mr. William Friel, engineer to the Waterford Harbour Board, Mr. A. Cameron Hurtzig (a partner of the late Sir Benjamin Baker), Mr. C. S. Meik, Mr. J. S. E. De Vesian, Mr. Price, engineer for Cork Harbour, and others, the Lord Chancellor said that as all the parties desired ferro-concrete and undertook its responsibility, the committee did not think it expedient to go against their views. There appeared no doubt that greater economy would result from the adoption of this material, and this consideration was legitimate as long as economy was consistent with efficiency and durability. It would be necessary that plans and specifications should be brought before the committee, and consequently they would adjourn the matter until the plans and specifications were ready.

Efficiency of Reinforced Concrete.

We would not wish to suggest the foregoing saving as applicable to all examples of bridgework. We merely instance it as showing the advisability of giving new methods a fair field and no favour, and considering the arguments on both sides with an open mind. If we were all to wait for new methods to be tried and tested for many years, the world would make little progress. We can by proper investigation determine the suitability and sufficiency of any construction in the course of a year or two. There is now an accumulation of testimony that puts the efficiency of reinforced concrete structures beyond doubt, and if it cannot be employed in any one circumstance with a saving it is unwise and unfair to dismiss its consideration for other work even of the same character.

COLOURED CONCRETE!

It is reported from Paris that a distinguished French chemist has discovered a method of producing coloured concrete. This he does, we understand, not by adding pigments, but by means of some special process or treatment that develops the colouring matter latent in certain constituents of the concrete itself. At present, however, the subject seems to possess but little practical importance.

THE INDENTED STEEL BAR SYSTEM.

The Patent Indented Steel Bar Co., Ltd., of Queen Anne's Chambers, Westminster, have just issued a new edition of their large catalogue, which contains illustrations of work executed subsequently to the former issue. Since the establishment of the business in 1907, its growth and development have been considerable, and now we find the company with branch offices in Manchester, Birmingham, Leeds, and Glasgow, from which preliminary designs and other information can be obtained without delay by clients in the districts controlled by these centres. There are also other agents in Liverpool and Newcastle-on-Tyne to undertake similar work, and sale agents in many other places. In the present edition of the catalogue the illustrations solely refer to work executed in the United Kingdom. We have on various occasions called attention in these columns to the functions which the mechanical bond provided by the indented steel bar is intended to perform, and the theoretical considerations put forward as arguments for its employment. The bar is rolled from high carbon steel, and, consequently, has a high elastic limit and a high ultimate strength. The mechanical bond and the high elastic limit, combined with readiness to supply information and assistance, and with progressive methods, have evidently resulted in much business for the company.

A STRONG CONCRETE BRIDGE.

The extraordinary strength of concrete, and hence its trustworthiness as a structural material, are very strikingly illustrated in an interesting letter to the Editor which appears on page 495, in which are detailed the structural particulars of a bridge built for the Dusseldorf Exhibition, which withstood all endeavours to destroy it by loading, and ultimately had to be demolished by means of explosives.

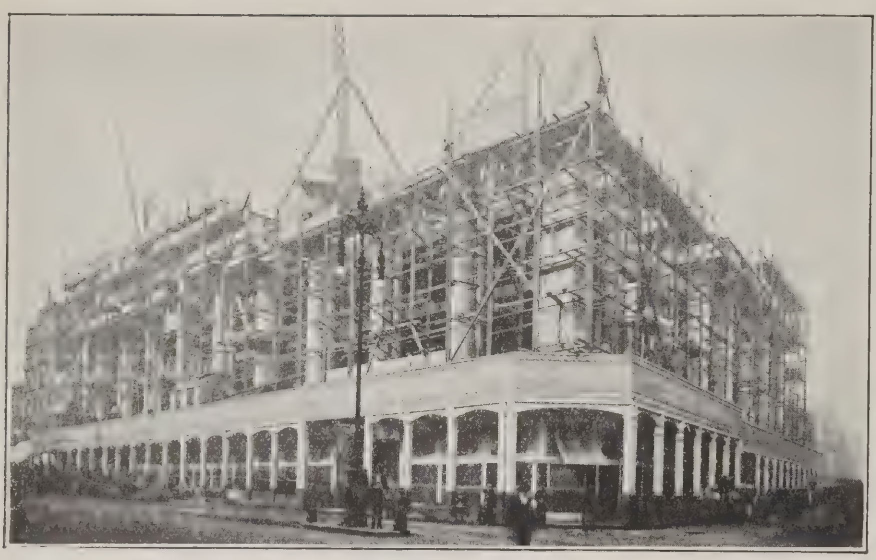

FIG. 1.—THE SELFRIDGE BUILDING NEARING COMPLETION.

STEEL CONSTRUCTION AT THE SELFRIDGE STORE.

In this issue we continue our publication of detail drawings and photographs of the main construction of the Selfridge Store in Oxford Street, London, W., and we shall supplement them with other details of the special girders in a future issue. In previous issues we have described the main features of this steel frame building, our information being kindly furnished us by Messrs. Waring and White, Ltd., the contractors, and their engineer, Mr. S. Bylander, who was responsible for the design of the engineering work in the structure.

On page 496 we publish a photograph of the completed building. Fig. 1 is a photograph from the same point of view, showing the work nearing completion.

Details of the arrangement of spandril beams at the first floor are shown in Figs. 2 and 3. Plate diaphragms are used to brace the beams and keep them at the required distances apart.

THE SELFRIDGE STORE.

Fig. 4 shows the method adopted for carrying the stonework. The main cornice at the fifth floor is carried on steel cantilevers, as indicated in Figs. 5 and 6.

In Figs. 7 and 8 will be seen the steelwork during erection, and the cranes employed for its erection.

In Fig. 7 we would call attention to the bundles of rods lying on the steelwork. These are the rods for the reinforced concrete floors described in previous issues. The rods were "Indented Steel Bars," and were delivered from the mill in bundles already bent as required for the floors as shown in the view. The rods in each bundle were exactly the same in shape, and each bundle had a tag or label to distinguish it, and facilitate erection.

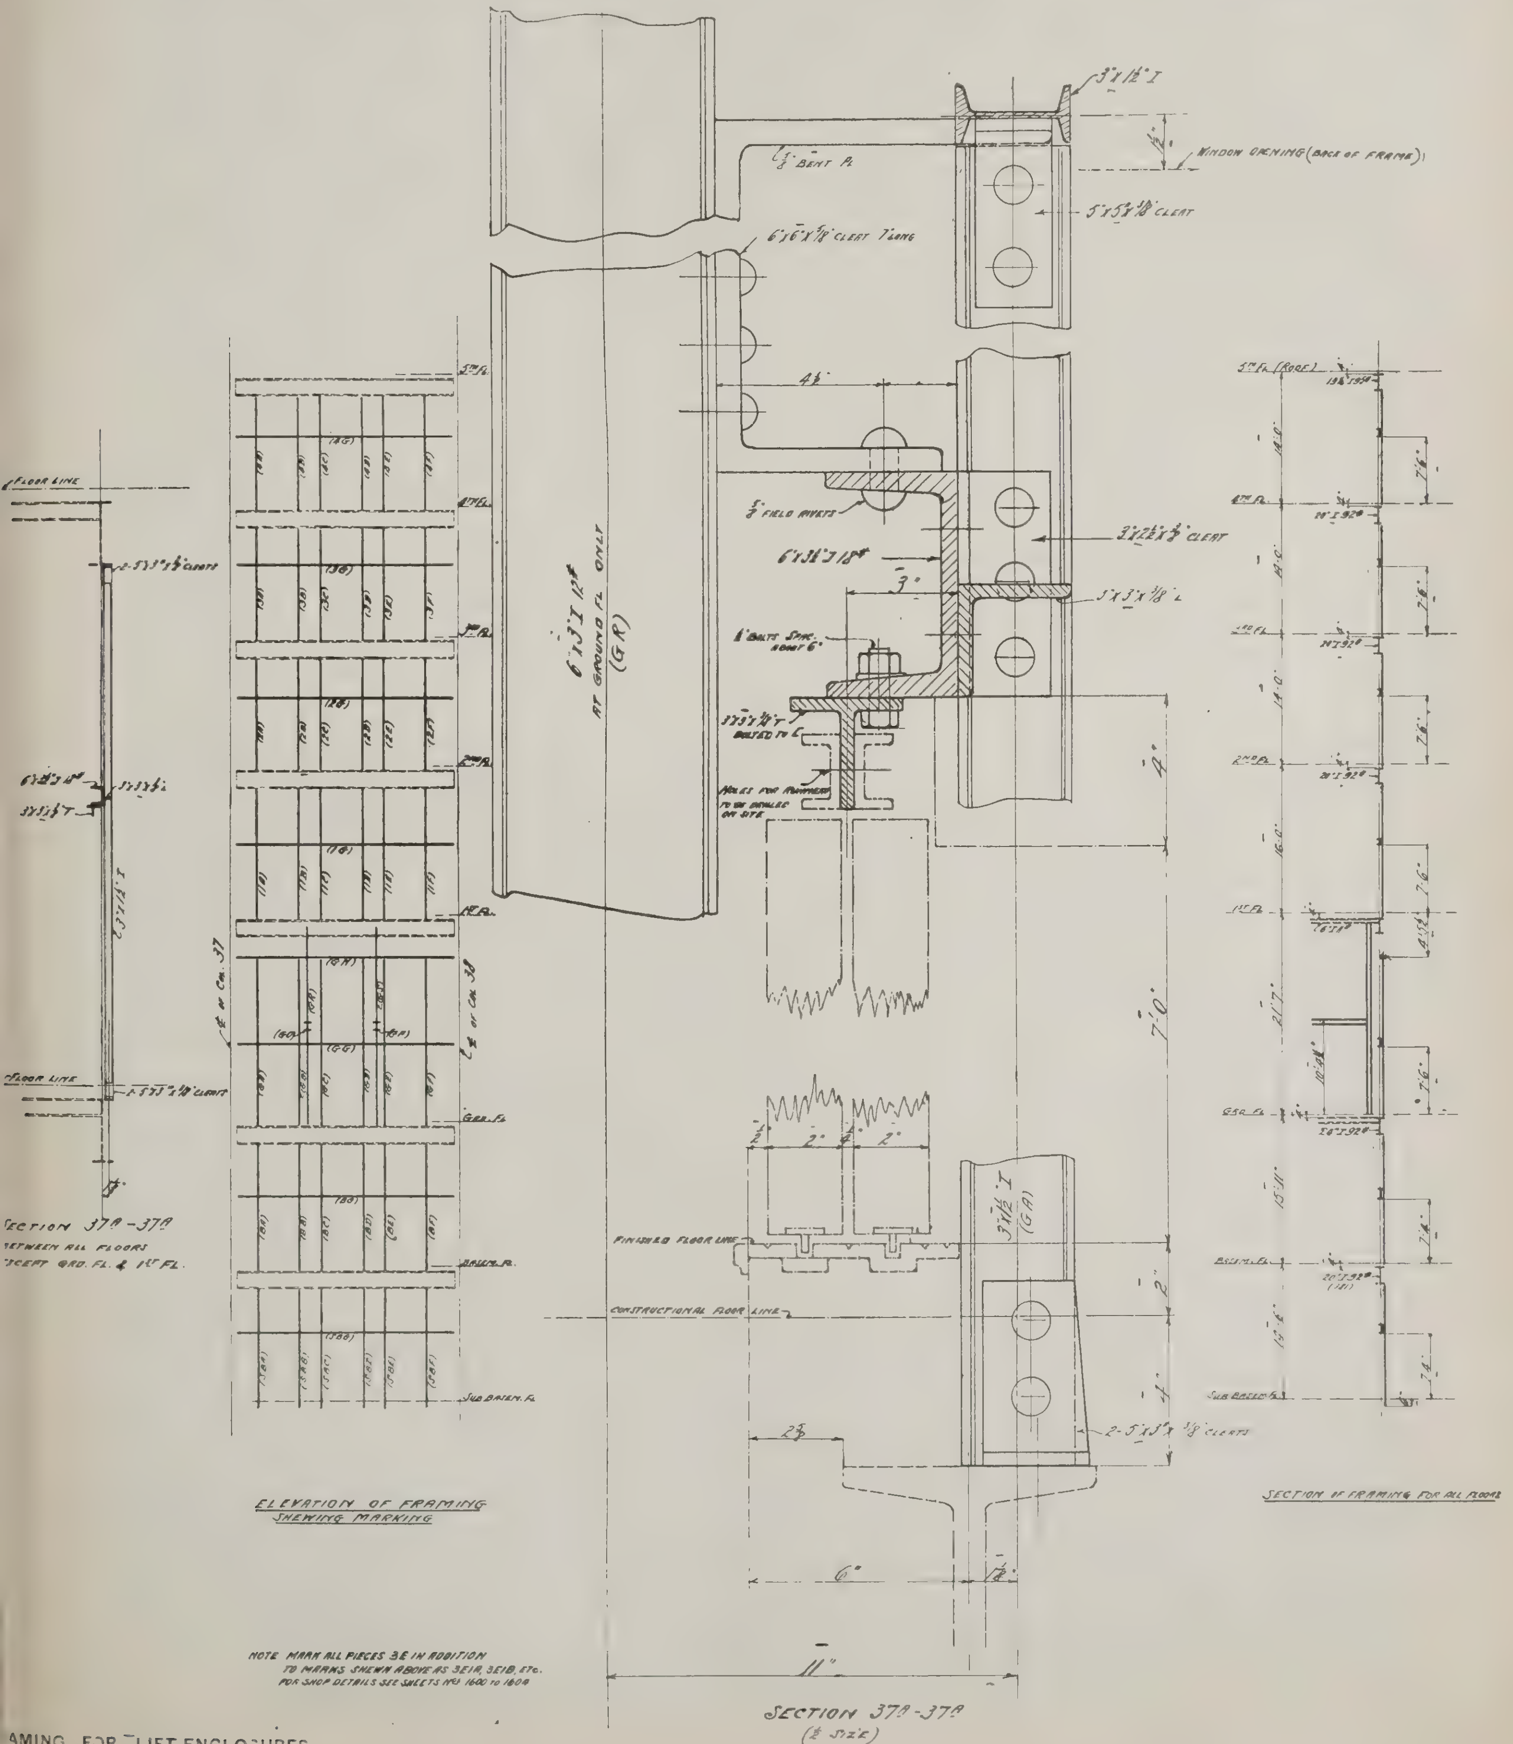
Columns.

The columns are built up of angles and plates.

The girders are connected to the column by means of top and bottom brackets, the bottom angle-iron bracket being strengthened by vertical stiffener angles. Each length of column extends through two storeys, the splice being made about 18ins. above the floor-level by means of splice-plates.

Beams.

Most of the beams used were 20ins. deep. It will be noticed that the position of every rivet is given except for standard connections, when the dimensions are given on a drawing for standard connections. The system used is practically the same as adopted for the Ritz Hotel and "Morning Post" building steel work, both of which buildings were executed by the same contractors, and the steelwork of which was likewise designed by Mr. S. Bylander, their engineer.



AMING FOR LIFT-ENCLOSURES.

TESTS OF REINFORCED CONCRETE BEAMS AT McGILL UNIVERSITY.

During the academic session of 1906-07 a series of tests on reinforced concrete beams having sections of 6 × 8ins. and 8 × 12ins. and reinforced with Kahn trussed bars and Johnson old style corrugated bars, was made in the testing laboratories of McGill University, Montreal, under the direction of Mr. E. Brown, who recently described and discussed the tests before the Canadian Society of Civil Engineers. The following notes are taken from that paper:

The chief difference between these tests and those generally made is stated by Mr. Brown to be the use of five extensometers on each beam in order to learn whether it is correct to determine the position of the neutral axis by the ordinary practice of assuming a linear law of deformation, or strain, between two layers, one near the compression face and the other along the line of steel reinforcement. As a rule but two extensometers are used, determining the deformation at the layers just mentioned, and in addition to these, three were placed at intermediate points in the McGill tests. The deformation curves were then plotted with these five readings, instead of using an assumed law applied to the two extreme readings. By this means the movement of the neutral axis could also be carefully watched. In many cases the curves were practically straight; in most instances they are slightly concave, while in one or two instances the concavity was very marked, especially on the tension side.

Composition.

The concrete was a 1:2:4 mixture, with ¾-in. trap rock, having 46 per cent. voids, river bank sand, and International Portland cement. Ten per cent. of water was used in mixing, and the beams were carefully tamped. The ½-in. corrugated bars had a yield point of about 45,300lbs. per square inch, and a breaking strength of 71,200lbs.; the ½-in. trussed bars, a yield point of 45,000lbs. and a breaking strength of 69,000 lbs.; the ¾-in. trussed bars, a yield point of 38,000lbs. and a breaking strength of 64,000lbs. per square inch. The steel was placed with its centre line ¾in. above the bottom of the beams, and the corrugated rods bent up at the ends to take the shear.

Loading and Deformations.

All of the beams were supported at the ends and loaded at the third points. The extensometers were of reflecting type and for an alteration of length of 0.001in. between gauge points, which were 10in. apart, gave a movement of 2cm. on the scale. By reading to millimeters only, a deformation of 1/200,000 could be measured. From the deformation at the reinforcement line the stress in the steel was found, on the assumption that the elongation of the steel and concrete were the same. From this stress the moment of resistance of the beam was calculated. In order to trace the beginning and progress of cracking, the surfaces were kept moist and viewed by oblique illumination, using mirrors and magnifiers. The load was applied to the beams of 6-ft. span in 500lb. increments and to the beams of 10ft. span in 1,000-lb. increments.

Method of Comparison and Analysis.

The method used in comparing the resisting moment of the beams, as figured from the steel stress, and the actual moment, due to the applied loads, is discussed, in substance, as follows by Mr. Brown: Some of the curves showing the measured deformations at the various layers of the beams show slight concavity, but in nearly all cases the strain curve for the compression layers is very approximately a straight line. If it be assumed that the modulus of elasticity of concrete in compression is constant, the stresses in the concrete will also be represented by the straight line, and the centre of the compression forces will be at a distance from the neutral line, equal to two-thirds of the distance of that line from the compression face of the beam, which distance can be measured from the diagram. By thus measuring the distance of the centre of the compressive forces from the centre line of reinforcement, the length of the arm of the resisting couple can be found. The total tensile force in the steel can be estimated by determining the stress intensity in the steel from the deformation at the reinforcement line, and multiplying by the net area of the reinforcing bars. Neglecting the tensile force on the concrete, the product of the force in the steel and the arm of the couple, gives the resisting moment of the beam as calculated from the measured deformations, and the result can be compared with the actual moment due to the applied loads. Mr. Brown is well aware that this method may be regarded by some as altogether too simple, in that it ignores the variable co-efficient of elasticity of concrete in compression. Before work was commenced he had always felt that many of the formulas which have been proposed and developed from tests on beams are far more elaborate than is justifiable, in view of the variable quality both of the component parts of concrete and of the resulting mixtures. The tests made on the concrete cubes have shown surprising differences in the compressive strains, even when the ultimate strengths have been about the same, and no definite law of variation of the co-efficient of elasticity of concrete in compression could be found from the tests.

Basis of Calculations.

The following simple analysis has been used as the basis of the work, in accordance with the above views:—

Let b = breadth of beam.

d = depth of beam to centre line of reinforcement.

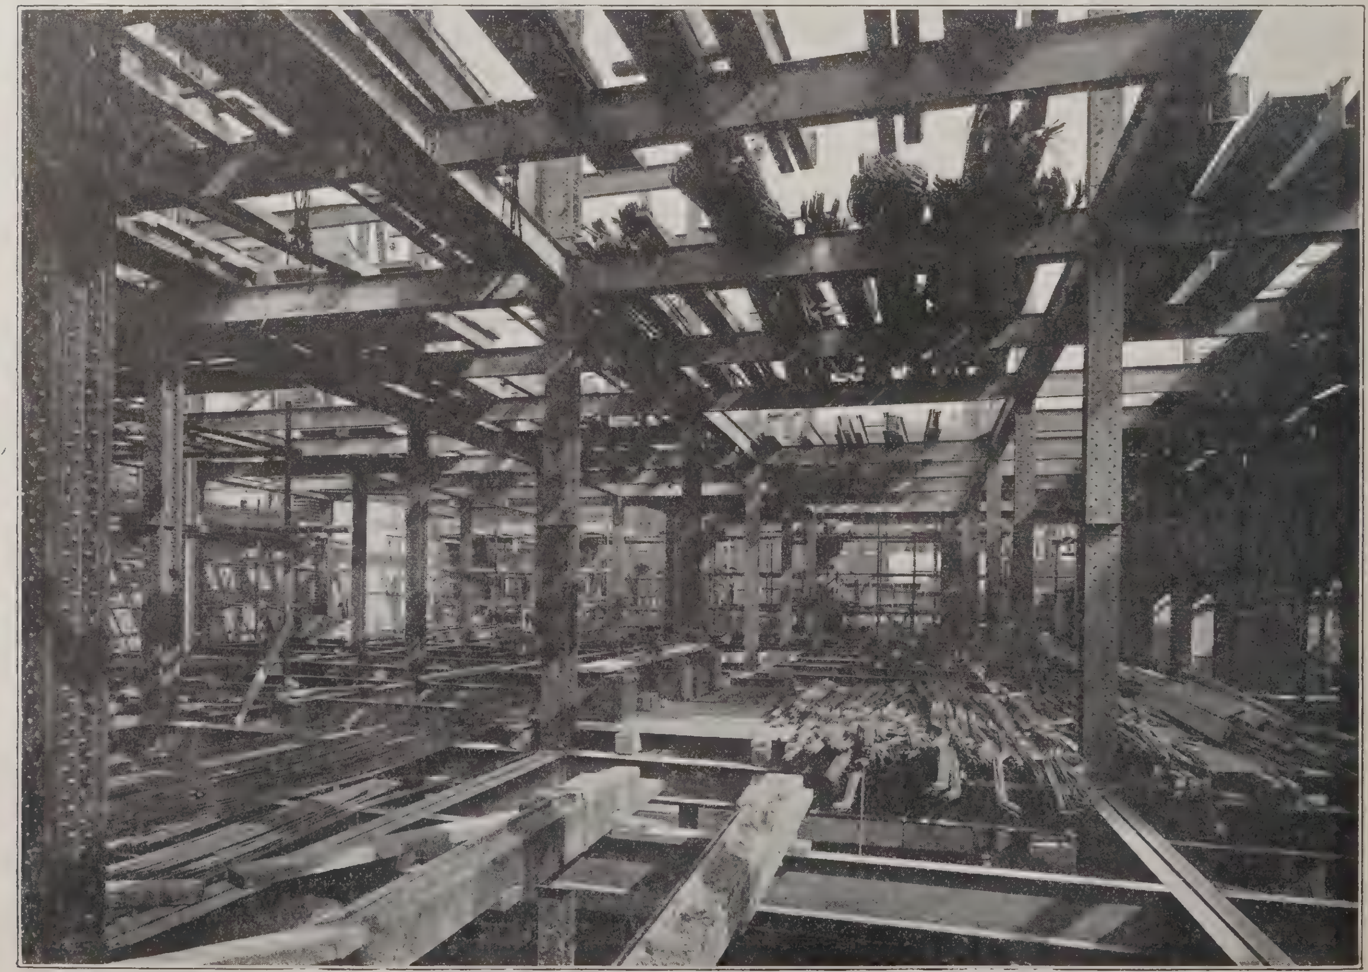


FIG. 7.—THE SELFRIDGE STORE GENERAL VIEW OF THE STEELWORK.

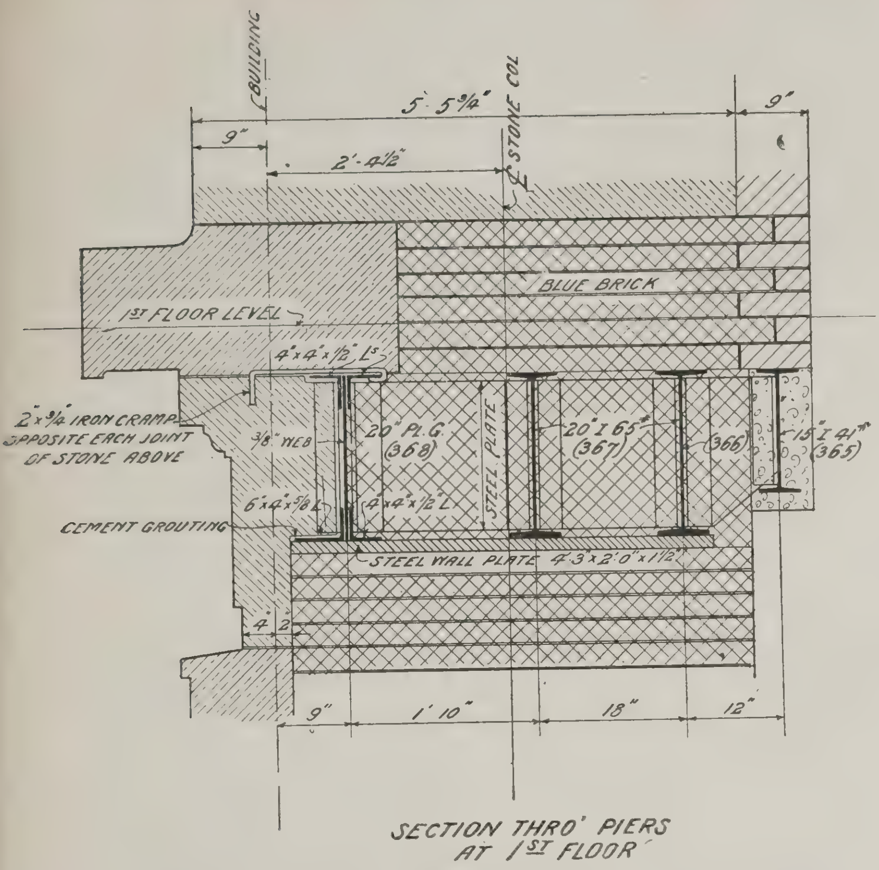

FIG. 2.—THE SELFRIDGE STORE. ARRANGEMENT OF SPANDRIL BEAMS.

xd = depth of neutral axis from outermost compression layer.

A = net sectional area of reinforcing steel.

f_s = intensity of stress in steel.

f_c = intensity of compressive stress in concrete at outermost layer.

E_c = modulus of elasticity of concrete in compression.

E_s = modulus of elasticity of steel in tension.

$c = E_s / E_c$.

Then assuming linear law for variation of compression stress, $bxd\, f_c / 2$ = total comprehensive force $= Af_s$ = total tensile force, neglecting tension in concrete. But if the strain at horizontal layers follows the linear law,

$$\frac{f_c}{f_s} = \frac{E_c\, xd}{E_s\, (1-x)\, d}$$

Hence,

$$\frac{f_c}{f_s} = \frac{2A}{vxd} = \frac{E_c\, x}{E_s\, (1-x)} = \frac{x}{c(1-x)}$$

$$\therefore \frac{x^2}{1-x} = \frac{2\, Ac}{bd} = 2pc$$

where p is the ratio A/bd, or the ratio of section of metal to section of concrete. In this equation c is the ratio E_s / E_c, and the equation gives the position of the neutral axis for any assigned values on the right-hand side of the equation. The equation gives

$$x = \sqrt{p^2 c^2 + 2pc} - pc.$$

Substituting values of p and c in this equation shows that the neutral axis is lower as the amount of reinforcement is greater, and is below the half depth when the reinforcement exceeds 2 per cent. with $c = 15$.

The centre of compressive stresses is at a distance of $xd/3$ from the compressive face, and the moment of resistance of the steel stresses in the beam is given by

$$M = Af_s\, d(1 - x/3) = k\, Af_s\, d,$$

where k is some coefficient to be determined experimentally, and which varies with x; k is found in these tests to vary from 0.82 to 0.88, and is usually about 0.85. This method of analysis is more applicable during the later stages of the loading, than when the concrete is uncracked and carrying some tension. In the earlier stages of loading, the above moment is always much less than the load moment, owing to tension in the concrete.

Variation of Compressed Modulus.

Cubes for compression tests were made from the mixtures used in the making of the various beams. These were tested at different ages, and the tests showed some large variations in the rate of yielding of the concrete under load, although the compressive strength varied but slightly, the latter ranging from 2,080lbs. per square inch to 2,486lbs. per square inch in seven tests out of nine. In connection with a discussion of these cube tests Mr. Brown refers further to the effect of the variation of the compression modulus on the computation of beams. If it be assumed that the compression modulus varies according to some parabolic law, that the vertex of the parabola is at the outermost compression layer, and that the ultimate value of the modulus is two-thirds of the initial value, a theoretical investigation along the above lines shows that when the concrete at the outermost layer reaches one-fourth of its ultimate deformation z, the distance of the centre of compression stresses from the outermost compressive fibre is $0.34xd$; at one-half ultimate deformation $z = 0.35xd$; at three-fourths ultimate deformation $z = 0.36xd$. If a constant modulus is assumed z is always $xd/3$. It will be seen that the result of such deviations from the simple linear law is to alter the position of the centre of stresses very slightly indeed. With the above notation the ultimate moment of resistance of the beam is $Af\ (d-z)$. It is shown by actual tests that for average conditions x may be about 0.4. Thus, for a beam in which $d = 10$ins., the value of z at three-fourths ultimate deformation of concrete is $0.36\ x\ 0.4d = 1.44$ins. Taking $z = 0.33xd$, the result would be 1.33ins., a difference of 1/10in. Thus by making allowance for the variation in modulus concrete, there is a difference of the order of 1/10in. in the value $(d-z)$, the arm of the resisting couple. The theoretical value of x is slightly different in the two cases, but the difference is not so great as to affect the order of the change in $(d-z)$. In deducting the practical value of a formula, the degree of accuracy

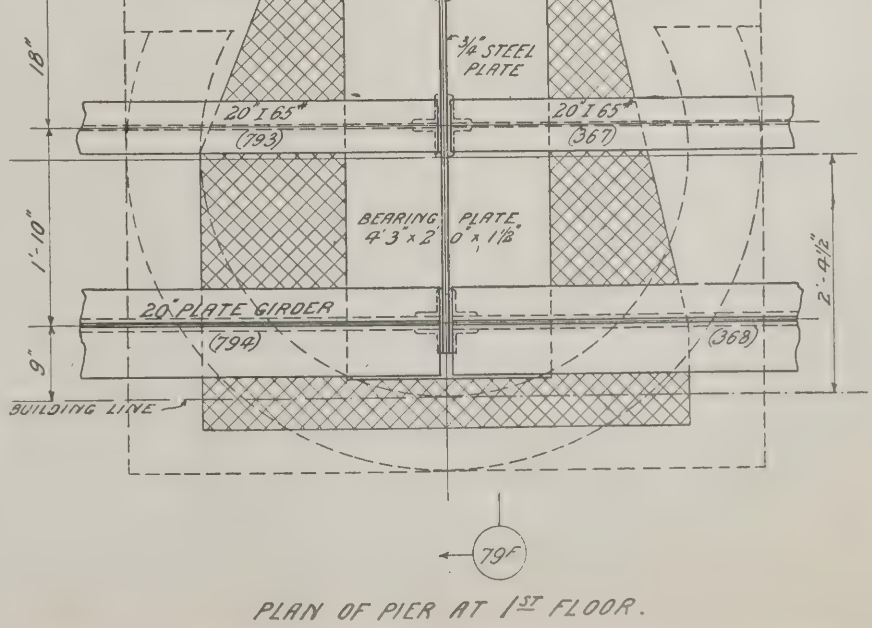

FIG. 3.—THE SELFRIDGE STORE. ARRANGEMENT OF SPANDRIL BEAMS.

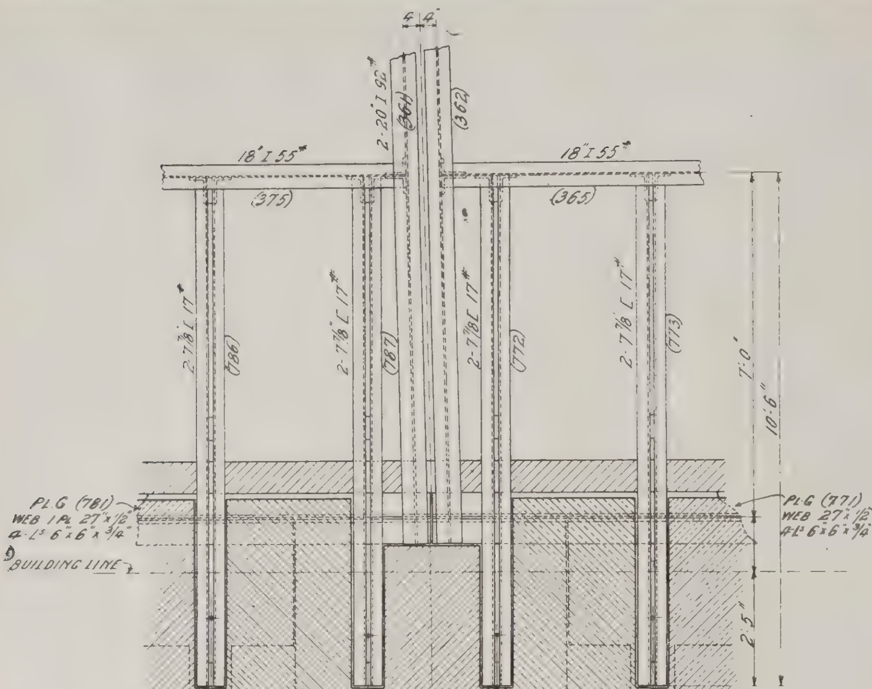


PLAN OF CORNICE
AT 5TH FLOOR

FIG. 5.—THE SELFRIDGE STORE. CANTILEVERS TO CARRY CORNICE.

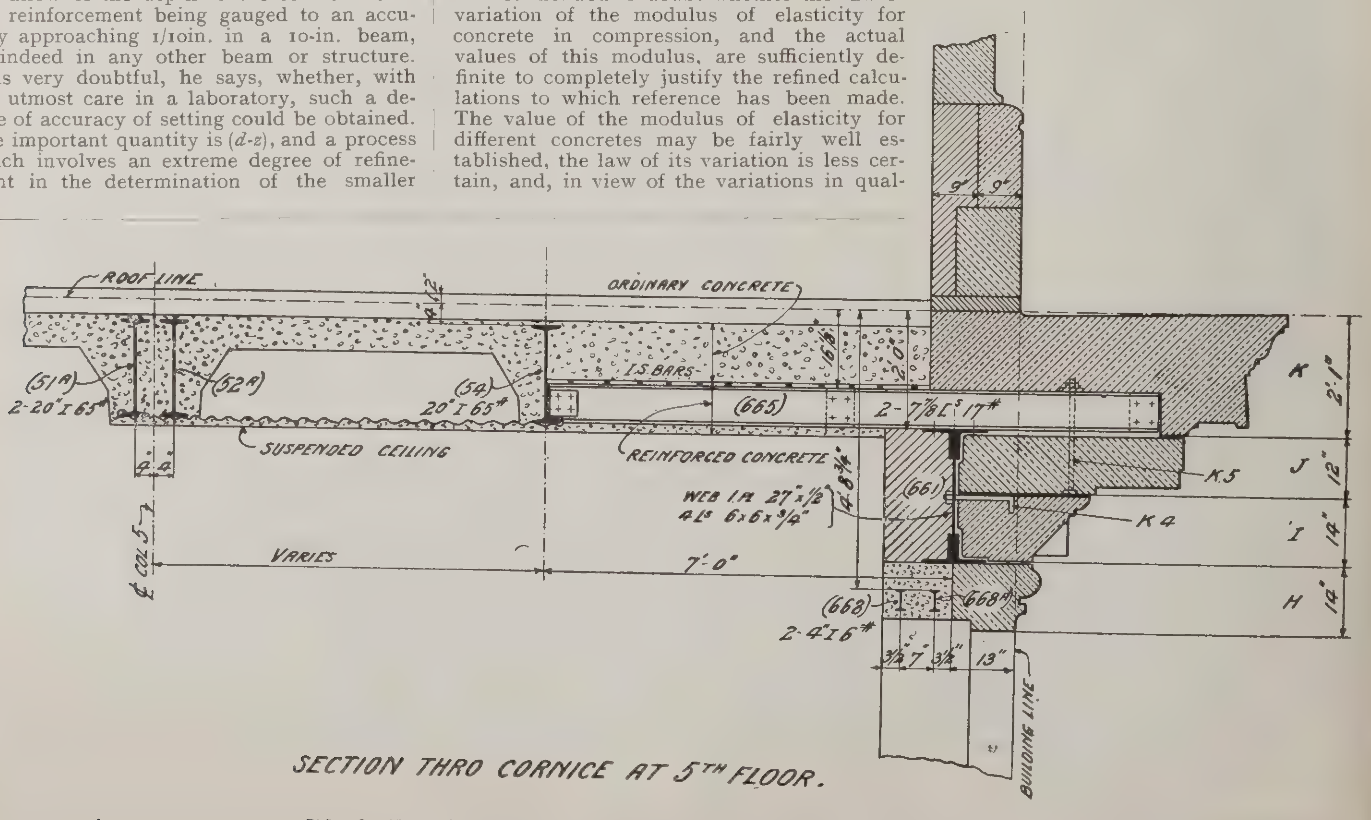
with which the conditions of practice approach the assumed conditions of the analysis must be carefully considered. In this connection Mr. Brown contends that the conditions under which rods are placed do not allow of the depth to the centre line of the reinforcement being gauged to an accuracy approaching 1/10in. in a 10-in. beam, or indeed in any other beam or structure. It is very doubtful, he says, whether, with the utmost care in a laboratory, such a degree of accuracy of setting could be obtained. The important quantity is (d-z), and a process which involves an extreme degree of refinement in the determination of the smaller term z, and ignores the practical conditions which govern the larger term d cannot well be defended as being a necessary part of the work of calculation of the strength of an actual reinforced beam. Mr. Brown is further inclined to doubt whether the law of variation of the modulus of elasticity for concrete in compression, and the actual values of this modulus, are sufficiently definite to completely justify the refined calculations to which reference has been made. The value of the modulus of elasticity for different concretes may be fairly well established, the law of its variation is less certain, and, in view of the variations in quality of the component parts of concrete and the conditions of practice under which it is made and laid, he believes there is reasonable room for doubting whether the ultimate strength, modulus of elasticity, and the law of its variation can be known to within perhaps 20 per cent.

The ratio E_c / E_s is principally of interest in the theoretical determination of the position of the neutral axis. Take the formula $x^2/(1-x)=2Ac/bd$ for the position of the neutral axis, on the assumption of linearity of stress across the section. Put $A/bd=0.01$ $=1$ per cent. reinforcement. Suppose E = 2×10^6 lb. per square inch, and $E_s=30\times10^6$ lb. per square inch, so that $c=15$; the equation gives $x=0.42$. If E_c / E_s $=0.1$, or $E=3\times10^6$ lb. per square inch, then $x=0.36$. Hence in a beam having a depth of 10 in. to the centre line of the reinforcement, the neutral axis is 4.2 in. from the outer compression layer, if $E=2\times10^4$ lb. per square inch; and 3.6 in. from that layer, if $E=3\times10^6$ lb. per square inch.

The arm of the resisting couple is therefore 10—4.2/3 = 8.6in. in the former case, and 10—3.6/3 = 8.8in. in the latter case, a difference of some 2½ per cent., so small as to be completely discounted by an error in setting of the rods.

Fire Tests.

Simultaneously with these tests four beams and four cubes were placed in a furnace of the metallurgical laboratories of the university, and gradually heated from the ordinary room temperature to 1,250 degs. F. The heating was begun at 8.30 a.m. and reached the maximum at 3 p.m. the same day. The furnace was then allowed to cool slowly, and the beams were removed on the following day when the furnace could be entered. The beams were supported on firebricks so as to be inclined upward from the fire end of the furnace. The gases were thus equally distributed on their way to the flue. The reinforcement was uppermost and the firebrick supports about 2ft. from the ends of the beams, which were, for test, on 6ft. centres. On removal from the furnace it was evident that there was initial strain in the beams, for they were appreciably cambered, so as to be concave on the reinforcement side. All of them were more or less cracked when



SECTION THRO CORNICE AT 5TH FLOOR.

FIG. 6.—THE SELFRIDGE STORE. METHOD OF CANTILEVERING CORNICE.

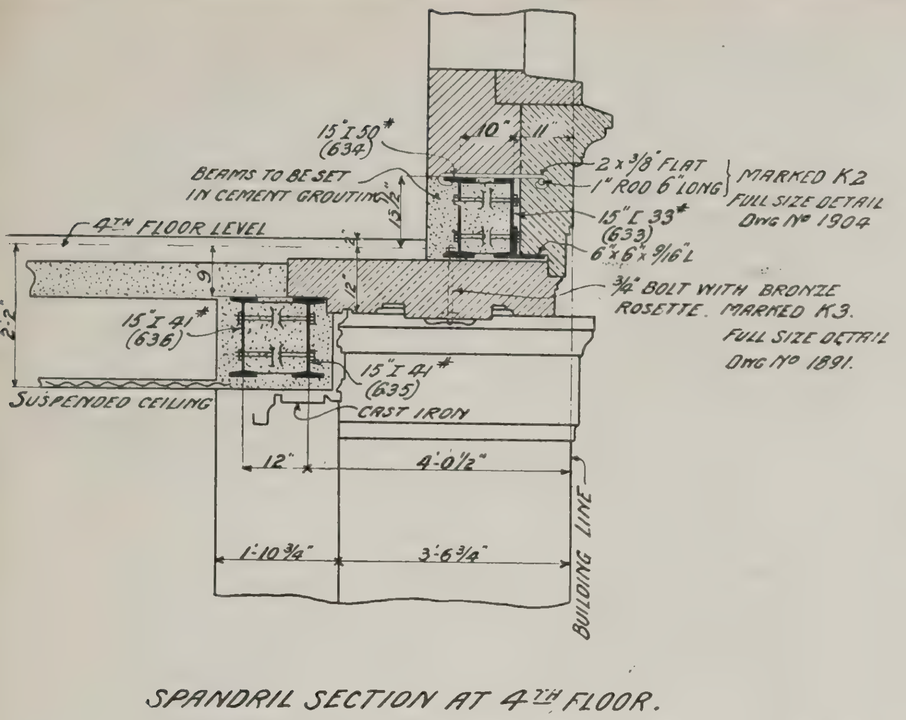


FIG. 4. THE SELFRIDGE STORE. SHOWING METHOD OF CARRYING STONEWORK ON THE STEEL FRAME.

taken from the furnace. When tested the breaking load varied from one-third to seven-tenths of beams of the same dimensions and same percentage of reinforcement which were not heated. In all the roasted beams the neutral axis was very close to the centre line of the steel, varying from 0.6 to 1.6in. in beams 8ins. deep.

The results of the tests of the roasted cubes indicated a marked reduction in the value of the compression modulus, an average value being about 125,000lbs. per square inch, against 2 to 3 million pounds per square inch for normal concrete. The average compressive strength, 1,560lbs. per square inch, was about 70 per cent. of that of normal concrete. The reduction in concrete modulus shows some reason for the fact that the neutral surface is so near the steel reinforcement. The position of the neutral surface is given by

$$k=\sqrt{p^2c^2+2pc}-pc.$$

on the assumption that the strain follows the linear law

$$c=\frac{E_s}{E_c}=\frac{30\times 10^6}{125,000}=240$$

$100\,p$ = percentage reinforcement. The average reinforcement in the roasted beams was 1.23 per cent. These values, if substituted in the above equation, give $k=1.0$. This would mean that the neutral surface was at the steel line, but the above values of E_c are necessarily only very approximate, and the calculation shows that the actual results of the beam tests check reasonably with those of the tests on the cubes. It is quite reasonable that the properties of the concrete in the cubes should differ somewhat from those of the concrete in the beams. In the latter case, heat must have been conducted to the interior of the beam by the metal rods, and the effect of the high temperature in a beam 6 × 8ins., with reinforcement, may well be different from the effect of the same conditions on 9-in. concrete cubes. A slight change of the ratio E_s / E_c would bring the value of k into agreement with the experiments.

(*a*) Diagonal end failure. (*b*) Tension failure central third, compression above. (*c*) Tension failure central third.

The accompanying table gives the principal points in connection with the tests of the regular beams, which were not roasted. A perusal of the table shows that two of the

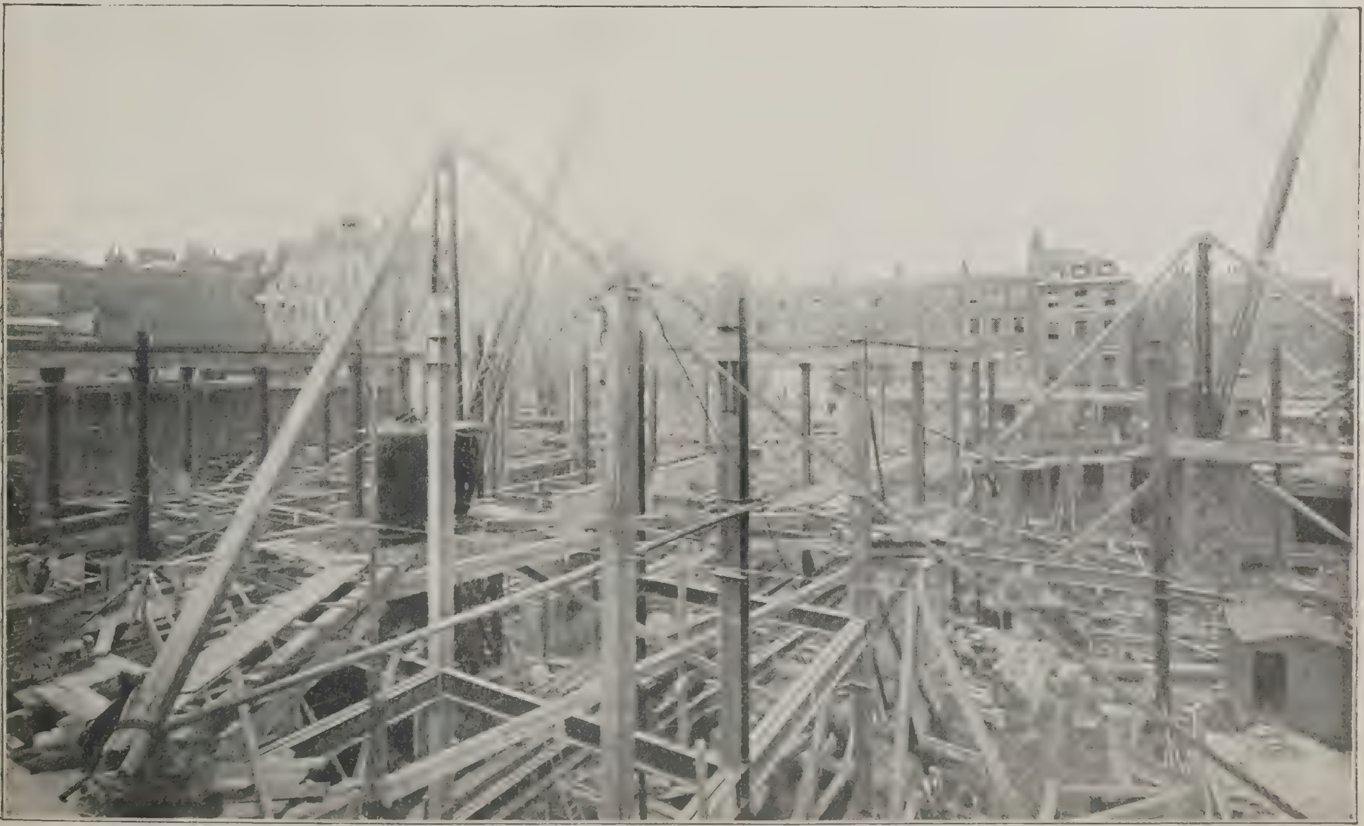

FIG. 8. THE SELFRIDGE STORE. ERECTION OF THE STEELWORK.

Johnson beams failed by diagonal cracking at the ends. In both these the centre bar of the three was bent up at 45 degs., leaving some portion of the beam near the supports without diagonal reinforcement. Beam No. 2 had a diagonal rod running to the support, and failed in the central third, at the highest load of the three 6 × 8-in. beams. Of the Kahn beams, only one failed by diagonal cracking at the ends. Both Ransome beams failed by diagonal cracking. In the case of No 14, the span, 6ft., was short compared with the depth of 9½ins., and the conditions were such as to induce excessive diagonal tension due to end shear. Ransome No. 15 was much more heavily reinforced than the other 6 × 8-in. beams, and carried a much higher load. Owing to the high yield point of the steel, and the heavy reinforcement, it was not surprising that diagonal end failure resulted. Both Ransome beams, therefore, may be regarded as being of proportions liable to result in diagonal end failure. A test made this year on a Ransome beam, 6ins. × 8ins. × 6ft., reinforced with two ½-in. rods, and having no diagonal reinforcement whatsoever, carried a maximum load of 16,000lbs. at the third points. The concrete was nearly thirteen months old. The failure of the above beam occurred by tension cracking within the load points and compression failure above. The ends, although having no diagonal reinforcement, remained perfectly sound. The percentage reinforcement was 1.15. The total weight of the beam was 312lbs.; steel, 10.81lbs. It may be said, therefore, that Johnson beams Nos. 1 and 3, and Ransome beams Nos. 14 and 15 were liable to end failure for special reasons. Of the eight Kahn beams tested, only one failed diagonally at the end.

Position of Neutral Axis.

		Depth of neutral axis from compression face in per cent. of depth.		
Beam.	Per cent. net reinforcement.	Average of experiments.	Theoretical $E=2\times 10^6$.	Theoretical $E=3\times 10^6$.

15....	1.72	49.5	50.5	44.0

An accompanying table enables a comparison to be made between the experimental position and that indicated by the analysis based on linear straining action and constant concrete modulus. The curves show that the position of the neutral axis varies in a given beam by as much as 9 per cent. of the depth. The value tabulated above is an average one. The concrete moduli given by tests on cubes were somewhat variable, and for that reason the table includes theoretical positions of the neutral axis for $E = 2 \times 10^6$, lb. per square inch and $E=3\times 10^4$ lb. per square inch. In most cases there is a rough agreement between the average experimental value, and the theoretical value corresponding to $E=2\times 10^6$ lb. per square inch. The results, however, indicate appreciable differences in the position of the neutral axis in the case of beams having the same net reinforcement, and support the view that since the actual position of the neutral axis is liable to such variations, any elaborate theoretical calculation of its position is out of place.

Messrs. Doulton and Co., Ltd., inform us that they have received the order for supplying the whole of the sanitary appliances for the new offices at the extension, Waterloo Station, London and South Western Railway. They announce also that the sanitary accommodation at the Imperial International Exhibition, Shepherd's Bush, which is necessitated by the requirements of the London County Council, has been placed in their hands by Mr. Imre Kiralfy.

HOW CEMENT IS MADE.

A party, numbering more than one hundred, composed of evening class students, teaching staff, and the principal, from the L.C.C. School of Building, Brixton, paid a visit, on a recent Saturday, to the works of the Associated Portland Cement Manufacturers (1900), Ltd., at Northfleet, Kent.

The party was conveyed in specially reserved electric cars from the railway station to the works, where the visitors were welcomed by Mr. C. J. Kean, in the unavoidable absence of the managing director, Mr. H. K. G. Bamber. In addition to Mr. Kean, there were several other members of the directorate, together with the secretary of the company, assembled to meet the visitors.

Under the guidance of Mr. Kean, the party were taken in the company's railway to the new jetty, which has recently been built of reinforced concrete by and to the designs of the company's own engineering staff. This jetty became necessary in order to provide greater facilities for shipping cement in consequence of the recently augmented output of these works, which now have a capacity for producing 1,000 tons of finished Portland cement per day.

The party continued by rail to the washmills, where it was divided into small groups, each under the care of a responsible officer of the company. The visitors here saw in operation the most modern method for the intimate admixture and reduction of the raw materials of chalk and clay with the addition of water.

The storage and mixing tanks were next visited, one of the largest holding 10,000 tons of slurry, as the mixture is called, sufficient for about 3,000 tons of cement. The material is here kept in continual motion by means of mechanical stirrers, thus preventing settlement and ensuring uniformity of composition.

The visitors were perhaps most interested in the modern rotary kilns, of which they saw sixteen in a battery, each kiln being a steel cylinder 120ft. or more in length and 8ft. to 10ft. in diameter. The slurry is pumped from the mixers to these kilns, into the upper end of which it is mechanically fed in definite measurable quantities. The axis of the cylindrical kiln being slightly inclined to the horizontal, the rotary movement, assisted by means of logitudinal baffle plates inside, aids the drying and decomposition of the slurry as it passes to the zone of heat at the lower end, where the fuel (pulverised coal) is injected by means of a steam blast. Here the process of calcination is completed at a temperature of about 3,000° Fah., and the clinker falls in a red-hot condition into the coolers in a stream of small pieces varying in size from a pea to a walnut. The burner or kiln operator showed how completely he could at once regulate the amount of slurry admitted to the kiln at the top end, the rate of rotation and consequently the speed at which the material travels down the kiln, and the quantity of pulverised coal injected, all of which were under his absolute control. There is practically no ash in rotary clinker, as at the great heat the pulverised coal is immediately gasified, and bursts into flame, and nearly all the ash or combustible matter is carried up the kiln by the draught and deposited in special dust-collecting chambers at the base of the chimney shafts, of which there are two 240ft. high. The rotary coolers connecting the kilns with the delivery hoppers and clinker trolleys for conveying the material to the grinding mills were next inspected. One could see the red-hot clinker dropping into the upper end of the inclined coolers, the internal action of which is similar to that in the kiln itself, except that the baffles or lifting angles extend practically the whole length of the cooler, and the clinker passing out at the lower end was quite cool, ready for the final process of grinding.

The pulverising is done by means of ball mills and tube mills. A sample of cement was shown as it issued from the ball mills, ground to a coarse powder; it then passes on to the inlet end of the tube mills, which are steel cylinders 26ft. long by 5ft. diameter, revolving on a horizontal axis; and the cement can be seen issuing from the opposite end ground to any degree of fineness by the percussive and abrasive action of the flint pebbles inside during the rotation of the mill. An interesting point at this stage was the action of the Bamber hydration apparatus, whereby, with a jet of steam, the pressure and quantity of which can be altered at will, the atmosphere in the tube mill is kept moist, and thus every particle of cement is subjected to superficial hydration, to the elimination of any free lime which might exist in the clinker; and at the same time the setting time of the finished cement can be regulated almost to any required degree. It was explained that all cement which went through this process was ready for immediate shipment and consumption as soon as the necessary tests had been made confirming the character of the material as in accordance with the requirements of the purchaser.

The chalk quarries on the company's premises were also visited. Here again it was noticed how expense and machinery are reduced to a minimum by taking advantage of the natural slope of the land.

On returning to the starting point, the party were invited to take tea with the directors and officials of the company, in the large hall of the Workmen's Institute attached to the works. During the tea a recital was given on the large organ by the company's organist. There was also a demonstration of cement testing and gauging by experts from the works.

After the tea, Principal Richards, of the L.C.C. School of Building, proposed a vote of thanks to the Associated Portland Cement Manufacturers (1900), Ltd., and to the officials of the company who had so courteously conducted the party. This was seconded by Mr. G. M. Rich, B.Sc., the representative of the Education Offices of the L.C.C., and was carried enthusiastically. Mr. C. J. Kean, replying on behalf of the A.P.C.M., was received with hearty applause, and apologised for the unavoidable absence therefrom of Mr. H. K. G. Bamber, managing director of the company.

The Westminster City Council has decided that all temporary awnings, are, in future, to be at last 8ft. above the pavement. The inconvenience to the public from the low height of awnings and of shops' blinds we have frequently drawn attention to.

* * *

The duty of preserving the architectural features of Paris has hitherto been conducted by the Ministries of the Interior, of Finance and of Fine Arts, working independently and often in opposition. The Prefect of the Seine has also a say in the matter. It has been decided to do away with this divided control and appoint a new ministerial committee to secure maintenance on uniform principles. The question of classing a number of well-known streets and squares as "monuments" will be considered soon by the new committee.

* * *

The slate trade continues in a depressed condition. The quantity of slates shipped at Carnarvon Port during last March shows an increase of 212 tons over March, 1908, which was a poor month; but the figures for the three months ending March this year, show a decrease of 1,465 tons. The quantity shipped from Carnarvon Town was under 1,000 tons for the three months. Mr. Ellis Davies put a question in the House of Commons as to the Royalties charged by the Office of Woods and Forests on slate quarries on Crown lands in North Wales. It is asserted that the Crown Royalties are between 2s 10d. and 3s. 5d. per ton, the average on quarries on private property being between 2s. and 2s. 6d. Mr. Hobhouse in reply said that the Royalties were charged as a percentage on the sums realised by the sale of the slates; consequently they rise and fall with the fluctuations of the market, and when prices are low the lessees get the benefit of an automatic reduction.

A GUIDE TO REINFORCED CONCRETE DESIGN.

The usual catalogue issued by trade firms says a great deal about the special manufactures it is designed to advertise, and contains very little about any subject from the general point of view that would be useful to the architect and engineer. We occasionally find tables and memoranda included that are to be found in many other reference books, but seldom do catalogues take the form of handbooks. The most notable exception to the general run of catalogues that we have seen is the catalogue of the "Lock Woven Mesh System of Reinforced Concrete," issued by Messrs. James H. Tozer and Son, Ltd. It is really a compendium of information on reinforced concrete, without regard to any particular systems, and, therefore, more in the nature of a book on the subject written for sale by a disinterested author. Though not exactly a text book, it would be valuable and instructive to the student, but its greatest value will be to the practising architect and engineer, for it is a sort of pocket-book on reinforced concrete specialist design, and comprises a full summary of the most approved methods of calculating the dimensions of reinforced concrete members of all kinds, and contains a remarkable amount of information in a small space, all of the most practical character, evidently compiled by an expert in the subject, who has not endeavoured to mystify and complicate the subject but to elucidate and show the most rational methods of design, and to provide short cuts that are used in the designing office to save time and labour and avoid mistakes. The methods of calculation are generally based upon the R.I.B.A. Report on Reinforced Concrete, but they go much further, and information is included on many parts of design not touched upon in that report. For instance, there are provided the following:—Standards for adequate superimposed floor loads; bending moments and shearing forces under beams, with different kinds of loading, and built-in or continuous over-supports; slabs supported on all sides, cantilevers and "mushroom" floors; double reinforcements; shearing stresses; column foundations; sewers, mains, culverts, circular reservoirs, and silos; arches; and temperature stresses. Much of the information on design is quite new, or conveyed in an original manner, and it is well illustrated by clear diagrams. The information on the design of arches—a complicated subject—is the shortest and most practical we have yet seen, and when the method is fully grasped and followed will save a great amount of time to the designer, for

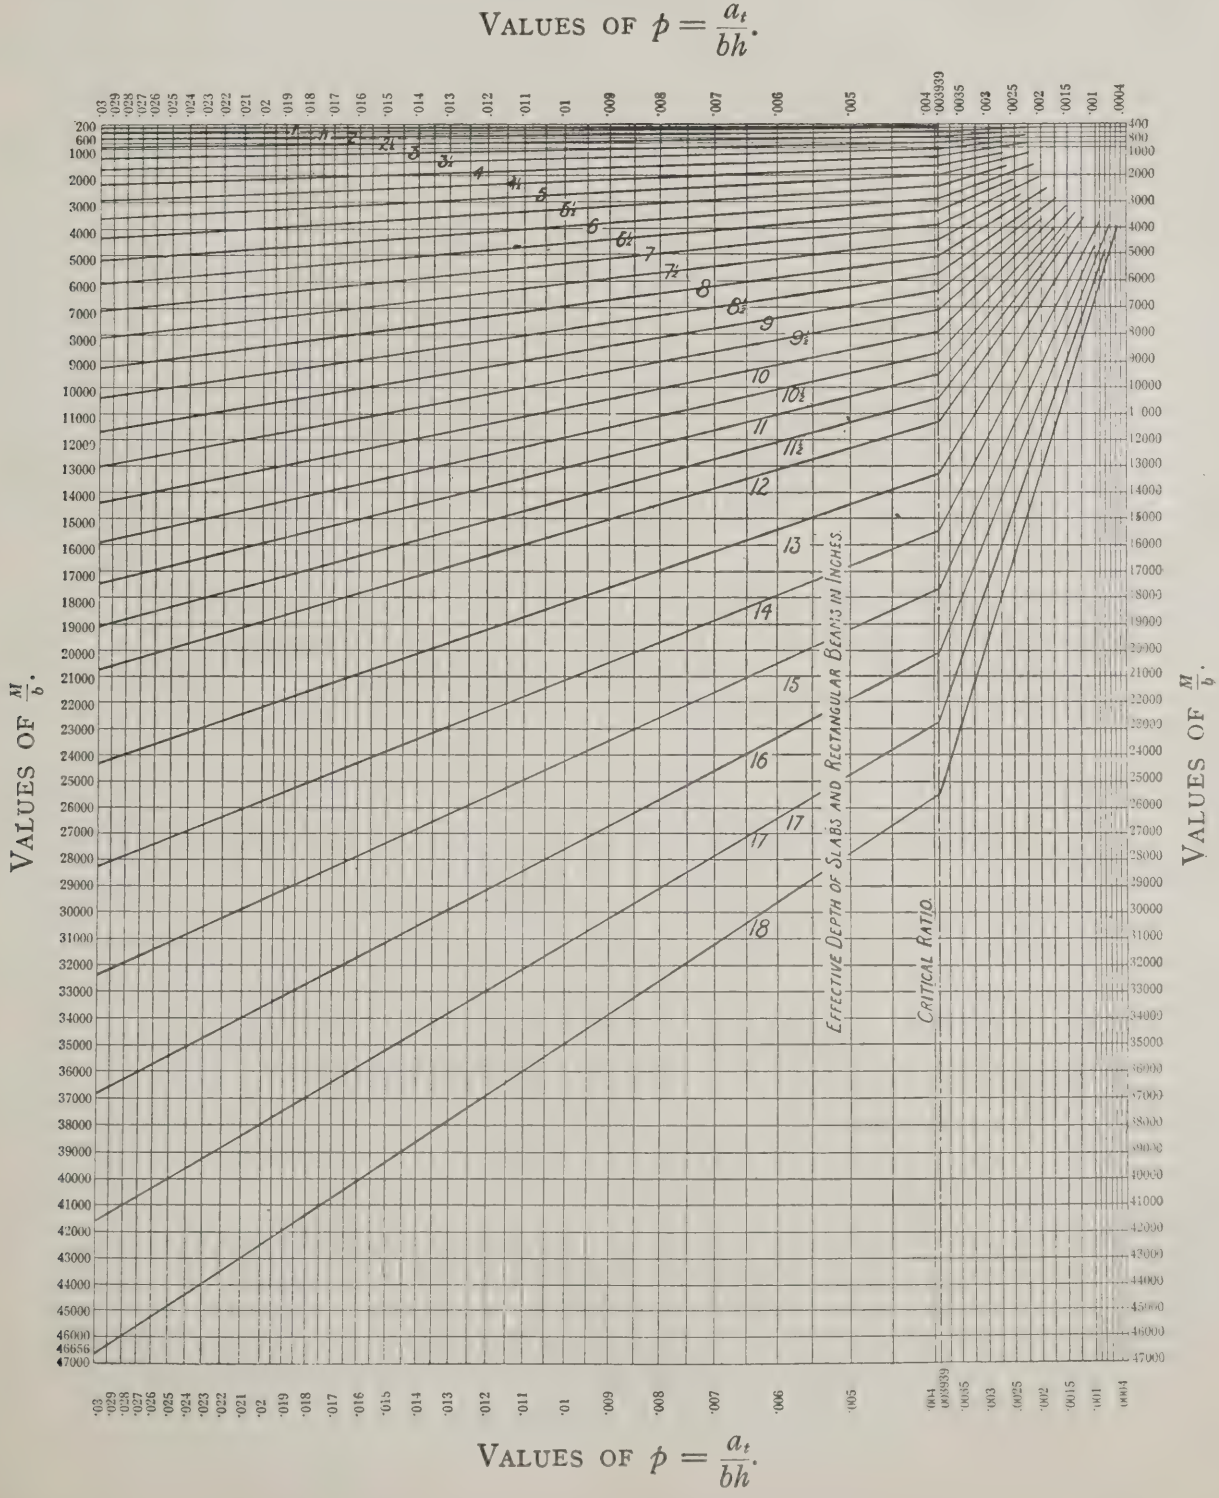

Diagram for calculating effective depth of Slabs and Rectangular Beams.

Steel = 22,000 pounds, Concrete = 600 pounds, only the necessary steps are recorded—the method is a rational one, and gives reliable results, whereas the design of reinforced concrete arches is too often empirical. We reproduce one of the diagrams included in the book for the saving of time in calculations; it is for high elastic limit steel and a strong broken stone or ballast concrete conforming to the R.I.B.A. standard, and although of general application is really designed to apply to Tozer's Lock Woven Mesh, which is made of drawn steel wire. This diagram is suitable for use in designing floor slabs, or rectangular beams, and may be used quite well for T-beams also. It is only necessary in using it to calculate the bending moment for dead and live loads (assuming a depth to start to obtain the former) in lbs., and divide same by the breadth (12ins., say, in the case of a slab). Then read along the line corresponding to this value of $\frac{M}{b}$ until any suitable depth is arrived at, remembering that the nearer this is to the critical ratio the more economical it will be; we then read vertically up or down to find the ratio p; we then find the sectional area of the piece by multiplying the thickness by the breadth, and finally multiply by the value of p, which gives us the sectional area of steel required. The depth must be increased by any protection required for the steel, *i.e.*, against corrosion and for fire resistance, say, ¾in. The symbols used on this diagram are as follows:—

M = bending moment in inch-lbs.
b = breadth or width of beam.
h = effective height or depth.
a = area of steel in tension.
p = proportion of area of steel compared to effective area.

Similar diagrams for ordinary mild steel and for both kinds of steel and coke-breeze or clinker concrete are provided, as well as a novel diagram for immediately finding the best section of Lock Woven Mesh for the purpose. The catalogue also opens with a most interesting and authoritative short history of the invention and progress of reinforced concrete, in which the system is traced from Roman times to be rejuvenated again in 1830. At the end of the catalogue there are illustrations of various structures and ways and means of employing Lock Woven Mesh for various purposes, which are both useful and instructive. The descriptions here included are quite to the point, and not overloaded with flowery epithets. The standard meshes are given, with size of longitudinal and crosswires and spacing and weights of the sheet. Two methods of securing the wires at intersections are used, as shown in Figs. 1 and 2. There are also illustrations of buildings, in which Tozer's Lock Woven Mesh has been employed, and some diagrams for ascertaining the cost of stone, gravel, and cement in mixtures of concrete of different proportions customary in practice. All who are interested in the subject of reinforced concrete should unquestionably study this catalogue carefully, and no doubt many will use it regularly in the work of design.

STRESSES IN ROOF TRUSSES.

By Max Am. Ende.

Continued from page 273, No. 713.

Introducing now into the system AN, containing n bars, the redundant bar AD and let its extensibility be $m' = \frac{l'}{a' E'}$, its stress, as yet unknown, S', so that its extension be $\Delta l' = S'm'$, then, regarding S' as an additional force, we can determine in the usual way the n stresses σ' due to the unit of S' (some of which will be = 0), and we have $r+1$ forces and an additional d, which, however, is in the opposite direction to that of the force.

$$d' = -\Delta l' = -S'm'.$$

Equation (3b) will then be as follows:

$$\Sigma^n_0 \sigma' S' (\sigma_1 F_1 + \sigma_2 F_2 + \ldots + \sigma_r F_r + \sigma' S')\, m_x = -(S')^2 m'. \qquad (7)$$

Dividing by S' and putting the stress in the bar x from all forces F. viz.:

$$\sigma_1 F_1 + \sigma_2 F_2 + \ldots + \sigma_r F_r = R_x \qquad (8)$$

we have

$$S'm' + \Sigma^n_0 (\sigma')^2 S' m_x + \Sigma^n_0 \sigma' R_x m_x = 0 \ (9).$$

Introducing into the system another redundant bar KL of the extensibility m'' and with the unknown stress S'' we should have the two additional members $\sigma'S'$ and $\sigma''S''$ in the parenthesis of (7) and there would be two equations (9).

In the same way we can extend equation (9) to any number of redundant bars. For three redundant bars the three equations will be as follows:

$$\left.\begin{aligned} & S'm' + \Sigma^n_0 (\sigma')^2 S' m_x \\ & \quad + \Sigma^n_0 \sigma' \sigma'' S'' m_x + \Sigma^n_c \sigma' \sigma''' S''' m_x \\ & \quad + \Sigma^n_0 \sigma' R_x m_x = 0 \\ & S''m'' + \Sigma^n_0 \sigma'' \sigma' S' m_x \\ & \quad + \Sigma^n_0 (\sigma'')^2 S'' m_x + \Sigma^n_0 \sigma'' \sigma''' S''' m_x \\ & \quad + \Sigma^n_0 \sigma'' R_x m_x = 0 \\ & S'''m''' + \Sigma^n_0 \sigma''' \sigma' S' m_x \\ & \quad + \Sigma^n_0 \sigma''' \sigma'' S'' m_x + \Sigma^n_0 (\sigma''')^2 S''' m_x \\ & \quad + \Sigma^n_0 \sigma''' R_x m_x = 0 \end{aligned}\right\} (10)$$

Putting here $\sigma''' = 0$ we get the two equations for two redundant bars.

[Note 0=nil.]

Example 1.

Fig. 4 is a system of the same type as Fig. 1, but having only 15 instead of 37 necessary bars it is better suited here. AB is the redundant bar. Any one of the bars 1 to 9 might be regarded as redundant instead of AB, as the system would then also be stable, but AB is preferable on account of its symmetrical position. Equation (9) has to be used. The two sums consist each of 15 members, which are stated in the following Table I. Assuming the material to be throughout the same, E, in $m = \frac{l}{aE}$, will be constant. Changes of length, if calculated, will be found in feet as l is stated in feet.

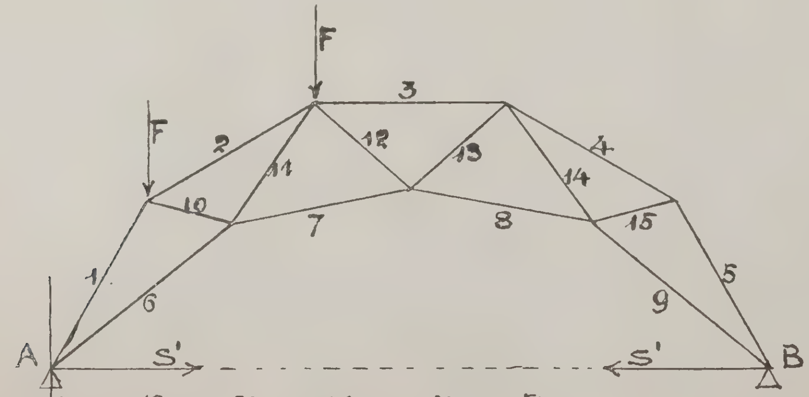

FIG. 4.

Table 1.

Bar No.	l (feet)	a (inch²)	m	Rx	σ'	$(\sigma')^2 m_x$	$\sigma' R_x m_x$
1	20	8	2·5	−3·15	+1·63	+5·64	−12·83
2	20	8	2·5	−2·87	+2·16	+11·65	15·49
3	20	8	2·5	−1·94	+1·30	+9·02	−9·21
4	20	8	2·5	−1·38	+2·16	+11·65	−7·58
5	20	8	2·5	−1·06	+1·63	+5·64	−4·32
6	23·3	4	5·8	+2·08	2·33	+31·50	−28·11
7	19·0	4	4·8	+2·14	−2·25	+24·29	−23·11
8	19·0	4	4·8	+1·23	−2·25	+24·29	−13·28
9	23·3	4	5·8	+0·69	−2·33	+31·50	−8·89
10	9·0	3	3·0	+0·95	−1·10	+3·63	−3·13
11	14·2	3	4·7	+0·62	−0·73	+2·50	−2·13
12	13·5	3	4·5	−0·16	−0·67	+2·02	+0·48
13	13·5	3	4·5	+1·06	−0·67	+2·02	−3·19
14	14·2	3	4·7	−0·05	−0·73	+2·50	+0·17
15	9·0	3	3·0	+0·70	−1·10	+3·63	−2·31
AB	74·6	6	12·4	—	—	—	—
			$\times\frac{1}{E}$	×F		$\times\frac{1}{E}$	$\times\frac{F}{E}$
					$\Sigma^n_0 =$	$+171{\cdot}48\frac{1}{E}$	$-132{\cdot}92\frac{F}{E}$

Then equation (9) will be:

$$\frac{12{\cdot}4S'}{E} + \frac{171{\cdot}48S'}{E} - \frac{132{\cdot}02F}{E} = 0$$

$$183{\cdot}88S' = 132{\cdot}92F$$

$$S' = 0{\cdot}723F.$$

The stress in any bar X will then be $R_x + S'_x \sigma'_x$, for example:

$$S_9 = +0{\cdot}69F - 2{\cdot}33 . 0{\cdot}723F = -0{\cdot}99F.$$

This is for the load assumed in Fig. 4. If the other two junction points are equally loaded (total load) each bar will receive an additional stress R_x equal to that of the bar opposite to it so that $\Sigma\, \sigma^1 Rm$ is doubled.

$$183{\cdot}88\ S' = 265{\cdot}84;\ S' = 1{\cdot}446\ F.$$

$$S_9 = (2{\cdot}08 + 0{\cdot}69)\ F - 2{\cdot}23 . 1{\cdot}446F;$$

$$S_9 = -0{\cdot}45\ F.$$

The present example may be used to illustrate the artificial adjustment of stresses. If for any practical reason it is required that under any loading with F on a point the bar S_9 should never be in compression, then its greatest value $S_9 = -0{\cdot}99\ F$ should become nil, and we have the condition: $S_9 = 0 = +0{\cdot}69\ F - 2{\cdot}33\ S'$; $S' = +0{\cdot}3\ F$. Therefore, as the structure is erected without initial strain, S' would be $(0{\cdot}723 - 0{\cdot}3)\ F = 0.423F$ too great; *i.e.*, the bar AB should be $\Delta l' = 0{\cdot}423Fm'$ longer. With $m' = \frac{12{\cdot}4}{E}$ (see Table I.) and assuming $F = 24$ tons and $E = 12{,}800$ tons we have: $\Delta l' = \frac{0{\cdot}423 . 12{\cdot}4\ 24}{12800} = \frac{126}{12800}$ ft. = about ⅛ inch. In order to fit this bar, being ⅛ inch too long, into the structure we should loosen the supporting wedges and perhaps load the structure artificially until there is room to put it in.

(*To be concluded.*)

A well-illustrated catalogue of sanitary fittings has been issued by Messrs. John Jones (Chelsea), Ltd., Carlyle Works, Church Street, Chelsea, S.W., showing various descriptions of baths, lavatory ranges, bracket and pedestal lavatories, spray lavatories, various types of closets, etc. Among several special features is the "Denman" pedal spray lavatory, as supplied to the Metropolitan Asylums Board for isolated cubicles, and awarded a bronze medal by the Royal Sanitary Institute in 1907.

* * *

Messrs. Mark H. Judge and Sons (Mr. Mark H. Judge and Mr. Max Judge), by reason of the death of their late partner, Mr. Leonard Judge, have now taken into partnership Mr. Guy Widfrid Hayler, and as from May 1st the firm will be conducted under the title of Mark H. Judge, Son, and Hayler, architects, sanitary surveyors, and engineers. Mr. Hayler is a nephew of Mr. Mark H. Judge; is an architect and surveyor, a Member of the Royal Sanitary Institute, and a Member of the Institution of Municipal Engineers. For the last eight years he has been assistant to the borough engineer of the Corporation of Gateshead.

Federation News.

SHEFFIELD ASSOCIATION.

Secretary: Thos. Smith.

At the April monthly meeting of Sheffield Master Builders' Association Mr W. W Mears presided.

Previous to the meeting the committee met a deputation from the U.T.C. of Carpenters and Joiners, in reference to an allegation by the latter that on a large contract for the Sheffield Corporation there had been a breach of the fair wages clause.

After some discussion it was decided that the secretary of the M.B.A. should write to the contractors (who are not members of this association) for their version of the matter, and assist as far as possible in adjusting it to the satisfaction of all concerned.—Since the meeting, the contractors have met representatives of the operatives, but the result of their negotiations has not yet transpired.

The treasurer's statement showed the finances of the association to be in a satisfactory state, and amongst the accounts passed for payment was a first instalment of £30 on account of levy payable to the Yorkshire Federation for the current year.

The accounts of the annual dinner were presented by the secretary, and showed a loss of over £30, which, as is customary, had been paid by the president (Mr. W. W. Mears), to whom a most hearty vote of thanks was accorded. Some comment was made about the largeness of the sum, and at a later stage of the meeting it was suggested that at least a portion of the expense ought to be borne by the association's funds, but the president intimated that he was pleased to continue the precedent of his predecessors in the office, and the fact that the dinner was a great success was the greatest complimentary vote of thanks they could give him.

Mr. Chas. Boot called the attention of the association to an alteration in the City Council's form of contract for small alteration and repair jobs. It had previously been the practice of the corporation to issue a short form of contract for these jobs, but now the city architect's department were requiring the corporation's ordinary form of contract, such as was required for jobs of considerable magnitude. The association saw no reason for the alteration; and, moreover, the ordinary form of contract was obviously inapplicable, and never intended for such jobs. The ordinary form contained a clause whereby ten per cent. of a contract was retained for 6 months, and a balance of 5 per cent. of this for 12 months, whereas these small jobs had previously been settled up at the end of 3 months. The ordinary contract also required work to be kept in repair for 12 months, and it was most unreasonable that such a clause should apply in the case of, say, a pitch-pine partition put in hurriedly at the request of the education department at holiday time, as no amount of precaution at such short notice could prevent a certain amount of shrinkage, for which the contractor could not reasonably be held to be responsible. A further provision was that the alteration should be insured by the contractor, whereas the association thought this should be included in the insurance of the building, as in case of two insurances (one for a very small amount, being the amount of the contract for alteration) existing there might be costly litigation as to responsibility for an outbreak of fire and differences as to apportionment of liability. A further point was that it would be most inconvenient for balances to remain on small jobs for a period of 12 months. After a lengthy discussion the secretary was instructed to write to the city architect suggesting that a deputation from the association should meet him. Since the meeting a deputation has been favourably received by the city architect and town clerk, and it has been agreed that all jobs of not more than £100 shall be settled up in three months. Some further concessions are still in negotiation.

The president said that he and Mr. Sivil had attended a meeting of the Chamber of Commerce, and felt sure that the inclusion of members of the association on the committees inaugurated for the discussion of builders' questions would be productive of good to the association and the building trade of Sheffield. Mr. Sivil supplemented the president's remarks with a *resumé* of the business transacted by the committee. It was the regulations the City Council had inaugurated which had in the main occupied their attention, and it was a moot point as to whether the council had power to enforce regulations which had not received government sanction. These regulations in regard to projections affected them very seriously as builders, not only in cases where they built up to the street line, but where there was a set-back. In regard to bay windows, these regulations prescribed that a projection must not exceed 4ins. per foot set-back, so that a set-back of 8ft. gave a projection of only 2ft. 8ins. That seemed exceedingly small as a maximum, and the committee suggested at least 5ins. or 6ins. With regard to area lighting, nothing was allowed in the street line beyond an ordinary cellar grate 12ins. by 14ins. This was really most ridiculous, and would seem to presume that the authorities concerned had nothing more in mind than the lighting of a coal cellar. He could assure his fellow members that the committee of the Chamber of Commerce were quite in agreement with the requirements of practical builders, and would be prepared to back the suggestions of the delegates of the Master Builders' Association. They were now awaiting a communication from the City Council before proceeding further.

The secretary said that he had not received any further communication from the Builders' Merchants Association in regard to the preferential terms which had been proposed, and he was instructed to write again. (Since the meeting a conference has been held between the two associations, and the result will be reported to next meeting).

It was decided to purchase a sufficient number of copies of the Federation directory to supply each member of the association with a copy.

Attention was called to the serious illness of Mr. A. Mastin, late treasurer of the association, and a resolution was unanimously passed instructing the secretary to convey to him the sincere sympathy of the association, and express the hope that he would soon be restored to his usual health. The secretary was also instructed to send letters of condolence to Mrs. A. Bradbury and Mrs. W. J. Tune, expressing the sympathy of the association on hearing of the deaths of Mr. Bradbury and Mr. Tune, both of whom were old members of the association. A further letter of sympathy was ordered to be sent to Mr. G. E. Powell, an ex-president of the association, in reference to the serious illness of Mrs. Powell.

REDDITCH ASSOCIATION.

Secretary: F. Turner.

At the annual meeting of the Redditch Master Builders' Association, a vote of thanks was accorded to the president and other officers for their services during the past year. Mr. Henry James Surman was appointed president and Mr. Thomas Huins vice-president for the ensuing year.

One new member was admitted to the Association.

Mr. Arthur George Avery was re-appointed treasurer of the association for the ensuing year. Twenty-three applications were received for the appointment of secretary, and, after a ballot, Mr. Fred Turner, of 185, Mount Pleasant, Redditch, was appointed.

A further meeting of the association was held on April 30th, at which Mr. Surman presided, and welcomed Mr. Turner as the secretary of the association.

The secretary submitted to the meeting the minutes of a meeting of the Midland Conciliation Board, held on April 6th last, at which was considered a notice of the operative masons, that the following be added to the working rules, namely:—"That piecework be not allowed, and no worked stone, or part-worked stone to come into the district from a lower paid district." The Board declined to agree to the proposition, and this association agreed with the decision of the Board.

At the annual meeting of the Redditch Urban District Counciy, held last month, Mr. Thomas Huins was appointed chairman and Mr. Henry James Surman vice-chairman of the Council. Both these gentlemen are members of the association.

BARNSLEY ASSOCIATION.

Secretary: S. Wigham.

The April meeting of the Barnsley Federation of Building Trade Employers was held at the King's Head Hotel, Barnsley, the President (Councillor J. Haigh) occupying the chair.

Minutes of the previous monthly meeting were confirmed.

The report of the Finance Committee of the Yorkshire Federation was submitted by the secretary and approved.

The report of the last Yorkshire meeting, held in Huddersfield, was submitted by the president.

A discussion took place on the proposed agreement between contractors and sub-contractors *re* the payment of moneys from the contractor to his various sub-contractors on public contracts.

The delegates to the Yorkshire Federation were instructed to submit certain recommendations *re* agreement at the next meeting of the Yorkshire Federation.

The inter-trading rule (continued) again was the cause of an animated discussion, and after its several vicissitudes was ultimately cast into oblivion for the present in favour of the Barnsley rule. It will, however, at an early future date, emerge from its retirement in a greatly strengthened condition, and its success cannot be delayed much longer.

BARNOLDSWICK AND DISTRICT ASSOCIATION.

Secretary: J. C. Addyman.

A special meeting of the Barnoldswick and District Master Builders' and Kindred Trades Association was held at the Liberal Club, Barnoldswick, on Tuesday evening, April 20th. The president, Mr. Edward Smith, occupied the chair, and there was a good attendance of members.

The minutes of the previous meeting having been read and approved, a discussion took place as to the advisability of appointing a collector of subscriptions who would attend personally upon members to receive subscriptions where necessary, and it was eventually resolved that a collector be appointed, and a committee was formed to see likely persons to take the appointment.

Alteration of rule was discussed, and the matter dealt with.

It was resolved that the May meeting of the Yorkshire Federation, which had been arranged should take place in the district, be postponed as requested by the Yorkshire Federation secretary, and that a fresh date be decided upon at the next meeting.

It was decided to give certain builders invitation to join the association, and to forward them full particulars of advantages to be derived through joining.

The question as to the annual outing was discussed, and a small committee was appointed to obtain information on likely places suggested, they to report at next meeting.

Arrangements were made for a meeting of plumbers at Earby to settle price lists and make working rules.

The monthly meeting which took place on Tuesday evening, May 4th, was at first presided over by Mr. T. Waite, vice-president, and afterwards by Mr. E. Smith, president, who were supported by a very large attendance of members.

The minutes of the previous meeting having been read and approved, correspondence was read by the secretary and considered.

The report of the annual outing committee was given, and after some discussion it was unanimously resolved that the Dukeries be visited on Tuesday, May 25th. A small committee was appointed and empowered to make all necessary arrangements for the outing.

Discussion followed as to further invitation to be given to Yorkshire Federation to visit the district, and it was resolved that they be invited to fix their June meeting for this district. The committee appointed to see likely persons to take position as collector gave their report, and it was resolved that Mr. H. Pye, of Barnoldswick, accountant, be appointed.

SUNDERLAND AND DISTRICT ASSOCIATION.

Secretary: W. H. Hope, Solicitor.

A meeting of the Executive Council of Sunderland and District Association was held in the Board Room on Tuesday, April 27th, Mr. Robt. J. Huntley in the chair.

The minutes of the Executive Council meetings held on March 2nd, 1909, which had appeared in the "Builders' Journal," were read, and were signed as correct.

The secretary reported that a complaint had been received from the operatives that a certain firm that had come from another district were not complying with the local working rules. The matter was taken up by him, and eventually a meeting was held with the operatives, when the firm agreed to conform to the local working rules.

A notice of alteration to the winter working hours has been given to the joiners, and a counter proposal has been received.

As the joiners were to be present later to discuss the alterations, it was resolved, on the proposition of the president, seconded by Mr. James McMillan, "That this association adhere to the proposals put forward by the employers, and, failing any agreement being arrived at, that the question be placed before the Conciliation Board, on the understanding that the other trades can be induced to join in the reference, so that the hours may be kept uniform for the different trades."

The estimated income and expenditure for the current year were carefully considered, and, on the proposition of Mr. F. W. Ranken, seconded by Mr. R. Swan, it was resolved "That the subscription for the current year be the same as last year, viz., at the rate of 3s. for each £100 paid in wages, and that the minimum subscription for all members be 21s."

The question of serving formal notice for alteration of the winter working hours of the stonemasons was discussed, and it was resolved to serve upon them a similar notice to that served upon the joiners—the notice of alteration to refer only to fixers, wallers, and all masons attending upon them.

A draft fair wages clause was considered, along with suggested amendments received from the operatives, who had inserted the words. "trade union" before the words "rate of wages." The association recommended that those words be objected to, and the following be the clause: "That the contractor, in carrying out this contract, shall pay the rate of wages as agreed upon by the associations of the employers and societies of the workmen in the district where any work for this contract is being carried out." The operatives also suggested "That in the event of any breach of the contract the building owner shall reserve the right to determine the contract." The employers decided to recommend a penalty of £5 for each offence.

Votes of condolence were passed with the respective families of the late Mr. J. B. Scott (a past president) and Mr. T. P. Shaftoe, and with Councillor R. Hudson, who recently lost his wife.

Minutes of a meeting held between the association and the Joiners' Society, in the Board Room, on Tuesday, April 27th, Mr. Robt. J. Huntley in the chair:—

The chairman intimated that the meeting had been called to consider the question of the alteration of the winter working hours, formal notice of which had been served upon the joiners as follows:—(b) From November 8th until November 20th (both inclusive) all men shall commence work at 7 a.m. and cease at 4.30 p.m. (instead of 5 p.m.), with half-an-hour for breakfast and one hour for dinner, except on Saturdays, when work shall cease at 12 noon, with the usual half-hour for breakfast, making a total of 44½ hours per week (instead of 47). (c) From November 21st until January 31st (both inclusive), all men shall commence work at 8 a.m., and cease work at 4 p.m, with no time allowed for breakfast and one hour for dinner, except on Saturdays, when work shall cease at 12 noon, making a total of 39 hours per week. (d) From February 1st until February 20th (both inclusive), all men shall commence work at 8 a.m. and cease work at 4.30 p.m., with no breakfast time, and one hour for dinner, except on Saturdays, when work shall cease at 12 noon, making a total of 41½ hours per week. The chairman gave the reasons why the changes were sought.

The operatives replied that they could not entertain the employers' proposals, as they were too drastic, reducing the hours in midwinter period to 39 and a wage of 30s. 1d.; and they were of opinion that any alterations were unnecessary, and that the working rules as they now stand are all that could be desired. They had given counter-notice as follows:—(c) That November 21st be deleted, and December 5th inserted. (d) That February 20th should read February 6th. The intention is to work a fortnight longer at the beginning of the winter period, and shorten the winter period by a fortnight.

Considerable discussion ensued upon the matter, and ultimately the operatives withdrew from the room, so that both parties could confer privately together. On their return, on the proposition of the chairman, seconded by an operative, it was unanimously resolved, "That this meeting be adjourned, and that the bricklayers be invited to attend a joint meeting of the association and the bricklayers' and joiners' societies on May 18th."

The question of a draft fair wages clause was considered, and several alterations were suggested, particularly with respect to the wages, penalty, and strike clauses. It was agreed that certain amendments be adopted, and, when drafted by the employers' secretary, be submitted to the operatives for their approval.

Coming Events.

Thursday, May 27.

"Are You a TRAINED Man?
THAT is the QUESTION!"

—the question which every employer asks when he interviews an applicant for any post above the routine grade. On the answer you can give to it turns the possibility of your securing a better paid position than the one you now occupy.

You *want* to enjoy a better position; to secure progressive promotion; to ensure a future of success and happiness instead of an eternal round of drudgery.

Determine, then, without delay, to get the necessary training through the International Correspondence Schools.

The I.C.S. system of training men *for* their work while *at* their work provides the precise means you need to qualify for a good position. You study at home, by correspondence, just as and when convenient. You make the fullest use of your leisure —wasting no time travelling to and from classes. You are kept on sound, practical salary-raising lines of study all the time.

Thousands of men and women have proved the £ s. d. value of the I.C.S. courses during the 17 years our institution has been established. Here is typical testimony:—

"Bermondsey, London.

"I owe so much of my success in business to the thorough teaching and study of the Instruction Papers in my Course, that I cannot find words to describe my praise of the Schools. Since I completed the Drawing Course I have been able, for over six years now, to follow the most important part of my trade as mechanical engineer, as designer and draughtsman for large general and manufacturing engineers. Since becoming a student *my salary has been vastly increased*—the information obtained from the Mechanical Electrical Course being the cause.

"(Signed) G. W. Torr."

We will give you not only just such efficient training in your chosen line, but we will stand behind you with our

"STUDENT'S AID DEPARTMENT."

This department is in close touch with employers in every district, and devotes its entire attention to assisting I.C.S. students in the matter of employment by introductions, recommendations, &c. Let us send you full particulars of this valuable service. Mark the coupon or write us about any other career—TO-DAY

L. & C. HARDTMUTH'S
KOH-I-NOOR
PENCIL

is the most economical Pencil made. It lasts six times as long as an ordinary pencil. But it is the velvety smoothness of the lead that is the great charm of the Koh-I-Noor. There is no other pencil that nearly approaches its quality. The lead of the Koh-I-Noor is specially prepared by a perfected process which gives it a firmness yet delicacy of touch that cannot be imitated. The Koh-I-Noor is made in seventeen degrees to suit all pencil purposes.

Koh-I-Noor Pencils are **4d.** each, and **3s. 6d.** per dozen, everywhere. Of Stationers, Artists' Colourmen, Photographic Dealers, &c. Booklet free from

L. & C. HARDTMUTH,
12, Golden Lane, London, E.C.

KOH-I-NOOR
TRACING CLOTH

Is a stout and substantial cloth possessing every advantage for the drawing room. Its surface is smooth and clear, free from blotches. Does not tear or break. Is transparent enough for the finest work. Erasures may be freely made without causing the ink to run. Is excellent for giving impressions by process.

THE GREATEST SATISFACTION IN USING THIS SPECIALITY IS FOUND IN ALL DRAWING OFFICES.

Of Stationers, Artists' Colourmen, Photographic Dealers, &c.

L. & C. HARDTMUTH, 12, Golden Lane, London, E.C.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 28. ROMFORD, ESSEX.—Erection of a new county high school for 250 girls, at Heath Park, Romford, Essex, for the governors. Plans and specification of Hickton and Farmer, FF.R.I.B.A., Bridge Street, Walsall, and Council Chambers "A," Martineau Street, Birmingham, and of D. T. Reinforcement of the R.I.B.A. The special general meeting of the R.I.B.A. held on Monday, May 24th, "to consider the proposals of the Council for the revision of the by-laws under the new Supplemental Charter," was one of the liveliest on record. Most of the Council's proposals were carried either without alteration or with only slight verbal amendment; but in one instance an important modification was carried. By-law 27, relating to the composition of the Council, provided that it should consist of forty members, including only four Associates. It was, however, proposed, seconded, and carried, that the Council should be increased by the addition of two more Associates. And so the Council can no longer be called "the Immortal Forty." Nevertheless, it will not lose by augmentation. That the former representation of Associates on the Council was disproportionately small was thus practically conceded, it must be remembered, by the Fellows who alone have the power of voting on questions relating to the by-laws. It is therefore the more valuable as a slight but very welcome indication that, after all, the R.I.B.A. is not a hopelessly unprogressive body. The reactionaries, however, fought hard; and the debate on this and on other matters of moment was conducted with rare animation and with considerable dialectic skill. Its brightest moments, however, will probably suffer mere eclipse at the resumption on June 7th, when such explosive materials as the ethics of electioneering, and a question of "privilege" are to be handled.

The Trade Boards Bill. In the National Federation reports appearing in the present issue, it is noted that, as a result of an interview with Mr. Winston Churchill, to whom a deputation of the Employers' Parliamentary Council represented the facilities contained in the Trade Boards Bill for injuriously extending its operation to other trades than those scheduled, a promise was given that properly organised trades having machinery for settling such matters should be adequately safeguarded by modifications in Committee. This specific instance, however, does not quite fully meet the general objection by the Yorkshire Federation to the mischievous and growing practice of extending the scope of such Bills by the insertion of a clause giving this arbitrary power to a Secretary of State. In the case of the Trade Boards Bill, the first clause, as it originally stood, gave power to the Board of Trade to apply the Act to unscheduled trades as to which the Board was satisfied that the rate of wages was exceptionally low. Mr. Churchill, in promptly acceding to the reasonable request of the employers' deputation, by securing that extensions to unscheduled trades may not take place except by means of a Provisional Order and Act of Parliament, has demonstrated yet again the immense value of influential organisations in protecting the interests they represent.

The Victoria Monument and Some Others. The uncovering to the public gaze of the lower portion of the national memorial to Queen Victoria in the Mall should not give rise to the impression that the monument is nearing completion. It is not likely to be ready before the summer of 1911, even supposing that no unforeseen delay occurs. It is a stupendous undertaking; and all the monuments in this country, or elsewhere, that are at all comparable to it, have, as Mr. M. H. Spielmann has pointed out as a palliative to impatience, afforded so many concrete illustrations of the adage that art is long. The Petersburg monument to Peter the Great was twelve years in the making, the Vienna memorial to the Empress Maria Theresa twelve years, the Albert Memorial twelve years. The memorial to King Victor Emmanuel, in Rome, is not nearly finished after twenty-five years' continuous work. It is estimated that the cost of this monument, upon which already more than a million sterling has been spent, will ultimately exceed two millions. It is well that the cost is being distributed over so long a period of years. Mr. Spielmann admires Zumbusch's Maria Theresa monument in Vienna, but holds that the great variety of sizes in the different figures is a rather serious drawback. The more modern monument to Gambetta, in Paris, by M. Aule, he regards as a capital example of the excellent silhouette type beloved of French sculptors; the Spanish sculptor Querol's monument to Alfonso XII. is, he thinks, too much of a *tour de force*; and the monument he likes best of all is that in Berlin to Frederick the Great, by Rauch, "a work fine in character, excellent in effect and in light and shade, and admirable in technical details of texture and finish." Concerning the monument to Queen Victoria, the exposed portion has evoked a chorus of praise. One admirer finds that "the rhythm of the superbly modelled figures has the swing and swish associated with the seas that carry Britain's authority over the world." This dithyramb was apparently penned on Empire Day. Mr. Thomas Brock, R.A., has finished the colossal marble statue of the Queen (it is 17ft. high), as well as the group representing "Justice" and "Motherhood;" while the statue of "Victory" is in the hands of the founders. This figure will crown the monument, and will be higher than Buckingham Palace. If the combined efforts of Sir Aston Webb and Mr. Thomas Brock yield the magnificent consummation that this partial unveiling has rendered more than ever probable, Buckingham Palace will hardly survive the comparison. It will have to give place to a more worthy building. But what a pity that the new Palace and the new monument could not be simultaneously designed in a complete scheme. But in this country everything relating to art is cruelly cramped for want of a mere modicum of the courage and enterprise that, exhibited abundantly in other directions, are the national boast.

Labour Exchanges. The Labour Exchanges Bill, of which the text has just been issued, is probably of more importance to builders than to any other class of the community, not even excepting agriculturists, whose industry keeps them away from the towns, where the exchanges will necessarily be situated. Ever since the days of Sir Thomas Gresham, the exchange has been indispensable to commerce; and now it would seem as if the tremendous pressure of the unemployment problem had forced the Government to attempt a really serious application of the principle to the conditions peculiar to the hiring of labour. The text of Mr. Churchill's Bill is vague and indeterminate. It simply seeks to assume for the Board of Trade power to establish and maintain labour exchanges, and to assist labour exchanges maintained by other authorities and persons. Apparently the Board is to have *carte blanche* to exercise this power as it thinks fit. It may appoint officers and servants for the purposes of the Act, make general regulations as to the management of the exchanges, authorise advances to be made by way of loan towards meeting the expenses of workpeople travelling to places where employment has been found for them through a labour exchange, and prosecute any person making false representations for the purpose either of obtaining employment or procuring workpeople. Reticence as to the details of working this machinery is perhaps wise. It may be inferred that the chief object is to co-ordinate scattered forces, and to bring order out of chaos by rendering more uniform, more systematic, and altogether more effectual the means of bringing together the work and the workpeople — to galvanise into vital activity and to link up into helpful co-operation the various agencies already existing, and, above all, to supply the necessary funds. Such exchanges can do little in the way of making work (although they can occasionally set a man on to a job that goes undone for want of a suitable man to do it), but they can do much in distributing it—or, rather, in distributing the men who require it, and thus relieving congestion of work and congestion of workers. The exchanges would be freely used by employers when it was found that genuine and competent workers made free use of such agencies; and self-respecting craftsmen or labourers would freely apply to the exchanges as soon as it was found that no "relief-works" taint was implied in the application. The convenience to employers is sufficiently manifest; so, alas! is the fact that upon them will largely fall the burden of paying the inevitable bill.

Dinners and Diners. The dinner of the Royal Institute last Wednesday evening brought together an assembly of people distinguished in many different walks of life. It suffered somewhat from the size of the gathering and from the consequent fact that at a distance some of the speakers were almost inaudible. Mr. Blomfield's speech was marred by this difficulty, and from our end of the hall it was only possible to catch a word now and then. Sir Charles McLaren, M.P., made due apologies for the parsimony of Parliament in the encouragement of architecture, but claimed for the members of the House of Commons an open-handed generosity in devoting sums for the benefit of architectural schemes which architects will hardly, we think, endorse. The difficulty, according to Sir Charles, lies with the Treasury, but he still expects to see Hyde Park Corner taken in hand and made something of. A fine opera house was his own suggestion; and he has hopes for a new front to Buckingham Palace. Mr. Henry Morris, the well-known surgeon, responding for Science, was able to claim a number of past practitioners in medicine among the poets, authors, and artists, and even the redoubtable Wren was a distinguished anatomist. One's general impression of the assembly was that of a restlessness, and with the very fateful Council election upon them it was not perhaps to be wondered at that the members should discuss the probable constitution and policy of the new Council. It is rumoured that the poll for the new Council is a heavy one, and in ordinary circumstances this would point to the success of the forward movement. We do not doubt that most of the members will be eager to learn the results of the poll, to be announced on June 7th.—The British Fire Preventers, to the number of about 80, celebrated the tenth anniversary of their incorporation on the 25th ult., and, as in the case of the R.I.B.A. dinner, the proceedings verged on the early hours. It occurs to us that the toast lists of most of these dinners are rather formidable, and that it might be preferable, where the speeches are to be made the vehicle of some important discussion or statement of policy, that they should be printed beforehand and circulated with the table plan. The presenters and seconders might then rise and formally draw attention to the speeches printed in the list. This would be more valuable, as in many cases distinguished men, down for speeches, are prevented from being present, and the gatherings are thus deprived of their valuable ideas and opinions. It would also obviate the difficulty already indicated of speakers being inaudible.

The National Pantheon. In the House of Commons last Wednesday, the subject of burial in Westminster Abbey and the Dean's right of veto was raised by Mr. Godfrey Baring, who questioned whether legislation could not be introduced which would place the control of sepulture in other hands than those of the Dean. We presume that the enquiry resulted from a certain disappointment that the Dean could not see his way to permit the burial of the late Mr. George Meredith within the Abbey precincts. As to the ethics of burial in the Abbey, we, of course, offer no opinion; but from the structural point of view we would like to point out that the Abbey was not originally designed as a burying place, and that frequent excavations within its walls may naturally be expected to weaken the superstructure. In the case of St. Paul's it has been many times pointed out how seriously the stability of the fabric is injured by cutting through the concrete foundation. Apart, however, from the question of endangering the edifice, the Abbey is at present so full of the bones of the illustrious dead that the time has come to consider seriously what policy should be pursued with regard to burials in the future. Designs have been prepared in past years for an addition constructed for the purposes of an English Pantheon, and we think the Government and the Abbey authorities would be well advised to consider the idea seriously.

THE R.I.B.A. DINNER.

The annual dinner of the Royal Institute of British Architects was held in the Whitehall Rooms, Hotel Metropole, on Wednesday evening last, the President, Mr. Ernest George, being in the chair. Amongst the guests present were Sir Charles McLaren, M.P., Sir Melvill Beachcroft (chairman of London County Council), Sir Ernest Waterlow, R.A., Sir L. Alma-Tadema, R.A., Sir James Linton, R.I., Sir Henry Howorth, K.C.I.E., Sir T. Vansittart Bowater, Mr. W. H. Lever, M.P., the Ven. Archdeacon Sinclair, Mr. J. S. Sargent, R.A., Mr. Thomas Brock, R.A., Mr. Frank Dicksee, R.A., Mr. Henry Morris (president Royal College of Surgeons), Mr. Philip Norman, F.S.A., Mr. W. J. Locke, Mr. A. R. Stenning (president Surveyors' Institution), Professor Gerald Moira, Mr. Bertram MacKennal, A.R.A., Mr. P. Ogden Lawrence, K.C., Mr. F. G. Rice (president London Master Builders' Association), Mr. W. F. Wallis (president Institute of Builders), and Mr. G. L. Gomme, F.S.A. (clerk to L.C.C.). Among the architects present were Mr. Fredk. Batchelor, Professor Reginald Blomfield, A.R.A., Messrs. Detmar Blow, Geo. T. Brown, G. E. Bond, John J. Burnet, A.R.S.A., James T. Cackett, T. E. Collcutt, A. W. S. Cross, E. Guy Dawber, Sir William Emerson, Messrs. J. S. Gibson, Alex. Graham, Edwin T. Hall, Henry T. Hare, E. L. Lutyens, Mervyn Macartney, W. H. May, Paul Ogden, Professor C. H. Reilly, Messrs. Percy Robinson, W. H. Seth-Smith, John W. Simpson, John Slater, Sir Henry Tanner, Sir John Taylor, Sir Brumwell Thomas, Sir Aston Webb, R.A., and Mr. Percy S. Worthington.

Mr. John W. Simpson, vice-president, proposing the toast of "The Houses of Parliament," observed that their art was dependent on good order and good government, and that architects were outside the strife of legislative effort. Politically, the architect was a curious study. The American definition "mugwump" was not inappropriate, for the architect was a conscientious opportunist. In regard to schemes for improvements, new streets and developments, he was recklessly radical, but in the preservation of ancient buildings he was intensely conservative.

Sir Charles McLaren, M.P., in reply, said he thought politics and art had not been very good friends since the days of the Florentines. At the beginning of the 19th century, when oratory was at its greatest height, art was at its lowest. Now that oratory was said to have disappeared from Parliament, he hoped art would show a compensating rise. Speaking for the House of Commons, they were always ready to vote money for fine buildings, but the Treasury was the difficulty. Sir Charles concluded with a tribute to Mr. Brock's fine memorial in the Mall.

Professor Reginald Blomfield proposed the toast of "Art, Science, and Literature." He said all architects worthy of the name were artists by intention if not by achievement. Their art exercised a fascination denied by a more prosaic calling. One should not perhaps blow one's own trumpet, but if no one else would do so he thought he might give a humble tootle himself. He instanced a letter in "The Times" recently, which stated that the standard of architecture in this country was higher than at any time since the 18th century, and he thought that statement extremely well founded; but architecture did not meet in this country with the recognition it deserved, and he thought that was not so much the fault of the public as the fault of those gentlemen through whose eyes the public sees all works of art. There were writers who used architecture to belabour societies and people with whom they disagreed, and others—and this was the unkindest cut of all—who ignored their very existence. In regard to the sister arts of sculpture and painting, wherein all found pleasure, the splendid beginning by Mr. Brock in the Memorial in the Mall he instanced as the work of not only a fine artist, but also of a very fine Englishman. Mr. Blomfield proceeded to speak of the benefits conferred by the masters of science, but the remainder of his remarks were inaudible from where our representative was sitting.

Sir Lawrence Alma-Tadema, acknowledging the toast on behalf of Art, said the art of explaining what Art was seemed to be almost impossible; but he always recollected the definition of the King of Sweden at an Academy dinner, that "Art is the flower of the tree of life." He thought that our life would be like the trees in winter if it had not Art to relieve it.

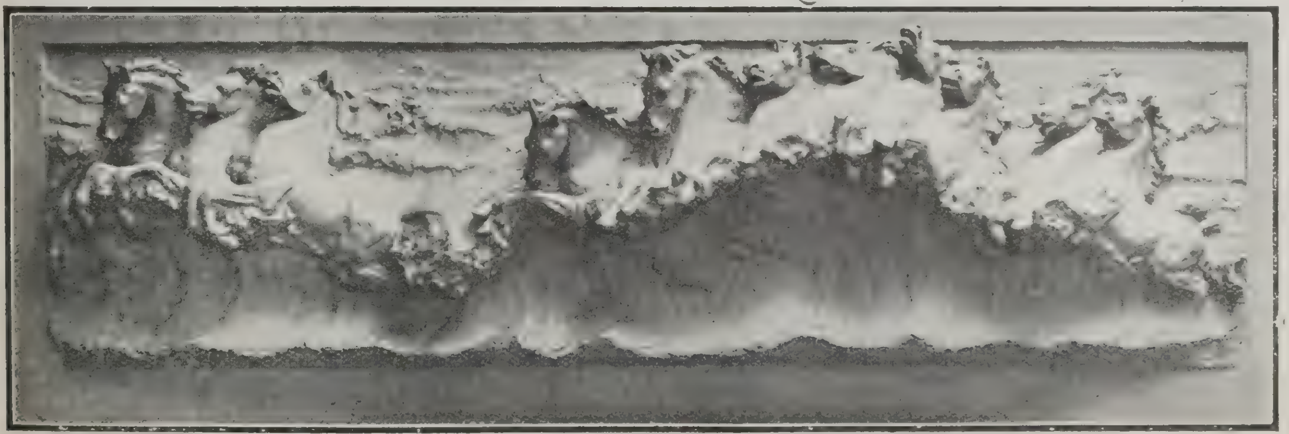
Mr. Henry Morris, President of the Royal College of Surgeons, responding on behalf of Science, said that it was such a comprehensive subject that few men were privileged to speak on more than one branch of it. With regard to surgery, with which he was more immediately connected, marvellous progress had been made in the last 25 or 30 years, and this was due largely to the advance of other branches of science as well as to literature and art, to which the scientist was largely indebted. The goal of science was simple truth; literature aimed at beauty and effect; true art blends the ideal with the actual, and the actual with the real. Science was no sycophant; no flatterer or tyrant. He thought that in the esteem of the world medicine stood foremost. Mr. Morris proceeded to recite the names of Linacre, Radcliffe, Mead, and other past-masters of medicine, who were also identified with the arts, recalling finally the name of Sir Christopher Wren, who was an expert anatomist.

Mr. W. J. Locke, who was greeted with prolonged applause on rising to respond for Literature, said he had been struck with the same difficulty of defining what literature was as that expressed by Sir Lawrence Alma-Tadema in finding a definition of art. Whether literature should be confined to dull history or to the fancies of fiction reminded him of a story of two working men leaning over a bar. Said one, "Bill, why do you mix beer and whiskey?" "Well," replied Bill, "Can't you see? If I drink beer before I drink whiskey I get full before I get drunk, and if I drink whiskey I get drunk before I get full, but if I mix them I get forrader very comfortable." He thought that with a mixture of Shelley and Gibbon, one could get on very comfortably. Mr. Locke alluded to the death of the great chieftain of letters, Mr. Meredith, whose works he always regarded as part of a great architectonic scheme, a scheme with perfectly applied details. He thought his vacant place would be conceded to Mr. Thomas Hardy, who commenced life as an architect, and won the Institute medal in the year before he (Mr. Locke) was born. He always regretted that the Institute Library had not a copy of this essay.

Sir Melvill Beachcroft proposed the toast of the "Royal Institute of British Architects and the Allied Societies." He said the London County Council, of which he had the honour to be chairman, had just completed 20 years of its life, and he thought it had done much for the progress of the metropolis in that time. The London County Council, with its street widenings and its slum demolitions, had done much to improve London architecture, and in that work they had been largely assisted by members of the Royal Institute of British Architects. They had not always been able to follow the advice and suggestions of the Institute; as, for instance, in the alignment of the north side of the Strand widening. Whenever it was practicable to do so they had been glad to follow the advice which the Royal Institute was always ready to give them.

The President's reply was not audible to the members of the Press, but a copy of his speech was handed to us and is as follows: Since their gathering last year the most important event in their history had been the granting by the King of the Supplemental Charter for which they applied. This enabled them to make rules for the better ordering of their own house, for the regulation of themselves, and, they hoped, for the benefit of the community. This revision of the Charter and by-laws was the result of a movement that stirred, if it did not divide, their camp. Architects, especially those in the provinces, found that work which should come to them, too often went to auctioneers, who ventured to include architecture in their sphere of usefulness. This was a trouble, but it must be met by keeping their own work at a high level and by a growing perception of what was good on the part of the public. To have all architects registered had been proposed—(loud applause greeted this remark)—though this would not prevent the employment of outsiders; they would also, he held, have to admit all sorts and conditions of men in practice. They preferred to insist that in future all should enter through the schools, obtaining the diploma or certificate which should distinguish the architect from the quack, and they looked for further legislation to accentuate the difference. The training would come gradually by the wise organisation of the training school, bringing all men into line, and demanding that a standard of efficiency should be attained by those who would enter their Guild. This would be the preparation for Associateship, and Fellows of the Institute would be chosen only from those who had passed through the schools with a sound knowledge of the constructive art, thus insuring the public against ignorance and incompetence. No board of examiners could guarantee that a man was an artist. To meet the exigencies of the hour, the Charter made provision for a new class, to be styled "Licentiates," under which head they hoped to receive into the Institute the large number of practising architects who had outgrown the days of schooling and examination. The subject of Examination had had serious consideration, and on their Educational Board professors of the Universities were working with their best men. Till of late the Institute had not been an educational body, having helped only by the award of the Pugin and Travelling Studentships. A distinct advance had been made in the system of training, and young men would now start with a better equipment than their seniors enjoyed. He hoped they would do better work. Students of ability were coming to the front every year and carrying off the Institute scholarships. It would be a grand thing if some of them had the opportunity of carrying their studies further in a higher school, acquiring a knowledge of what is really great in art. A special school had been suggested for these Diploma men, among whom a distinctive prize—a *Prix de Rome*—would be awarded. They felt that Englishmen should have their School of Rome and be under the influence of the noblest monuments, as well as Frenchmen, Germans, and Americans, who already had that advantage. The Council had been conferring with the existing British School of Rome, and had received a cordial invitation to co-operate in any project. The present arrangements of that school did not, however, accommodate the Institute students, nor meet the requirements that had been formulated for an architectural school; but the Institute Committee, who were considering the subject, would shortly have, he hoped, a definite proposal to bring forward. Hitherto the general public had declined to know anything about architecture as a fine art; a good building had not always been appreciated, nor a bad building found out; but there were indications of a growing knowledge in these matters, and of a higher criticism, to which architects would, he felt sure, respond. Technical schools would increase knowledge and power among skilled craftsmen, but they were not a substitute for a good system of apprenticeship. There was a danger that those who gained a smattering of the arts in such schools would expect to become painters, sculptors, or architects, and so swell the ranks of the useless unemployed. A good mechanic was a nobler object than a bad architect. In passing, he referred in terms of approval to Mr. Burns's Housing and Town-Planning Bill, and to the generous endowment by their guest, Mr. W. H. Lever, of a school of architects for the special study of town-planning. Architects ought to be willing, he considered, in the interests of their art, to sink some of their individuality for the sake of obtaining in towns continuity, harmony, symmetry, and balance. After a passing allusion to the desirability of protecting historic buildings from being "Grimthorped," and to the need for an amended and simplified London Building Act, the President urged the advisability of securing copyright for architects, mentioning that a good client recently showed him with pride a group of cottages that looked curiously familiar, though in strange surroundings. "These," said the client, "are copied from those you did for me on the other side of the park." The chairman added that he had not the heart to tell his informant, good easy man, that he had committed an act of piracy. He concluded by remarking that the Institute was in a healthy and prosperous condition, having now the largest membership on record, here being 2,300 on the roll. They had now seventeen allied societies in the United Kingdom, three in South Africa, one in Canada, and one in Australia. The Institute possessed, moreover, an increasing influence, which, he trusted, had been used for the general good.

The last toast of "The Visitors" was briefly proposed by Sir Aston Webb, the hour being very late. Mr. W. H. Lever, M.P., who replied, laid very great stress on the difficulties attending speculative building, and hoped the architect would be able to devise some way of furnishing good designs for this class of work, as the speculative builder, being deprived of artistic assistance, was covering the earth with streets of mean and dreary buildings. Mr. Lever also referred to the question of town-planning.



"WHITE HORSES": SCULPTURED RELIEF PANEL IN OXYDISED SILVER. F. W. DOYLE JONES, SCULPTOR.

This panel, now on exhibition at the Royal Academy, is designed as a decoration for an oak room at Halsey Hall, near Northallerton. The subject is suggested by Kipling's poem, "White Horses," in which the incoming waves surrounding Britain are likened to droves upon droves of rearing and plunging horses, eddying and wheeling, sweeping and racing over the plains. In the relief is represented the onrush of a turbulent wave, with plunging and rearing horses in the foam.

THE QUEEN VICTORIA MEMORIAL.

Completion of First Portion.

The lower portion of the Queen Victoria Memorial was opened very appropriately on Monday, May 24th—Empire Day—the date of the late Queen's birthday. The portion now completed embraces the marble fountains and basins, retaining walls, sculptured reliefs in bronze and marble, granite paving steps and plateau, as well as the bronze electric lamps. In all, it comprises no less than 1,000 tons of marble and 800 tons of granite. The monument proper in the memorial scheme is wholly the work of Mr. Thomas Brock, R.A., who has given the memorial his undivided attention since the scheme was approved by the King in June, 1902. The portion now disclosed to view is dignified and simple in treatment, the whole with the exception of the granite steps and the bronze panels being carried out in fine Carrara marble. The motive in the decorative panels is emblematical of the sea-power of the Empire. The great panel with its low relief figures of Tritons and Nereids symbolises the sea, and the water of the ponds flowing in a broad stream from weirs under the bronze panels of the pedestals adds to the symbolical effect. The scale of the memorial is heroic, and a welcome departure from the pettiness of the average British monumental design. The erection of the marble work of the great central pedestal is now in hand, and Mr. Brock has completed the colossal statue of Her late Majesty, which is some 18ft. high, as well as the groups of "Justice" and "Motherhood." The group for the fourth side of the pedestal is nearly completed, and the winged "Victory" which surmounts the monument is now being cast. There are also the groups of "Courage" and "Constancy" over the water inlets to be completed. It is expected that the whole of the central feature will be completed by 1910, and there will then remain only the four symbolical groups on the pedestals flanking the steps. Messrs. Walton, Gooddy and Cripps, Ltd., are the contractors for the marble work. The water for the cascades is provided by shallow wells in the gravel at the end of the lake in St. James's Park, with an additional supply from the lake itself, and the quantity required is no less than 108,000 gallons per hour. This is pumped up by engines in a pumping station specially erected in St. James's Park, and after the water has passed through the cascades, and basins, it returns to the lake again. The pumping installation has been specially devised by Mr. E. G. Rivers, M.Inst.C.E., the Chief Engineer to H.M. Office of Works. The roads, gardens, and architectural detail surrounding the monument have been carried out to the design of Sir Aston Webb, R.A.

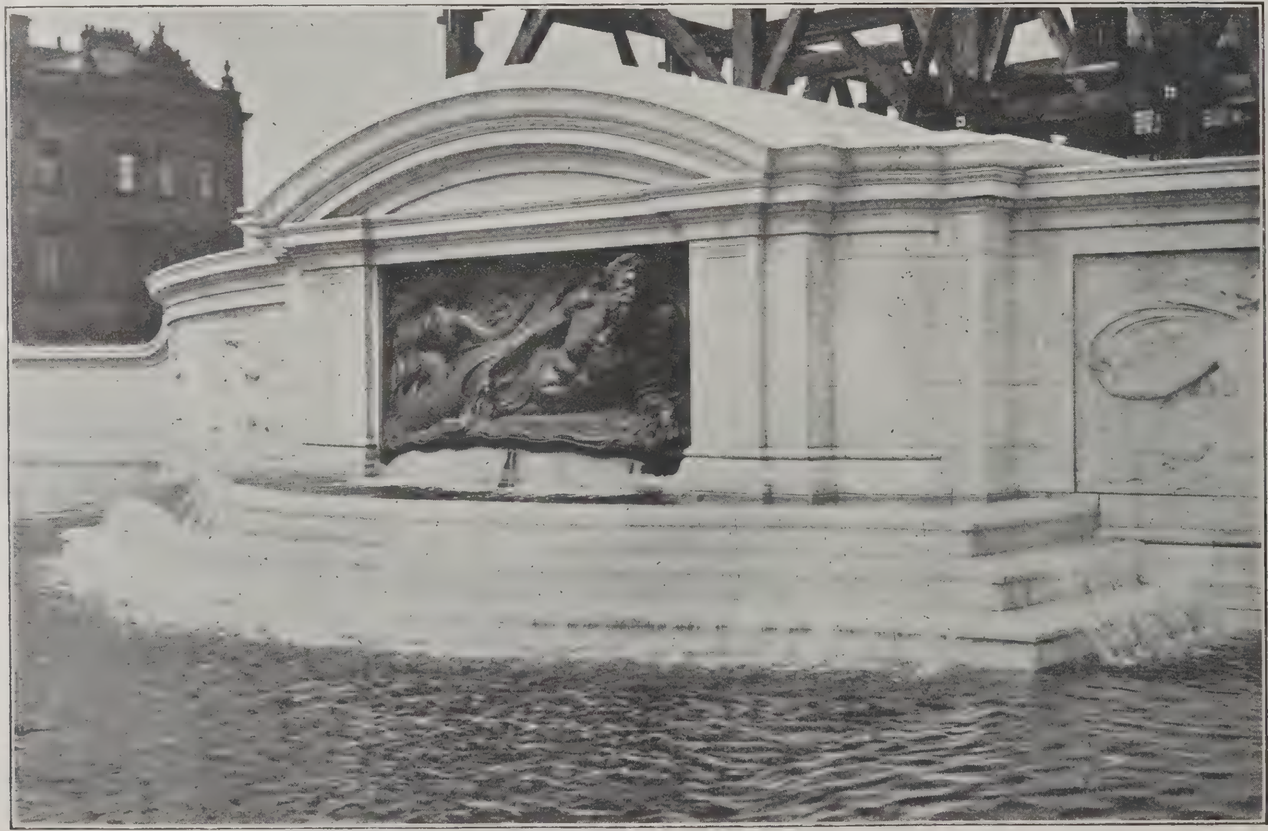
LEGISLATION AND THE BUILDING TRADE.

It is long since the building trade was made the subject of so much legislative enactment as has been lately the case. The last amendment of the Workmen's Compensation Act doubled the already heavy premiums which builders had to pay for insurance of workmen's risks; this was followed by an enquiry as to prevention of accidents, with the result that shortly regulations as to scaffolding, etc., may be expected, which must enhance the cost of construction. Then there are the present Budget proposals as to taxing development land, which, whatever their ultimate result, are likely for the present to upset existing schemes and arrangements, and interfere with building operations for a time; and now we have the proposed compulsory insurance against unemployment, part of the cost of which is intended to fall on building trade employers.

In the meantime, unfortunately, the building industry has been suffering from one of the severest and most prolonged periods of bad trade within living memory, so that, however sympathetic the employers may be to the objects of these various legislative measures, they cannot fail to view with dismay the retardation of trade revival which they seem likely to cause. We hope their fears may not be realised, and that the slight signs of revival shown in places by the unemployment returns mean that a period of prosperity is at hand which will enable employers to face their new responsibilities cheerfully. It is also clear, from the explanations given by Mr. Churchill in the House on Wednesday last, that the formation of the system of labour exchanges will involve a considerable amount of building work; and other social betterment schemes, such as the Town-Planning Act and the Small Holdings Bill, may be expected in the future likewise to promote activity in the building trade.

* * *

Opinions on the Budget proposals in regard to land are filtering through slowly; and on the whole considerable apprehension exists among builders as to the ultimate effect of the new taxes in regard to their business. Sir G. Hayter Chubb gives to "The Times" the experience of a builder who had two or three estimates out awaiting decision; but since the introduction of the Budget he has been informed that none of the buildings will be proceeded with. Consequently, he is paying off 60 of his men. Sir G. H. Chubb also instances the effect of the proposed tax on increased values by the case of a company with which he is connected, which had been negotiating a long building lease at an increased rent. The company is liable for all land taxes, and having been advised that the extra cost, under the new proposals, may be £2,000, have held up their £10,000 building scheme. Lord Redesdale also instances the case of one of the principal builders in the Midlands who lost the chance of three contracts for country mansions through the Budget, the invitation to tender in each case being withdrawn. A builder and estate developer in Surrey, employing 500 men, has also given notice to a large number of his employees, though prior to the introduction of these taxation proposals he contemplated taking on another 200 workmen.



THE QUEEN VICTORIA MEMORIAL, LONDON. THOMAS BROCK, R.A., SCULPTOR.

The illustrations on this and the next page show the lower or completed portion of the Memorial, disclosed to view on Empire Day. The monument is situated at the end of the Mall, opposite Buckingham Palace (seen on the left), and the scaffolding above is that erected for the centre portion of the memorial including the colossal statue of the late Queen now being put up. Over 1,000 tons of the finest Carrara marble and 800 tons of granite have been used for this part of the work.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

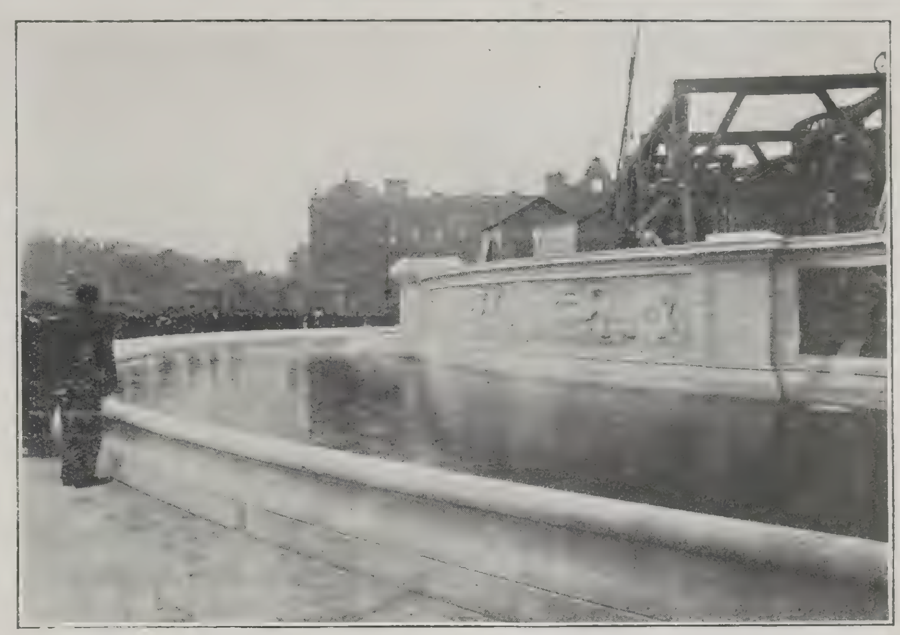
DATE OF DELIVERY.	COMPETITION.
June 4	COTTAGE HOSPITAL, BODMIN. Architects are invited to submit competitive designs for the above, to be erected at an approximate cost of £2,000. Premiums, £12 12s., £8 8s., and £5 5s., for the three sets of plans *which the Committee may select.* Premiums of selected Architects to merge in Commission. Site can be seen on application to Henry D. Foster, Hon. Secretary to the East Cornwall Hospital, Bodmin, from whom particulars are to be obtained.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading, Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively.
June 24	NEW PUBLIC BUILDINGS, BURSLEM. The Architect whose design is placed first by the Assessor will be appointed to carry out the work. Premiums of £100 and £75 to authors of second and third designs, respectively, Conditions and plan of site from F. Bettany, Borough Surveyor. Deposit, £2 2s., returnable on receipt of *bona fide* design.
July 9	STOKE-UPON-TRENT. Additions to Town Hall including large hall to seat 3,000 people, police court, etc. Premiums of £100 and £50 for second and third designs respectively. Assessor nominated by Pres. R.I.B.A. Conditions and particulars from Jno. B. Ashwell, Town Clerk, Town Hall, Stoke-on-Trent,
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50. and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	WALLASEY U.D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Berkshire County Offices, Reading.

The Council of the Royal Institute of British Architects has received a satisfactory reply to its suggestion for the amendment of paragraph 1 of the printed conditions.—Ian MacAlister, secretary, R.I.B.A.

Grimsby Town Hall Extension.

The Competitions Committee of the Royal Institute of British Architects has received satisfactory explanation in respect of those conditions of this competition which appeared to be objectionable.—Ian MacAlister, secretary, R.I.B.A.



THE QUEEN VICTORIA MEMORIAL, LONDON, THOMAS BROCK, R.A., SCULPTOR.

This view gives some idea of the immense scale of the monument, which is wholly the work of Mr. Brock. The motif of the low relief marble and bronze panels is Sea-power, the figures being those of Tritons and Nereids, and the effect is heightened by the basins and cascades, for which 108,000 gallons of water per hour is required, this being obtained from wells and the lake in St. James's Park, where a special pumping station has been erected. The water afterwards returns to the lake. Mr. Brock was warmly congratulated on his work at the R.I.B.A. dinner last Wednesday.

New Arts Building, Liverpool.

The President of the R.I.B.A. has nominated Mr. E. Guy Dawber, F.R.I.B.A., to be assessor in this competition.

National Museum of Wales.

The assessors in this competition are Sir Aston Webb, R.A., F.R.I.B.A., Mr. J. J. Burnet, A.R.S.A., F.R.I.B.A., appointed by the Directors of the Museum; and Mr. Edwin T. Hall, F.R.I.B.A., appointed by the President R.I.B.A.

Cemetery at Chislehurst.

Mr. Ernest Newton, F.R.I.B.A., has been nominated by the President, R.I.B.A., as assessor for the above competition.

Correspondence.

[*The Editor declines responsibility for the statements made by correspondents.*]

R.I.B.A. and Registration.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—My reason for having given notice to bring forward two resolutions at the general meeting of the Royal Institute of British Architects, on June 7th, are to correct what appears to me to be a wrong impression which has been conveyed to the members of the Institute in the circular letter signed by the president, the four vice-presidents, and the hon. secretary, and posted to every member of the Institute in the envelope with the voting papers.

As a member of the Institute who has followed the registration movement for some years, I am anxious to see its fulfilment in due course. At two general meetings at the Institute, one held on April 3rd, 1906, the approval of an application to Parliament for a Bill was unanimously agreed.

It was then felt that contentious matters should be dropped, as, unless the profession could approach Parliament with practical unanimity, there was little chance of getting the Bill passed.

So contentious matters were dropped, and the committee recommended in their report that "the Institute should confine itself to attempting to obtain Parliamentary recognition for its membership, an attempt which it was believed would meet with very general support."

That belief on the part of the committee was well founded, for their report was unanimously adopted at a general meeting, when it was "resolved, after a revised or supplemental Charter had been obtained, that the Council should prepare and present a Bill to Parliament."

This view was held unanimously on April 3rd, 1906, and was adopted at a subsequent general meeting held at the Institute on March 4th, 1907, as follows:—"The Council have given careful consideration to all the principles above enumerated, and recommend that as a first step a revised or supplemental Charter should be applied for, embodying as many of the principles set forth in Section II. as possible, and that when this has been done, an Act of Parliament should be applied for as soon as possible."

The circular says "as soon as all architects are thus practically united within the Institute, an opportunity will be afforded of considering the possibility of submitting a Bill to Parliament."

To my mind, after the definite and unanimous expression of opinion at general meetings, the wording of the circular conveys an unauthorised change of policy.

Now, to prevent any misunderstanding ocsioned by the circular letter, I am bringing forward the following resolution:—"That in the opinion of this meeting the circular letter enclosed in the envelope accompanying the voting papers for election of candidates to the Council and Standing Committees, does not correctly represent the policy of the members of the Institute as embodied in an adopted report at a general meeting held at the Institute on March 4th, 1907."

My second resolution is:—"That this meeting desires that in future no circular letter be posted in the envelope containing the ballot papers, which has not first received the approval of the Council." I feel that this resolution requires no argument to commend itself. I would, in fact, prefer having the resolution simply put to the meeting without comments. I fear if this form of circularising the members is taken as a precedent, an objectionable custom would become established.—Yours faithfully,

GEORGE HUBBARD.

112, Fenchurch Street, London, E.C.

It is estimated that the cost of a new higher grade school, Wick, shortly to be erected, will approximate £1,000. The mason work alone, which is in the hands of Messrs. Alex. Milne and Son, of Buckie, will account for about £4,000.

THE PENALTY CLAUSE.

By a Barrister.

The object of the penalty clause is to ensure that a contractor shall work to time. It is inserted when time is—to use a legal phrase—of the essence of the contract. Thus, a man will order a certain plant to be erected by a particular date. As the damages which may result from any infraction of this clause are difficult to estimate, a daily penalty may be exacted. In signing a contract which contains a penalty clause, the contractor undertakes a serious responsibility, for he may have, in effect, to pay large damages for what is but a slight injury to the person employing him. Where, however, it could be shown that the damage actually sustained by a breach of contract was very much less than the amount of penalties, a court of justice might interfere to reduce the penalties; but, to use the words of Lord Coleridge: "Where the damage is entirely uncertain, and the parties agree upon a definite and not unreasonable sum, then that sum will be regarded and will be recoverable."

Sometimes the penalty clause, after providing for the payment of a certain sum, goes on: "The same to be regarded as liquidated damages, and not as a penalty." This is an attempt to exclude the jurisdiction of the court to interfere even if the penalty is out of all proportion to the damage done. It has been held that in spite of these words, if the judge sees a method of assessing damages and relieving the party at fault against payment of a large sum, the mere use of the expression, "liquidated damages," does not in any way curtail his power to do so.

We now propose to consider the conditions which, apart from the terms of the agreement, may operate to excuse a contractor from the performance of his agreement within the given time. In the first place, undue interference on the part of an employer, or the imposition of new terms can at once be raised in defence to an action for the enforcement of penalties. Again, an agreement to make certain alterations has a similar effect. In fact, such a subsidiary agreement stops a claim for penalties, unless it be shown that the time spent upon the whole job was unreasonable. Thus, suppose the employer's engineer or architect ordered works to be done which were outside the specification. Unless an express term imposing liability to complete extra work was inserted, the contractor could not be held responsible for any delay so caused. It has been decided, however, that where an agreement to complete works by a certain date contains a clause providing for the execution of any additional works which may from time to time be demanded by the engineer, there is no implied term that the additions shall be such as can be reasonably performed within the time. To avoid a difficulty of this kind, the contractor should pay careful attention to the terms of his contract.

Where an engineer or architect is empowered to order additional works, he is generally permitted to allow extra time for the execution thereof. Should he omit to grant an extension, it appears that the contractor becomes liable to pay penalties for delay in accordance with the original contract.

Payment of penalties is excused in the following cases:—

(a) If the work in hand is totally destroyed—e.g., by fire—both parties being then released.

(b) If the employer (or contractor) cause a delay by interference;

(c) If additional works are ordered.

It may happen that the penalty clause imposes terms of such an onerous nature that the contractor's profits would entirely disappear if his completion were to be delayed for any lengthened period.

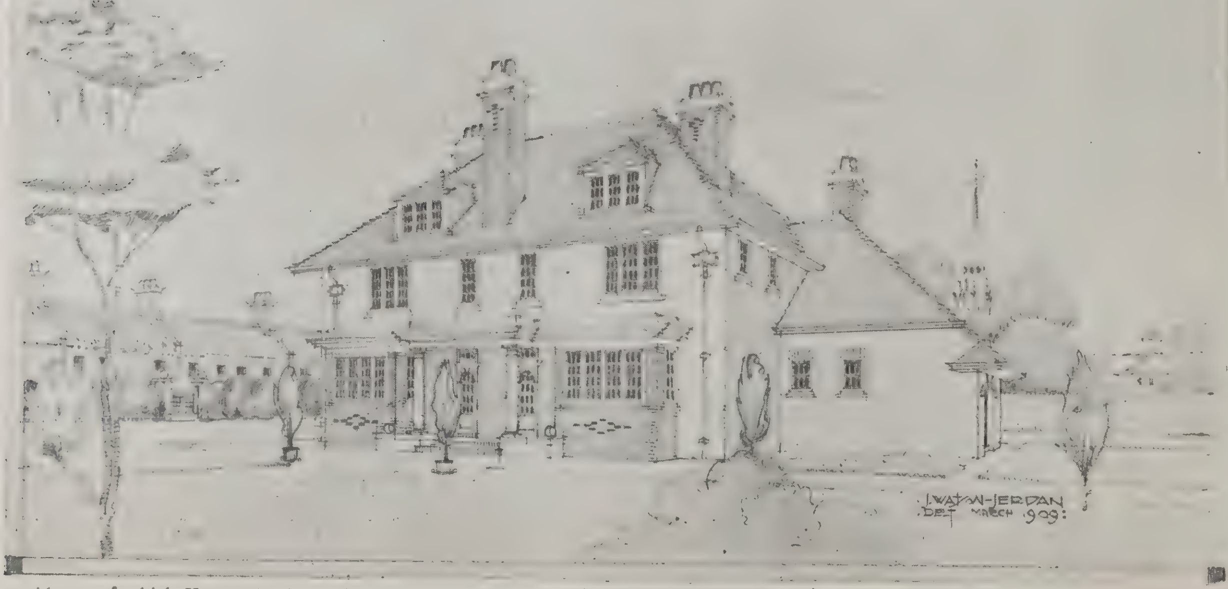
Circumstances might arise which would prevent his completing until a very considerable time after the date fixed by his agreement. What position should he take up? It is conceived that his wisest course might be to abandon the undertaking. In that case the ordinary penalty clause would not apply, as there being no date of completion it would be impossible to assess the amount due. The employer, however, would be relegated to his remedy for breach of contract; but the result of such an action might be far more favourable to the contractor than the payment of an enormous sum in accordance with the penalty clause.

Having said so much in regard to penalties, we turn to the consideration of bonus clauses. It should be stated, at the outset, that these clauses are independent. A contract may well contain one without the other.

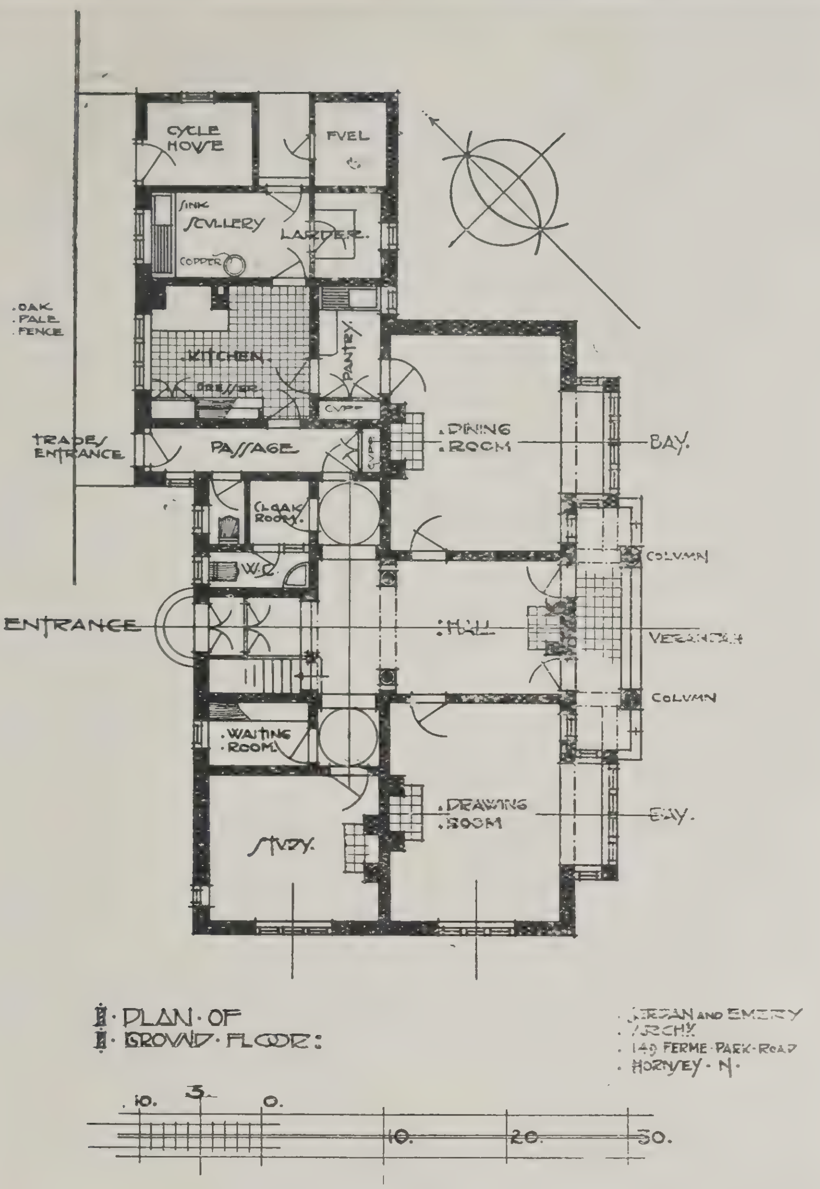
A bonus clause usually provides, that if the contractor manages to complete his work before the time reserved by the contract, he shall be entitled to so much per day for every day in which he is in advance of his time. If by the imposition of fresh terms, or the execution, at the request of the employer, of works which were not prescribed by the original contract, the contractor is unable to earn any bonus, it is a matter of some doubt whether he could recover it. There does not appear to be any case upon the point, but it is conceived that, applying the principles already considered in relation to penalties, if the contractor were in a position to show that he would have completed before the day fixed, but was unable to do so owing to the fault of his employer, he would be entitled to damages. But if he had undertaken to do any extras which might be ordered within the contract period, he would be entitled to no relief, if the doing of those extras made it impossible for him to complete within the specified period.

THE BRITISH FIRE PREVENTION COMMITTEE DINNER.

The dinner of the B.F.P.C. in celebration of the tenth anniversary of incorporation was held in the Georgian Hall of the Gaiety Resturant on Tuesday, May 25th, Mr. Edwin O. Sachs presiding. Among the guests present were the Earl of Londesborough, K.C.V.O., Sir Henry Tanner, I.S.O., Sir James Williamson, C.B. (late Director of H.M. Dockyards), Sir John Cockburn, K.C.M.G., M.D. (late Premier of South Australia), Sir Thomas Brooke-Hitching, Sir J. W. Szlumper, D.L., J.P., His Honour Judge Rentoul, K.C., LL.D., Mr. J. Brandon (vice-chairman L.C.C. Fire Brigade Committee), Captain



This residence, of which Messrs. Jerdan and Emery are the architects (see note on opposite page), has plum-coloured facing bricks of various tints, and Fareham red brick dressings. The chimneys have Portland stone caps. The verandah seen here is constructed of teak.



ST. LUKE'S VICARAGE, HORNSEY.

The object of the plan in this house has been to keep the kitchen and offices well in the background, with the windows away from the garden, while the living rooms overlook the latter.

J. de Courcy Hamilton, R.N. (chief officer, London Fire Brigade), Lieut. Sladen, R.N. (London Fire Brigade), Mr. Sidney Gamble, F.S.I., A.M.Inst.C.E. (London Fire Brigade), Chief Officer J. Meier, Amsterdam Fire Brigade), Chief Officer Reichel (Berlin Royal Police Fire Brigade), Chief Officer Westphalen (Hamburg Fire Brigade), Chief Officer De Marie (Ettelbruck Fire Brigade), M. Phillips (Termonde Fire Brigade), Lieut.-Col. Fox (London Salvage Corps), Lieut.-Col. Seabroke, V.D. (chairman National Fire Brigades Union), Major Cooper-Key (H.M. Chief Inspector of Explosives), Mr. R. A. S. Redmayne (H.M. Chief Inspector of Mines), Mr. George R. Sims, Mr. Ellis Marsland, Mr. H. K. G. Bamber, and many others.

After the toasts of "The King," and "The Sovereigns and Presidents of Foreign States," had been duly honoured, the Earl of Londesborough proposed the toast of the "British Fire Prevention Committee," and mentioned that the committee had been formed after the great Cripplegate Fire in 1897, and was incorporated in 1899. The work of the committee had been wonderful, and it had been scientific work, in which he hoped the general public would take a wider interest. Too often it was thought that fire protection was merely the slapping of water on a fire. He thought it was very greatly to the credit of the gentlemen of the committee that they had carried out so much painstaking work which was entirely honorary, and that they had given their valuable time gratuitously.

Mr. Edwin O. Sachs, replying, refrained from reading the many letters and telegrams that had been received; but mentioned one containing good wishes from Mr. Herbert Gladstone, the Home Secretary, who was prevented by illness from attending; and others from abroad, including one from M. Lepine, Prefect of the Police, Paris. These letters showed that their work was appreciated, and despite the subsidies and grants received by their friends abroad, he thought that they had the finest testing station in the world. The modern fireman thinks of protection and is pleased to see better construction, and with that their work had hitherto been mainly confined. But he thought the time had come for popularising fire prevention, and dealing with matters of direct interest to the "man-in-the-street." The use of celluloid hair-combs, the risks of flannelette, the throwing down of lighted matches were examples of matters to which they could direct the attention of the general public.

Sir John Cockburn, proposing the toast of "The International Fire Service," said that in an international gathering, such as there was that night, there was too often a divergence of view and purpose; but here was one with a common aim. Soldiers donned their uniform for the purpose of taking life; but the fireman's uniform was worn by men who preserved life. Theirs was one of the noblest professions, and a fireman was a popular hero in the imagination of the people. Nothing bound people together like defence against a common foe, and theirs was a fierce, insidious and deadly foe.

Chief Officer Meier, of the Amsterdam brigade, speaking in English, said all the services had the same aim and object, but the practical means of attaining it were different, and because of that they desired to travel and learn. He spoke of their interesting visits to the London Fire Stations and to the Salvage Corps. The International Fire Service Council, over which he had the honour to preside, was not only a union of fire brigades, but other societies were admitted, and the principal was the British Fire Prevention Committee. No society had accomplished so much in so few years.

Chief Officer Reichel, of the Berlin brigade, speaking in German, said that all firemen were members of one great brotherhood. He had opportunities of observing the work of the British Fire Prevention Committee, and he believed it was the best in the world.

Judge Rentoul proposed the toast of "The British Fire Service" in a witty speech, in the course of which he said that the policy of the committee in eliminating opinions and confining their reports to hard facts was contrary to the policy of his profession, which lived by giving opinions, and, very frequently, by obscuring the facts.

Captain de Courcy Hamilton, R.N. (Chief Officer London Fire Brigade) and Lieut.-Col. Seabroke (chairman National Fire Brigades Union), who responded, both spoke of the excellent relations existing between the various fire-services, and the good work done by the Prevention Committee. Capt. Hamilton also gave a short review of the inception and history of the London force.

Mr. Percy Collins, J.P., proposed the health of "The Visitors," to which response was made by Sir Thomas Brooke-Hitching, Mr. George Sims (who gave some statistics of the loss of child life through wearing dangerous flannelette), and Chief Officer Westphalen, of the Hamburg Brigade.

The diners were entertained by some excellent lantern and cinematograph views of the B. F.P.C. testing station and tests, great fires, the parade of the London Brigade in Hyde Park, American "turns-out," etc., arranged by Mr. Ellis Marsland, the Committee's hon. sec. A vote of thanks to the chairman brought the proceedings to a close at a late hour.

ST. LUKE'S VICARAGE, HORNSEY.

The object of the plan in this house has been to keep the kitchen and offices well in the background, with the windows away from the garden, while the principal rooms overlook the latter, each having a sunny aspect at some part of the day. The materials used in the construction of the building are as follows:—The building bricks generally are Flettons, with Luton plum-coloured facings of various tints, and Fareham red dressings; the chimney stacks are finished with Portland stone caps. The back addition is covered with cement roughcast. The roofs are covered with Broseley tiles. The verandah is constructed in teak, left in its natural colour, and well oiled. The remaining external woodwork is in yellow deal, painted white, the windows being glazed with lead glazing. The wood chimney pieces to reception rooms and principal bedrooms are supplied by Messrs. D. E. Brown and Co., of 10, Basinghall Street, E.C., the sanitary goods by Messrs. Twyford, Ltd. The building is lighted throughout with electric light. The builders are Messrs. Sheffield Bros., of Dalston, N.E., the architects Messrs. Jerdan and Emery, of Hornsey, N.

The Leeds local Building Societies are supporting the Leeds Corporation in the effort to get that city exempted from the clauses prohibiting back-to-back houses in the Town Planning Bill. The societies have lent a good deal of money on this class of dwelling, and their mortgage securities will be seriously affected if these clauses are made to apply to Leeds.

NOTES ON PAINTING AND DECORATION.

Points in Paint-mixing.

A great deal of misapprehension exists among those — other than experienced painters—who from time to time are called upon to mix paints; and a recent letter, asking for assistance, brought the fact very forcibly to mind. The correspondent in question had successfully mixed paints for outside use from white lead and such pigments as siennas, ochres, and chromes ground in oil. He had used pure boiled linseed oil and turpentine, and had added as a drier powdered litharge. In mixing his inside paint, he was not successful. Here he wanted a green paint, so he stained white lead with Brunswick green, but found that to get the desired tint at least half of the mixture had to be green. His merchant had recommended him to use green as the base, and to add patent driers instead of litharge. He objects to do this, on the ground that "ordinary patent drier" is usually a lime drier, which "may contain a considerable amount of oxygen in combination with such substances as iron, clay, silica calcium and magnesium, which are not materials we should expect to find in good paint. The first two might be introduced in pigments, but not otherwise." Finally, he asks whether terebine renders paint inelastic.

Some Dangers from Driers.

Now here is material upon which many pages might be written, and we may deal with the most important parts. First as to driers. Litharge should never be employed in the manner described. It is a powerful drier used in drying oils, but to mix it in a pot of paint spells ruin. Each particle, however well mixed, will remain in suspension instead of being distributed thoughout the entire mass by the agency of the linseed oil. When boiled oil is employed, little or no driers are as a rule required; because litharge or some similar substance has already been added to it on scientific principles. We are afraid that our friend's paint will not last, from the very fact that it contains too much driers. Painters say that an excess of driers "burns the life out of paint," and this very nearly expresses the fact. To this excess may be attributed one-half the troubles which arise in painting work.

Mixing Green Paint.

The next point as to mixing green reminds one of the popular delusion that a paint to be good must necessarily contain at least a considerable amount of white lead, while, as a matter of fact, nothing is farther from the truth. Lead makes a good paint for many purposes, because it is easy to mix and to apply, and principally for the reason that it has a good "body," which of course means the property of hiding the surface to which it is applied. But practically any of the pigments, such as the ochres, Venetian red, siennas, blacks, blues, greens, yellows—in fact, every pigment made excepting the very transparent ones, such as the lakes, can be used either by themselves or mixed together without a particle of lead; it is all a question of colour. Then, again, the base might be zinc oxide, zinc sulphide, etc. Greens are almost always used pure and without admixture, excepting when perhaps one wants a very dark green, which can be obtained from chrome, yellow, and black.

Liquid Driers.

Returning to the subject of driers, there can be no doubt that there are a very large number that are of poor quality; but there is no difficulty in getting a good one, and, if used in moderation, the presence of those minerals which are necessarily added to prevent the mass hardening will not be in the slightest degree detrimental to the body or the life of the paint. During the past few years, painters are taking very much more kindly to liquid driers, for two reasons; first they understand how often patent driers are adulterated; and, secondly, because they are aware that if they select a good make of liquid drier or terebine it cannot possibly spoil the work—for one reason, because the paint mixer can measure it to a nicety.

The whole question of paint-mixing is an intricate one; but if the writer wished to have some houses painted and did not wish to put the work into the hands of an experienced master painter, he would not hesitate to use a high-class ready-mixed paint. Some of the brands are so widely advertised that the manufacturers could not afford to give an inferior article. They are mostly combination paints—i.e., are made from an admixture of two or more pigments. Pure linseed oil and pure turpentine are as a rule used exclusively in them, with just sufficient driers—liquid, of course—to cause the paint to dry dust-proof in a reasonable time, and that quantity has been ascertained by exhaustive and careful experiment.

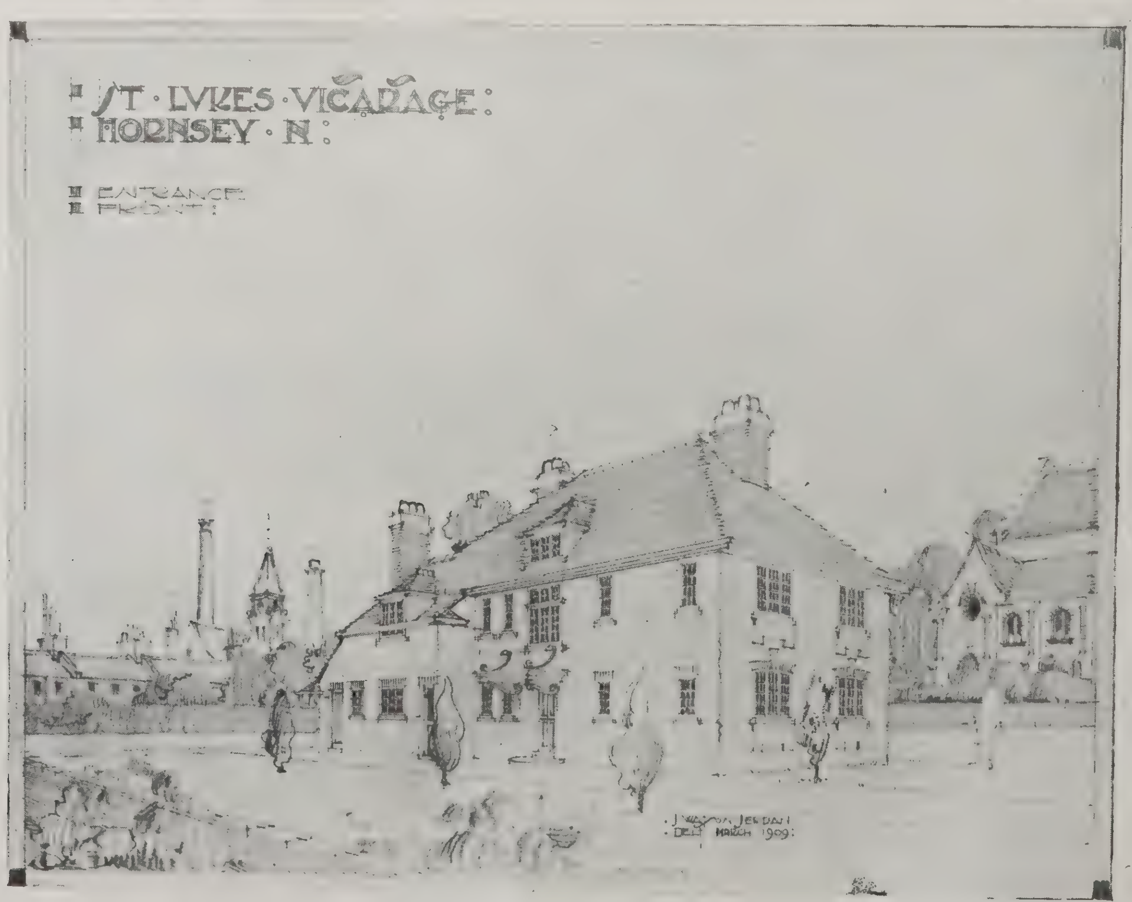
Paint and Pigment.

There are two little slips in our correspondent's letter to which attention may be drawn. He speaks of a drier "containing oxygen." It can hardly do that. Certain materials, of which white lead is one and litharge is another, possess the property, when mixed with a drying oil such as linseed, hempseed, walnut oil, poppy oil, etc., of causing them to absorb oxygen from the atmosphere quicker than they otherwise would do, and hence to dry quicker. When in the form of a dry powder they have no such power, and it is only through the oil that the property can be exerted. For this reason it is far better, if litharge is to be used as the drying agent, to introduce it into the paint-pot in the shape of an oil to which it has been added, and with which it has been very thoroughly incorporated. The other little slip refers to the use of the words "paint" and "pigment." White lead, colours, etc., are all pigments when dry; but they become paints when ground in oil.

Our Plate.

House at Hampstead.

This house has recently been built in Hampstead Way, Hampstead Garden Suburb, for Mr. C. J. Tait. The house is rough-cast and tiled, and the accommodation consists of porch, hall, sitting-room, and offices, on the ground floor; while on the first floor are four bedrooms, bathroom, boxes, etc. The contractors were Messrs. W. Moss and Sons, of Loughborough and Hampstead, who are



This view shows the entrance front. The roof is covered with Broseley tiles, and the external woodwork is of deal, painted white, the windows having leaded glazing.

the contractors to The Garden Suburb Development Company (Hampstead), Ltd., and the architect is Mr. Geoffry Lucas, A.R.I.B.A., of 14, Hart Street, W.C., and Hitchin, Herts. The other houses, in Willifield Way, are of similar design and by the same architect.

Builders' Notes.

A meeting of the Liberty and Property Defence League will be held at the Westminster Palace Hotel on Thursday, June 10th, to protest against the Finance Bill.

* * *

Two districts in the United Kingdom report temporary briskness in the building trade—Harrogate, and Troon, in Scotland. The baths extension and the building of St. Mary's Church account largely for Harrogate's building activity, and at Troon house property and estate development account for the increase in building operations.

* * *

A settlement has been arrived at in the dispute between the masters and operatives in the building trade in West Bromwich. In November last the West Bromwich Master Builders' Association gave notices to the men in practically all departments for a reduction in hours. The local branches of the men's unions thereupon gave counter notices to the employers for a rise in wages to counterbalance the reduction of hours. Several conferences were held between the employers and workmen, and finally the bricklayers, labourers, and stonemasons accepted the revised hours, the employers conceding some alterations in regard to overtime. The carpenters, however, could not come to terms, and the matter was brought before the local Conciliation Board. They were unable to come to any agreement, and the dispute was referred to the Midland Centre Conciliation Board. They sat at Leicester, and finally decided in favour of the employers, the reduced hours to come into operation without any alteration of the rate of wages. The bricklayers, labourers, and stonemasons have already begun to work under revised rules, and the carpenters will also do so as soon as the necessary arrangements can be made. The building trade in West Bromwich will now be on the same footing as regards hours as in Wolverhampton and Birmingham. A similar arrangement has been come to as regards the Liverpool bricklayers, but the rate of wages has been raised from 9¾d. to 10d. per hour.

* * *

PARTNERSHIPS DISSOLVED.—William Dawson, Frank Hall, and Thomas Robinson, painters, decorators, plumbers, etc., trading as W. DAWSON & CO., at 85, Station Road, Hadfield, as and from November 1st, 1908, by reason of death of said William Dawson. Business continued by two last-named partners as "Successors to W. Dawson and Co." William James Jones, of 6, Granville Road, Bedford; George Ephraim Jones, 6, Granville Road, Bedford; and Ephraim Jones, 2a, Littledale Street, Kempston, builders, carrying on business at Bedford and Kempston as JONES BROTHERS, as and from May 15th, 1909.—Emma Harriett Brown, Francis Joseph William Brown and Herbert John Russell Brown, carrying on business as decorators, builders, picture framers, and oil colour dealers, at Bridgewater, under style of E. H. BROWN & SONS, as and from May 8th, 1909.—Thomas Moore and Robert Moore, carrying on business as builders and contractors at Mansfield, Nottinghamshire, under the style of T. & R. MOORE, as and from May 1, 1909. Business continued by the said Thomas Moore under style of R. Moore.

* * *

Mr. Justice Joyce has, on the motion of the Governors of Westminster Hospital, granted an injunction against the Trustees of the Wesleyan Twentieth Century Fund from building the new Wesleyan Memorial Hall to such a height as to interfere with the access of light and air to the hospital. The matter had been referred to Mr. John Slater, F.R.I.B.A., and that gentleman reported that if the proposed scheme was proceeded with, the access of light to one portion of the hospital would be very considerably interfered with. He suggested that the plans should be remodelled. In giving his decision the judge said it was obvious that there should be a speedy trial of the action.

* * *

The "Labour Gazette" for May reports that employment in the building trades in April was slack in all parts of the United Kingdom, except the painters, who were fairly well employed. There was an improvement on March, but it was worse than a year ago. There was an increase of 3.7 per cent. in the number of skilled men employed, and of 5.9 per cent. in the provinces; and in the case of labourers the figures were 10.0 per cent. and 9.7 per cent. respectively. Compared with a year ago there were in London increases of 2.1 per cent. skilled men and 6.5 per cent. labourers. The figures in the provinces show decreases of 12.3 per cent. and 9.0 respectively.

* * *

CONCILIATION CASES.—The Board of Trade appointed Mr. A. A. Hudson to arbitrate in the disputes between the master and operative painters at St. Helens. The master painters had given notice of alterations in the existing working rules, the principal alteration (resulting in a reduction in the number of hours worked per week) relating to starting-time and to the question of breakfasting before commencing work; the operatives were willing to agree to the reduction in working hours, in consideration of receiving an increase in the hourly rate of wages, but objected to breakfast before commencing work. The arbitrator awarded that the men should receive an increase of ½d. per hour (from 8d. to 8½d.), and should breakfast before commencing work. Mr. Hudson was also the umpire in the dispute between the master and operative slaters at Glasgow. The master slaters had given notice of a reduction in wages from 9d. to 8d. per hour; Mr. Hudson decided that the standard rate of wages should be reduced to 8½d. per hour.

* * *

The Belgian builders are expected at Sheffield on August 10th. As the Sheffield builders were officially received at Brussels, it is hoped that the Lord Mayor will give them an official welcome at the Town Hall. In the afternoon after luncheon visits will be paid to representative works, and in the evening there will be a dinner, at which the Sheffield builders will do their best to show that Yorkshire hospitality is at least equal to that of Belgium. Wednesday will be devoted to excursions in the Dukeries, probably; on Thursday morning there will be more visits to works; and the visitors will leave Sheffield for London on the Thursday afternoon.

* * *

Lecturing on "Afforestation" at the Royal Institution, the Hon. Ivor Guest, M.P., dealt with the report of the Commission on Coast Erosion and Afforestation, over which he presided. We imported, he said, from countries having a climate more or less similar to our own, and producing therefore the same classes of timber, wood to the value of over 20 millions sterling a year. On the basis that there were nine million acres of land available for timber growing, and on the assumption that each acre would produce annually one ton of timber when the crop comes to maturity in 80 years' time, and if proper methods were adopted to assure its continuance, this country would produce about the same amount of timber as it now imported. Mr. Guest then referred to the temporary employment which would be afforded in the course of afforesting 150,000 acres a year, which would be about the proper proportion, and to the permanent work that would be provided in looking after the afforested areas. The State's putting money in afforestation would mean almost a 4 per cent. investment, on the assumption that timber remained at its present price, though the price was in fact likely to increase. The Government seemed inclined to make a start in an experimental way.

* * *

In the unavoidable absence of the Hon. Percy Wyndham, Sir William Chance presided at the sixth annual meeting of the Building By-laws Reform Association at the Whitehall Rooms on Wednesday last. A conference with the Rural District Councils Association was reported, the outcome of which was the drafting of a Bill for amending the Public Health Acts for the purpose of giving relief under oppressive administration by means of by-laws. The draft Bill was submitted and approved. The Dowager Lady Lovelace, Mr. Lacey W. Ridge, Mr. C. F. A. Voysey, and Mr. R. A. Read (hon. secretary) were elected to represent the Association at the adjourned meeting of the Conference on the Taxation of Land Values.

* * *

The fifth annual conference of the National Federation of Building Trade Employers of South Africa was held recently at East London, delegates being present from various parts of South Africa. Mr. Reynolds, of Port Elizabeth, was in the chair. In his address the President referred to the depression in the building trade, but expressed the conviction that a United South Africa had a great future before it. The secretary (Mr. J. T. Brown) submitted a report of the year's work. The Congress adopted a resolution recognising the advisability of appointing members in each of the Colonial Parliaments to watch legislation affecting the building trades. Mr. Drake (Cape Town) reported on the progress and development of the national federal insurance scheme inaugurated at the Cape Town Congress, and it was resolved to recommend its adoption by the affiliated associations. The Congress also discussed the practice of merchants giving special discounts to members of building trade associations, and it was resolved to endeavour to secure its practice in other towns than those wherein it at present operates. The question was discussed of entering into negotiations with the various institutes of architects in South Africa for the purpose of securing a reciprocal agreement whereby architects, members of the Institute, shall only receive tenders from recognised members of master builders' associations, who in return will submit their tenders to the recognised members of the South African Institute of Architects. The question was referred as a recommendation to the next Congress for discussion.

* * *

Difficulty has been experienced by the Athy (Kildare) Rural District Council in getting contractors to tender for the labourers' cottages being erected under the Labourers' Cottages Act. Of the 200 cottages advertised, contracts for 120 only have been let, the maximum cost per cottage, £130, allowed by the Local Government Board, being a figure that the contractors say will not pay them. A suggestion was made that, there being no suitable stone in the neighbourhood, concrete should be employed; and the surveyor was instructed to prepare specifications for two concrete cottages as an experiment.

* * *

At the Bradford Technical College on May 22nd, Mr. F. S. Drury (Halifax) read a paper on "Building Calculations: A general consideration of what calculations should be included in a properly organised building course," before the building section of the Association of Teachers in Technical Instruction. Mr. Drury sketched out a syllabus for a four years' course, and pointed out the importance of giving students a thorough grounding in the earlier stages of the subject, as the lack of such grounding rendered them incapable of profiting by the teaching in the higher stages. Discussion followed, and at the close Mr. Drury was heartily thanked for his address.

* * *

In reply to questions from Mr. Mackarness and Mr. Morrell, Mr. Asquith stated in the House of Commons on May 24th that the Government hoped to make provision for the further progress of the Housing and Town Planning Bill after the Finance Bill had been read a second time, and shortly after Whitsun. It was intended to pass the Bill through all its stages this session.

* * *

The members of the Edinburgh Building Trade Exchange paid a visit recently to Whitehill Brick Works, Rosewell, the property of the Lothian Coal Company. On arrival there they were met by the manager, Mr. James Hamilton, who conducted the party over the works, and explained the various processes. On the invitation of Mr. Hamilton, the party was entertained to tea on the lawn of his house. On the proposal of Mr. James Millar, builder, a hearty vote of thanks was accorded Mr. Hamilton for the interesting and instructive visit the members had been able to enjoy.

* * *

The Burgomasters and thirty members of the municipality of Berlin have just concluded a week's visit to the Corporation of London. They have inspected the Tower Bridge and the Tower of London, and were received by the King at Buckingham Palace. Among the items in the week's programme were a banquet at the Guildhall, visits to the public buildings in the City, the British Museum, and the National Gallery, the Naval and Military Tournament at Olympia, performances at the Royal Opera and Palace Theatre, lunch with the Drapers' Company, a banquet provided by the Fishmongers' Company, and a reception at Windsor Castle.

Buildings in Progress and Completed.

AUCHTERDENAN.—The school is to be remodelled and extended at a cost of £2,500. Mr. Williamson, of Kirkcaldy, is the architect, and the following are the contractors:—Mason, Wright and Reekie, Kirkcaldy; slater, Mr. John Robertson, Dunfermline; joiner, Mr. Adam Proudfoot, Lochgelly.

CASTLETON.—A new Primitive Methodist Chapel is being erected at a cost of about £900. Mr. J. Miller, of Bradwell and St. James's Street, Sheffield, is the architect. The mason's work is being done by Mr. J. Elliott, Bradwell; joiner's work, Mr. A. E. Wheat, Castleton; plastering and seating, Mr. J. Slack, Tideswell; plumbing, Mr. Nicholson, Castleton.

CLIFTON.—The Council of Clifton College have decided to proceed with the enlargement of the chapel. Sir Charles Nicholson, Bart., F.R.I.B.A., is the architect, and drawings of the extension are shown in this year's Academy.

DEWSBURY.—A nurses' home in connection with the Dewsbury Hospital is being built at Staincliffe. Mr. A. W. Hanstock is the architect.

EDINBURGH.—Lord Kinnaird laid the foundation stone recently of Lady Glenorchy's new church and halls in Roxburgh Place, to which the buildings have a frontage of 175ft. Messrs. McGibbon and Ross are the architects.

GUISELEY.—The foundation stone of the extension to the parish church has been laid. The accommodation is to be almost doubled at a cost of about £5,000. The original old church is not to be interfered with, openings in the comparatively modern north wall only being contemplated. A new nave, north aisle, chancel, organ chamber, and vestries, are to be built. Sir Charles Nicholson, Bart., F.R.I.B.A., of London, is the architect.

HEBDEN BRIDGE.—A new secondary school has been erected here at a cost of about £7,000.

LONDON.—The new chapel of the Holy Spirit at the Church of St. Peter's, Cranley Gardens, S.W., has been opened. The reredos and the whole of the carved work throughout are the work of Mr. Nathaniel Hitch; the altar, which is of carved oak, has been made by Messrs. Dart and Francis, of Crediton, to the design of Mr. W. D. Caroe, F.R.I.B.A., the architect; and the stained glass windows are by Messrs. James Powell and Sons. The contractors were Messrs. Colins and Godfrey, of Tewkesbury.

PURLEY.—A new wing to the Warehousemen's, Clerks' and Drapers' Schools, Russell Hill, has been erected at a cost of between £5,000 and £6,000.

RYHOPE AND SILKSWORTH.—Model dwellings, consisting of 48 five-room, 24 four-room self-contained houses, and 48 flats of three and four rooms, have been erected here by the R.D. Council. Mr. Joseph Spain, A.R.I.B.A., of 12, John Street, Sunderland, was the architect, and will, with Mr. George Brown, A.R.I.B.A., carry out a similar scheme at Usworth for the Durham County Council. Messrs. J. and F. Parker, of Sunderland, were the builders at Ryhope, and Mr. H. B. Pitt, of Sunderland, the builder at Silksworth. Mr. J. W. White, Sunderland, executed the street works at Ryhope, and Messrs. J. Clark and Sons, of Ryhope, those at Silksworth.

WALLSEND.—The Borough Theatre is being erected at the corner of High Street and Park Road, from the designs of Messrs. J. Fleming Davidson, Willington Quay and Newcastle, and C. D. James, Newcastle, joint architects. The total cost is estimated at £10,000.

WORKSOP.—It has been decided that a chapel shall be erected at Worksop College with a gift of £10,000 from Lord Mountgarret, which was given conditionally on a further sum of £15,000 being raised to complete the College buildings. The response to the appeal for the latter sum has been very encouraging, and the plans of the College, by Sir Aston Webb, A.R.A., and Mr. B. Ingelow, have now been prepared. Lady Mountgarret will lay the foundation-stone in July next. The extensions will be commenced next month, and additional blocks started during the summer.

WREXHAM.—The new St. John's Church is to be built of Cefn stone, and will consist of a nave of four bays, with narrow ambulatories for aisles, and a clerestory with traceried windows. A barrel-vaulted ceiling, a carved oak chancel screen, oak chancel fittings, oak chair stalls, and an oak pulpit are included in the scheme. The church will seat four hundred people, and will cost £6,210. Messrs. Collins and Godfrey of Tewkesbury, are the contractors, and the architects are Messrs. Prothero, Phillott, and Barnard, of Cheltenham.

Proposed New Buildings.

ABBEYDALE, SHEFFIELD.—It has been decided to build the new church of St. Oswald in one scheme. £5,500 of the £8,000 has been raised, and it is hoped the church will be erected by next Easter.

ABERDEEN.—A new market for produce is being favourably discussed, and a site in Exchequer Row has been suggested for it.

BATH.—L.G.B. enquiry has been held respecting a loan of £500 for the purchase of certain premises in Swallow Street as a site for extension of engine house at the Baths. The extension scheme was not fully prepared; but plans have been prepared by Mr. A. J. Taylor.

BEDFORD.—Plans approved:—3 houses, Denmark Street (Mr. C. Rootham); 2 houses, Bromham Road (Mr. E. Casheard); 6 houses, Denmark Street (Mr. D. Francis); house, Veverley Crescent (Mr. R. Jeakings); 4 houses, Chaucer Road (Messrs. Jacobs and Burton); additions to shops, 2 and 4, Kimbolton Road (Trustees of the Moravian Estate); alterations, "Burnaby Arms," Stanley Street (Mr. Chas. Wells); 4 houses, York Street, and 6 houses, Rosamond Road (Mr. H. J. Jones); 6 houses, Honey Hill Road, and 6 houses, Trinity Road (Mr. R. Jeakings).

CAMBRIDGE.—Plans approved: Additions to Bull Hotel, lecture rooms, etc., Garrett Hostel Lane (both for Masters, Fellows, and Scholars of Trinity Hall).

CAMBUSBARRON.—Plans for the new U.F. Church here have been approved.

FOREST TOWN, NOTTS.—Funds are being collected for a new church here. The Duke of Portland has given £2,000 and the Colliery Co. £500 towards a total cost of £4,600. Plans have been prepared by Mr. Louis Ambler, F.R.I.B.A., of London.

LINCOLN.—The Board of Guardians are considering sites for a new infirmary.

LONDON.—The County Council proposes to erect 88 additional cottages on the Norbury Estate, and tenders are to be invited for 105 on the Tower Gardens section of the White Hart Lane estate.

MEXBORO'.—The Borough Council has approved plans for the new Empire Palace in Oxford Road, subject to some alterations to one or two entrances. Plans for 16 houses, Lorna Road (Mr. S. Jackson); 8 cottages, York Street (Messrs. Oliver and Son); 8 cottages, Carlyle Street (Messrs. F. and F. Lazenby); new machines rooms, "Times" Publishing Co.; were also approved.

RHOS-ON-SEA.—At a cost of £1,000 it is proposed to proceed with the school part of the new Congragational centre designed by Messrs. Porter and Elcock, of Colwyn Bay, which gained the first place in the recent competition. The cost of the entire scheme will amount to between £3,000 and £4,000.

SHEFFIELD. — The Managers of the Training College for Teachers recommend that Messrs. Gibbs and Flocton prepare plans for completing the Women's Hostel to provide accommodation for 60 more students; also that the City Architect prepare plans for alterations to the College to provide accommodation for instruction in chemistry, physics, and nature study.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Party Wall.

LONDON, W.—A. J. H. writes: "Under the London Building Act I am entitled (if the adjoining owner will not agree to a party wall) to build an external wall on my own land and allow the footings to project on to the adjoining owner's land; also to have access to his land to build the footings, provided I do so at my own expense and compensate for any damage done. Does this rule apply in the country? I understand that common law there governs these matters."

No, the provisions of the London Building Act do not at all apply to the country, and you are right in thinking that common law there governs the matter. You must build everything on your own ground, and not encroach at all; walls, footings, and verges, all being kept within your boundary line. F.S.I.

Local Authority and Sewering.

CAMBRIDGE.—X Y. Z. writes: "Seven houses are to be erected in an urban district area. The plans have been passed by the local authorities, with the exception of the drainage, for which their surveyor has asked for an amended plan. Drainage was shown to discharge into the sewer of the main road in the usual manner. Unfortunately no sewer exists within a distance of 130 yards from the site. The drains were thus shown with the hope that the council would extend their sewer to the point where wanted, and a letter was written requesting them to do so. They now say that they cannot comply with our wishes. Can the local authority be forced to provide a sewer within reasonable distance of the property?"

There is no legal obligation upon the local sanitary authority to provide a sewer, or to extend their existing system to reach your houses; and unless you can come to some voluntary arrangement with the authority the responsibility of providing for the drainage of the proposed new houses will entirely devolve upon the owner. F.S.I.

Floors for Dancing.

Mr. Percy Fawckner (Newport, Mon.), writes: "In your reply to 'Trichinopoly's' enquiry under the above heading, in the issue of May 5th, you give a plan and section of the floor referred to, and I notice that you show the flooring boards to run tranversely across the room, and not with the length of the room. Surely it is most important that in ball-rooms the boards should run with the length of the room."

On the same subject, "E. C. H.," who has constructed such a floor in a West End Hotel, where it is giving complete satisfaction, kindly offers to furnish the details to "Trinchinopoly," to whose address we will forward them on receipt.

"P. (Croydon)," who requires similar information, is referred to this correspondence.

Responsibility for Drainage Repairs.

SHERINGHAM.—C. A. S. writes: "The drains of a house becoming choked, the tenant called in the sanitary inspector, who ordered that the drains should be relaid. Enclosed [not reproduced] are the clauses of the lease referring to drainage. Who, in your opinion, is responsible for the work, the landlord or the tenant?"

The sanitary authority have full legal rights to serve the notice of abatement of the nuisance on either landlord or tenant, and have powers of enforcement in either case. The ultimate incidence of the burden, however, depends on the terms of the tenancy, and were it not for the clause in the lease which you now quote, there is little doubt but that the liability would fall upon the tenant. The indemnity clause you submit at first sight is certainly a little obscure, but certainly does not appear to me to override the other clause which so clearly and distinctly lays upon the tenant the obligation of keeping the drains in order, and I am therefore of opinion that this expense will fall entirely upon the tenant. F.S.I.

Questions on Paint.

LONDON, E.—VIATOR writes interesting details of his difficulties in mixing paint, and asks for advice and assistance. The points raised are far too many to be dealt with in this column, but as they are of general interest, they have been incorporated in the "Notes on Painting and Decoration" on page 520. It may, however, be here remarked that the practice of adding litharge in the form of a dry powder to a paint is absolutely wrong. It might be sparingly used by a paint-maker, but is quite unsuitable when used by a painter, unless the circumstances are very exceptional. The green should, as the querist's merchant suggests, be used as a base; patent driers, if of really good quality, may be sparingly used with safety, although we prefer a first-class liquid drier. A terebine of really good quality would answer. A teaspoonful to a gallon of paint would be ample. J.

Weakness in Roof Truss.

ELGIN.—SURVEYOR writes: "The enclosed tracing shows a roof that, erected some time ago, now shows signs of weakness. Please state whether the design of the roof is weak either in the scantlings or constructionally. If the roof is weak, what would be the best way to make it safe?"

The design submitted, as shown on the left-hand side of Fig. 1, is too light. As the roof is already constructed, the best method of strengthening it would probably be as shown on the right-hand side of Fig. 1, of which enlarged details are shown in Figs. 2 and 3. The purlins are also not stiff enough, and should be trussed as shown in Fig. 3, the rod being made to do its full work by means of the strut and folding wedges. The buttresses should be increased in projection and height as shown, the added portion being properly bonded to the old work.

ILLUSTRATING REPLY TO "ELGIN SURVEYOR," WEAKNESS IN ROOF TRUSS.

ARE DAMP WALLS CAUSED BY BAD CLAY?

By Alfred B. Searle.

The dangers of houses and other buildings possessing damp walls are too well known to need comment, but an interesting view of the situation has recently been published by a medical man whose zeal has somewhat outrun his technical knowledge of building. In an article in a London evening paper he described how he built a house some years ago with bricks which were "faultless to the eye, having smooth, almost shining surfaces and sharp, clear-cut edges and corners." Yet the rooms (which faced north-east) are almost unusable on account of dampness which the owner states does not rise from the ground, but appears to come through the walls. The walls are 15ins. thick, yet the dampness is sufficient to cause the growth of moulds or conferva.

The doctor gave interesting details of a case under his care where a child was troubled with a white growth in the throat, this growth being identical with a similar growth on the walls of the house where it lived. In this case also the bricks appeared to be faultless with smooth and glossy surfaces. It is further stated that other similar cases can be quoted.

We are not concerned with the medical aspect of the question, except in so far as it affects the builder, but the problem presented is very interesting and is well known, particularly in the North and Midlands, though apparently no explanation of it has appeared in print. This dampness is not confined to bricks of one particular class, but is characteristic of several varieties, and is also known in connection with certain varieties of close, dense stone, or with stone which has been protected by an impervious coating on the exterior. It is most apparent when a cold snap comes suddenly after a spell of warm weather, but apparently a number of causes produce effects which are so similar as to make the study of the question by no means simple.

In some cases, certainly, the present writer has found that the dampness is not connected in any way with the material of which the walls are built, but is really a condensation product, the surface of large mirrors in certain disused rooms being covered at times with a mist or dew even when they are quite away from any wall. Rooms with a north aspect are more subject to this dampness for the simple reason that their position makes them normally cooler than the rest of the house.

That the moisture in this case is purely superficial (and therefore the result of moisture in the atmosphere condensing on the interior of the walls and not of dampness coming through them) is shown by the fact that the admission of warm air from another part of the house, or the lighting of a fire in the room in question, will in a very few minutes remove all signs of moisture, whereas in a house in which the walls are damp throughout a considerable time is required for drying.

The doctor's suggestion that the moisture is due to the way in which the clay is manipulated when being made into bricks is quite untenable from a technical point of view, and his implication that bricks made by the semi-dry or similar processes are more porous than those in which the plasticity of the clay has been fully developed is contrary to actual experience. Indeed, the interest of the article lies chiefly in this curious discrepancy between observation and conclusion, and indicates how dangerous it is to attempt explanations unless one is possessed of sufficient technical knowledge.

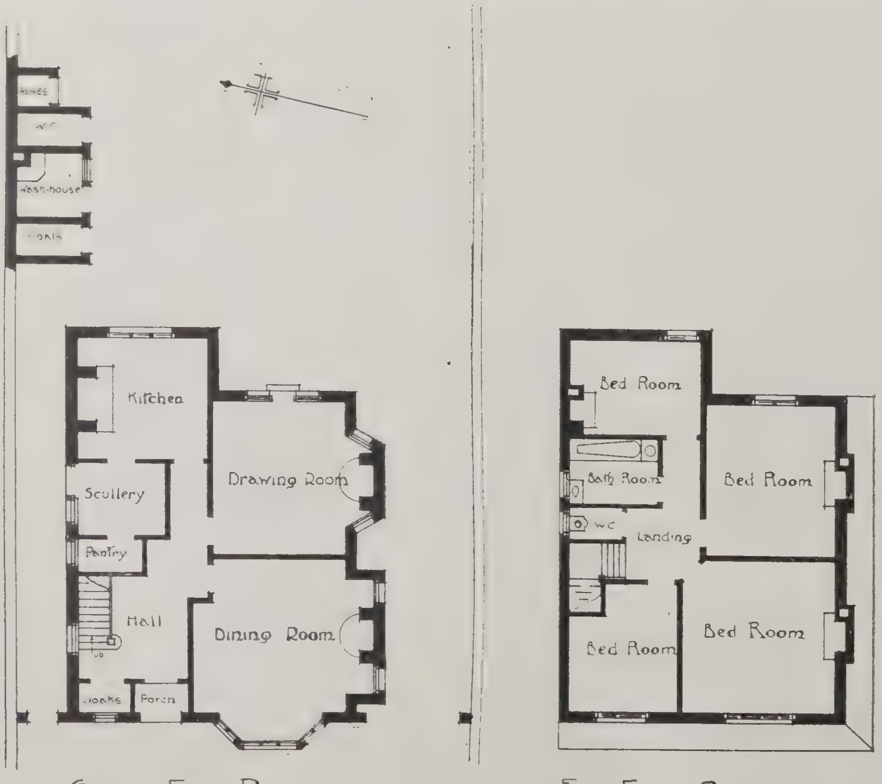
In common with many others, the doctor has observed "the constantly damp north walls of houses built of modern bricks made since the invention of machines for using" semi-dry instead of plastic clay. Yet the dampness of such walls is not related to their porosity at all, but rather to the absence of it. Bricks made of plastic clay are usually very porous—many of them absorbing more than one-seventh of their weight of water when soaked—yet houses built with them remain dry, if the walls are reasonably protected by overhanging eaves, because such bricks can absorb far more water than is likely to come into contact with them from ordinary rain. Indeed, so absorbent are they, that they will actually draw moisture from rooms in their interior, because the outside air is constantly in motion and so dries the outside of the brick, rendering it porous and capable of attracting moisture from the inside of the room.

In such cases condensation on the inner surface of the walls is almost impossible, unless an impervious wall paper is used, as the bricks will absorb the moisture as fast as it is condensed. Further, condensation is less likely to occur as porous walls act as excellent circulators of air and an accumulation of air heavily charged with moisture seldom occurs in cases where the walls are of porous bricks.

It is important here to point out that there is a great difference between porous and broken bricks. In the former the pores or spaces are extremely minute, and are evenly distributed throughout the whole mass; in the latter, on the contrary, fissures and cracks occur in places, but are irregular, and the effect of the brick is entirely different.

It appears probable, if one may trust the opinion of many eminent architects and the conclusion reached by technical men, that it is precisely the porous brick which makes the driest walls, because it acts as a "breather," drawing off moisture from the interior and expelling it on the outside of the house.

Modern methods of brickmaking tend to utilise machinery which will produce a denser brick than was formerly made, but this should not materially affect the damp-



GROUND FLOOR PLAN FIRST FLOOR PLAN

HOUSE AT CROSSENS, SOUTHPORT. REGINALD TINKLER, ARCHITECT.

This house is built of brick, faced with white roughcast, and the roof is covered with dark red san faced tiles. The dressings to the windows and front entrance are of Cefn stone, and the windows ha wooden casements. The cost complete was £500.

ness or dryness of the walls into which they are built, providing the bricks are really well made and properly laid. If this is not the case it is not improbable that moisture which has once penetrated to the interior of a brick of low plasticity remains there for a much longer time than it would in a porous brick, though even this fact (if it could be shown to exist) would not explain why such walls should be permanently damp on the interior, unless it is assumed that whilst it would not dry on the outside it could easily show moisture on the interior surface—a curious paradox which it is difficult to imagine.

The greater cheapness of bricks made by the stiff-plastic, semi-dry and other systems in which the plasticity of the clay is not fully developed makes the return of the days of plastic bricks improbable, and, provided that the other bricks are properly made, undesirable. If it were necessary, bricks could be made almost, if not quite, as porous, when manufactured by the more modern processes as are the older bricks, but the popular demand at the present time is in precisely the contrary direction, and dense, strong bricks are required.

For many purposes these denser, less pervious bricks are superior, and when properly made their very lack of porosity makes them more dampproof than the most porous bricks and provided that they are not used for rooms which are normally far colder than the rest of the house no trouble with dampness (or rather with condensed moisture) should be experienced. Where north or north-east walls are built of impervious bricks greater provision should be made for circulation of the air in the rooms, so that the atmosphere cannot become so heavily charged with moisture.

It will be noticed that it has been assumed throughout that the dampness has not arisen from the ground. If buildings are constructed without a proper damp-proof course nothing short of reconstruction can prevent their becoming damp in some situations. The special case of walls exposed to unusually heavy rain is also considered to be beyond the scope of the present discussion, as such walls should be protected in a special manner.

In short, the nature of the clay used is not of great importance providing that it be worked up properly and so treated that it will make good bricks. Nor, on the other hand, does the porosity of the bricks affect the question seriously, though for the reasons given it often happens that the most porous bricks provide the driest house. When badly made porous bricks are used, defects in their manufacture are, however, of less importance, from this hygienic point of view, than are those made by some of the more modern methods.

Messrs. Hartley and Sugden, Ltd., of the Atlas Boiler Works, Halifax, announce that in order to facilitate and encourage business in London and the suburbs, one of their managing directors, Mr. J. E. Hartley, has decided to reside in London, and thus place himself personally in touch with customers' requirements. Mr. Hartley's city address is 52, Gray's Inn Road, Holborn, W.C. (telephone, Holborn 2346).

* * *

We understand that the 10th publication of "The Committee for the Survey of the Memorials of Greater London," being the 2nd volume of their survey of the Palaces of London, will be ready almost immediately. It deals with the Parish of Chelsea, including Paradise Row and the river front from the Royal Hospital to the Old Church. The compilation has been made by Mr. Walter H. Godfrey, who has had the assistance of well-known authorities on Chelsea, including Mr. Randal Davies, F.S.A., Mr. William Ascroft and Mr. J. Henry Quinn, and the general editor of "The Survey," Mr. Phillip Norman, F.S.A. Copies may be obtained from the Secretary to the Committee, Parliament Chambers, Great Smith Street, S.W.

SCAFFOLDING IN BRUSSELS.

By A. G. H. Thatcher.

Readers who may remember the articles which appeared in our columns last year on types of French scaffolding will doubtless be interested in the attached photographs recently taken in Brussels. Both are built of framed timbers, somewhat on the Scottish system of gabbard scaffolding. The first (Fig. 1) is built around the Colonne du Congrès and gives a good representation of the scientific principles in which scaffolding should be erected, providing for both strength and safety. The platforms are complete, regularly boarded and railed to prevent danger to workmen. Regular stairways are provided, and generally speaking, it would be difficult to improve upon such a structure as this, considering its purpose.

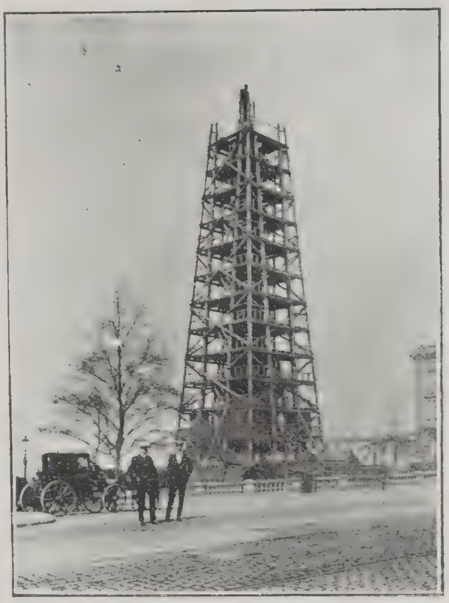


Fig. 1. Framed Timber Scaffolding around the Colonne du Congrès, Brussels, resembling the Scotch gabbard System.

The second photograph (Fig. 2) is more complicated in design, but built to a great extent on the same principles. It was erected for the repair of the Eglise du Petit Sablon. As pointed out before in this paper, the parts of this type of scaffolding are largely interchangeable, so that no great waste of timber occurs, which would at first be thought probable.

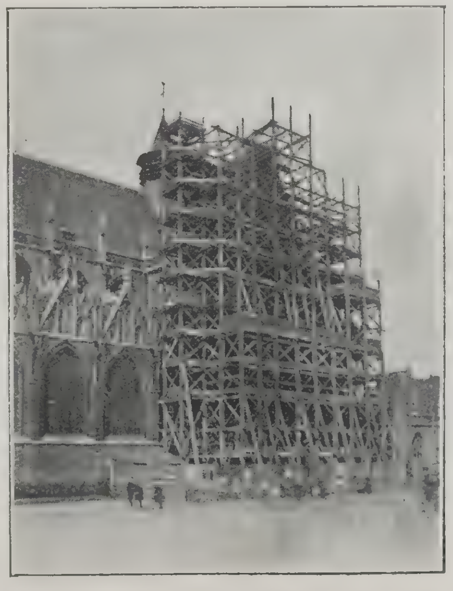

Fig. 2. Framed Timber Scaffolding at the Eglise du Petit Sablon, Brussels. This is not as expensive as it looks, the parts being largely interchangeable.

There seems at present no probability of framed timber scaffolds, except for derricks and gantries being used in this country. The spruce pole still holds its sway. It would be thought that some enterprising builder would effect its use, if only to do away with the hempen ties and lashings which are unreliable when compared with the use of the bolt.

A NEW SUB-CONTRACT FORM.

The following sub-contract form, prepared by Messrs. Ritson and Hope, and confirmed by Mr. A. A. Hudson, barrister-at-law, has been, we understand, approved by the Tees-side and District Master Builders' Association. Its general interest is obvious.

MEMORANDUM OF AGREEMENT made the day of 190 BETWEEN of in the County of (hereinafter called the "Sub-Contractor") of the one part and of in the County of Building Contractor (hereinafter called "the Contractor") of the other part.

[Strike out inappropriate words.] WHEREAS the Contractor has entered into a Contract with (hereinafter called "the building owner") for the erection and completion of the repairs and alteration of in accordance with plans, specifications, Bills of Quantities and general conditions incorporated into the said Contract, which said Contract, plans, specifications, Bills of Quantities and general conditions have been inspected by the Sub-Contractor and of the terms of which he shall be deemed to have express notice and all of which documents are included in the expression "the said Contract" when used hereafter in these presents. AND WHEREAS the Sub-Contractor has agreed with the Contractor for the execution and completion of all work mentioned in the said Contract in accordance with the said Contract and to the satisfaction of the Contractor and of the Architect for the time being employed by the Building Owner or his assigns for the sum of £ to be paid by such payments as are hereinafter mentioned.

NOW IT IS HEREBY AGREED by and between the said parties hereto as follows:—

1. The Sub-Contractor shall execute and complete in manner hereinbefore expressed all the work hereinbefore referred to and all extra work which may from time to time be ordered by the Architect for the time being of the Building Owner or his assigns and shall be paid for all such extra work at the rates contained in the schedule hereto annexed so far as the same may be applicable and where the said rates are not applicable at reasonable rates having regard to the rates in such schedule contained. The Sub-Contractor shall conform and be subject to the provisions of the said Contract so far as the same are applicable to this Sub-Contract.

2. The Contractor will pay for the work hereby agreed to be done in the manner following. The Contractor will on receiving payment of any certificate in which a sum is allocated to the said work forthwith pay the Sub-Contractor the sum so allocated and received by him. On receiving payment of any interim certificate in which no sum is allocated to the said work the Contractor will forthwith pay to the Sub-Contractor such a sum as will with any previous sum or sums paid on account make up per cent. of the value of the said work executed at the date of the giving of such certificate and on receiving payment of the final certificate the Contractor will pay to the Sub-Contractor the balance due in respect of the work. Whenever the Contractor is entitled to receive a certificate on account of work done under the said Contract he shall before applying for or immediately on receiving the same if such certificate has not been applied for give notice to the Sub-Contractor in writing that he is about to apply for or that he has received a certificate as the case may be.

[To be struck out if not applicable.] The Contractor hereby requests and authorises the Building Owner to pay to the Sub-Contractor on demand, any portion of any certificate which may be allocated in such certificate to the work hereby agreed to be done.

3. If the Contractor shall apply for any certificate without having given notice to the Sub-Contractor of such application or if he shall receive any certificate for which he has not applied and shall omit to give notice to the Sub-Contractor that he has received such certificate within two days of the receipt thereof then and in such case notwithstanding anything herein appearing the Sub-Contractor shall be entitled by notice in writing, to forthwith terminate his Sub-Contract and to bring an action forthwith, for the price of all material labour and profit up to the time when he shall have so terminated his Sub-Contract by notice as aforesaid.

4. In case of the insolvency of the Building Owner the Sub-Contractor shall only be entitled to receive such proportion of any dividend or composition as shall be payable to the Contractor in respect of the Sub-Contracting work then done by the sub-Contractor and not paid for by the Contractor.

5. The Contractor shall insure and keep insured the building and works against fire and the Sub-Contractor shall have the benefit of any insurance effected by the Contractor of the work included in the said Contract to the extent that the proportion of work executed by him bears to the total amount of insurance money payable.

6. If at any time during which the works specified in the said Contract are being carried on a claim for compensation shall be preferred against the Contractor by a workman of the Sub-Contractor or any dependant of such workman or any person entitled to payment under the Workmen's Compensation Act, 1906, or any statutory modification thereof on account of any injury (fatal or otherwise) sustained by such workmen while employed on such work then the Sub-Contractor shall keep the Contractor indemnified against such claim and all costs and expenses in relation to such claim. The Contractor shall not settle any claim preferred against him by any such workman or dependant or person entitled by law as aforesaid in respect of which he is indemnified hereby or admit any liability or voluntarily make any payment in respect of such injury but the Sub-Contractor shall be entitled to take the absolute conduct and control at his own expense of all arbitrations or other proceedings in relation to such claim and to use the name of the Contractor to enforce for the benefit of the Sub-Contractor any order made for costs or otherwise or any claim for indemnity against third parties. In case of any claim being preferred against the Contractor by or on behalf of any workman or dependant of workman of the Sub-Contractor in respect of personal injuries whether fatal or otherwise to such workmen where such claim is based on the negligence of the Contractor or of any person or persons for whom the Contractor is by law responsible the Sub-Contractor shall not be liable to indemnify the Contractor against such claim or any costs or expenses in relation thereto nor shall the Sub-Contractor be liable to conduct the proceedings in relation to such claim.

7. In case any dispute or difference of opinion shall arise between the parties hereto the same shall be settled by the Quantity Surveyor for the time being of the Building Owner or his assigns whose decision shall be conclusive and final as to the legal construction of these presents and what is to be done thereunder and the amount of moneys to be from time to time paid or allowed by either of the said parties hereto to the other of them but this clause shall not be construed as in any way limiting the right of action conferred by clause 3 hereof in the event there specified.

Provided always and if such Quantity Surveyor shall refuse to act under this clause the President of the Northern Counties Federation of Building Trade Employers may upon the request of either party hereto appoint somebody to act in his stead who shall exercise all the powers confered upon the said Quantity Surveyor AS WITNESS the hands of the parties.

PAINT AND ITS APPLICATION TO STRUCTURAL STEEL.*

By Gaston Depierres

Various theories are expounded by various authors; but, not wishing to add a fresh one, I will only say that my experiments have convinced me that pure white lead paint is not a good protective coating for iron. It is possible to-day to get paint uniformly well prepared for almost any purpose. A painter or paint user of the present time who attempts to mix and grind his own paints is as unlikely to succeed as if he were to attempt to make his own varnish, brushes, etc. It is not my purpose to discuss methods of applying coverings to structural steel, other than to insist that a mechanic to do good work must have good tools to work with, and fair conditions under which to do the work set before him. Many worthy paints are ruined because they are flowed on with a broad, thin, flat brush, not much better than a common whitewash brush, instead of being rubbed out and well into the surface with a good, full, round bristle brush. Then again, painters are apt—if the paint used is a little heavy or the parts to be covered are difficult of access—to add an excess of thinners to save labour, and reduce cost of material.

It is known that the durability of any oil paint depends largely upon the number of particles of pigment, the better protection to the binder and to the metal underneath —the evil of thinning paints too much is therefore obvious. A layer of air exists on all surfaces—hence the importance of rubbing out the paint thoroughly, as otherwise bubbles of air may be discovered which, coming through the paint, render the coating porous.

The Adherence of Paint

would no doubt greatly increase if it were possible to heat the surface by artificial heat; but when painting is done on the job, it is impracticable to warm and dry the metal artificially; however, it is a good plan to apply the paint heated to a temperature of 100 to 120 degrees Fahrenheit, especially when the temperature of the air is below 55 degrees. This is easily attained by placing the cans of paint in pails of hot water. It is important to always note the atmospheric conditions when painting is being done—a temperature of 70 degs. F., and an atmosphere free from moisture, favour the right kind of drying; in fact, the humidity is more harmful than a low temperature. Nothing retards drying more than dampness and darkness.

To aid in the inspection of new work, a shop-coating of linseed oil is often specified. This does, in a measure, protect the iron from rust; but a very uneven film of dried oil is often obtained by this method of treatment. Oil applied to a vertical surface runs off until the layer reaches a certain thickness. When the current meets with an obstruction, it piles up into a thick and uneven coating. The thick parts of the layer may require months to harden into a substance firm enough to be fit to paint over. The results are also most disastrous in cold weather, when oil thickens and contracts, and—as painters express it—"Oil, when applied to a cold steel, crawls, wrinkles, and crinkles."

If oil is used as a primer on steel, it should be used hot, not warm; then it will penetrate the skin of the metal, and we shall probably obtain a thin and even film, hard enough to form a surface to receive paint.

Many places—such as the under and inner sides of girders, boltheads, nuts, rivets, etc., which should be painted with the greatest care to prevent the incursion of water—are often neglected.

To aid inspectors and clerks of works, a proper check upon the workmanship can be secured by selecting different colours for several coatings, so that the uncoated or defective places may be readily detected.

To Secure Durability

with paint, it should always be used fairly thick—and then well rubbed out with the brush into thin and even layers.

From experiment with an ocular micrometer in connection with a microscope, I found that a single coat of dried paint varied in thickness from 1-500th to 1-1,000th of an inch—the difference being due no doubt to the manner of application, that is to say, whether under light or heavy pressure of the brush. We do not realise enough the thinness of a coat of paint, or the strains to which its dried film is subjected.

Much has been said and written of late regarding the apparent failure of paints, enjoying a good reputation, when applied to structural steel. From a limited personal knowledge, and from information gained from others, I am led to conclude that some contractors use less of the paint specified than has been presumed. What they do use is frequently applied in the open, under such unfavourable weather conditions, and under conditions of painting contracts at such a low rate as to preclude the possibility of either employing competent workmen to apply the paint, or such application of same as to prevent corrosion. The best paint in the world illegitimately thinned with cheap oils, Japans or turpentine substitutes, is practically rendered of little protective value; and to apply it to structural steel more or less covered with rolling-mill scale, dew, frost, snow, slush, grease, etc., is waste of time and material throughout.

There is no reason to-day why paint applied to steel should not wear well, provided it is used under fair conditions, applied by honest workmen, and enough time allowed to elapse between each coat. I venture to suggest that the only way to secure better painting is to employ competent and vigilant inspectors and clerks of works, who will carefully superintend the painters' work.

Paint tests may be of three kinds—viz., chemical, mechanical, and physical.

Chemical Tests.

"Chemistry is physic applied to atoms and molecules." A chemical analysis is applied to very small quantities of the substance used, and the accuracy of the results obtained from it depends largely upon the method of sampling. When one considers that all pigments are allotropic, that no two lots of paint liquids are really alike, and that any prepared paint changes more or less in one way or another, with age, the chemist's test is proved to be of value, in so far as it relates to the matter, subject to his analysis and determination; and no further.

The general ideal of a chemist is that of one who can analyse material substances and determine the exact composition. The main study of the progressive paint maker of to-day is now synthetic chemistry; that is, the forming, combining, and reconstructing substances into new forms.

Chemistry can no doubt tell us the things that have been used in making certain paint; it may possibly foretell some of the phenomena that may develop; but I doubt whether it can foretell its *vis viva*—that is, what the paint will do; and what it will do is the only true measure of its value and worth.

"Essentially heterogeneous bodies excite chemical affinity." Can it be supposed that a chemist can possibly know the affinities

---

*** Abstract of a portion of a paper read by Mr. Gaston Depierres at a meeting of the Paint and Varnish Society. An abstract of the first portion appeared on page 301 of our issue for April 7th.**

that exist between the various materials used by the paint maker as well as can the competent paint maker himself? As a logical conclusion, I will say that the quality of a paint depends as much upon its physical as it does upon its chemical properties.

Mechanical Tests.

By this, I mean the tests made by a competent and skilful painter. No one can determine the working qualities of paint as well as the man whose eye, hand, and arm are perfectly trained through practice.

The importance of the proper application of paint receives less attention than it deserves. A poor painter may use 50 per cent. more material than a good painter will use, and get poorer results with it. Engineers and architects should demand the employment of competent artisans to do their painting; for results are quite as much dependent upon the intelligence and goodwill of the painter as upon the quality of the paint used. In confirmation of this, I may say that during all the years the company with which I am connected has been making tests of paints upon roofs, bridges, and test-plates of wood, iron, steel, and glass (while, of course, results have often been non-concordant, and we have noted great difference in durability, covering and drying properties), yet we have never had the paint blister, scale, or peel off. Why, gentlemen? Because each coat has been applied under proper supervision by an expert painter, with thought and care, to a clean surface in a fit condition to receive it; and the paint was, in each instance, protected when drying.

Physical Tests.

By this I mean weather tests, or the exposure of the dried paint or metallic or other surfaces to the destructive forces of nature; such as sunshine, rain, frost, dew, heat, cold, light, darkness, etc., etc., or to agencies which are frequently present in atmospheric air that shorten the life of dry paint, such as acid, gases, and vapours.

Comparative tests on limited surfaces—that is to say, small plates of steel or glass—are often misleading. In order to make such tests more reliable, they should be repeated a number of times to note whether the results are concordant.

Actual service tests under normal conditions give the most conclusive data to guide us; but so long as it takes years to make them, common sense dictates that paint users are right in holding fast to materials that have proved trustworthy until better are found.

Accelerated tests under "abnormally severe conditions" have little value unless the results obtained by the method selected will be in complete harmony with "long time service tests." It is easy to test the effects of artificial heat upon dried paint, but this does not determine with perfect accuracy the power of the paint to withstand sunshine.

No quick test exists to determine the probable life of paint under given conditions; but I believe that one intimately acquainted with the properties of the paint, and with the forces of nature, may reasonably predict its life—if he knows the method of application, the conditions under which it is to be exposed, and the state of the surface upon which it is to be applied.

Efforts have repeatedly been made by various Governments and institutions to establish a standard in the testing of anti-corrosive paints; but when these specifications are carefully studied by a competent paint maker, he soon realises that they fail almost completely to secure that for which they were intended. I dare say, gentlemen, some of you may even call to mind a good many specifications which only possessed the advantage of relieving the monotony of our daily routine by causing much amusement. In fact, some are quite impossible to fulfil.

Guided by the study of phenomena pertaining to subject matter, and reasoning by analogy from practice and experiments, the following conclusions can be reached with regard to structural steel coatings:—

First, that the surface of steel must be in fit condition to receive paint; otherwise it is better to use a cheap paint, tar or anything. Secondly, that to know the probable results to be obtained from the use of paint materials, one must know the following things about them: their history and mode of preparation, their physical properties, their chemical properties. Thirdly, that a competent paint maker can design a paint to meet any reasonable conditions of location, atmosphere, temperature, surface, application, drying and wear; but that in order to do so, he must know the conditions. That these being known, he should be entrusted with the manufacture of a coating to accomplish the result desired. Fourthly, that the priming coat upon the surface is the most important one, and that it should form a perfect foundation for those to follow. Fifthly, that under coats should dry harder and more quickly than those above, and that the difference in drying and elasticity between adjoining coats should not be very great. Sixthly, that the quality of the binder is as important as the quality of the pigment. Seventhly, that the quantity of weight of pigment used is as important as its quantity or volume. Eighthly, that the method of application is as important as the quality of the paint. Ninthly, that no accelerated tests can be the equivalent of a lifetime service test.

Theory is practice applied to atoms and molecules. Practice is theory applied to masses.

Discussion.

Mr. Cruickshank Smith said he was sure they were all agreed that they had listened to a most able lecture from Mr. Depierres. He had given them a brief survey of practically every point that one could imagine in connection with the manufacture and application of a protective paint. He had begun by dealing with what was logically the fundamental subject in connection with protective paints, viz, the foundation or ground on which they were applied, and in dealing with that part of the subject he had referred very briefly to the somewhat contradictory and conflicting theories in regard to the production of rust. He did not propose to discuss Mr. Depierres' paper fully at the moment, but he would revert very briefly to the main headings of the paper in order to elicit as full and wide a discussion as possible. First, there was rust formation, and in connection with that the lecturer had referred to what was a very important matter in modern construction; that was the embedding of large steel and iron girders in cement, and he had made a remark which might be termed the cry of many paint manufacturers, viz., how was it architects and engineers allowed these girders to be embedded in cement without having them coated in a careful manner to prevent corrosion? That was a point on which it would be useful to hear different experiences. After dealing with more or less scientific points, Mr. Depierres went on to deal with the composition of the paint, and he gave it as his opinion that in many cases too much oil was used in thinning the paint, and that a protective paint varied much in ultimate utility in proportion to the amount of pigment spread over a given surface. He thought that was a subject which some present might give an opinion on. Then it would be interesting to hear the expression of opinions on the subject of varnish paints. He thought Mr. Depierres had mentioned that varnish paints were better technically than those paints whose medium or vehicle consisted of oil and turpentine. It was a point on which there was great diversity of opinion. Then there were the methods of painting, scraping, cleaning, etc. There was also the question of ideal binders, that brought them again to the question of their old friend, driers. Mr. Depierres had also touched on the questions of the tendency on the part of certain contractors to carry out their contracts as cheaply as possible; the manner of testing and the matter of specifications. All these points were interesting, and he hoped that all present would contribute as heartily as possible to the discussion.

Mr. Oliver said with regard to the question of embedding steel in concrete, this was thrashed out by the Architectural Association some two or three years ago, and they then proved that steel did not deteriorate in concrete, and that rusting did not take place. They demolished buildings which had been standing some twenty or thirty years, and found that where the steel had been buried in concrete there was no rust present.

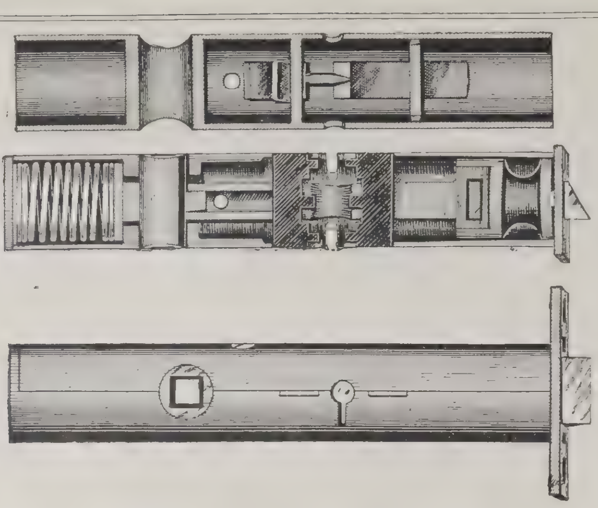
Mr. McIntosh said Mr. Depierres had used no chemical formulæ, and he thought that was a lesson to chemists, as it showed how interesting a lecture could be made without chemical formulæ. With reference to Mr. Oliver's remark, he thought there were recorded some results of experiments conducted in New York where diametrically opposite results to those he had mentioned had been obtained, and it was proved that the steel had corroded. Regarding the cleaning of iron, Mr. Depierres had mentioned hydrochloric acid and sulphuric acid, but he would not recommend the use of sulphuric acid for cleaning iron. Steel varied considerably in its composition, and a paint which would suit one kind of steel would not suit another. There were many processes of making steel, as Mr. Depierres had described, and to work thoroughly, and get at the very root of the matter, he thought a microscopic examination ought to be made of the steel. He was not a steel chemist, but he could see the force of that point. The impurities in the steel formed the nucleus for rust.

Mr. Robertson asked the lecturer whether he could give them some information as to the various grades of oxides of iron that were used in paint making. First they had the native red earths, then they had the artificial oxides, and a third group was the deep reds of the hematite class, and a fourth group was that of the magnetic oxides. Could the lecturer inform them whether magnetic oxides could be obtained in bright red shades?

Mr. Harrison said he was particularly attracted by the remarks regarding the presence of water in paint. He would like to emphasise that because he fully appreciated the difficulty of getting a paint which would be practically free from water. He thought manufacturers sometimes overlooked that important fact. Pigments undoubtedly contained water in varying quantities. He thought Mr. Depierres' remarks on that point were a warning to the trade generally. Another important point touched upon by Mr. Depierres was the inert character of pigments used in making protective paints; that said a good deal for barytes. With regard to red lead v. orange lead, he had taken some photo-micrographs of red lead, and on careful study of this material under a powerful lens he had come to the conclusion that it was a very crystallised substance. If orange lead was examined in the same way it would be noticed that it was much less crystallised, and he agreed with Mr. Depierres that orange lead should take the place of red lead for priming, owing probably to its greater absorptive powers of the oil or binding medium. He did not consider white lead suitable for painting iron. Speaking generally in regard to the question of protective coatings for iron and steel, it was his opinion that there would be no efficient paint for this purpose until they had efficient methods of application. They all knew that iron was a great conductor of heat. A thin film of water was usually found on cold iron, and the painting was often commenced on such a surface, with the result that rusting often occurred. He agreed with Mr. Depierres with regard to the heating. If it were possible to heat the iron, say, to the temperature of boiling water, he thought it would be found that the paint would adhere to the surface better. He should like to ask Mr. Depierres also if he could give them any information regarding the application of paint on the interior of a refrigerator.

(To be concluded.)

Mr. Samuel Thomas, of Manchester and Ansdell, has been selected by a special sub-committee of Blackpool Corporation for the office of quantities surveyor for the new Carnegie Public Library and Grundy Art Gallery.



THE STEVENS PATENT MORTICE LOCK.

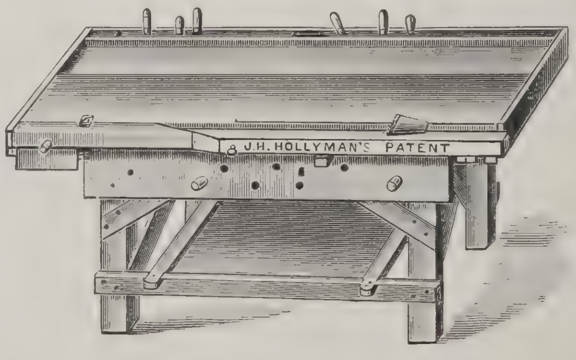
A lock that is constructed on a new principle, and is remarkably compact and strong, and of simple mechanical action. It has a spiral spring, and works with extraordinary smoothness.

A NEW MORTICE LOCK.

A mortice lock of unusual merits, of which a sample has been shown to us by the inventor, Mr. Arthur C. Stevens (the Stevens' Patent Lock Co., 199, Strand, W.C.; works, Willenhall, Staffs.), is shown in the accompanying illustration. The follower moves entirely without friction in a wide solid bearing; and, by the adoption of an entirely new principle, the bolt is drawn back by a projection on the side of the follower, the simple mechanical action ensuring the utmost smoothness of working. Other points in its favour are the simplicity in construction and action of the reversible bolt; the even running, rigidity, and superior durability of the spiral spring, and the ease and simplicity with which the lock can be fixed without mutilating or weakening the door, and without the worry of distinguishing between right and left hand opening. The wearing parts do not get out of order, as the action is almost frictionless. It is also impossible to unlock the door surreptitiously without using the proper key. Simple, compact, designed on sound mechanical principles, with no element of weakness, and sold at a low price, this lock is likely to become exceedingly popular.

AN IMPROVED WORK BENCH.

The "Hollyman" patent work bench, of which an illustration is here given, embodies many improvements on the old type of woodworking benches. Its main features being the patent gripping attachment, which, with the front edge of the bench, forms an instantaneous grip vice. It altogether dispenses with the familiar and clumsy bench-screw, all boards, battens, and the like, being clamped in a perfectly upright position, and evenly and rigidly gripped on both sides and along the whole length. The action may be compared to a parallel ruler. The work, when inserted, is fixed by the wedge-shaped front end of the sliding jaw being pushed forward, thus being made to engage with a corresponding recess, while at the back end there is a projecting arm underneath, working in a slot, in a direction parallel to the angular recess, so as to control the movement of this sliding jaw. The gripping power is surprising. There are no screw threads to wear out, and there is no part that can get out of order. Immediately under the front edge of the bench-top, and at intervals, are wooden supports, each turning on a screw centre for the purpose of being made as occasion requires to project below the opening of the vice to form a base for supporting work. Hence it is quite impossible for wood to slip down when under pressure of a plane, hammer, and chisel, etc. For example, the edges of two or more pieces can be planed together without the slightest fear of any of them slipping either down or sideways; thus turning them out all of exactly the same width. The work is released by withdrawing the sliding jaw by a knob attached to it. Along the inner edge of this sliding vice is a rebate, which is convenient for supporting lathes, mouldings, and any work narrower than the thickness of the bench-top. The projecting batten (at the back end of the bench, and on which the back end of the slide rests) has a step cut on it to prevent wood which is being planed backwards from slipping out. The holes in the side of the bench receive pegs (supplied with the bench) for supporting boards of various widths when edges are being planed, or holes are being bored, etc. There are two bench-tops, front and back. The front stop (Hollyman's improved registered) is of conical shape, about 2¼ins. long, and with teeth round the larger end. It revolves eccentrically upon a steel spindle let lengthwise into the bench, and can be instantly adjusted to any height simply by moving it round with thumb and fingers (a set screw bearing on the spindle keeping it into whatever position it is put). These rotary stops can be fitted to any bench. The back or tail stop is used in conjunction with the sliding parallel vice. It is formed of a piece of T-iron about 4½ ins. long; the upper part having teeth at one end, while the "stem" is held in the patent vice, which grips it firmly at any desired point along the bench. It holds down the back ends of boards that are being planed or carved, superseding the old-fashioned bench knife. There is a trough for tools, etc., and as the bottom of this is not a permanent fixture, it can be brought flush with the bench top by a simple arrangement, thus widening the surface. For holding tools there is a rack at the back, a tray underneath, and a drawer at front end; and if an instantaneous grip metal vice be required to be fitted to the bench, the drawer should be removed for that purpose. These benches are made in any size from 66ins. long, 24ins. wide, and 30ins. to 34ins. high. For use in technical schools (where it has been already adopted), double benches are constructed for two students to work at.



THE HOLLYMAN PATENT WORK BENCH.

This bench dispenses with the clumsy old screw-vice, and, besides an instantaneous gripping attachment, is fitted with many other ingenious arrangements.

OFFICIAL REPORTS.

THE NATIONAL FEDERATION.

Trade Boards Bill

On May 4th a deputation from the Employers' Parliamentary Council had an interview with Mr. Churchill at which representations were made as to the facilities contained in the Bill to extend its operation to other trades; this the deputation urged, should not be done without the direct sanction of Parliament. Mr. Shepherd said that the trades scheduled for the immediate application of the provisions of the Bill had been so scheduled as the result of an investigation which had afforded them an opportunity to be heard, and it was only right that other trades should only be scheduled after they had been made the subject of an investigation and had been allowed an opportunity to be heard also.

Mr. Churchill indicated, that while it was necessary to have some means provided for extending the operations of the Bill to certain other trades, it was not contemplated to extend them to properly organised trades having machinery for settling such matters themselves; and that he was in sympathy with the object of the deputation, and would propose certain modifications in committee which would, he thought, prove an adequate safeguard. On May 17th Mr. Churchill gave notice of the promised amendments with the object of securing that the provisions of the Bill shall only be extended by means of an Act of Parliament to other trades than those specified in the schedule. It is proposed that the Board of Trade shall have power to make a provisional order applying the Act, and shall afterwards present a Bill confirming the order. It will then be open to all parties interested to present petitions which will go before a Committee of either House; or, if the two Houses so order, a joint Committee of both Houses. The petitioners will appear by counsel in the usual way, so that all questions involved will be thoroughly considered. In spite of some opposition from the Labour Party, this amendment was carried in Committee.

Annual Return of Membership and Number of Men and Apprentices Employed.

Forms, for the 1909 return, have been sent to each Federation in sufficient numbers to enable each member to make the above return. The forms have been simplified, and so arranged that members may make their return under a reference number without appending any signature. It is hoped that the greater privacy so secured will induce all members to assist in making these returns as complete as possible.

Checkweighing Bill.

The attention of the County Federations has been called to the above Bill, with a request for any observations they may desire to make thereon.

N.A.O.P. Agreement.

A further meeting of the Joint Committee under above agreement was held May 25th, when the Sub-Committee's report was considered, slightly amended, and finally unanimously approved and remitted to the parties to the agreement for confirmation. The revised draft somewhat amplifies the scope of the agreement, while a re-wording of clause 5 has been adopted with the object of making the document clearer. Rules of procedure based on those in use in the Conciliation Scheme have been added, and provision has been made for the annual constituting of the Joint Committees under Rule 5.

National Board of Conciliation.

The annual meeting of the above Board was held May 25th. In addition to the usual formal business, an appeal of the carpenters and joiners of Swansea was heard and decided. The operatives asked for an advance of 1d. per hour and some reduction of the working hours; the employers also asked for an alteration of the winter hours but on different lines. The decision is that the wages remain as at present, but that the hours be altered in accordance with the notice given by the operatives. Notices by the Northern Centre for amendments and additions to rules were considered. It was decided that the rule as to voting should remain as at present. The rest of the proposals were adopted.

The resolutions of the National Federation as to the terms on which builders' labourers could be admitted to participate in the Conciliation Scheme were considered and adopted.

Two suggestions involving future amendments of the rules were considered and approved, and will now be remitted to the parties to the agreement for consideration, so that if desired the necessary six months' notice may be given in October.

Meetings of the Contract Sub-Committee and Bureau Sub-Committee have also been held.

Organisation.

The president and secretary visited Tunbridge Wells and conferred with some of the builders of that district with a view to the formation of a builders' association. The gentlemen present asked to be furnished with the necessary details to enable them to consider the proposal, and it was agreed to hold another meeting on June 8th to go further into the matter. Meanwhile they would speak to other members of the trade.—A. G. WHITE, Secretary.

The Northern Centre.

Lancashire, Cheshire and North Wales Federation.

BARROW-IN-FURNESS ASSOCIATION.

Secretary: J. Baker.

The monthly meeting of Barrow-in-Furness Master Builders' Association was held on April 27th. Before the commencement of the formal business of the meeting the Chairman referred to the death of Mr. Alderman Cox, who had been connected with the association ever since its formation. A vote of condolence with the widow and family was passed.

The matter of binding apprentices was discussed as raised by the operative plasterers, but final settlement was deferred.

The question of w.c. accommodation for workmen on building jobs was also dealt with in consequence of correspondence between the town clerk and the local trades council.

A sample of a calendar for the use of members, and with a view of keeping before the public works, offices, and general public a list of the members of the association, was submitted by the secretary and adopted. Three new members were balloted and unanimously accepted, and two other new ones were nominated.

It was resolved to subscribe to the fund being raised towards a testimonial for the retiring national treasurer.

It was arranged to hold meetings during the ensuing month of the rules revision committee and retail prices committee.

BURNLEY AND DISTRICT ASSOCIATION.

Secretary: C. Astwood.

The half-yearly meeting of the Burnley and District Association was held on Tuesday, April 20th, Mr. Samuel Smith presiding.

The Federation reports were read, also the circular relating to the proposed changes in the Administrative Committee, and it was deemed advisable to leave this arrangement with the Executive Board.

In the secretary's report for the half-year it was stated that the committee have had seven meetings, with an average attendance of seven at each meeting. With respect to a certain contract, for which tenders were invited without quantities being supplied, Federation members were advised not to tender. The contract, however, was let to a firm of non-members. It is further recorded in the report that this committee have approached the local architects soliciting their influence with respect to prompt settlement of accounts. Several favourable replies were received. The committee have under consideration the charges for water used on jobs in course of erection, and the secretary was instructed to write other towns in order to ascertain their charges for water supplied through meter or otherwise. The membership of the association showed an increase of five as compared with the preceding year.

LEIGH AND DISTRICT ASSOCIATION.

Secretary: S. Wigham.

In November, 1908, the operative painters of Leigh, Atherton, and Tyldesley gave six months' notice of their intention to demand an increase of wages of one penny per hour (from 8d. to 9d.), as and from May 1st, 1909. The masters offered them an advance of ½d. per hour as and from July 1st, 1909. The men refused the offer, and according to Rule VII., the subject had to be placed before an umpire. Both parties eventually chose Mr. W. Harrison (Mayor of Leigh) as arbitrator, who made the following award: (1) That as and from June 1st, 1909, to December 31st, 1909, the wages to be paid to the operatives shall be at the rate of eightpence halfpenny per hour; and (2) that as and from January 1st, 1910, the wages shall be at the rate of ninepence per hour.

LONGRIDGE AND DISTRICT ASSOCIATION.

Secretary: T. J. Watson.

The half-yearly general meeting of the Longridge and District Association was held on Friday evening, May 4th, Mr. Thomas Kay (president) presiding.

Various correspondence from the Lancashire, Cheshire, and North Wales Federation was read, and the general affairs of the association were considered.

Two new members were elected. Messrs. Alfred Blacklock, and Thomas Dolphin, both of Ribchester.

The annual trip (which has always been a strong feature of the social side of the association) was arranged to take place on July 15th, the place selected being Chester.

The Yorkshire Federation.

The monthly meeting of the Executive Council of the Yorkshire Federation was held at the Victoria Hotel, The Pier, Hull, on Thursday, May 20th. Councillor W. G. England, J.P. (vice-president), took the chair, and 48 delegates from affiliated associations were present.

The Chairman stated that the president, Mr. W. R. Thompson, of Dewsbury, had recovered from his illness. The Chairman referred to the death of an ex-president of the Federation, Mr. E. Good, of Hull, who had rendered yeoman service to the Federation, and had taken an earnest and active interest in its welfare, especially during the period of his office as president. The Chairman moved that an expression of deep regret and profound sympathy be conveyed to the relatives in their heavy bereavement, together with an acknowledgment of their appreciation of Mr. Good's valuable services. The resolution was passed in silence by the members standing.

On the motion of Mr. A. J. Forsdike, seconded by Councillor J. Dawson, it was resolved to tender to Mr. Day, solicitor, of Leeds, the appreciation of the Federation for his services in connection with the York case, which had been settled.

The Treasurer reported receipt of £5 3s. on account of subscriptions, and £25 6s. towards the National reserve fund. He also made an earnest request for an early payment of outstanding subscriptions, and reminded the Council that the appeal of the Federation in aid of the National reserve fund should receive loyal and generous support. On the motion of Mr. W. T. Ledgard, seconded by Mr. J. Biggin, accounts amounting to £85 19s. 3d., having been examined and recommended for payment by the Finance Committee, were approved and ordered for payment.

A report was presented showing that only 35 copies of the Federation Directory remained in hand out of the 1,000 printed. The issue had been most generously supported by a large number of associations, and would, it was estimated, yield a profit.

A letter was read from the Hull Association containing the observations of the Ocean Insurance Company on the suggested subcontract form. The Morley, Sheffield, and York Associations reported that they had considered and approved the form. The Wakefield Association suggested that the rate of interest for deferred payment to sub-contractors should be 15 per cent. per annum and not 5 per cent. On the motion of Mr. E. Quibell, seconded by Mr. A. J. Forsdike, it was resolved to request Mr. W. H. Hope, solicitor, of Sunderland, to prepare a draft form of sub-contract which incorporates the provisions of the Workmen's Compensation Act, and also includes the principles laid down in the suggested form, together with such other clauses as in his opinion are expedient and necessary.

The Leeds and Bradford Associations stated that there was considerable difficulty in making the inter-trading rule operative in their towns. The Morley and Sheffield Associations intimated their approval of the inter-trading regulations recently submitted to the local associations for observation. The Wakefield Association suggested that the words "whenever possible" should be added in two or three places. The Hull and York Associations stated they could not agree with the regulations as suggested, as they would conflict with their local rules.

ROBERT HALL,
Building Surveyor,
52, Frederick Street, BURY.

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following :—

The Measuring-up and Adjustment of Accounts,
Collection and Settlement of Accounts,
Assistance given in Estimating,
Annual or other Periodical Stocktakings,
Private Enquiries and Arbitrations undertaken,
or any other special work incidental to that of a Builder or Contractor.

The Finance and Emergency Committee recommended that the Federation should continue the arrangement with a syndicate of Lloyds' Underwriters for workmen's compensation insurance for another year at an increase of 10 per cent. on the present rates: the existing rates to be reverted to when the Building Operations and Engineering Works Bill becomes operative. It was stated that most of the insurance companies had experienced very heavy losses in connection with workmen's compensation risks, and it was anticipated that in many cases the premiums would be seriously increased. The endorsements on policies had been extended in their restrictions, limiting the liability of insurance companies and increasing the responsibility of employers. On the motion of Mr. A. W. Sinclair, seconded by Mr. A. J. Forsdike, it was unanimously resolved to approve of the recommendation of the Emergency Committee, and members were earnestly requested to give the scheme their serious consideration, seeing that the terms compare most favourably with those of insurance offices, while the complete indemnity given and security afforded is unsurpassed.

On the motion of Mr. A. W. Sinclair, seconded by Mr. A. J. Forsdike, it was declared that any negotiations for collective insurance which may be necessary in the future should be carried out direct with insurance companies by the secretary of the Federation, and that it be an essential condition that the Federation and local association secretaries be recognised as agents.

A letter was read from the National secretary with respect to the sending of priced schedule with tenders. It was reported that the custom obtains in Yorkshire of engineers and railway companies requiring priced schedules to be forwarded with tenders. In some cases arrangements had been made for the schedule to be sent under seal and returned in the event of the tender not being accepted. Many local authorities also ask for the same procedure to be adopted, and where it was not possible to get this waived, members were strongly advised to send in the schedules under seal, with an endorsement that the same is not to be opened in the event of its not being accepted. In most cases the local authorities return the schedule unopened, in accordance with an agreement which has been made with the local associations. This custom is not adopted in Yorkshire by architects. They only require the priced quantities to be sent in at the time when the contract has to be signed. A copy of the quantities is subsequently filled in and forwarded by the architect to the contractor. Cases have been known in which mistakes have occurred in making this copy, and some considerable difficulty has been experienced in obtaining rectification when the final account was under consideration. It was therefore suggested that the architect should forward a blank copy to the contractor when intimating acceptance of tender, in order that the contractor may fill in and deposit same with the architect.

The subject of checkweighing in the Various Industries Bill was carefully considered. While it was felt that the building trade might not be directly affected by the provisions of the Bill, attention was drawn to the growing practice of inserting clauses in Government Bills enabling a Secretary of State to bring other industries within purview of the Bill by the issue of an Order. On the motion of Mr. J. Biggin, seconded by Mr. A. Moulson, the Federation expressed the opinion that it is most inexpedient that the provisions of any Act introduced to meet the peculiar requirements of specific trades, or which were admittedly of an experimental nature, should be extended to other industries by the issue of an Order by a Secretary of State.

The question of labour exchanges and unemployment insurance was considered, and it was realised that the building trade would be particularly affected by any legislation on these matters. It was resolved, on the motion of Mr. A. W. Sinclair, seconded by Mr. J. Biggin, earnestly to request the National Administrative Committee to take steps to ensure that the interests of employers are fully safeguarded, and also to endeavour to obtain from the Government equal facilities with regard to consultation, assistance, and advice as have been or may be accorded to trades unionists.

The minutes of the Northern centre, dated April 21st, 1909; of the Northern Centre Conciliation Board, dated May 18th, 1909; and the April report of the Lancashire, Cheshire and North Wales Federation, were read and considered.

It was reported that Mr. J. T. Levitt, of Hull, had intimated that he did not desire to serve as a member of the Northern Centre Conciliation Board. On the motion of Mr. A. J. Forsdike, seconded by Mr. R. Finch, Mr. E. Quibell, of Hull, was appointed to fill the vacancy.

It was reported that several associations had not yet forwarded the comparative statements of hours and wages which were requested by May 1st. On the motion of Mr. S. Coop, seconded by Mr. A. W. Sinclair, it was resolved to remind the local associations of the value of the comparative statements, and request that the necessary information be supplied at the very earliest convenience in order that the printed abstract may be absolutely complete and up-to-date.

An invitation was read from the Barnoldswick Association for the Federation to hold the June meeting in that town. On the motion of Mr. Forsdike, seconded by Mr. Quibell, it was resolved to leave the arrangements for next meeting in the hands of the president and secretary.

The Hull Association had kindly chartered a vessel in order that the delegates might inspect the Humber. A large number accepted the invitation, and the sail was greatly appreciated, the weather being gloriously fine. The delegates were subsequently entertained to tea, and a vote of thanks was tendered to the president and members of the Hull Association for their kind arrangements and generous hospitality.—J. Davidson, 14, Park Row, Leeds.

BRADFORD ASSOCIATION.

Joint Secretaries: J. Davidson and J. H. Hopkinson.

The annual meeting of the Bradford Local Conciliation Board was held on Tuesday, May 11th. Mr. T. E. Taylor was in the chair, and all the members, with one exception, were present.

The chairman said it was a matter of congratulation that the spirit of harmony and goodwill which prevailed between the employers and operatives had been strengthened during the year, and that there had been no necessity for a meeting of the Board to deal with any matter of dispute.

The following officers were re-elected, viz.: Mr. T. E. Taylor, chairman; Mr. F. Firth, vice-chairman; and Messrs. J. Davidson and J. H. Hopkinson, joint secretaries. A vote of thanks to the chairman concluded the meeting.

HULL ASSOCIATION.

Hon. Secretary: A. Peers.

The monthly meeting of the Hull Association was held at the Builders' Exchange, on Tuesday evening, May 11th, Mr. E. Quibell presiding. Mr. E. Good, who had been an active worker in the interests of the association, and also a past president (1904) of the Yorkshire Federation, had passed away that day at "Riseholme," Sutton-on-Hull, after a very sudden and brief illness, and the members, after rising as a taken of their regret, desired that a letter expressing their deep sympathy be forwarded to the widow and family.

Correspondence was considered which had passed between the association and the operatives' societies respecting the arranged general week's holiday in August, and the matter was relegated to the management committee.

A recommendation from the management committee to admit Mr. G. H. Stonehouse, who had become a partner in the firm of Messrs. J. Jackson and Sons, into membership was accepted. Mr. F. Hall was also admitted to membership.

The criticisms of an insurance company upon the new sub-contractors' agreement issued by the Yorkshire Federation were discussed. It was decided that any further opinions and criticisms be obtained, and then discussed.

The date for the annual outing to Pateley Bridge was fixed for Thursday, June 24th, and not Wednesday, June 30th, as previously stated.

A report of the last Federation meeting was given by Mr. Quibell. The arrangements in connection with the visit of the Yorkshire Federation for their monthly meeting on June 20th, were announced as follows:—Meet at the Vittoria Hotel, Nelson Street, at 12.30 p.m., where light refreshments would be provided. Sail up the river Humber from 12.45 to 2.30 p.m., starting from the Corporation Pier. Business meeting at 2.45 p.m. at the Vittoria Hotel. Tea to be served about 4.45 p.m. In the event of unfavourable weather preventing the sail, arrangements will be made to have the visitors taken to inspect some of Hull's historic buildings.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

The monthly meeting of the Leeds Association was held on Tuestay, May 11th. In the absence of the president, Mr. O. Mawson, vice-president, occupied the chair. Apologies for absence were reported from Messrs W. Irwin and W. H. Dews.

A letter was read from a member resigning the appointments he held on various committees on account of pressure of time. All the members present, while appreciating the circumstances in which the member was placed, urged upon him to withdraw his resignation, and promised that every consideration and assistance would be extended to him by the members. The member concerned stated that he was willing to meet the wish of the members.

It was decided to appeal to the members with respect to the National reserve fund, and the amounts of subscriptions reported as received were ordered to be forwarded to the Yorkshire Federation.

The minutes of the Yorkshire Federation were read and considered.

Leeds Local Conciliation Board.

The annual meeting of the Leeds Local Conciliation Board was held on May 4th. A letter was read from the president (Mr. Wm. Irwin) regretting his inability to be present, and in his absence Mr. W. T. Newlove (vice-chairman) presided.

The officers were all re-elected, viz.:—Mr. W. Irwin, chairman; Mr. W. T. Newlove, vice-chairman; and Messrs. J. Davidson and T. Holmes, joint secretaries.

An informal discussion took place as to the desirability of an agreement or rule being mutually agreed upon by which the association or society receiving notice of alteration of rules at the last moment should be in a position, within a prescribed number of days, of giving a counter notice if considered expedient. No resolution was passed on the matter.

The recognition of notices of claims by the operatives' secretary under the Workmen's Compensation Act, and the alteration of winter working hours, were also informally discussed.

SHIPLEY AND DISTRICT ASSOCIATION.

Secretary: J. Davidson.

A general meeting of the association was held on Wednesday, May 5th. The reports of the National and Yorkshire Federations were discussed, and several points of interest were particularly considered. Arrangements were made for the annual meeting of the Local Conciliation Board. County Councillor Joseph Midgley referred to his interesting experience as a member of the recent deputation to the continent *re* town planning, housing, etc., and mentioned several particulars which had impressed him in respect to these matters.

WAKEFIELD AND DISTRICT ASSOCIATION.

Secretary: J. Beaumont.

The monthly meeting of the members of this Association was held at the Bull Hotel, Wakefield, on May 6th, Mr. Tom Lee (president) in the chair.

After the confirmation of the minutes of the last meeting, the minutes of a meeting of the Executive Council of the Yorkshire Federation, held at the Town Hall, Dewsbury, on April 15th, were read, and a supplementary report on various matters dealt with at such meeting was made by the president, and Mr. H. Fallas, who represented the Association at that meeting.

The meeting was occupied some time in considering certain suggested regulations dealing with the reciprocal relations of members of the Association and Yorkshire Federation, and the purchasing of materials from manufacturers and merchants, which regulations had been submitted by the Yorkshire Federation to the Association for consideration. It was ultimately decided to approve the regulations, subject to some slight suggested amendments thereto.

The form of contract prepared by the Yorkshire Federation to be signed by subcontractors was also dealt with, and on the motion of Mr. Crook, seconded by Councillor Spink, a resolution was passed recommending the Federation to make an alteration therein as to the amount and rate of interest to be paid by head contractors to their sub-contractors on moneys due to the latter under the contract, and retained in hand by the former beyond the specified time.

Wakefield and District Building Trades Conciliation Board.

The annual meeting of Wakefield and District Board was held at the Bull Hotel, Wakefield, on May 13th.

At the commencement of the meeting Ald. Judge, the retiring chairman, took the chair, and proposed the election of Mr. J. Pashley as chairman for the ensuing year. The proposition was seconded by Mr. H. Green, and Mr. Pashley was unanimously elected. On the proposition of Mr. J. Bagnall, seconded by Alderman Judge, Mr. H. Green was elected vice-chairman. The hon. secretaries were re-elected on the motion of Alderman Judge, seconded by Mr. H. Slade.

After the election of officers, a discussion took place on several matters affecting the building trade, and on the objects of the Conciliation Board.

YORK ASSOCIATION.

Secretary: J. Hague, Solicitor.

An executive meeting of the York Association was held at the Old George Hotel, Pavement, on Thursday, May 6th, at 8 p.m. Mr. W. E. Biscomb presided. The minutes of last meeting having been read and confirmed, the chairman referred to the loss sustained by the association since the last meeting in the death of Mr. H E. Turner, a past president and most valued member. He moved that a letter expressive of the association's sympathy be sent to the widow and family of deceased. Mr. C. Dent endorsed the chairman's remarks, and the resolution was carried by the members standing.

The Yorkshire Federation's suggestions as to interpretation of inter-trading by those associations who have adopted the rule were considered in detail. Suggestions 1 and 2 were unanimously rejected and disapproved of so far as York was concerned. The interpretation was unsuitable for the working of the local association, and its adoption would mar the effectiveness of the rule and hinder the progress of the association.

The last suggestion was considered unnecessary, having regard to the preceding ones, but (although unnecessary) the principle was disapproved of by the members. There was no objection to the other suggested interpretations of rule.

The proposed form was considered by the members, and approved, and reference was made to the clause relating to insurance against third-party risks, which was a risk increasingly necessary to be provided for. Correspondence was read and rates compared with reference to this risk, and finally a scheme was recommended to be placed before the members at the next general meeting. The secretary was asked to obtain as much information as possible, so as to impress upon members the gravity of the risk and the necessity for adequate provision being made against it.

It was unanimously resolved to purchase copies of the Federation Directory, at the special preferential rate, and present them free of charge to members.

The secretary reported that the pageant committee had agreed to allow applications for special workmen's tickets to view the three dress rehearsal performances, to be sent collectively through him, and he had accordingly notified all members of the fact. The secretary's action was approved, and the hope was expressed that arrangements would be made to allow of the workmen attending these special shows.

The question of the proposed annual excursion was adjourned for further consideration and report to the next executive meeting.

Messrs. H. Braithwaite and Co., Ltd., were elected members of the association.

A letter was read from the local secretary of operative bricklayers enclosing draft of new rules and asking for masters' interpretation of a clause relating to walking time in one of the existing rules. The secretary was asked to reply giving the association's ruling.

The following were unanimously elected to sit on the local Conciliation Board for the coming year: Councillor Sharp (chairman), Councillor Mansfield, J.P., and Messrs. W. Bellerby, W. E. Biscomb, H. Colman, and R. Dent.

Northern Counties Federation.

SOUTH SHIELDS.

Secretary: J. G. Robertson.

A special meeting of the South Shields Association was held in the Victoria Hall on Thursday, May 6th, the president, Councillor J. T. Armstrong, presiding.

The Chairman explained that the meeting had been called as the result of the action of the Sunderland and South Shields Water Company in refusing to connect the water to a member's new houses when requested to do so. He then called upon the secretary to read the correspondence that had passed between the water company and the Association on the subject. To the question as to why they had refused to connect the water in the case referred to, the water company's reply was that it was because the water pipes had not been inspected by one of their inspectors previous to their having been covered up. The water company, having been asked for a explicit statement of their requirements, replied that, pending the issue of their new regulations, they had given their inspectors the following instructions:—I.—That all service pipes should be laid at a minimum depth of 2ft., and inspected before being covered up. II.—That in all new buildings all lead joints shall be proper wiped plumbing joints. III.—That, whereever possible, taps should be placed inside; or, if not practicable to put tap inside, to be efficiently protected against frost or other injury.

After a long general discussion on the above, it was eventually agreed to fall in with the water company's suggestion, and to meet the water company's chief inspector in order to discuss the matter, and Messrs. J. T. Armstrong, A. Ross, W. Brown, and the secretary, were appointed to meet him for that purpose.

It was unanimously agreed to write the Member for the borough, Sir W. S. Robson, K.C., M.P., Attorney-General, protesting most strongly against the Budget proposal of an additional 10s. per cent. stamp duty on property transfer, and to ask him to use his influence in trying to get it removed; the Association believing the addition will seriously affect the building trade, and will stop for some time any hope of selling property. The members also intend to ask the Tyne and Blyth Federation to join in this protest.

It was agreed that in future the monthly meeting should be held on the first Tuesday of every month.

As the result of a long discussion on the question of accident insurance, it was resolved to invite Mr. Creasor, of the Federated Builders' Insurance Co., to attend the next meeting in order to put his company's proposals before the Association.

It was resolved to write the glass merchants in the town with reference to their terms.

The chairman and secretary referred to the "Builders' Journal," and urged members who were not already subscribers to become so. Several members present spoke to the great value of the journal, the amount of information it contained, and as to its great usefulness to all engaged in the building trade and the benefit they had personally derived from reading it.

STOCKTON-ON-TEES ASSOCIATION.

Secretary: W. C. Creasor.

At a meeting of Stockton-on-Tees and District Association held on May 4th, Mr. T. Brown, in the absence of the president, presided over a good attendance of members.

Mr. J. Routledge, lime merchant, of Ferryhill, was accepted as an honorary member.

The Secretary reported that he had approached the Master Painters' Association on the question of affiliation with this association, and was still awaiting a reply. The secretary's action was approved.

A long discussion took place on the amended form of sub-contract, submitted by the Teesside Association Executive, and it was decided to recommend the formal adoption of this agreement; but at the present time it was not to be made compulsory on all members to use it.

Owing to increased membership, an extra representative was required, on both Teesside and Federation Committees, and it was unanimously decided to elect Mr. Wintersgill, slater, for the former committee, and Alderman T. B. Watson, plumber, for the latter committee.

It was decided to support the suggestion that the Teesside executive should arrange for a summer outing.

It was also decided to support the suggestions for a uniform starting time for all trades in all the towns covered by the Teesside and District Association, and for an apprenticeship indenture form for the same district.

A report of the Northern Counties Federation meeting was presented by the secretary, and discussion ensued thereon, principally in relation to the national form of contract.

TEES-SIDE AND DISTRICT ASSOCIATION.

Secretary: W. C. Creasor.

At a meeting of Teesside and District Association Executive Committee, held on May 6th at Stockton, Mr. J. Proud (president), of West Hartlepool, presided over nearly a full complement of the committee.

The chief interest centred in the question of the form of sub-contract drawn up by this committee, and reports were received from the local associations. After a lengthy discussion, it was decided formally to adopt the agreement (which is printed in another portion of the present issue), but not to make its use compulsory at present, and the secretary was ordered to have 500 copies printed at once.

On the question of apprenticeship indenture forms, it was reported that further supplies of the National form could not now be obtained from the National Federation, and it was decided that we adopt this form as a Teesside form, and that copies be printed at once; a scale of wages for apprentices in the different trades to be also compiled.

Reports were received from the local association on the question of uniform working hours for the district for all trades, and it was thought that it would be well to ask the operatives to send representatives to an informal conference to discuss this question, the secretary to arrange date and other details.

The Secretary reported that the annual meeting of Conciliation Boards was due to be held in May, and it was decided to make no change in the representation on our side.

It was decided to have a summer outing, the secretary to confer with the local secretaries and submit details at next meeting.

Midland Centre.

The fourth annual meeting of the Midland Centre Conciliation Board was held at Leicester, on May 18th, under the chairmanship of Mr. John B. Whitehouse (Birmingham).

The secretaries' annual report stated that the past year had not been quite so free from disputes in the Midland Centre area as the previous 12 months. The difficulties, however, which had arisen had not been of a very serious nature, and their settlement had proved conclusively the value of the various Conciliation Boards. The Midland Centre Board had had to deal with 3 disputes, one of which (the first since the inauguration of the Board) it had been unable to settle. Difficulties had been settled locally at Birmingham, Leicester, and Newark. Three new local Boards had been formed since last annual meeting—at Stourbridge, Redditch, and Bromsgrove. The report was approved.

The joint secretaries were instructed to take steps with a view to the formation of other local Conciliation Boards in the Midland Centre area.

A resolution was passed recommending the National Board to admit the Builders' Labourers to the full benefits of the Conciliation Board scheme. The proposals of the Northern Centre for amending the National Conciliation Board rules were considered, and the National Board were recommended to approve the suggested addition to rule 2, and (with slight verbal alteration) the two proposed new rules. The National Board were recommended not to alter rule 13 (decisions and voting).

Mr. F. Camm (Amalgamated Society of Carpenters and Joiners, Nottingham), who has been vice-chairman of the Board for the past 12 months, was appointed chairman for the ensuing year. A hearty vote of thanks was accorded Mr. J. B. Whitehouse (Birmingham) for his valuable services as chairman of the Board since its inauguration in March, 1906. Mr. Fred. H. Fish (Nottingham) was appointed vice-chairman, and Messrs. F. W. Amphlet and J. Blount (Derby) were re-appointed employers' and operatives' secretaries respectively.

It was decided to hold the next annual meeting of the Board in Worcester. An appeal from the West Bromwich Local Conciliation Board was then considered. The employers had given notice of alteration of working hours so that the time for starting in summer should be 6.30 a.m. instead of 6 a.m. The carpenters and joiners had refused to accept the alteration unless an advance of ½d. per hour in wages were made. Councillor H. Smith, who represented the employers, stated that the West Bromwich Master Builders wished to secure uniformity of working hours in all branches, and that the bricklayers, masons, and labourers had accepted the alteration. In view of the lower rate of wages in adjoining towns and the depression in trade, the time was inopportune for an increase in wages.

Messrs. J. Thursfield, J.P., D. Parkes, and W. Neale represented the operatives, and stated that they wished to secure uniform wages as the employers wished to secure uniform hours of work. The carpenters had for some time desired to be placed on the same level as the bricklayers, but (owing to the state of trade) had refrained from asking for an advance. They would not have done so now, if the employers had not given notice as to the hours of work. The Board decided, by the cross vote, that the working hours of the carpenters and joiners of West Bromwich should be the same as those arranged with the bricklayers, stonemasons, and labourers, and that the rate of wages per hour should remain as at present.

In view of the proposals of the Northern Centre to alter No. 13 of the general rules,

it is interesting to note that this is the second dispute decided by the Midland Centre Board within the past two months, by a majority of one cross vote, and in both cases the verdict was in favour of the employers.—Fred. W. Amphlet, Employers' Secretary, 58, New Street, Birmingham.

South-Eastern Centre.

SOUTHAMPTON AND DISTRICT ASSOCIATION.

Hon. Secretary: A. T. Doggrell.

The annual meeting of the Southampton Association was held at the Royal Hotel, April 29th, when there were a large number of members present.

Notices having been received from the operatives of all trades asking for an increase of wages of 1d. per hour and sundry alterations of rules, it was agreed to appoint a date to receive deputations from the various trades, in order to point out to them the impossibility of increasing wages while trade remained in such a depressed state. The balance sheet for 1908 having been received and adopted, the election of officers resulted in the following being appointed:—President, Mr. J. P. Beer; vice-president, Mr. W. R. Franklin; hon. treasurer, Mr. J. T. Othen; hon. secretary, Mr. A. T. Doggrell; assistant secretary, Mr. S. J. Moore; hon. auditor, Mr. J. Franklin; committee, Messrs. Cawte, Grace, Hampton, Dyer, Jordan, Marshall, Stevens, Cook, Rashley, Franklin (G.), Lewis, Jupe, and Kimber (S.); Conciliation Board, Messrs. Cawte, Stevens, Beer, Marshall, Dyer, Franklin, and Doggrell (hon. secretary). Other business dealt with by the meeting included the election of a new member, and a proposal to write the town clerk pointing out that the National Form of Contract is in general use amongst local architects and has recently been adopted by the Board of Guardians, and asking if his Council could see their way clear to adopt same—this was carried unanimously.

A vote of thanks to the chairman closed the meeting.

NORWICH BUILDING TRADES CONCILIATION BOARD.

Secretary: G. E. Whitrod.

The third annual meeting of this Board was held on Friday evening, April 30th, at Victoria Chambers, Bank Plain, Norwich, the chairman (Mr. G. Brown) presiding. The business was entirely of a formal character, and consisted of the election of representatives for the current year. The new representatives are as under:—Employers: masons, Messrs. G. A. Hawes and John Young; bricklayers, Messrs. B. E. Scarles and Frank Hurn; carpenters, Messrs. W. T. Scarles and W. S. Daws; plumbers, Messrs. W. E. Bird and R. A. Pank. Operatives: Bricklayers, Messrs. G. Brown and G. F. Hifferson; masons, Messrs. E. Green and F. Buttress; carpenters, Messrs. J. Newman and G. E. Beckwith; plumbers, Messrs. C. Lake and A. Pigg. The chairman appointed was Mr. B. E. Scarles; vice-chairman, Mr. F. Buttress. Votes of thanks were accorded to the retiring chairman and vice-chairman (Mr. J. S. Smith), for their services during the year.

Westminster City Council has received a communication from the superintending architect of the London County Council, enclosing a copy of a letter from Lord Curzon with reference to the proposal to re-name Charles Street, Whitehall. Lord Curzon points out that a sum of more than £5,000 has been contributed for the erection of a bronze statue of Robert Lord Clive, the founder of the British Dominion in India; that a site has been selected on the top of the proposed flight of steps at the St. James's Park end of Charles Street; and that the statue will therefore stand close to the India Office. It has been suggested that Milton Street would be a suitable name, but Lord Curzon points out that it would be strangely incongruous to arrive at Clive's statue by walking down Milton Street. The London County Council suggests that Charles Street shall be re-named "Clive Gate."

A POINT IN TOWN PLANNING.

By G. Cadogan Rothery.

By no means the least valuable addition to the Housing and Town-Planning Bill as re-introduced into the House of Commons by Mr. Burns, is the new clause by which local authorities are compelled to prepare registers of housing accommodation within their areas, and to revise them every five years. If other provisions of the Bill are to become effective, this clause is indispensable, as it alone affords the machinery for gauging the actual needs of any locality. There is a tendency to criticise this innovation, on the ground that it would present many difficulties and entail heavy expenses. That this need not be the case in either respect in shown by what has been done in Paris on these lines, and that, too, on a more elaborate scale than is here proposed, and with other and far wider reaching aims in view. It is well worth while going into particulars, as we may draw some useful lessons therefrom.

It was as far back as January, 1894, that the Casier Sanitaire—or what we may call the House Sanitary Census—was inaugurated in two moderate rooms of an annexe to the Hotel de Ville. The work was entrusted to an official of the Prefecture of the Seine, M. Juillerat, Chief of the Bureau of House Sanitation. The aims kept in view were to assist the sanitary inspectors in their duties, and, mainly, to provide reliable statistics required as a basis for the study of certain important health problems. Very simple preparations were made. The inner of the two rooms referred to is sixteen feet square and thirteen feet high, and is completely lined with shelves divided up into pigeon-holes of varying widths. Each pigeon-hole contains a cardboard box, labelled with the name of a street, bearing the arrondissement number, and certain index figures affixed by rubber stamps. The boxes are classed by arrondissements (corresponding to our Metropolitan boroughs), and arranged alphabetically in each division. Inside the box is a plan of the street, showing its fringe of houses. Accompanying this is a ruled sheet of paper with printed headings, whereon are entered particulars as to length and width of street, nature of paving, sewerage and drainage, and water mains, and all other necessary information of this character. The boxes also contain cartridge paper wrappers or folders, marked with the number of individual houses, as well as name of street, and arrondissement numeral. There is a folder for every house in the street, square, or yard. On the inside of the cover there is a small tinted plan, showing area occupied by house and court yard, a section showing number of floors and indications as to drainage and water supply. Within the folder are a collection of differently coloured sheets of ruled paper, with printed headings. The first, white, gives a complete description of the structure and planning; floor by floor are indicated the number of rooms, their dimensions, sanitary accommodation, and number of inhabitants. A second sheet, printed on green paper, is reserved for records of deaths and occurrences of notifiable and certain other diseases (at the present moment: typhoid, measles, scarlatina, diphtheria, smallpox, whooping cough, cholera, tuberculosis, erysipelas, and puerperal fever). Then follows a yellow sheet, kept for records of any disinfecting operations carried out on the premises. On a brown sheet are tabulated reports furnished by sanitary inspectors, after visits following upon complaints received. Any orders made regarding cleansing or structural repairs and alterations are entered on a final sheet, which is also provided with ruled spaces for recording particulars as to legal proceedings, and reference numbers to files relating to the special case. If a house is pulled down, the folder and its contents are not destroyed; the cover is merely stamped with the word "Demolished." When a new house has been erected on the site, a fresh folder and record is prepared, the old one being included within the new folder for purposes of comparison. This practice has been found most useful by the health authorities and the social economy officers.

It will be seen that by adopting the above method the Paris Municipality is now in possession not only of an exhaustive register of dwellings, but a record of their hygienic history, with other data invaluable for the statistical officers. Already it has been possible to draw deductions, to note how certain diseases are localised, and to judge whether such localisation is due to natural conditions or to the structures themselves, or their grouping. Consequently the work done is gradually becoming widely appreciated, not only by officials, but by the public. Our own municipal authorities at home possess records of much of the information referred to above, but it is not collected or classified on any methodical plan analogous to that existing in Paris.

At the first blush the amount of labour involved seems stupendous, but as a matter of fact, as explained to me by M. Juillerat some few years ago when I visited his department, it did not involve the employment of a big staff. Begun in January, 1894, the work was brought to a successful conclusion in 1900. Yet, the Municipality possessed no special powers conferred either by legislation or ministerial decree. It was all accomplished by quiet, unostentatious extension of office routine work. For the preliminary stages (which occupied three months) the rating register was utilised, the labelling of street boxes and the house folders being prepared therefrom. But all else was blank, for this register is only a somewhat incomplete directory. All details had to be collected on the spot, district by district, although folders were also filled sporadically as the daily operations of the sanitary or building departments went on. Meanwhile every record is kept well up to date. It is somewhat remarkable that M. Juillerat, who has his other routine duties to attend to, has only two assistants for the indoor work of this Casier Sanitaire. Then as regards the outside work, even this entails little additional expense, for it is carried on not by a special staff, but by the existing officials, sanitary inspectors and disinfecting officers, whose reports are made use of as the basis for the records.

Certainly what has been done by the hard-worked officials of the Paris Municipality could well be done over here. In Paris there were no special legal facilities to smooth the way: here our local authorities will possess all the impelling force conferred by a definite clause in an Act, which should prove an immense help in the matter of saving time and also of securing thoroughness. As regards the financial side of the question, there is nothing to alarm the severest economist in the very moderate clause inserted in the Housing and Town-Planning Bill. Such registers should be easily and quickly prepared, even in populous cities, and should, eventually, form, with the co-operation of the Medical Officers' departments, a basis for a complete sanitary census on some such lines as briefly described above.

Coming Events.

Saturday, June 5.

Edinburgh Architectural Association, 117, George Street.—Visit to Glasgow.

Monday, June 7.

Royal Institute of British Architects, 9, Conduit Street, Hanover Square, W.—General Meeting (Business), 8 p.m.

Society of Engineers, Royal United Service Institution, Whitehall.—Ordinary Meeting.

Thursday, June 10.

Paint and Varnish Society, St. Bride's Institute, E.C.—Mr. M. B. Blackler, Ph.D., on "The Use and Abuse of Driers."

Thursday, June 10—Saturday, June 12.

Association of Water Engineers, 54, Parliament Street, Westminster.—Fourteenth Annual General Meeting, Durham.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 1—3. **UPTON PARK.**—Decorative repairs at the schools, Green Street, Upton Park, E., for the guardians of the poor of the parish of St. George-in-the-East. Specification upon personal application to R. Murray Lochner, clerk, guardians' offices, Raine Street, Old Gravel Lane, E.

June 5—22. **HELSBY.**—Erection of new school for 200 children at Helsby, for the Cheshire C.C. Application may be made for bills of quantities to the architect, Joseph Holt, A.R.I.B.A., 9, Albert Square, Manchester, not later than June 5, after which date bills of quantities will be issued, and drawings, specifications and conditions of contract may be inspected at 9, Albert Square. All applications must be accompanied by a deposit of £2. Tenders, marked "Helsby New Council School," must be sent to Geo. F. Ashton, clerk to the sub-committee, 71, High Street, Runcorn.

June 7. **PONTYPOOL.**—Erection of a hall in connection with St. James's Church, Pontypool, for the Rev. G. Gower (vicar) and committee. Plans, etc., of D. J. Lougher, architect, Bank Chambers, Pontypool, to whom tenders are to be sent.

June 7. **BRIDLINGTON.**—Erection of new buildings in extension of the Bridlington high school for girls. Drawings, etc., on deposit of £1 with John Bilson, architect, 23, Parliament Street, Hull. Tenders to be delivered to Geo. G. O. Sutcliffe (clerk to the governors), solicitor, Bridlington.

June 7. **ROBERT TOWN.**—Alterations (all trades) to the Wesleyan Church, Robert Town. Drawings and specifications in the vestry. The architect will be in attendance to answer questions on Tuesdays and Thursdays, from 4.30 p.m. to 5.30 p.m. Tenders to be sent to E. Vincent King, A.R.I.B.A., architect, 24, Westgate, Dewsbury.

June 7. **COVENTRY.**—Erection of proposed workshop, Dale Street, for the Triumph Cycle Co., Ltd. Plans and specification by Herbert W. Chattaway, architect, Trinity Churchyard, Coventry, may be seen, and all particulars obtained, of Herbert W. Chattaway, architect, Trinity Churchyard, Coventry, to whom tenders are to be sent.

June 7. **AWBRIDGE (SOUTHAMPTON).**—Erection of an additional classroom for forty children, and a cloakroom at Awbridge council school, for the C.C. Plans, specification, and conditions (no quantities), of W. J. Taylor, county surveyor, The Castle, Winchester. Tenders to be delivered to H. Barber, clerk of the C.C., The Castle, Winchester.

June 7. **RAVENSTHORPE (YORKS).**—Erection of a new club and caretaker's house in Foundry Street, Ravensthorpe, for Ravensthorpe Liberal Club. Plans and specifications, for masons, joiners, slaters, plasterers and plumbers may be seen on application to the caretaker of the club, 238, Huddersfield Road. Tenders to be sent to J. C. Cartwright, Craven Street, Ravensthorpe.

June 7. **ECCLES.**—Erection of three shelters in the recreation grounds, also supplying labour in fixing a Jarrah wood fence in the Winton recreation ground, for the corporation. Erection of a hose drying tower in the town's yard, Patricroft, for the watch committee. Plans, etc., may be seen at the office of the borough surveyor, of whom bills of quantities may be obtained on receipt of £1 1s.

June 8. **BARROW-IN-FURNESS.**—Alterations to windows, Rawlinson Street Schools, for the corporation. Plans, bills of quantities and forms of tender of the borough engineer, town hall, to whom tenders are to be sent.

June 8. **SPENNYMOOR.**—Construction of a subway under the North Eastern Railway, for the Spennymoor and Tudhoe Gas Company. Plans and specifications at the company's offices, 32, Thomas Street, Spennymoor, where tenders are to be delivered.

June 8. **USK (Mon.).**—Erection of a new council school, to accommodate 96 children, at Usk, for the Monmouthshire education committee. Plans and specification and bills of quantities on deposit of £2 2s., with C. Dauncey, C.C. offices, Newport, to whom tenders are to be sent.

June 8. **CONISBOROUGH.**—Alterations to conveniences, erection of playsheds, etc., etc., at Conisborough Morley Place provided school (builder, joiner, slater, plumber, plasterer, painter, asphalter, and heating engineer), for the West Riding C.C. Bills of quantities, whole or separate tenders, of W. R. Hudson, Education Offices, Mexborough.

June 8. **BIRMINGHAM.**—Erection of chimney stack and extensions to engine foundations, etc., at electric generating station, Summer Lane, Birmingham, for the corporation. Advertisements are accepted for 3 insertions for the price of two, and six announcements are given free in the Employment Register to advertisers seeking situations who order three insertions of their advertisement (see "Employment Register").

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion for the first four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements can be received up to 5 o'clock on Monday evening.

ABLE Draughtsman (24), 9 years' experience; structural and ornamental ironwork, desires post in London or Southampton, office or outdoor.—Z., 36, Bartholomew Villas, London, N.W. 5082

ACADEMY (Royal) exhibitor prepares perspectives on moderate terms; specimens sent; also designs, plans from rough sketches, drawings, tracings, competition work, etc.—Box 4983, Builders' Journal Office.

ADVERTISER, with six years' practical experience and a knowledge of bookkeeping and office routine, desires situation in builder's or estate agent's office.—C. J. Mountei, 24, Hillfield Road, West Hampstead, N.W. 5028

A "B.B.B."—The British Business Bureau (Architects) 140, Fleet Street, E.C., can recommend several first class assistants. Particulars free on application. No fees. 5066

ADVERTISER, (30), seeks situation in Drawing Office rapid tracer, colourist, good printer; used to making tracings for reproduction. Experience gained in architects' offices.—Box 5057, Builders' Journal Office.

ARCHITECT. Surveyor and Constructional Engineer fully qualified, seeks engagement, 15 years' experience, moderate salary; would represent good constructional firm.—Box 5063, Office of the Builders' Journal.

ADVERTISER seeks position as junior assistant, 3½ years' experience; excellent draughtsman, surveying, levelling, book-keeping, general office routine; highest testimonials; low salary.—Box 5045, Builders' Journal Office.

AN experienced young architect, with small connection, desires position or work at own office; prolific designer and rapid draughtsman; specifications, etc.—"C.," 24, Hainthorpe Road, West Norwood, S.E. 5026

AN Architect's Assistant desires re-engagement; town or country; neat and quick draughtsman; thoroughly capable; moderate salary.—M. P., 358, New Cross Road, S.E.

APPOINTMENT as Improver (19), just completed three years' articles with architect; good draughtsman, tracer, etc.; excellent testimonials; moderate salary.—J.S.C., 10, Almeric Road, Clapham Common. 4993

ARCHITECT'S Assistant desires re-engagement in a good London office; eight years' experience; good references; experience in competition work.—B. E. Atkinson, jun., 14, Rosslyn Hill, Hampstead, N.W. 5018

ARCHITECT'S Assistant (27), good draughtsman and colourist; contract drawings, designs, details, perspectives, surveys; travelling studentship winner; specimens.—H. C. S., 65, Grove Road, Norwich. 5025

ARCHITECT'S Assistant (24), disengaged; Inter. R.I.B.A., 6½ years' varied experience, town and country; working drawings, details, and perspectives; levelling, reinforced concrete details; assist with quantities.—Riches, 35, Culverden Road, Balham, S.W. 5013

ARCHITECT'S Assistant (23), 6½ years' experience; excellent draughtsman, working drawings, details, specifications, surveying; assist with quantities; first-class references.—H.B., 23, Springfield Road, Bury St. Edmunds. 5001

ARCHITECT'S Assistant (23), student R.I.B.A. 6½ years, varied experience, working drawings, details, levelling, surveying, drainage, specifications, quantities; excellent references; town or country; salary moderate.—Bernard A. Dyer, 3, St. Peter Street, Hereford. 5085.

ARCHITECT'S Assistant (23), excellent draughtsman, desires re-engagement; six years' first-class experience; contract, detail and competition drawings, specifications, perspectives (exhibitor at Royal Academy); prizeman for architectural design; highest references; moderate terms.—F.E.T., 10, Cobham Road, Kingston-on-Thames. 5015

ARCHITECT, 32, qualified, seeks any position where his services would be available; energetic; disengaged; mod. salary.—Box 5006, Builders' Journal Office.

ARCHITECT, civil engineer (26), building, municipal, and engineering experience, desires immediate appointment; good draughtsman; quantities, surveys, levels, sewage, railway, domestic and industrial buildings; testimonials; moderate salary. —Box 5080, Builders' Journal Office.

ARCHITECT'S Assistant, engagement wanted; member Society of Architects, 11½ years first-class provincial public and domestic work; drawings, specifications, assist quantities, supervision; permanency; age 27; salary £3 3s. — Box 5081, Builders' Journal Office.

ARCHITECT'S Assistant seeks engagement; 14 years' experience; plans, details, specifications, quantities, surveying, dilapidations, and levelling; excellent references.—C. G., "Brooklyn," Leas Road, Guildford.

ARCHITECT'S Assistant disengaged, good all-round; design, construction, specification, supervision, dilapidations, surveying, etc.; excellent testimonials.—H., "Bowood," Heronsgate, Ricksmansworth, Herts.

ARCHITECT'S Assistant seeks engagement; good draughtsman; working drawings, details, surveying, levelling, and quantities; eight years' experience.—Owen, "Meadowside," New Queen Street, Chesterfield.

ARCHITECT'S Competent Assistant desires engagement; many years' practical experience; designs, details, specifications, superintendence, surveying; two guineas.—Arch, 23, Lavenham Road, Wandsworth, S.W.

ARCHITECT and Surveyor's junior assistant (22), 4½ years' experience, desires re-engagement; neat and expeditious draughtsman; working drawings, surveying and levelling.—Williams, "Brynderwen," Pontyclun, Glam.

A.R.I.B.A., disengaged shortly, London training; chief and senior assistant in leading provincial offices; expert designer, and experienced in all branches.—A. G., "Beverley," Yardley Wood Road, Moseley, Birmingham.

ARCHITECT'S Assistant (23), capable draughtsman; good constructionalist; would go on trial for permanency; town or country; temporary work 35s.—H. J. W. E., 1, St. Dunstan's Road, Hanwell, W.

ARCHITECT'S Assistant (22), desires re-engagement in London office; contract drawings, details, surveys, double scholarship holder; Stage III. Building Construction.—Smeed, 24, West Ham Lane, Stratford, E. 5050

ARCHITECT, prepares designs, working drawings, specifications, on moderate terms; assistance rendered, town or country.—Box 5,036, Builders' Journal Office.

ARCHITECT'S Junior Assistant (20), 4½ years' experience, West End and country offices; working drawings, details, perspectives, competitions, general office routine; excellent draughtsman and tracer. Highest references; salary 25s.—G. W. S., 26, Cowley Road, Ilford, Essex. 5056

AS traveller, constructional steel, or founders; good connection architects, builders; good estimating and draughtsmanship; over 22 years' experience.—W. 61, Royal Hill, Greenwich. 5077

BUILDER'S Clerk, used to double entry, dissecting time sheets, etc.; good general experience; draughtsman; within 60 miles radius.—Henry, 4, Plimsoll Road, Finsbury Park, N. 5037

BUILDER'S Book-keeper, 9 years' excellent reference from present employer. All books, double entry, prime costs, accounts, trading and profit and loss accounts, etc.—Box 5049, Builders' Journal Office.

BUILDER'S Assistant (30), wants position with large provincial builder, accurate surveyor and estimator; extensive experience with architects' settlement and accounts; has revised present temporary employers' routine, and obtains accurate and immediate information on all matters; gives entire satisfaction.—Malpas, Much Hadham, Herts. 5071

BUILDER'S and Contractor's Assistant (29), thirteen year's experience, all branches, including roads and sewers, asphalting, etc.; plans, specifications, quantities and accounts, shorthand, and typewriting. — Box 5069, Builders' Journal Office.

CLERK (24), requires situation in building trade; 7 years' commercial experience; 4 years' in building trade; bookkeeping, correspondence, and general routine; excellent references; moderate salary for prospects.—Box 5068, Builders' Journal Office.

CARPENTER, and French polisher wants situation, young, capable workman, good refs.; moderate wage.—C.P., 21, Redstone Road, Redhill, Surrey. 4989

CLERK of Works, disengaged, well up in all trades; levelling and surveying; best references; abstainer.—R. E., 3, Oakfield Road, Stroud Green, London, N. 5084

CONTRACTOR'S or surveyor's assistant desires situation; experienced in measuring, leveling, setting out, accounts, supervision; good references, moderate salary for permanency. Could invest small sum.—Box 5074, Builders' Journal Office.

DRAUGHTSMAN (26), home or abroad, neat, quick tracer and colourist, working drawings from rough sketches, bookkeeping and general office routine; foreign experience.—H.W., 64, Crofton Road, Camberwell, S.E. 5003

ENGINEER, mechanic, desiring change, requires permanent situation on staff, official or private; thorough all-round general experience; married.—J.G., 86, Bathurst Gardens, Willesden, N.W. 5011

GRAINING wanted, piecework; distance no object; best work only.—C. Monk, Oakdene, Parkfield Road, Willesden, N.W. 4951

GENTLEMAN, with good connection amongst architects and builders with offices in Westminster, is open to undertake agency for London and district for good provincial firm.—Box 5072, Builders' Journal Office.

JUNIOR (20), 4 years' experience, good draughtsman, quick and accurate leveller and surveyor, building, sewerage, water supply, abstracting, billing quantities, typewriting, shorthand; salary no object.—S.F.H., 16, Dodington, Whitchurch, Salop. 5032

JUNIOR Assistant, disengaged; good knowledge of domestic architecture.—Reply, J. R. F., 248, Sandycombe Road, Kew Gardens, S.W. 5031

MASONRY, manager or foreman, machinery and all details, all classes of masonry work; London and country experience; terms moderate.—G.B., 38, Napier Road, Tottenham, London. 4975

FRENCHMAN, Architectural Draughtsman, having an office at Rouen (France) is willing to accept representation of English articles used in building.—Write Ledien, 39, Petherton Road, Highbury, London, N.

SHOP-FITTING, or high-class joinery, advertiser (38), seeks situation as foreman in shop-fitting or high-class joinery works; can take full control; 9 years' references; abstainer.—Box No. 5007, Builders' Journal Office.

SIGNWRITER, Grainer and Decorator, good; fill up time, Paint, Paper; 10 years' reference; permanency, or estate; can take charge.—B.B., 58, Moffatt Road Thornton Heath. 5070

TYPEWRITING, tracing, shorthand, good class work, requiring intelligence and accuracy, can be undertaken in spare time by architect's clerk.—Address, "Typist," 2, Marsham Street, Westminster. 5043

YOUTH wants situation, surveyor's or builder's office; four years' experience; working up quantities, measuring up, good draughtsman; scholarship holder; excellent testimonial.—J. R. O., 233, Essex Road, N. 5017

Appointments Vacant.

CLERK wanted (junior), knowledge of building trade; quick, and good education; salary 10s.—Apply, Architects' Technical Bureau, 24, Hart Street, Bloomsbury. 5079

WANTED.—Two smart young men for travelling Lancashire and Yorkshire, to sell high-class, widely advertised specialities used in the building trade. Knowledge of and connection in, the Varnish and Enamel trade a desideratum, but not absolutely necessary. Good opening for really live travellers.—Apply Box 5058, Builders Journal Office.

Businesses for Sale.

BUSINESS for sale, North London builder and decorator, large jobbing trade, turnover averages £3,000 per annum; price £400, including large plant, horse and van, trucks, compact premises; large yard, workshops, stabling; illness cause of selling. — Write, Frank Edwards, 43, Moorgate Street, City. 5054

PICTURE Framing, artists' colourman, decorating, jobbing, and undertaking business for sale, in important Surrey town. Only £180 is asked for an old-established business which, under energetic management, would provide a good income. Fire connection. Spacious premises with excellent double-fronted shop; splendid position; low rent.—Agent, Reginald C. S. Evennett, F.A.I., Farnham, Surrey, and at Haslemere and Hindhead. 5075

Competitions Open.

TO ARCHITECTS PREPARING COMPETITIVE DESIGNS.

SCHEMES FOR ENGINEERING WORK, with approximate Estimates, furnished free of charge by Strode and Co., Lighting, Heating, and Ventilating Engineers, 48, Osnaburgh Street, London.

June 9, 1909. Volume 29. No. 748.

The Middlesbrough Competition.

The feeling of chagrin among the unsuccessful competitors in any architectural competition is doubtless very natural, more especially at a time like the present, when the building trade is in a depressed condition and commissions are scarce. It is essential, therefore, that the feelings of the unsuccessful competitors shall not be rendered more acute by any suspicion that they have been unfairly handicapped. It is our uncongenial duty, however, to chronicle yet another competition, that for the Middlesbrough new Public Library, in which the award has caused much soreness, and is to be made the subject of an organised protest. There is no imputation of *mala-fides* in the matter. The Assessor is a very talented and highly skilled architect, with a wide knowledge of the planning of libraries and other public buildings, and there is no question that the design selected by him is the best submitted; but it is the contention of the unsuccessful competitors that this design ignores the conditions in several vital and important particulars, and that only by ignoring the conditions on these governing points was it possible to produce such a good and workable plan. In the drawing up of the conditions the Assessor had no part; and we understand that he was only appointed after the designs were sent in. The difficulty that has to be faced is one in the ethics of assessing. Should an Assessor select the best of the designs submitted to him, or should he select the best design conforming to the conditions laid down, presuming that the conditions are unsatisfactory—as, indeed, they were in the present instance? We have stated more than once that the heroic course, where such problems confront him, is for the Assessor to resign; but as this step might nullify the whole competition, the next best thing is for him to select a design that conforms to the conditions, to register in his report his strong disapproval of the conditions, and to name the design that he considers the most successful of all those submitted. The initial difficulty lies, of course, in the drawing up of conditions in an unskilful manner, and it is incredible to us that if public bodies consider it necessary to employ skilled advice in the selection of designs, they do not find it equally necessary to avail themselves of skilled assistance in drawing up the conditions on which those designs are to be based. In the case of the Middlesbrough Library, the promoters seem to have gone far to forestall the real object of the competition. They not only laid down requirements as to the rooms required and their sizes, but dictated the positions in which the principal rooms were to be placed. Surely the aim in a competition is to discover the architect who can put together the required accommodation in the most skilful and workable manner. It has been contended by one of our contemporaries that these particular conditions were so loosely drawn that any competitor was quite justified in ignoring them. We do not agree. Conditions should never be ignored by either the Assessor or the competitors. To follow them or to ignore them as one feels inclined, simply invites chaos, and would reduce competitions to a farce. Moreover, in the Middlesbrough competition the conditions were particularly definite, and uncertain points were made clear by the supplementary answers to questions. One competing firm, who were inclined to modify the conditions in order to frame a better plan, made enquiries on this very point, and they have shown us the Town Clerk's reply, in which it is distinctly stated that the Assessor would be asked to base his award upon the conditions laid down. A protest against the award has, we understand, been signed by one hundred and two of the unsuccessful competitors, and there has been some idea of taking legal action in the matter.

The Union of the Arts.

Sir William Richmond's plea for a method of artistic training devised to bring the architect, the sculptor, and the painter into closer and more sympathetic relationship is one which should appeal to all artists; for, whilst we are unable to accept Ruskin's uncompromising assertion that architecture is decoration and sculpture and nothing else, it will be very generally admitted that carved ornamentation and coloured decoration are elements of that art. It is extremely difficult to determine to what extent architects should be required to study the sister arts of painting and sculpture before they can be regarded as masters of an art in which the science of construction rightly holds the largest share. Whilst it is true that, in past epochs of art, architects have won immortality either as painters or sculptors, and, on rare occasions, as both, yet the exigencies of modern architecture now require from the exponents of the art so large an amount of technical knowledge as to render it impossible for the architect of to-day to possess more than a comparatively slight acquaintance with the technique of the art of his confrères, the painters and sculptors. Thus, whilst nothing but good could result from a systematic course of training in which students of architecture, painting, and sculpture worked side by side, we fear that the devotees of "the Mistress Art" would be unable to afford the necessary time to enable them to develop, to their fullest extent, any inherent or acquired taste for painting and sculpture. After all, as Alfred Stevens told us long ago, there is but *one* art; and the true artist, be he painter, sculptor, or architect, will realise and frankly admit the unavoidable limitations of his knowledge of those branches of art with which, owing to want of facilities for acquiring it, he has been unable to become intimately acquainted. A general comprehension of art, and a sedulously developed taste in it, he will possess as a matter of course.

The Sweet Uses of Adversity and Whitewash.

Whitewash, scorned and contemned of the artist, has often, in the sequel, turned out to be conservative of his works. Many are the churches, for instance, in which the removal of whitewash has revealed beautiful painting but little the worse for its venerable age; while the destruction of plaster has occasionally exposed rare moulding and carving that, thanks to its incarceration, has been preserved in almost the same condition as that in which it left the hands of the mediæval masons. Thus out of evil cometh good. The vandals and Puritans whitewashed and plastered better than they knew. A recent instance is reported from Fiesole, and we rejoice to know that the rescue-work has been accomplished by an Englishwoman. Miss Emily Stephens, having heard from the Sisters of the Convent of St. Girolamo that remains of frescoes were visible in a disused chapel enclosed by farm buildings belonging to them, obtained permission to do what she could to unmask the hidden beauties of the walls. Removing the dirt and whitewash from an entire wall of the sanctuary, the lady was rewarded with the revelation of an almost entire "Pieta," comprising six figures and angels. The work is probably of the fourteenth century, and the composition is Giottesque, but the types suggest Sienese influence, and at present it is impossible to assign the work to any known artist. At any rate, the painting has been pronounced by experts to be of great beauty and interest, and the experience should make both demolishers and renovators more than ever careful to conduct their operations with delicacy and expectancy.

Architect and Corporation. Architects and builders know to their cost that bargaining with elective corporations is like building on shifting sands. The corporation of to-day will with a light heart and an easy conscience repudiate the obligations of the corporation of yesteryear; or the powers that are above corporations may suddenly step in and render a contract of non-effect, to the undoing of the professional or business man who is party to it. Something of this kind seems to have happened at Cardiff. Some seven or eight years ago, Mr. Edwin Seward, F.R.I.B.A., was, we understand, commissioned by the Cardiff Corporation to prepare plans for a municipal museum, and Mr. Seward was formally appointed architect for the work. In 1905, the Government decreed that a national museum should be erected at Cardiff, and it was decided that the designs for it should be obtained in open competition. Mr. Seward was then "quietly dropped from the scheme," without recognition of the rights naturally arising from his many years of work, and without taking any steps towards paying the large sums due to him. We gather that his claims in these respects are ignored, if not repudiated, by the City Council, and to his protest and his appeal for investigation no response has been forthcoming. The National Council, however, have repudiated his position in the matter. The only remedy that seems open to the architect who has been thus shabbily treated is to oppose the Corporation's Parliamentary Bill, and it would not be surprising to hear that, in the absence of reparation, he had decided upon taking that course. Such opposition would place the Bill in jeopardy, and would probably prove far more costly to the Corporation than a just recognition of the architect's rights. Mr. Seward's attitude throughout seems to have been marked by dignity and restraint; and as he himself remarked to a representative of the Press, ' It is an extraordinary feature of the case that all along I appear to have the goodwill of almost every member of the corporation; but events have, perhaps, ruled rather than persons.'' It is one of the little ironies of the situation that it was Mr. Seward himself who proposed that the municipal museum should be made to assume a national character. Possibly the corporation is actually without the power to compensate Mr. Seward for his labours, to say nothing of his disappointed hopes. If that is the case, it is time that the law bearing upon the responsibilities of corporations was made more equitable. The invidious position in which Mr. Seward has apparently been placed ought not to be possible in a civilised community. Such cases seem to cry aloud for the prompt and determined intervention of the R.I.B.A.

London's Healthy Dwellings. Mr. John Burns, who is surely London's most ardent lover, now appears to claim that it is a health resort of the first order. In opening, at Whitechapel on Thursday last, the exhibition that has been organised by the National Association for the Prevention of Tuberculosis, he declared that in the fight against consumption, London was more successful than other great cities of the world, mainly because of her system of small houses. London has only eight persons per house, while Berlin has seventy-seven. Finsbury, Glasgow, Berlin, Paris, and New York all proved that the one-room tenement was the haunt of disease. He was glad that London builders no longer erected houses with basement rooms, and that cellar dwellings were doomed. He realises very clearly, however, the potency of personal habits in the prevention, or the promotion, of the terrible white scourge—the great plague of great cities. An important influence, he said, was "common sense operating by immediate personal and practical means." Windows and the registers of fireplaces should be constantly open. The fetish of the workman's parlour ought to be overthrown. It should not be reserved as a museum for wax fruit, stuffed birds, and china dogs, "sacred to the landlord, the insurance man, the undertaker, and the doctor—a place where children dared not enter, and even the father was a trespasser. The parlour should be put to common daily use, increasing the space of the home by at least twenty-five per cent."—the space of the home, observe, not the space of the house. It appears, then, that, generally speaking, London sets an example in the building of healthy homes, but not all the people are careful to keep them healthy. Mr. Burns, of course, is not an original censor of the sacrosanct front parlour. Many architects have devised small dwellings in which the parlour is superseded by a real living-room. The difficulty is to keep the living-room sufficiently spic-and-span and tidy for the reception of the grandees or supermen enumerated by Mr. Burns. To keep the front parlour select is, for the very poor, the only way to prevent the carpets and furniture from getting shabby, and the wall-paper from becoming dirty. The builder of small dwellings, therefore, will be reluctant to interpret Mr. Burns's homily as applying to planning; but it will encourage the good and growing custom, in which London has taken the lead, of building healthy separate dwellings rather than big barrack-like buildings, which, the larger they are made, become the less homelike and the less healthy.

The June issue of the "Architectural Review" (Caxton House, Westminster; price 1s. net) contains, as frontispiece, a view of the Radcliffe Library, Oxford (James Gibbs, architect). Under the heading, "The Practical Exemplar of Architecture," are given views and measured drawings of an early eighteenth century staircase at Brent House, Brentford; and of a fine doorway at Bocking High Street, Essex; and there is a note on "Staircases and Doorways." Notes of the Month deal with "The Study of Architecture," "Sculpture and Painting at the Royal Academy," "St. Paul's Cathedral," "Flower Beds," and "Town Planning." Buckland House, Berks, is described by Mr. Edward Warren, F.S.A. (five illustrations). The salient features of the Selfridge Store are shown in a series of interesting views and details; and the Churchill Cottage Homes, built to the designs of Messrs. Silcock and Reay, are shown in half-a-dozen illustrations. Mr. Walter H. Godfrey contributes an interesting note on the survey of Chelsea; and the reviews of books deal with "Old Interiors in Holland," "French Châteaux and Gardens in the Sixteenth Century," "Greek Buildings Represented by Fragments in the British Museum," etc., etc.

R.I.B.A.

Result of Council Elections.

The result of the balloting for the new Council was declared at the general business meeting on Monday evening. The Council and officers for the next session, 1909-10, are as follows: —

President: *Ernest George.

Hon. Secretary: Henry T. Hare.

Vice-Presidents (4): Professor Reginald Blomfield, A.R.A., M.A., F.S.A., A. W. S. Cross, M.A., E. Guy Dawber, *James S. Gibson.

Members (18): *J. J. Burnet, A.R.S.A., Max Clarke, W. A. Forsyth, *J. Alfred Gotch, F.S.A., Alex Graham, F.S.A., †Edwin T. Hall, *George Hubbard, F.S.A., *H. V. Lanchester, *Edwin L. Lutyens, *Mervyn E. Macartney, B.A., F.S.A., C. E. Mallows, *Ernest Newton, *A. N. Prentice, *Halsey Ricardo, *John Slater, B.A., †Leonard Stokes, *Paul Waterhouse, M.A., Edmund Wimperis.

Associate Members (4): A. E. Munby, M.A., Professor C. H. Reilly, M.A., H. W. Wills, A. Needham Wilson.

Representative of the Architectural Association: Henry Tanner, jun. (president).

* Re-elected.

† Past vice-president, re-elected on the Council.

THE A.A. SPORTS.

The Architectural Association Athletic Club Sports took place on Saturday afternoon last at the Stamford Bridge Sports Grounds, in dull and gloomy weather. There was a fair muster of members of the Association and their friends, amongst those present being Sir Henry and Lady Tanner, Mr. Walter Cave (late president, who acted as referee), Messrs. Henry Tanner, jun. (president), C. Wontner Smith, F. Dare Clapham, Edwin Quin, and T. L. Dale (who acted as judges), Mr. H. P. G. Maule (starter), Messrs. F. W. Parker, Alan Potter, and R. W. Cable (time-keepers), and D. G. Driver (secretary). The following were the results: —

100 Yards.—Heat I.—H. M. Whitehead 1, H. M. Archibald 2; time 12 secs. Heat II.—L. M. Gotch 1, P. H. Wyatt 2; time 12 2-5ths secs. Heat III.—T. C. Mannooch 1, A. F. Spencer 2; time 11 4-5ths secs. Final.—H. M. Archibald 1, A. F. Spencer 2, T. C. Mannooch 3; time 11 4-5ths secs.

Putting the Weight.—J. A. Cheston (30ft. 6¼ins) 1, P. E. Holland 2, L. Burton 3.

440 Yards Handicap.—H. M. Whitehead 1 (15 yards start), B. H. B. Symons Jeune 2 (10 yards), P. H. Wyatt 3 (30 yards); time 54 4-5ths secs.

Throwing the Cricket Ball.—S. A. Cowper 1 (86 yards), H. M. Archibald 2.

Hurdles.—Heat I.—A. F. Spencer 1, S. A. Cowper 2; time 20 2-5ths secs. Heat II.—J. E. MacGregor 1, Percy May 2; time 23 secs. Final.—S. A. Cowper 1, A. F. Spencer 2, Percy May 3; time 19 3-5ths secs.

Mile Scratch Race.—F. D. Sowerby 1, P. E. Holland 2, L. M. Yetts 3; time 4 mins. 48 1-5th secs.

Half-Mile Handicap.—H. M. Gale 1, B. H. B. Symons Jeune 2, L. M. Gotch 3; time 2 mins. 19 1-5th secs.

220 Yards.—T. C. Mannooch 1, H. M. Archibald 2, H. M. Whitehead 3; time 26 1-5th secs.

Mile Handicap.—C. Grellier (100 yards start) 1, P. E. Holland (scratch) 2, A. G. Blackford 3; time 5 mins. 1 2-5ths secs.

330 Yards Handicap.—H. M. Whitehead 1, H. M. Archibald 2, P. H. Wyatt 3; time 36 1-5th secs.

Long Jump.—S. A. Cowper 1 (18ft.), J. A. Cheston 2 (16ft. 11¾ins.), L. Binton 3 (16ft. 9ins.).

Walking Race (One Mile Handicap).—L. M. Yetts 1, H. M. Gale 2, A. S. G. Butler 3; time 8 mins. 48 4-5ths secs.

High Jump.—J. A. Cheston 5ft. 1in.

Three Miles Handicap.—F. D. Sowerby (scratch) 1, L. M. Yetts (150 yards start) 2, C. Grellier (200 yards start) 3. Only four finished; the winner lapped the second and third once and the last man twice; time 15 mins. 18 3-5ths secs.

440 Yards Scratch.—T. C. Mannooch 1, H. M. Archibald 2, A. F. Spencer 3; time 58 1-5th secs.

The Squire Shield for highest aggregate points in the various events competed for by the different sections of the Athletic Club went to the Rugby Football Section, with 33 points.

The Chelsea Borough Brass Band played various selections during the afternoon, and tea was served about half-way through the programme. The prizes were afterwards presented by Lady Tanner.

MIDDLESBROUGH PUBLIC LIBRARY COMPETITION.

The principal points of the conditions of the competition may be briefly enumerated as follows:—Each design submitted was required to give an estimate of the cost for the complete structure, which was not to exceed £12,000, exclusive of furniture and fittings. The drawings were to be limited to plans of each floor and roofs, elevations and cross-sections, all to scale of 8ft. to 1in. No perspective drawings were admitted, though reports explanatory of any details were allowed to be optional.

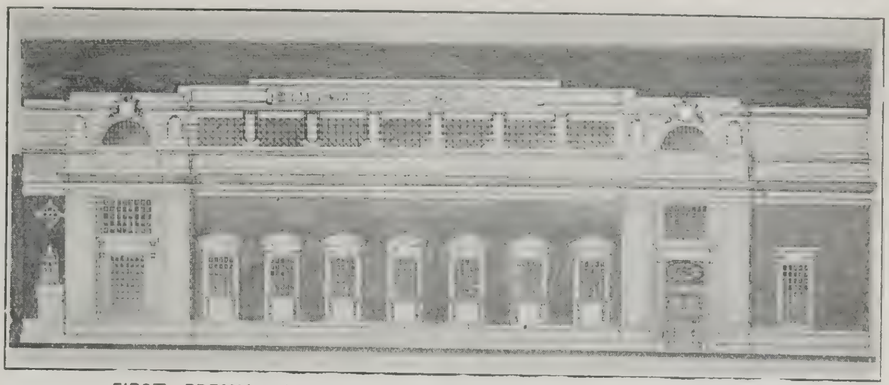
The choice of the professional assessor—Mr. J. S. Gibson, F.R.I.B.A.—was made later by the Free Library Committee, who were responsible for the framing of the conditions. Competitors now complain that several of he clauses were vague and unnecessary. n detailing the rooms required, however, he committee, instead of giving approximate uperficial areas, specified actual dimensions, t the same time explaining that small deviaons would not disqualify, a qualification of hich some of the competitors took full dvantage, whereas many others were handiapped by what ultimately proved to be a o literal reading of the conditions. The tter stipulated that the lending library hould be placed in the northern part of the lock adjoining the dwelling houses in Dunng Street. As will be seen from the plans, oth the first and second selected designs nored this condition.

Premiums of £50, £30 and £20 were offered r the designs placed respectively first, cond, and third—the premium on the scheme timately approved and accepted by the ouncil to be merged in a commission of per cent. on the actual expenditure up to e amount of the estimated cost.

The site, which is in close proximity to e Town Hall, is a rectangular corner block, ith frontages to Dunning Street and Grange oad East, and is practically level. A setck of 18ft. was to be allowed in the Grange oad East side, a projection of 3ft. being lowed for porches, bay windows, etc. The commodation required was to include on e ground floor a general lending library, out 67ft. by 39ft.; boys' and girls' reading oms, each about 31ft. 6ins. by 29ft., to be rved from the juvenile book store at a comon counter, and to be divided from each other a glazed partition running from the serce counter and provided with separate enances; a juvenile book store about 24ft. by ft.; a ladies' reading room, 22ft. 6ins. by ft.; a receiving, repairing, and catalogue om 23ft. by 10ft.; a janitor's room, about ft. by 10ft., with store, lavatory and w.c., d main entrance from general news room d access to other parts of building; a rnace, boiler and coke store, about 15ft. by ft., with direct access from janitor's room; general news room about 54ft. by 38ft. On first floor: a reference library, about 67ft. 39ft., immediately above general lending rary; a librarian's office, about 14ft. by t., with access to the reference library; law library, about 18ft. by 16ft.; a files om, also about 18ft. by 16ft.; a patents rary and extensions and lavatory and w.c.'s male and female staffs, etc., about 35ft. s. by 49ft. On the second floor (attic): a ff room, 14ft. by 16ft.; a space under gables be prepared as store rooms, and lighted m roof. The authors of the conditions to be commended for dispensing with any vision for public lavatory and w.c. acnmodation. The present writer's experie leads to the belief that such accommodan is entirely unnecessary, and when proed simply constitutes a general nuisance.

he extraordinary keenness which the comitive system has aroused was particularly istrated in this case—no fewer than 203 of drawings being submitted, for the exition of which the whole of the crypt of north block of the Town Hall was requisied.

he assessor's award (which has already



FIRST PREMIATED DESIGN. ELEVATION TO DUNNING STREET.
RUSSELL & COOPER, ARCHITECTS.

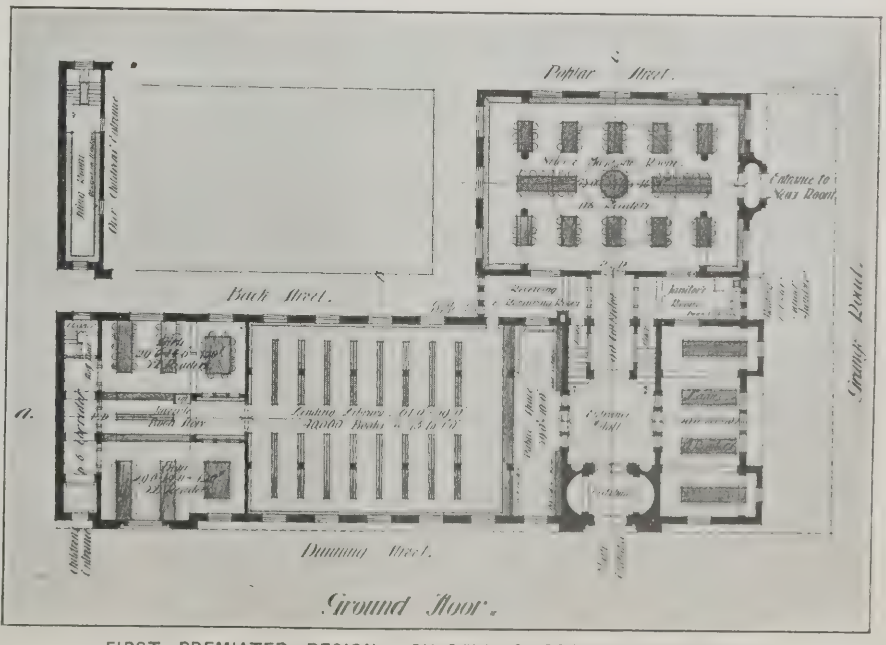
The elevations are unaffected and simple, and the fenestration is good. The bays on either side are rather high, and compete to some extent with the central mass.

been accepted by the Library Committee, and passed on to the Council for confirmation) seems to us to be, as regards the merits of the premiated designs, eminently satisfactory. The first selected design is that of Messrs. Russell and Cooper, 11, Gray's Inn Square, London, W.C.; Messrs. G. Wenyon and C. H. Potter, 194, Wolverhampton Street, Dudley, and Messrs. Cooper and Slater, 13, Richmond Terrace, Blackburn, are respectively the authors of the second and third successful designs.

Messrs. Russell and Cooper's plan is distinguished by extreme simplicity, resulting in general convenience, and the possibility of adequate supervision. Both the entrance portico and the ladies' room are of particularly pleasant shape, and the access to the latter through the main hall, on the same axis as the lending library entrance, is a very satisfactory arrangement. It will be observed that the boys' and girls' rooms are well placed with regard to the lending library; and the service of books to the juveniles from their particular store appears to us to be distinctly good, as also does the supervision, owing to the lending library being contiguous to the boys' and girls' rooms. The news room has the disadvantage of being approached by the somewhat meagre entrance from Grange Road East, and, being contained by external walls on two sides, is subject to annoying distractions from traffic outside. In the replies to queries, it was expressly stated that the only communication necessary between the news room and the other parts of the building should be through the janitor's room. Here a door, finishing the main axis of the hall, is provided; but it is generally found most satisfactory to isolate, if possible, the habitual occupants of the news room. We also cannot but feel that in supplying the room with top-light, as required by the conditions, it is rather unfortunate that this should be done by means of a dome springing suddenly from the flat surface of the ceiling, without any visible means of support.

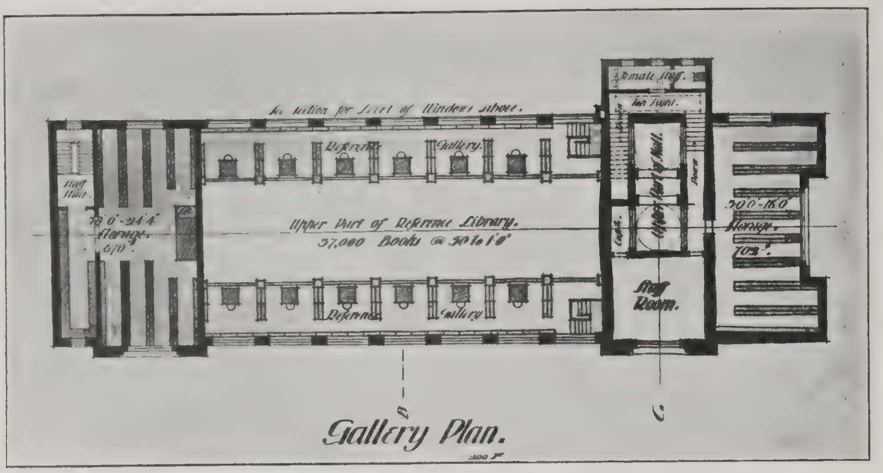
The arrangement adopted on the first floor with regard to the disposition of the reference, law, and patents libraries is much superior to that employed in some of the plans submitted, where access to the law and patents libraries can only be obtained by traversing the reference library. Although it appears to us that supervision would hardly be likely to be required for such libraries, yet it seems to have been this consideration that in certain cases led to such an arrangement. The administration rooms are fortunately placed, the back staircase giving almost direct access to the lending library from the librarian's room. The introduction of a special book-room opening off the latter is, in our opinion, a distinct advantage. With regard to the architectural treatment of the interior, we venture to suggest that in the reference library, the detail be somewhat lightened, and that the thin iron balcony and the heavy supporting columns be brought more into harmony. The desirability of this, we think, will be sufficiently clearly seen from the section. In short, the general character of the decoration would seem to warrant further consideration.

The main composition of the elevations is unaffectedly simple, and the fenestration well disposed. But we would point out that



FIRST PREMIATED DESIGN. RUSSELL & COOPER, ARCHITECTS.

This plan is distinguished by extreme simplicity, resulting in general convenience, and provides for adequate supervision. The access to the ladies' room is well arranged, and the boys' and girls' rooms are conveniently placed as regards the lending library.



FIRST PREMIATED DESIGN. RUSSELL & COOPER, ARCHITECTS.

The arrangement of the upper part of the reference library is very similar to that of the Patent Office Library in London, and provides for quiet study in the little bays, each of which can be devoted to books on one particular subject. Ample storage accommodation is also shown; and a lift for books.

the two balancing blocks in the main part, considered in themselves and in relation to the central mass, are rather unnecessarily high. In themselves they appear slightly attenuated, and in relation to the central mass they form undesirably competing features. On the side elevation, moreover, no attempt appears to have been made to bring the subsidiary mass of the news room into composition with the main building—though this, of course, would in any case be a problem of extreme difficulty.

Generally the design of the facades is a modern extension of the Georgian manner, with all the latest devices of detail; but it is nevertheless considerably above the average.

The second premiated plan, that of Messrs. G. Wenyon and C. H. Potter, though not so convenient on the whole as the first, exhibits several commendable features. It will be noted that the news room is shielded from traffic noises by the placing of the janitor's room and the store room on the outside, balancing on either side of the short entrance corridor from the main street—a very satisfactory device.

In the case of the juvenile rooms, however, the advantage derived from their having each a separate entrance seems to us to be nullified by the fact that this provision necessitates that the rooms be arranged longwise, resulting in their being of rather attenuated shape, and in consequence somewhat underlighted. The supervision throughout is excellent. In the elevation to Dunning Street we could have wished for a little more balance; and the decorative excrescences on the recessed face between the two main blocks have an appearance of crudity, whilst the windows in the latter, hanging from the architrave of the main entablature, are distinctly unfortunate.

The design of Messrs. Cooper and Slater, placed third, adheres more closely to the conditions than the other two premiated schemes, but in our opinion is not so generally convenient. In the disposition of the lending library, planned to balance the boys' and girls' rooms, the ladies' room and the receiving room, there is ingenious forethought, save for the fact that this arrangement involves an artificially lighted room. The planning of the juvenile rooms is one of the best shown, though their service counters from the book store might prove rather awkward. It will be observed that the secondary entrance asked for is here provided for the purpose of giving direct access. The news room is of good shape and well supervised, and the entrance is certainly less disturbing to the readers than that provided in many of the designs submitted.

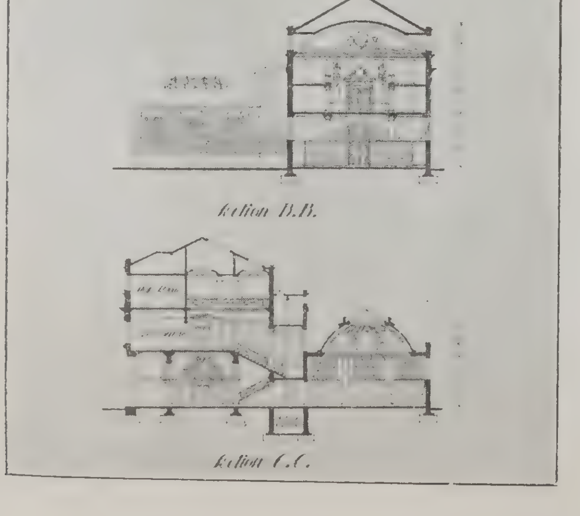
On the first floor the aforementioned symmetrical disposition of the rooms necessitates the introduction of an insufficiently lighted corridor communicating with the patents library and extension.

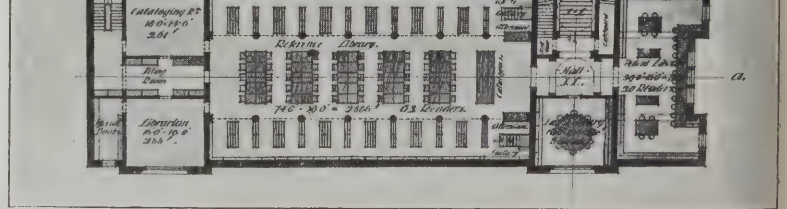
The elevations are composed with considerable success in their main lines, though we think the spacing of the windows is not quite as happy as might be desired, and in several cases the detail seems to err in the direction of over-boldness. The central tower on the Dunning Street facade is, after all, a rather needless extravagance in a public lending library, and it is pleasant to note that the tower as an indispensable feature in competition design is lessening in popularity. Still, on the whole, the design is strong and sincere, and is very well drawn.

With regard to the other plans submitted it would appear that many of the competitors had not quite realised the significance of the reply to the query as to whether the secondary entrance required from Grange Road East must give access to the lending and reference departments. In the best plans no such access is provided, and a much better arrangement is obtained in consequence. Several designs showed corner entrances—a feature which the nature of the site renders certainly inadvisable, as it inevitably results in awkward and ugly shapes, and is generally inconvenient. A number of the elevational treatments give evidence of the modern Greek movement. Messrs. Wills and Anderson, 24, Bloomsbury Square, W.C., present an exceptionally good design in this manner, successfully solving the difficult problem of obtaining a symmetrical front to Grange Road East. Mr. Harold Norton, 14, Bedford Row, W.C., has obviously expended the most careful thought on the detail of his facades. A delicately drawn set is submitted by Mr. G. Nott, 64, High Street, Leicester. Although the plan seems to us somewhat weak in parts, we would commend the simplicity and good taste with which the elevations are resolved. Messrs. Crouch and Pole, 12, Gray's Inn Square, W.C., have evolved an admirable conception in the neo-Greek style.

* * *

[We have received several communications in which complaint is made that those com-

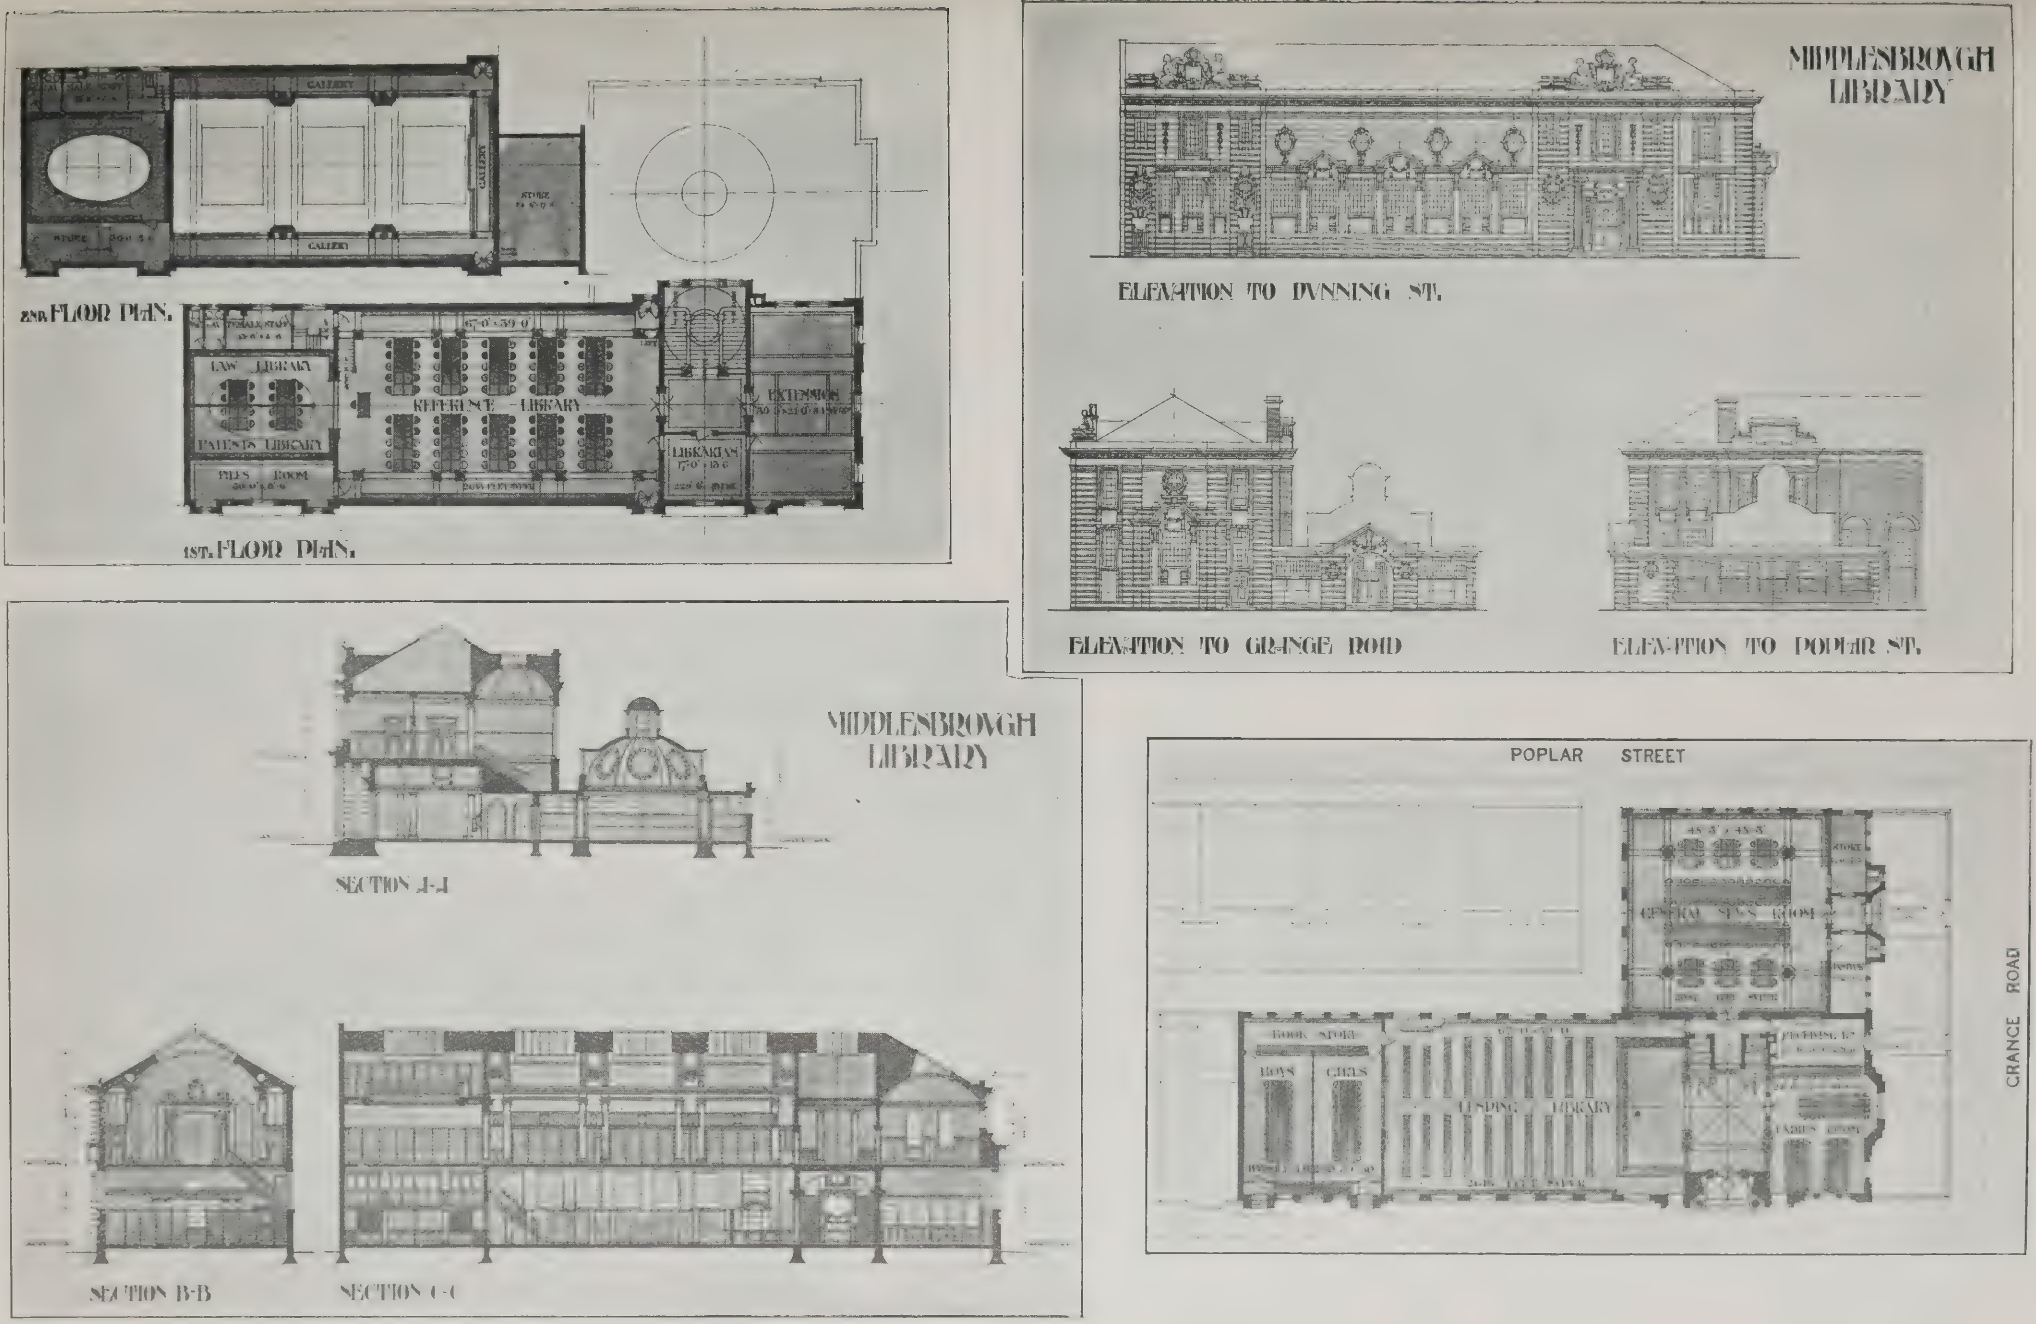




FIRST PREMIATED DESIGN. SECTIONS AND FIRST FLOOR PLAN.

RUSSELL & COOPER, ARCHITECTS.

On this floor is placed the main floor of the Reference Library, with seats and tables that can be used for periodicals; and bays for division of the books into different subjects. The arrangements here are superior to those in most of the designs. The administration rooms are well placed; the room for special books, opening out of the librarian's room, is a good feature. The interior treatment of the room might with advantage, and probably will be, further considered when the working drawings are prepared. The thin iron balcony requires bringing into harmony with the heavy supporting columns. This will be clear on reference to the sections.



SECOND PREMIATED DESIGN. G. H. WENYON AND CHARLES H. POTTER, JOINT ARCHITECTS.

The arrangements in this design for supervision are excellent It will be noted also that the news room is more shut off from the street noises by being placed behind the janitor's room and a store room. The children's rooms are separated, and have separate entrances, which is an additional advantage; but the rooms in consequence have had to be arranged lengthwise and, consequently, are not so well lighted. The elevation to Dunning Street is not so well balanced as in the winning design, but those to Grange Road and Poplar Street are better contrived.

petitors who adhered strictly to the conditions were severely handicapped as compared with those who, by modifying these conditions, were in a position to produce "an unhampered plan." In a formal protest that has been prepared for submission to the Middlesbrough Free Library Committee, the following departures from the conditions are alleged:—"(1) Lending library separated by about 35ft. from houses in Dunning Street, instead of adjoining same as laid down and confirmed (see No. 100, Replies to Queries). (2) Separate counters to boys' and girls' reading rooms instead of common counter as required. (3) Sizes of all rooms considerably varied, as, for instance, patents library and extensions, about 700 sup. ft. instead of 1,739 as required. (4) No secondary entrance in Grange Road. (5) Communication between news room and main buildings provided though expressly forbidden." This protest, we are informed, has been signed by more than a hundred competitors. It should be noted that the conditions were not drawn up by the assessor].

COMPETITION CONDITIONS.

(*Communicated.*)

Architectural competitions, in common with every other form of contest in which the prizes are few and the blanks are many, must necessarily give rise to much disappointment and disapproval, and it is natural that these emotions should yearn for expression. Consequently, almost every competition of any importance is normally followed by the bitter cries of the unsuccessful, who, in their hour of defeat, are perhaps apt to magnify trifling points that they conceive to have operated unfairly against them in the struggle. But in too many cases the grievance is only too real and palpable, as, for instance when the positions and dimensions of rooms having been definitely specified, the award is given to competitors who improve on the conditions, to the obvious disadvantage of those who faithfully adhere to them. It is impossible to withhold sympathy from those competitors who suffer from their close adhesion to the conditions. At the same time, it would be idle to ignore the difficulties of the position. The object of competitions is to secure the best building that the competitors can design. When, therefore, the design that the assessor considers to be best is found to override some of the conditions that were laid down, and the modifications are a positive improvement, it is surely by no means surprising that he should choose those designs. In truth, he must find himself in a very unenviable position. If he chooses the best design, in spite of the fact that it does not strictly conform to the conditions, the competitors who adhered to the conditions have a genuine grievance. If, on the other hand, he selects a less suitable design, which, however, fulfils the conditions to the letter, he defeats the real object of the competition. Which course he should adopt is rather a nice question in ethics. Surely the assessor could and should be spared this "divided duty." It might be avoided if the conditions were drawn up by the assessor, and were less minutely particular as to the position and dimensions of rooms, and so forth. The object being, as said before, to secure the best building, and the furtherance of that object being sought by obtaining the ideas of a multitude of counsellors, in whom is wisdom, why hamper the competitors with preconceived notions on the very points on which it is most necessary to obtain expert aid? If the employers know quite definitely what they want in the matter of planning, and are determined to have it, why hold a competition at all? Of course, if they are satisfied that they have conceived an entirely satisfactory plan, they might still require the aid of many minds and many talents in the designing of a suitable elevation; but in asking for it, there should be an explicit understanding that the plan supplied must not be modified—that there must be no deviations whatever. But this cast-iron method of procedure, although it would be fair to the competitors, who would then know exactly how they stood, would not secure such satisfactory results as must accrue if the planning also were submitted to unfettered competition, this being a matter in which, after all, there is most need of expert advice. The outcry about unfairness naturally arises when a committee make conditions that are apparently hard and fast, and do not stick to them. They should not make hard and fast conditions; it being humanly certain a strong competition will most probably yield them something that is very much better than their own conception. It would be better for all concerned—for the employers, for the assessor, and for the competitors—if the conditions were in every case drawn up by a specialist in such delicate work, who would know exactly what to bind and what to leave loose. The whole question of competitions seems to cry aloud for the most careful consideration that the R.I.B.A. can devote to it, and one would be delighted to hear that they are prepared to take it in hand in a statesmanlike spirit, with a determination to eradicate the cause of the "present discontents."

Correspondence.

[*The Editor declines responsibility for the statements made by correspondents.*]

Middlesbrough Public Library Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In the recent Public Library competition at Middlesbrough, 202 sets of designs were submitted in response to a set of conditions containing several requirements not usually associated with library buildings of this standard. The requirements, however, were expressed in a definite manner, and they generally set down the positions of rooms and entrances in such a way that a perfect arrangement was rendered impossible. The "system" to be adopted in the lending library had not been decided upon (an all-important factor in the treatment of the plan), but competitors were instructed definitely to place this room and the reference library "*adjoining* the dwelling houses in Dunning Street." The general news room also having been located in a similar way in the rear portion of the site, the competitors by following the conditions had no alternative but to arrange the minor departments in request in the remaining awkward portion of the site allowed to them. The effect of this upon some of the queries sent in was that perfect freedom in the arrangement of the rooms was asked for, but the answers generally were that the conditions were to be strictly adhered to. The following extract is from a letter from the Town Clerk to a competitor, confirming this:—"I have to inform you that the instructions which competitors already possess are those upon which the assessor will be asked to base his award."

In any case, a feeling of confidence in arriving at a plan in strict adherence to the conditions must have been established in the minds of most of the competitors; and complete satisfaction as to the ultimate fairness of the result must have been general when the R.I.B.A. had appointed an assessor of great reputation and experience.

In the first and second premiated designs for Middlesbrough Free Library the lending library in each case does not adjoin the dwelling-houses in Dunning Street, this position being occupied by the juvenile department. Further, the heating chamber, that was particularly asked for on the ground floor (a requirement that distressed many competitors greatly, and occupied valuable space), does not appear in this position in either of the three premiated designs.

The first premiated design shows the patents library and extension measuring 39ft. by 18ft., with the staff lavatory adjoining, whereas the conditions distinctly state that this should be 35ft. 6ins. by 49ft., including the lavatories. The janitor on the second premiated design is rendered quite an unnecessary introduction, supervision easily being effected from the administration counter of the lending library.

In all probability these first and second premiated plans stood apart from the remainder in no uncertain fashion, and if these licences had been open to all in the conditions, no complaint could be offered.

Clearly the main points of the conditions have had to be set aside as regards the first two premiated designs, and it would appear that the majority of the competitors have prejudiced their chances by too closely following the conditions!

"Practical Building Construction."

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I wish to thank the gentleman who reviewed my work in one of your late issues, for pointing out such a serious error as "w.c.'s instead of sinks." I had written "sinks" clearly, and the publishers have agreed to reprint the pages affected, with the word corrected. Again thanking you.

J. P. ALLEN.

THE LAND TAX AND THE BUILDING INDUSTRY.

How will the proposed land tax affect the building industry? As we have before observed, opinion on the matter appears to be sharply and almost equally divided; and, unfortunately, it is on both sides tinged with the unmistakable hues of political bias. Those who are in search of the unsophisticated truth of the matter are asking for information with respect to other countries in which the tax already exists, and towards the satisfaction of this demand there has just been issued a Parliamentary paper (Miscellaneous: No. 6 (1909), containing despatches from His Majesty's Consular Officers respecting the taxation of land values at New York, Boston, San Francisco, and Cleveland (Ohio). It is disappointing to find that they throw but very little light on the question at issue; but the following extracts will be read with interest.

It appears that, under the Tax Law of the State of New York, L.1896, each county in the State is entrusted with its own local taxation, and the assessors can divide a county into assessment districts, but no separate valuation for land and building was made prior to the year 1904. The Comptroller may sell any land for non-payment of taxes, if such tax and the interest thereon remain unpaid for a year and a month after the tax was levied. A State Board of Equalization, comprising the Commissioners of the Land Office and the three Commissioners of Taxes, meets annually for the purpose of examining and revising the valuations of real and personal properties, and there is a right of appeal against their decisions. The officers are appointed, not elected. Estimates of the rate at which land values are taxed vary considerably—from forty to ninety per cent.—but, taken all round, eighty per cent. of the actual value is assumed. The fair market price may be considered as the rule in the determination of value; but "there is no doubt that real property in the City and County of New York is not assessed at its full value." The value fixed by the assessors is disregarded in business transactions, and bankers granting mortgages on property make an independent survey. Firms of bankers, however, inform Consul-General Bennett that the valuations by the assessors come within ten or fifteen per cent. of the actual values. The entire expenses of the department charged with the work of assessment amount to about 71 dollars per million of the assessed value of real estate.

In California, there is a yearly house-to-house visitation, the assessors exacting from each person a statement under oath as to property owned. The land of delinquents is sold to the State, but may be redeemed by

MIDDLESBROUGH PUBLIC LIBRARY COMPETITION. THIRD PREMIATED DESIGN. COOPER AND SLATER, ARCHITECTS.

This scheme adheres more closely to the conditions than the first and second premiated designs, and in comparison suffers because of it. The arrangement of the lending library to balance the boys' and girls' rooms, the ladies' room, and and the receiving room is ingenious, and the planning of the children's rooms is perhaps the best shown. The news room is of good shape and well supervised, and the entrance is less disturbing than in many of the designs submitted. The first floor planning has been a little hampered by the symmetrical planning of the ground floor, and the corridor to the extension and patents library is, consequently, not well lighted. The main lines of the elevation are composed with considerable success, but the cupola is rather in the nature of an extravagance for a public library.

the owner within five years. The assessors are elected by popular vote.

In Boston, the full market value forms the basis of assessment, and the separate value of land has been made since 1874. Difficulty is found in following the upward and downward movements of the market. Interest at six per cent. is charged on unpaid taxes.

In Ohio, the owners are asked to report on the value of their property, and this loose system having led to great abuse, there is a movement in favour of changing the law, New York being mentioned as a model to be copied.

As to the effect of the taxes, very little that is value is said. Mr. Lawson Purdy, President of the Department Taxes and Assessments in the City of New York, writes: "The effect of the taxation of real estate in the City of New York, in so far as the tax falls on land, is undoubtedly the same as is described by John Stuart Mill, Edwin R. A. Seligman, and other writers on political economy. That is to say, that a tax on land being paid wholly by the owner, does not increase rentals, but decreases selling value. When land is sold, the tax is capitalized, the price is reduced, and the subsequent owner does not bear the burden of the tax so long as the rate does not increase. Any one familiar with New York conditions would say that the tax tends to induce a better improvement of valuable sites than would be the case if there were no such tax."

Mr. F. P. Leay, Consul-General at Boston, states that "the general effect of the tax is very difficult to estimate. It varies according to the facts considered. Undoubtedly, however, the consequences of the high tax on land and buildings *appear to have had an adverse effect on building and improvements, and thence on trades, and particularly on the establishment of industries at Boston.* It is difficult to differentiate specific effects in particular districts of the city or departments of business or enterprise, but the unfavourable influence may be said to have affected the general real estate market of late years."

Obituary.

The late Henry Dare-Bryan, F.R.I.B.A.

The funeral of the late Mr. H. Dare-Bryan, F.R.I.B.A., one of Bristol's ablest architects, took place at Westbury-on-Tryan cemetery on May 28th, and was attended by a large number of architects and builders of the city. Representing the Bristol Society of Architects, of which the deceased architect was a vice-president, were Messrs. Mowbray A. Green, F.R.I.B.A. (president), F. W. Wills, F.R.I.B.A., G. H. Oatley, F.R.I.B.A. (vice-president), W. L. Bernard, F.R.I.B.A., G. C. Lawrence, A.R.I.B.A., A. Harford, T. H. Weston, L. S. Reay, F.R.I.B.A., J. F. Wood, A.R.I.B.A., J. M. Froud, and A. R. Gough, A.R.I.B.A. The Bristol Master Builders' Association were represented by Messrs. F. N. Cowlin (president), E. I. Neale, G. Humphreys, and A. Dowling (past-presidents), and Audley Perkins. Messrs. J. Fisher, M. Park, A. Harford, and R. C. Tucket, were present on behalf of the artists and associate members of the Bristol Fine Arts Academy. Mr. Dare-Bryan's untimely death at the age of forty will be greatly regretted in Bristol and in the Architectural profession of which he was so distinguished a member.

* * *

Mr. W. Johnson, builder, of Doncaster, died there on May 29th, at the age of 73. The deceased, who was well known and one of the oldest builders in the town, never recovered from the effects of a trap accident sustained at the end of last year.

The Northampton Education Committee have appointed Mr. A. G. Lynham, of Bristol, to the post of assistant to the education surveyor. There were 588 applicants.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
June 15	BERKSHIRE COUNTY COUNCIL NEW OFFICES, COMMITTEE ROOMS, ETC., on the sites of Nos. 26, 28 and 30, The Forbury, Reading. Block plan and particulars can be obtained of J. Fred Hawkins, County Surveyor, Bank Chambers, Cross Street, Reading, Deposit £1 1s., refunded on receipt of *bona fide* design or the return within fourteen days of all particulars accompanied by letter announcing non-intention to compete. Premiums of £100, £75 and £50 for designs placed first, second, and third respectively.
July 9	STOKE-UPON TRENT. Additions to Town Hall including large hall to seat 3,000 people, police court, etc. Premiums of £100 and £50 for second and third designs respectively. Assessor nominated by Pres. R.I.B.A. Conditions and particulars from Jno. B. Ashwell, Town Clerk, Town Hall, Stoke-on-Trent,
July 17	NEW PUBLIC BUILDINGS, BURSLEM. The Architect whose design is placed first by the Assessor will be appointed to carry out the work. Premiums of £100 and £75 to authors of second and third designs, respectively, Conditions and plan of site from F. Bettany, Borough Surveyor. Deposit, £2 2s., returnable on receipt of *bona fide* design.
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	WALLASEY U.D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

The National Library of Wales.

Professor Reginald Blomfield, A.R.A., the assessor in the above competition, has selected the design submitted by Mr. Sidney K. Greenslade, of 11, Gray's Inn Square, London, W.C. The cost of the building is estimated at £85,000.

Elland Secondary School.

Mr. Vickers Edwards, county architect for the West Riding of Yorkshire, in conjunction with Mr. A. V. Houghton, principal of the Secondary Education Department of the County Council, having delivered their report on the designs submitted in this competition, the Council has accepted that sent in by Mr. W. S. Braithwaite, of 6, South Parade, Leeds. The building is estimated to cost £12,000.

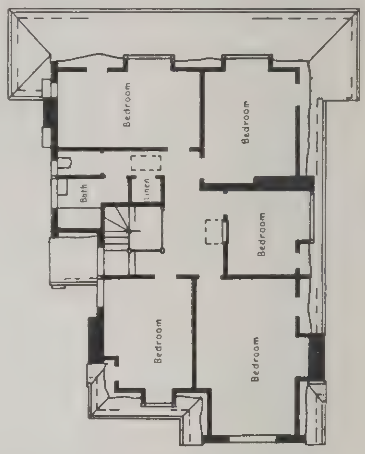
New Public Buildings, Burslem.

The Burslem Corporation has extended the time for this competition until July 17th, before which date all designs must be sent in.

Our Plate.

Two Houses at Sutton, Surrey.

We illustrate this week two houses at Sutton, Surrey, designed by Mr. H. D. Searles-Wood, F.R.I.B.A., of 157, Wool Exchange, London, E.C. That for Mr. C. J. Heffer, is built with roughcast walls with Ancaster stone dressings, and the roof is covered with dark Broseley tiles.



FIRST FLOOR PLAN, HOUSE FOR W. C. J. HEFFER, SUTTON, SURREY.

The ground floor plan and the plans of "Hillridge" are given on the centre plate.

The walls of the hall and the ceiling are panelled in oak; the windows are fitted with iron casements by the Crittall Manufacturing Co. "Hillridge," Sutton, is also built with roughcast walls, and dark Broseley tiles on the roof. The builders of both houses were Messrs. J. Huggett and Son, of Station Road, Belmont, Sutton.

Societies' Reports.

R.I.B.A.

By-law Revision.

A special general meeting of the R.I.B.A. was held on Monday, May 24th, to consider the proposals of the Council for the revision of the by-laws under the new supplemental Charter. Mr. E. T. Hall (vice-president) was in the chair, and the debate was conducted with skill and animation. Many of the proposed alterations were accepted by the general body with little or no discussion, but, following some remarks by Mr. Gammell and other Associates, a resolution in favour of increasing the number of Associate members of the Council from four (the number recommended by the Council) to six, was carried by a large majority. Some very important suggested changes with regard to other by-laws still remained to be discussed, for which purpose a general meeting was held at 8 o'clock on Monday evening, June 7th.

Junior members may be reminded that Associates, although not allowed to vote on questions relative to by-laws, are entitled to take part in any discussion following a resolution brought forward by a Fellow of the R.I.B.A. The success which attended Mr. Gammell's plea on behalf of a larger representation on the Council of the junior members of the Institute should encourage Associates to attend and speak at the business meetings, with the view of obtaining the support of their elders in respect to the removal of any legitimate grievance to which they desire to call attention.

The alleged indifference of the Council to the recommendations of the various standing Committees was brought to the notice of the meeting by a member, who thought it probably due to the fact that the members of Council were frequently out of touch with the work of the committees. He desired as a remedy that the committees should have the power to elect one of their number to the Council, by which means a sympathetic spokesman would be forthcoming when the committee's recommendations were under consideration. This proposal did not commend itself to the majority.

We understand that Mr. George Hubbard (F.) gave notice of his intention to move two resolutions having reference to the issue of a circular letter to the electorate (enclosed in the envelope containing the voting papers), presumably without the knowledge or consent of the Council. Arising out of these resolutions the recent action of the Council in censuring two of its members also came up for discussion.

On a point concerning the re-instatement of a member or Licentiate—after previous suspension or expulsion from the Institute, a member objected that the by-laws (No. 25 and 26), did not ensure that the announcement of reinstatement would appear in the same number of newspapers as that of the suspension or expulsion, and that hardship might result in consequence. The deletion of the words "if they so decide" from the latter part of by-law 25 was resolved upon by the meeting, and the objection thus overcome.

The Gloucestershire Architectural Association.

A meeting was held in Gloucester on Thursday week, the president (Mr. H. W. Chatters) being in the chair. Others present included Messrs. M. H. Medland, E. A. Pryer, G. P. Milnes, S. H. Healing, J. F. Trew, A. H. Smithson, T. Malvern, W. E. James, H. S. Davis, W. J. Knight, and T. Overbury (hon. secretary). Mr. S. A. Brooks was elected an associate. A paper was read by Mr. W. J. Bache (Cheltenham Electrical Engineer) entitled "Modern Electric Lighting." The lecturer first traced the development of artificial illumination from the rush light of early mediæval days down to the present time, and then explained the advantages and disadvantages of the various forms of electric lighting now in vogue, illustrating his remarks by means of lantern slides and actual examples. For the latter purpose the room was specially wired, a portion being in surface flexible wiring, so largely adopted on the Continent, while the new Siemens system of exposed wiring was also shown in use. The current was then switched on to numerous lamps, many of the most recent type, one 600-candle power Mercury vapour lamp producing some startling effects.—On the proposition of Mr. G. P. Milnes, seconded by Mr. M. H. Medland, a vote of thanks was accorded to Mr. Bache for his interesting and useful paper and experiments.

Junior Institution of Engineers.

At a recent meeting of the Junior Institution of Engineers, the chairman, Mr. Frank R. Durham, Assoc.M.Inst.C.E., presiding, a paper on "The Construction of Coin-freed Mechanisms as applied to Gas Meters," was read by Mr. T. S. F. Gibson, A.M.Inst.C.E., member of the Institution, superintendent of the Old Kent Road works of the South Metropolitan Gas Company. The origin and effects of the applications of coin-freed mechanisms were first briefly reviewed, and, as showing the prolific industry of inventors on the subjects, the author incidentally mentioned that no fewer than 320 patents had been registered previously to 1907. Read in sequence, these documents revealed the nature of the troubles met with as the use of the apparatus had developed. The essentials of a good machine were shown to be simplicity, strength, accuracy, and compactness, and features in its design and construction were pointed out as applicable to meters of both the wet and dry types. The author dwelt upon the necessity of guarding against fraud, and proceeded to describe in detail the various coin-freed mechanisms employed by gas undertakings, in illustration of which a fine collection of examples which had been lent by Mr. Charles Carpenter, M.Inst.C.E., chairman of the South Metropolitan Gas Company, was exhibited and their construction explained. A discussion followed the reading of the paper, in which Messrs. Walter Fendick, C. G. Evans, W. Ballantyne, N. S. Trustrum, C. H. Smith, A. W. Marshall, Sidney V. Cooke, and J. Wylie Nisbet, took part.

Manchester Society of Architects.

In the "Programme of Summer Visits and Scheme of Prize Competitions, 1909," that has been issued by the Manchester Society of Architects (Mr. J. H. Somerset, hon. sec. of Education Committee; Mr. J. Theo. Halliday, hon. sec. for summer visiting, 16, St. Mary's Parsonage, Manchester), the following coming events are included:—Tuesday evening, June 8th, Refuge Assurance Building, Oxford Street, extension (Mr. Paul Waterhouse, M.A., architect); Saturday, June 12th, the Old Hall, Nether Alderley, the church, Alderley; and the stalls at St. Philip's; Saturday, June 26th, St. Mary's Church, Astbury (leader, Mr. Isaac Taylor; Saturday, July 10th, "Heathcote," Ilkley (M. E. L. Lutyens, architect), and Bolton Abbey (leader, Mr. J. H. Sellers); Tuesday evening, July 13th, Cwen's College (Messrs. Beaumont, Capper, and Grant, architects); Saturday, July 31st, to Monday, August 2nd, Ludlow, St. Lawrence's Church, the Castle, Stokesay Castle, and Much Wenlock Priory; Saturday, August 14th, "Tirley Court," Cheshire (Mr. C. E. Mallows, architect; leader, Mr. F. P. Oakley); Tuesday evening, August 17th, Middleton schools (Messrs. Wood and Sellers, architects), fountain in park, new roof, etc., at St. Leonard's Church (Mr. Edgar Wood, architect); Saturday, September 4th, Liverpool Cathedral (Mr. G. G. Scott, architect); Tuesday, September 7th, Y.M.C.A. premises, Peter Street (Messrs. Woodhouse, Corbett and Dean, architects).

The Carpenters' Company.

The following prizes were awarded by the judges, for the competitions in connection with the lectures recently delivered on the Arts connected with Building, at Carpenters' Hall:—

1. A design for a simple building, to accommodate 200 people.—2nd prize, two guineas, Kershaw Peters; 3rd prize, one guinea, Rupert Midworth.

2. "Woodwork."—2nd prize, two guineas, F. J. Bradbeer; 3rd prize, one guinea, J. R. Shackleton.

3. Design for a dining room.—1st prize, four guineas, F. H. Luhmann; 2nd prize, two guineas, R. H. Flint.

The foregoing competitions were open to craftsmen only.

5. Design for a lounge hall.—Prize, four guineas, George Eldridge; extra prize, two guineas, Wm. Park; extra prize, one guinea, Paul Faraday.

6. Essay, with sketches, on timber built houses of the 16th and 16th centuries.—Prize, four guineas, Elfric H. Smith; extra prize, three guineas, W. Gandy; extra prize, two guineas, H. J. Chetwood.

These two competitions were open to all.

Leeds and Yorkshire Architectural Society.

The Green Book of the thirty-third and thirty-fourth sessions (1908-1909) of the Leeds and Yorkshire Architectural Society contains a full list of members (165), an account of the transactions of the Society for the twelvemonth to which it applies, the address of the President (Mr. Percy Robinson, F.R.I.B.A., whose portrait forms the frontispiece to the volume), the report of the Council, and the articles of association.

There having been persistent rumours to the effect that the Stanmore Estates (advertised for sale by auction at the Mart on June 14th, at the upset price of £275,000) have been sold, Messrs. Hampton and Sons, the auctioners, authorise us to state that such is not the case, and, furthermore, that the executors and trustees have decided that they will not sell under any circumstances previous to the auction.

REINFORCED CONCRETE CONSTRUCTION: DESIGN. QUANTITIES AND PRACTICE.

By Moritz Kahn.

Short abstract of a paper read at a general meeting of the Quantity Surveyors' Association.

(*Concluded from page* 461, *No.* 744.)

Reinforced concrete is economical when compared with other methods of fireproof construction, but the mistake should not be made that it is cheap. It is well known that the cost of materials and labour in different parts of the country vary to some degree, but it has been the lecturer's experience that in spite of the varying rates of wages and costs of material, the variations frequently offset each other, so that the unit cost obtained in any one place may, generally speaking, be used for any other locality. There are, of course, exceptions to every rule, and in certain instances careful investigations should be made of special conditions, as the result of which one must use his judgment in either increasing or decreasing the unit rates by certain percentages.

Actual Costs.

For general guidance the following figures of costs are given. They have been taken from actual constructions, and include a nett profit of about 10 per cent. to the contractor.

Cost of Complete Fireproof Buildings.

Kind of Building.	Cost of job.	Unit cost. Per cub. ft.	Unit cost. Per sq. ft.	
	£	d.	s.	d.
Offices and Stores ...	36,239	6¾	8	0
Factory	2,555	5¾	7	0
Factory	7,966	6¼	6	6
Garage	2,078	4¼	5	0
Fire Station ..	1,352	7¼	9	0
Store House ..	28,351	4¼	4	6
Cold Storage Building	40,010	6.	5	0
Highest		7¼	9	0
Lowest		4¼	4	6
Average		5¾	6	5

Taken from an average of nine Constructions.

Unit Costs of Concrete per Cubic Foot.

	s.	d.
For footings and mass concrete ...	0	10
Walls below ground	1	0
Walls above ground level	1	2½
Columns	1	2½
Beams and girders	1	5
Flat slabs	1	3
Slabs between steel beams	1	1½

Unit Costs of Centering per Yard Super.

Taken from an average of nine Constructions.

	s.	d.
For footings and mass concrete ...	1	6
Walls below ground level	2	6
Walls above ground level	3	6
Columns	4	0
Beams and girders	4	6
Flat slabs	2	6
Slabs between steel beams	1	9

Special Requirements.

The pricing of belt courses, cornices, mouldings, and surfaces requiring special treatment, presents some difficulty. It is obvious that these will depend entirely upon the individual requirements of each detail, a question of judgment for the estimator, and therefore no definite prices can be given which can be depended upon.

The subject of the pricing of reinforced concrete work is a large one, and naturally cannot be dealt with in detail in a paper of this length. Only broad principles have been touched on, but enough it is hoped to enable some general idea of the lines on which it is advisable to proceed.

Discussion.

The Chairman (Mr. Arnold E. Harris, J.P., F.S.I.) having invited discussion, Mr. H. T. A. Chidgey proposed a vote of thanks to Mr. Kahn. He thought some of the prices quoted by the lecturer were rather high. For buildings which have to carry heavy loads, and in which appearance is not perhaps a very great desideratum, reinforced concrete unquestionably is the material to be used.

Mr. A. J. Gate, F.S.I., in seconding the vote of thanks, said that practically the whole responsibility for the safety of a building may be said almost to rest on the quantity surveyor of to-day, and now he must turn to a study of concrete construction, and until he does study it he will not be able to tell our architects whether their drawings are right.

Mr. A. T. Babbs (of Cape Town) said that reinforced concrete in South Africa has a very, very uphill battle to fight. There is no Portland cement made in the country, and in many large districts there is hardly any sand that can be relied upon, while the rough labour that is necessary to use concrete is also very undependable. Then, again, the cost of centering is very heavy indeed, as all the timber has to be imported 6,000 miles. Large buildings have been put up in Johannesburg and Cape Town on the American steel frame system at great saving in cost, and they have stood the tests that have been imposed upon them. The oldest building of which he had any record was one constructed in England in 1837, which is therefore 72 years old.

Mr. Addiscott said that he did not agree with Mr. Kahn as to his methods of measurement. He considered that in taking out quantities of reinforced concrete, as in quantities of any other work, there is only one system of measuring, and that is strictly net. In his opinion, openings should be deducted and the labour entailed in their formation should be measured. Centering intersections should be taken net. He asked whether anything was known about the demolition of concrete buildings. Any ordinary building tends to become out of date in anything between 50 or 100 years, and at the present time you can get a building pulled down and the site cleared practically free of cost. But with reinforced concrete buildings, pulling down would be an expensive item, and the credit for all materials would be practically nil. Another point, also bearing on that is its availability for alterations, because even in a comparatively new building, alterations are necessary in a short time, and it seems to him considerably difficult.

Mr. Watson said that not long since an Italian professor, an antiquarian, called attention to some slabs which he had discovered at the Caracalla baths. There he found in the frigidarum in the roof some slabs with bronze rods interlacing. These must surely be one of the earliest examples of ferro-concrete, as they are certainly many hundreds of years old.

Several other speakers having addressed the meeting, and the vote of thanks having been carried unanimously, Mr. Kahn in reply said that with particular reference to remarks by Mr. Addiscott, it is very difficult for the reinforced concrete contractor to price, because he has not yet had sufficient experience to detail his cost sheets. It must be remembered that you deduct openings in brickwork because you are saving material, but when you have an opening in reinforced concrete you have to work the shutter above that to support the shutter below. As to demolition, he would rather put up a reinforced concrete building than take it down. In the Baltimore fire there was an instance where one building went through all right, but they started to take it down, and three contractors went smash during the operations. In that way, we build better than we know. When we build, we do not want the building to come down, and he (Mr. Kahn) certainly did not want to be around when it was being taken down. Regarding alterations, there is no difficulty about effecting these in reinforced concrete or structural steelwork. Having built a floor slab, say, of 16ft. span and 16ft. square, if in two months you say, "I want a lift-hole through there," the speaker would not hesitate to cut out a hole 8ft. square.

Mr. Richard Parsons, of Settle, Yorks, has been offered and has accepted the position of superintendent of the rebuilding operations at Messina. Over a hundred churches and eight hundred bungalows are, it is stated, to be built.

BUILDING MATERIALS AND THEIR FIRE-RESISTING PROPERTIES.

The technologic branch of the U.S. Geological Survey has recently made a number of tests of building materials at the laboratories of the National Board of Fire Underwriters at Chicago. The materials were subjected to higher temperatures than would probably be reached in an ordinary fire and when withdrawn from the furnace were quenched with water. The tests were made under the direction of Mr. Richard L. Humphrey, who, in a report on them, points out that the results are inconclusive and should be regarded merely as preliminary data and not as final proof of the relative resistance to fire of the materials tested.

Much of the damage done to the materials in this series of tests was caused by internal stresses, the gas flame of the furnace heating one face of the test pieces much more rapidly than the other. All the materials tested, including the hydraulic pressed brick, cracked more or less. The concrete cracked least, but the tests indicate the necessity for using metal reinforcement in concrete walls to distribute the effect of the expansion.

Concrete and Mortar Panels.

The fact brought out most clearly by the tests, according to Mr. Humphrey, is the low rate of heat transmission of Portland cement concretes and mortars. This is one of the desirable qualities in buildings intended for fireproofing purposes. For marking the cement blocks linen tags were fastened by wire nails to the interior walls at the time of moulding. Most of these tags remained in place during the test and when the walls were demolished the tags in every case were found entirely undamaged.

An average of all the tests shows that about 90 per cent. of the maximum temperatures attained by the faces of the panels were reached in one hour, while in the case of the mortar blocks the increase in temperature of the backs of the panels in one hour was only about 20 per cent. of the total increase in the two hours. Of the solid concrete panels the cinder concrete showed the smallest increase in the temperatures at the backs of the walls and the granite concrete the largest. The total increase in the temperatures of the mortar panels was about the same as the total increase in the temperatures of the backs of the concrete, but the increase in one hour was somewhat greater in the case of concrete.

The report states that the damage done to the faces of the mortar and concrete panels would probably be caused at a temperature about half that of the maximum temperatures reached, owing to the water of crystallization being driven from the mortar. This thin layer of dehydrated mortar may have formed a protective coating and prevented dehydration.

Concrete Blocks.

The concrete behaved remarkably well and it was difficult to determine whether the limestone, granite, gravel, or cinder concrete sustained the least damage. The faces of all the panels were more or less pitted by the fire and washed away by the stream of water. The test was unfair to the cinder concrete, as the cinder was very poor, containing a large percentage of unburned coal; however, the sample selected was the best of six or eight investigated in St. Louis. During the fire test the coal ignited and left the surface of the concrete very rough, and badly pitted. The limestone aggregate in the face calcined and the granite aggregate split and broke away from the surface mortar. The granite concrete probably behaved better than any of the above-mentioned concretes. Damage in no case extended deeply, probably not more than 1½ins. The evidence shows that even at this depth the temperature was comparatively low. The high stresses produced in the panels by the rapid rise of the temperature of the faces, while the backs remained cool, caused cracks. On taking down the panels the blocks of concrete were found to be cracked vertically for some distance from the face. The serious damage done the various natural building stones precludes any comparison among them.

Hollow Concrete Blocks.

The strength of the webs of ordinary hollow concrete blocks is stated to have been insufficient to resist the stresses set up in these tests, as in many cases the rapid rise in temperature and the subsequent quenching of one of the faces of the blocks caused the webs to split. It was noticeable that the richer the mortars used in these blocks the better they withstood the tests. The amount of water used in mixing the mortars had a similar effect on the fire-resistive qualities; the mortars mixed with the greatest percentage of water gave the best results.

When the blocks were cracked or spalled before the application of water the damage appeared to be greater in the dry mixtures containing the greatest percentage of sand, and it was further observed during the fire test that the richer mixtures warmed up more slowly than the others.

It is apparent that one of the causes of weakness in the cement hollow building blocks under these fire tests was the weakness of the concrete, a too dry and lean mixture, which, coupled with the thinness of the webs, provided insufficient strength to resist the stress due to the rapid expansion of the face. The report states that it is quite possible, as was shown in some of the block tests, to make blocks which will pass the conditions perfectly; the web must be thick enough to give the necessary strength.

Brick and Tile Panels.

The brick panels are considered by Mr. Humphrey to have withstood the tests better than the other materials. The common brick tested comprised unused new Chicago brick and used St. Louis brick. Fifty per cent. of the new bricks were split, while sixty to seventy per cent. of the old bricks were not damaged. Lime knots seemed to be responsible for most of the damage to the new bricks, as they were found at the bottom of nearly all the cracks. The bricks at the back of the panels were entirely unaffected. While the strength tests are not conclusive, there is apparently little difference in the strength of the bricks before and after firing.

The hydraulic-pressed brick withstood the test very well. No damage was apparent after the firing and before the water was applied, and although a number of the bricks cracked, 70 per cent. of them were found to be sound after quenching.

The sand-lime brick did not withstand the test as well as expected, but the sample tested, which was purchased at random, appeared to be somewhat below average quality.

The backs of the brick panels also showed a small increase in temperature, but the natural building stones and tiles proved poorer non-conductors of heat.

The tile tested was bought in the open market and one panel was taken from a lot of material about to be erected in a building. A large percentage of the faces of the tiles was washed away by the water and the material composing the faces became soft and could easily be crumbled in the fingers. There was a comparatively rapid rise in the temperature of the backs of the panels. The plaster on the partition panel tile fell off a few minutes after the test was started.

Members of the Building Trades Exchange of the City and District of Edinburgh, have visited Whitehill Brick Works, Rosewell, where they were received by the manager, Mr. James Hamilton. They were shown over the whole of the works, and saw the whole process of making fireclay and composition bricks, tiles, drain pipes, etc. One machine turns out 20,000 bricks in an ordinary working day.

A NEW FIRE-RESISTING POST OFFICE BUILDING.

The new Western District Post Office building, situated in Wimpole Street, Cavendish Square, W., is of considerable magnitude, having a frontage to Wimpole Street of about 160ft., and a depth of more than 200ft. It is constructed from the basement to the roof in reinforced concrete, the work being designed in His Majesty's Office of Works, and the plan has been kindly lent by the chief architect, Sir Henry Tanner, I.S.O. The building has been in the charge of Mr. J. Wager, A.R.I.B.A., of H.M. Office of Works.

Time was when Government departments were notoriously slow to adopt up-to-date methods; but here we have one of many gratifying indications that the old reproach of sluggishness no longer holds good—that a new and more enterprising spirit now prevails. Of all buildings, a post office should be rendered as completely as possible fire-resisting; and to this self-evident proposition Sir Henry Tanner has, in many other instances, as well as in the present case, given practical effect by the adoption of thoroughly up-to-date methods of construction. In taking this course, he has set an example that is sure to be widely followed, so that his choice is valuable not only in itself, but by its influence on general practice.

The erection of this structure in reinforced concrete by this Government Department furnishes, in fact, a further proof of the economical, space-saving, and fire-resisting qualities of armoured concrete. One of the most remarkable features of this structure is

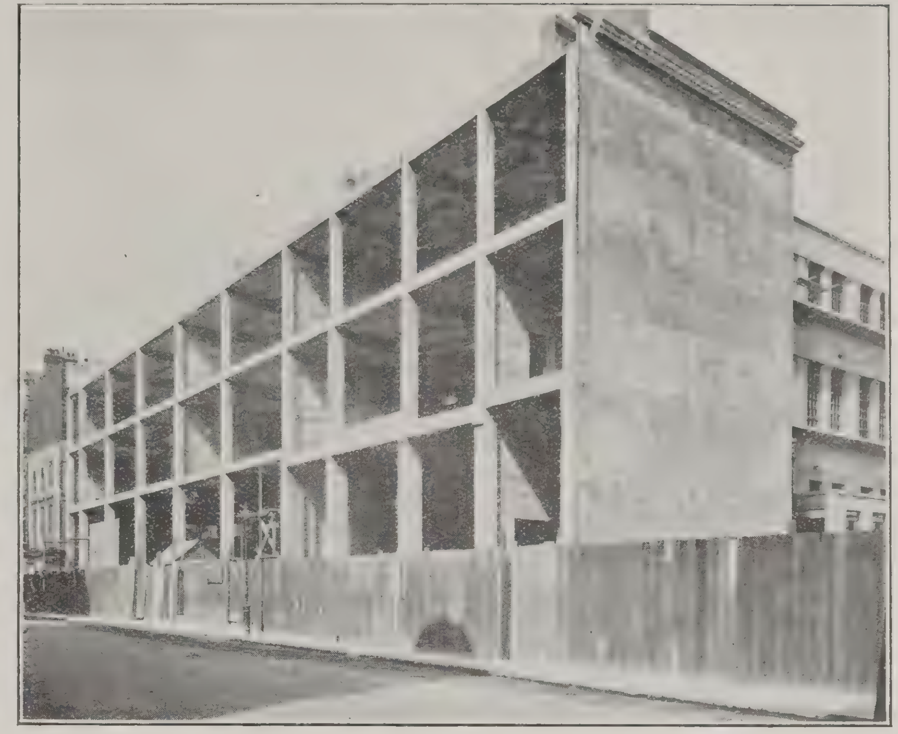


FIG. 1.—THE NEW WESTERN DISTRICT POST OFFICE, WIMPOLE STREET, LONDON, W. GENERAL VIEW OF BUILDING BEFORE THE ERECTION OF THE FACADE.

From this view a very good idea can be obtained of the concrete shell. This is the front portion of the building, and is to have a facade of Portland Stone.

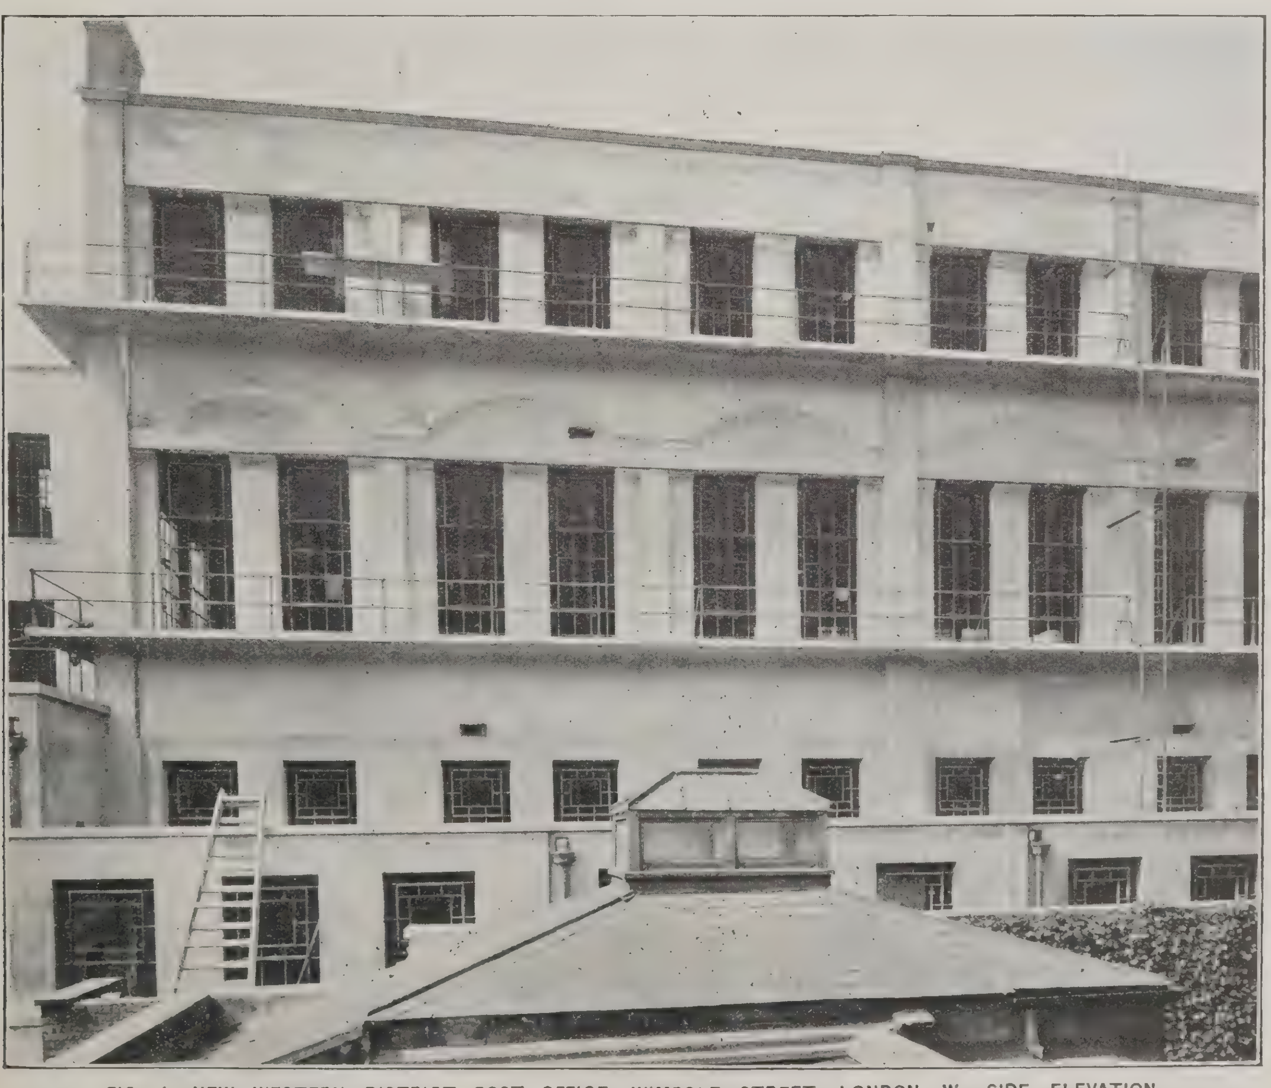

FIG. 4.—NEW WESTERN DISTRICT POST OFFICE, WIMPOLE STREET, LONDON, W., SIDE ELEVATION.

That a reinforced concrete facade can be designed to give a good effect is shown by the above illustration. The lines are extremely simple and pleasing, and are improved by the simple balconies which form a means of escape from fire.

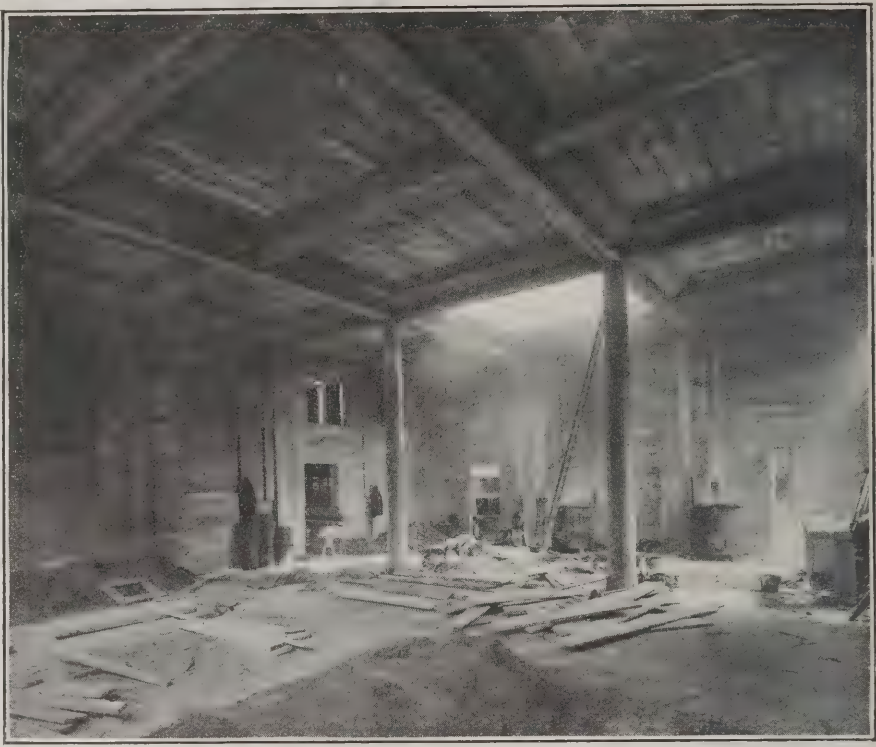

FIG. 2.—THE NEW WESTERN DISTRICT POST OFFICE, WIMPOLE STREET, LONDON, W.

This view shows the large Public Office; the dimensions being 38 ft. width, 50 ft. depth, and 18 ft. height. The slender columns (14 in. diameter) support a weight of many tons.

that the principal beams, supporting the first floor, second floor, and roof, are suspended by means of strong stirrups to beams formed in the thickness of the internal walls surrounding the inner court. By this means of construction it has been possible to obtain a maximum height for the windows.

Another feature worthy of notice is to be found in the great beams (which are over 12ft. in height) that suspend the beams supporting the principal floor. These beams have a series of windows in the portion which is underneath the first floor, and is situated below the neutral axis.

The photographic view shown in Fig. 1 represents the frontage of the building as it now stands, previous to the erection of the Portland stone front which will cover it.

All the walls, from basement to roof—a height varying from 60ft. to 70ft., are only 6ins. in thickness, and they are entirely erected in armoured concrete. On the roof has been built a large water tank that has a capacity of 7,500 gallons.

The public office is of considerable magnitude, the depth from the frontage being 50ft., the width 38ft., and the height 18ft. Fig. 2 shows this office, in which will be seen two circular columns supporting the floor and the walls, the weight of which amounts to many tons. Attention may be drawn to the slenderness of the columns. These are only 14ins. in diameter—a very striking and clear illustration of the fact that reinforced concrete columns can be constructed on a slight scantling to support heavy loads.

Fig. 3 gives a photographic view of one of the watching galleries that are erected on each floor. These are rather remarkable, as it will be seen that the gallery itself is entirely in cantilever, and has no bracketed support whatever.

Fig. 4 gives an exterior view of the south wall, showing the windows on the ground, first, and second floors. The second row of windows from the bottom are the windows referred to in a previous paragraph as being formed in the beam which supports the main beams of the principal floors. It will be noted that this elevation has been treated as a concrete structure, and has just been covered with two coats of plaster, together ⅝ins. thick, the backing coat being ½in. thick and the finishing coat ⅛in. The composition of the material was 3 to 1 of sand and cement. The entire structure has been carried out by Messrs. William King and Son, contractors, of 3, Vauxhall Bridge Road, London, licensees of Messrs. Edmond Coignet, Ltd., on whose system the building has been constructed. The "Ferrocrete" brand of Portland cement, manufactured by the Associated Portland Cement Manufacturers (1900), Ltd., has been used throughout, and mild steel round section bars, compose the reinforcement.

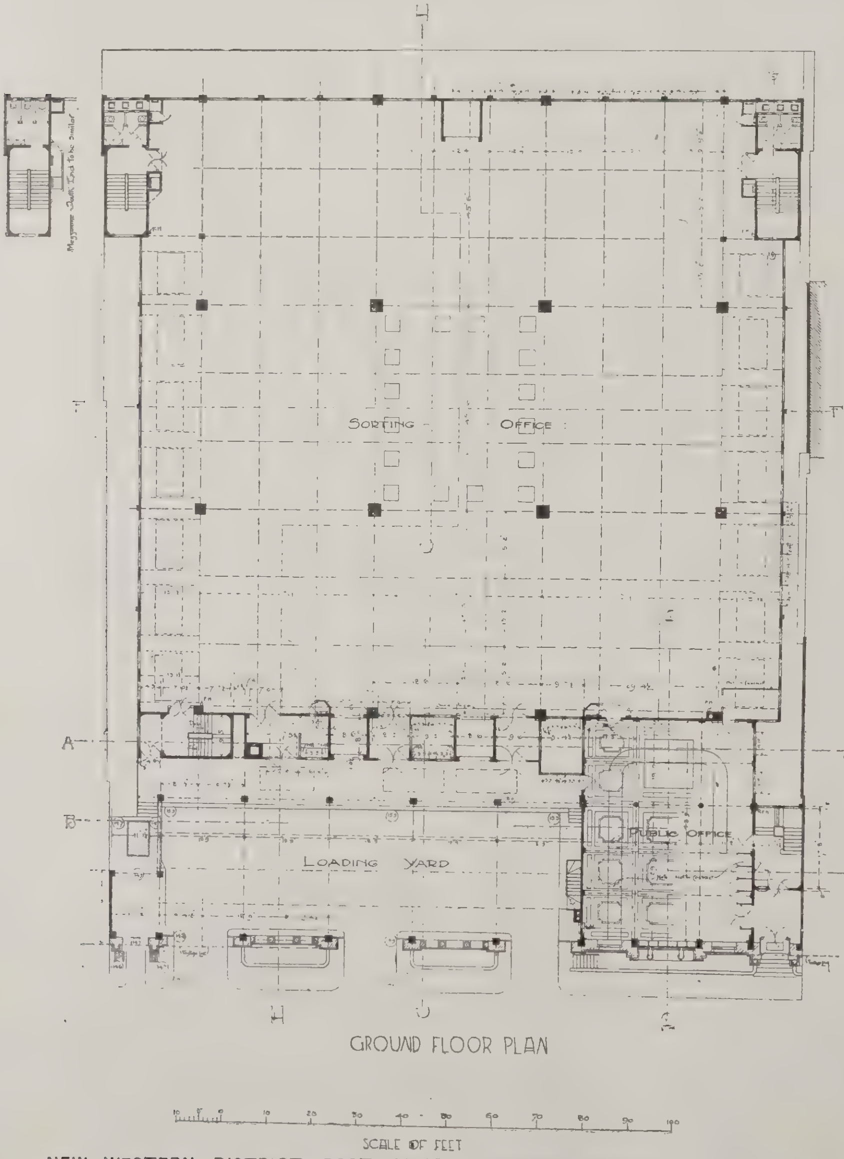
Messrs. C. John Mann and Son have removed from 29, Great George Street, to 50, Parliament Street, Westminster, S.W., the Government having acquired the former building for the extension of the New Public Buildings. The firm's telephone number remains the same—1670 Victoria.

* * *

A petition is being prepared for presentation to the Ecclesiastical Commissioners praying for the preservation of the last of the beautiful old streets of Georgian houses in the immediate precincts of Westminster Abbey and the Houses of Parliament. Cowley Street and Barton Street constitute the present threatened area.

* * *

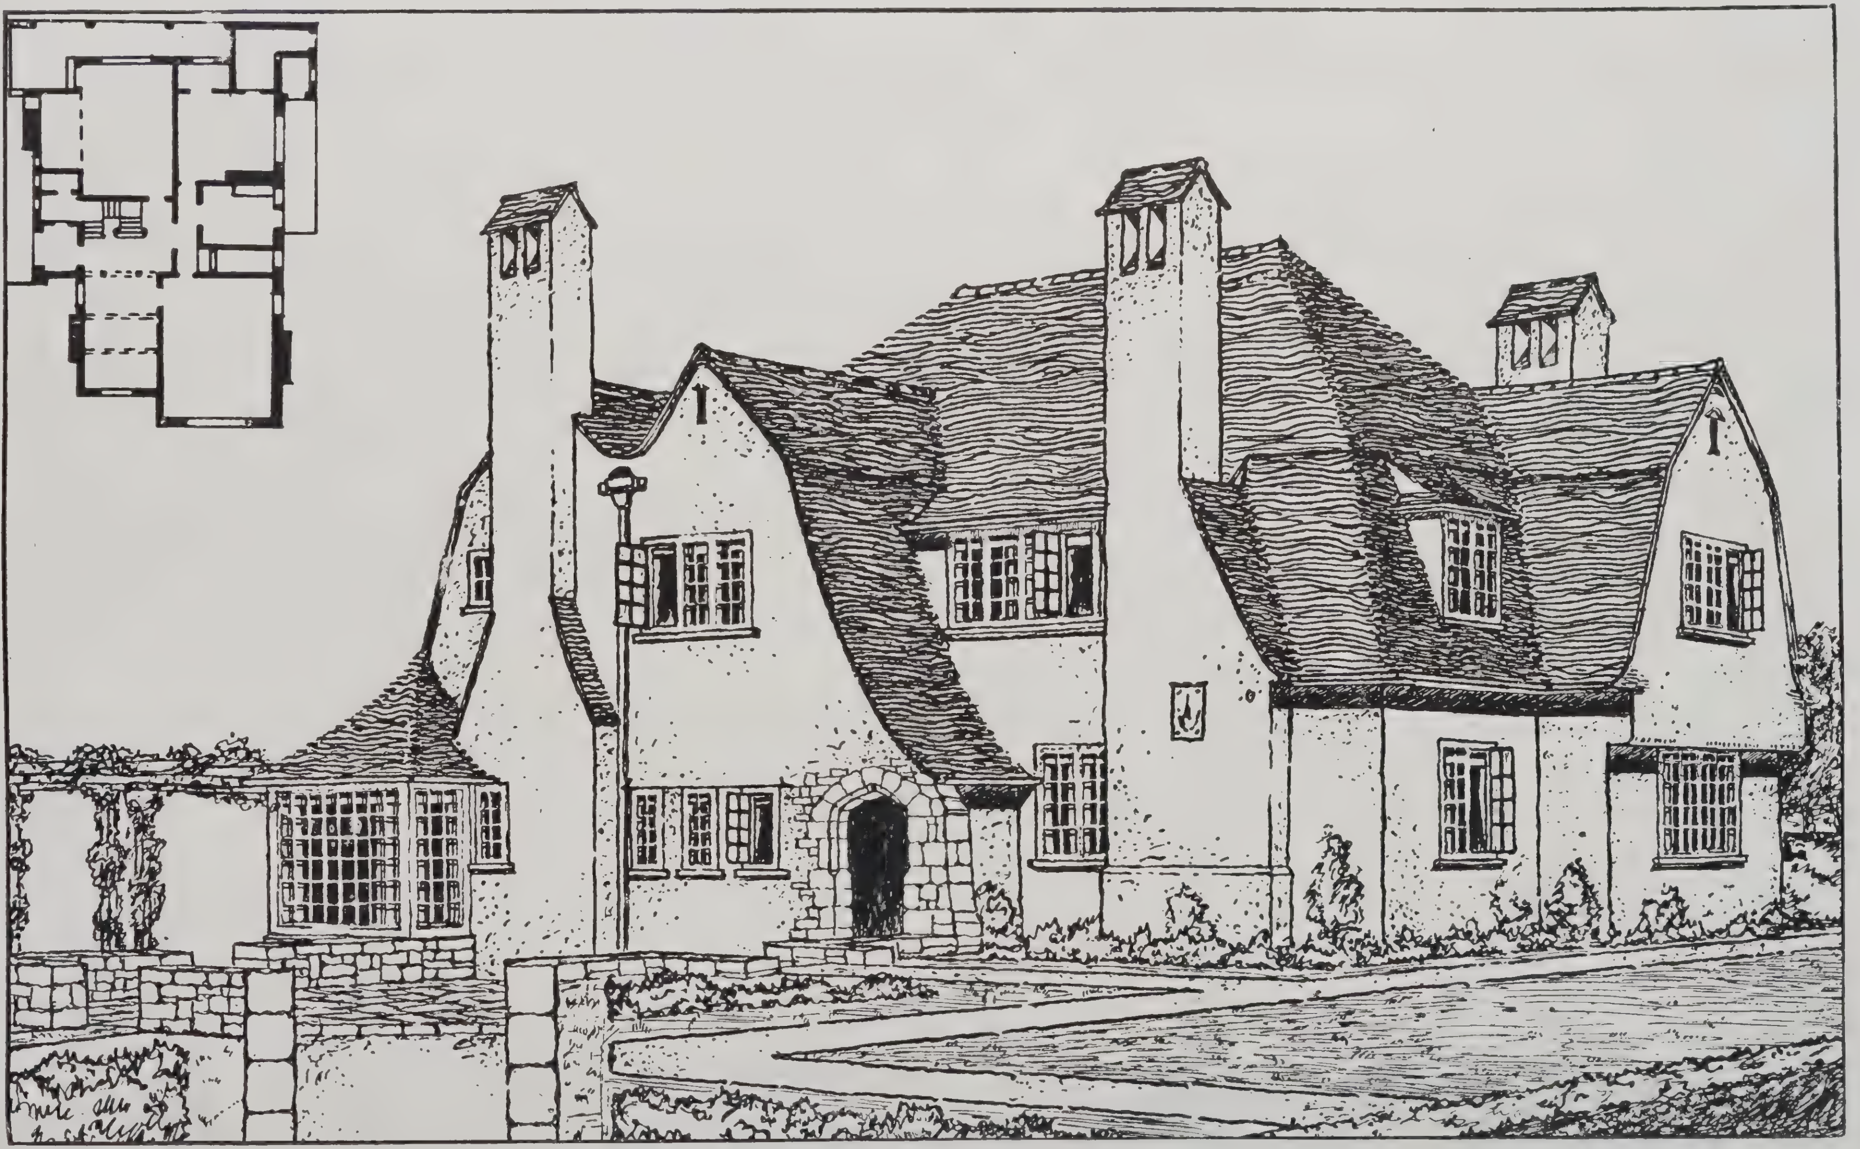
The "finest avenue in the world," that of the Champs Elysées, Paris, is to be improved by making the avenues of La Grande-Armée, Neuilly, and La Defense continuous and uniform, so as to form one great avenue, extending from the Place de la Concorde to the St. Germain Terrace—a straight stretch, as we measure it on the map, of about three miles and a-half. This splendid scheme of town planning has been definitely adopted.



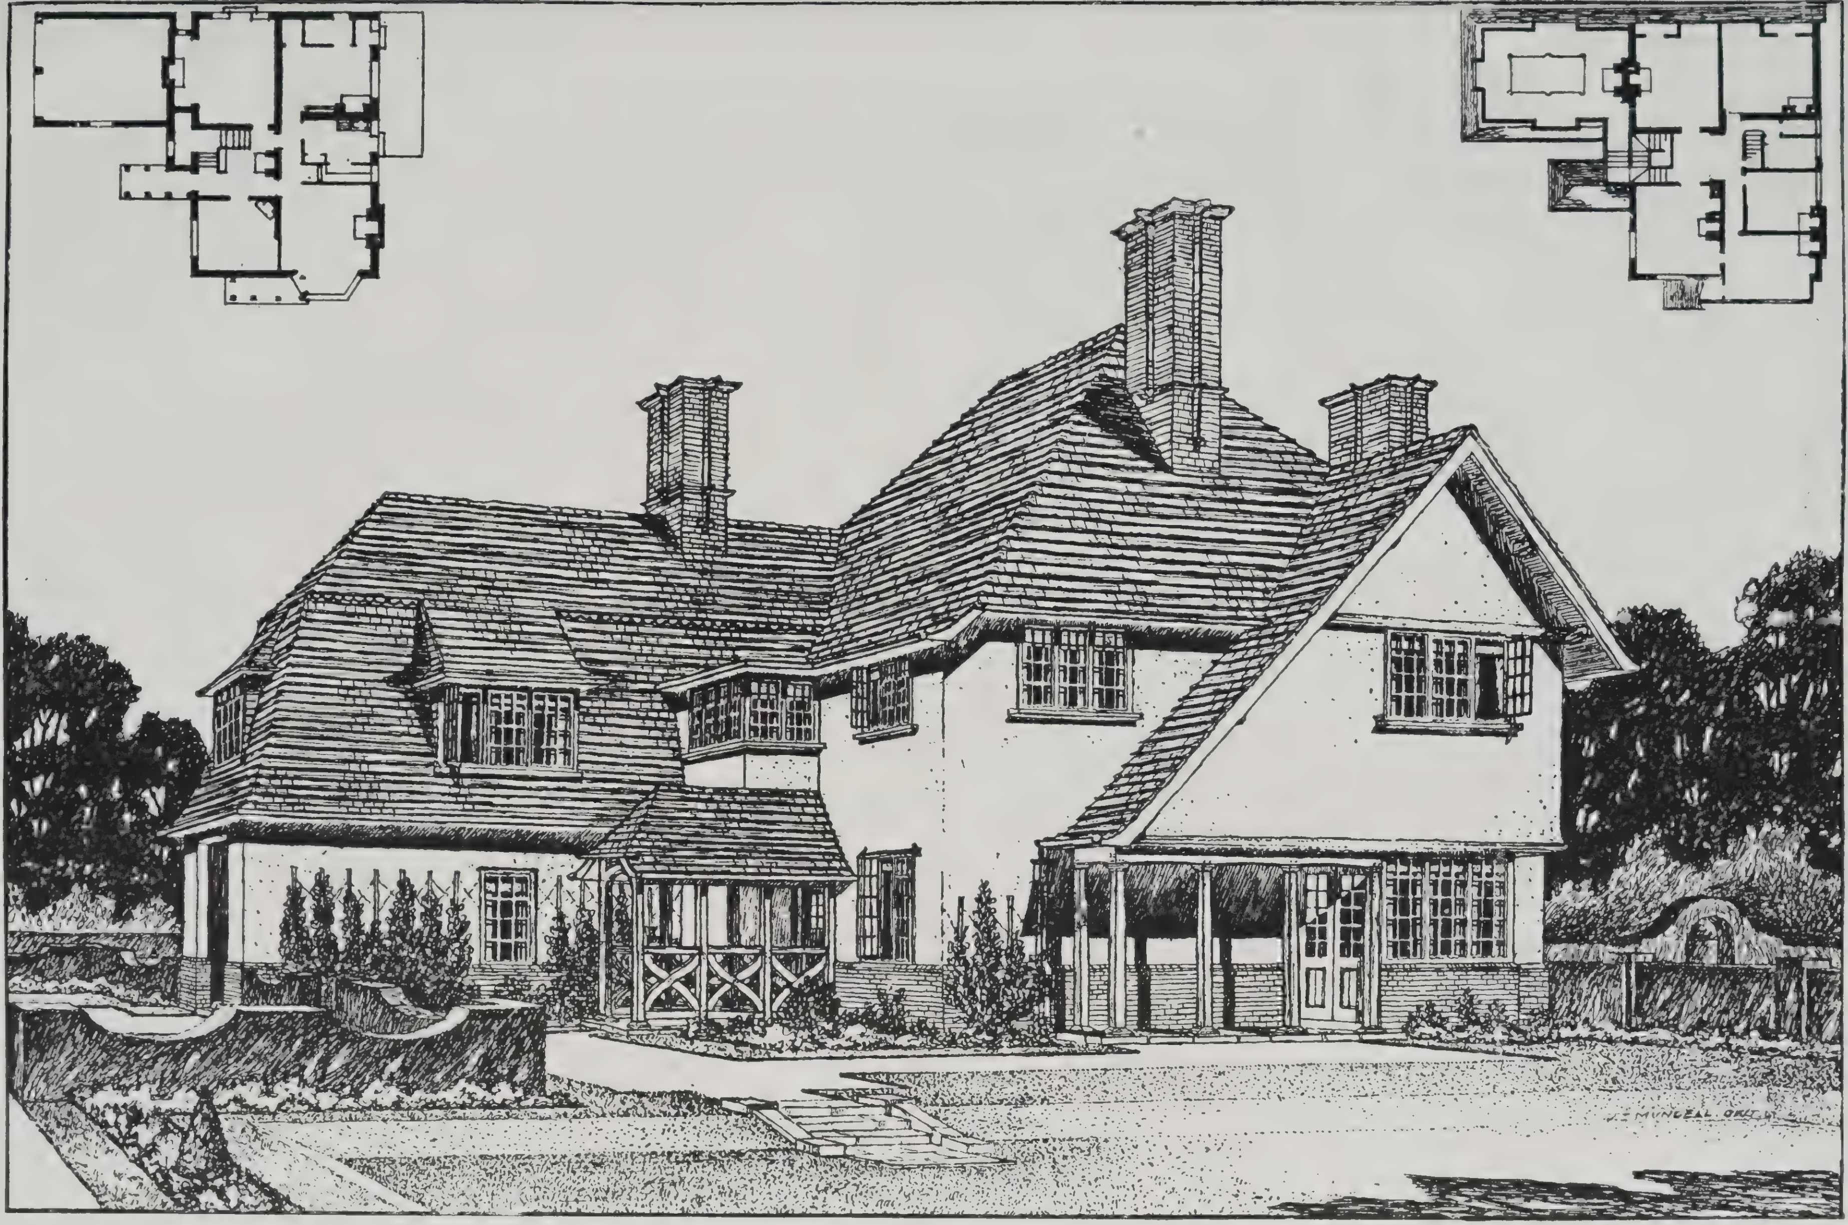
NEW WESTERN DISTRICT POST OFFICE, WIMPOLE STREET, LONDON, W.

The hatched walls in the front represent the Portland stone and brick facing. The striking difference between the thickness of these and of the reinforced concrete walls, will be duly noted.

OF THE
UNIVERSITY OF ILLINOIS

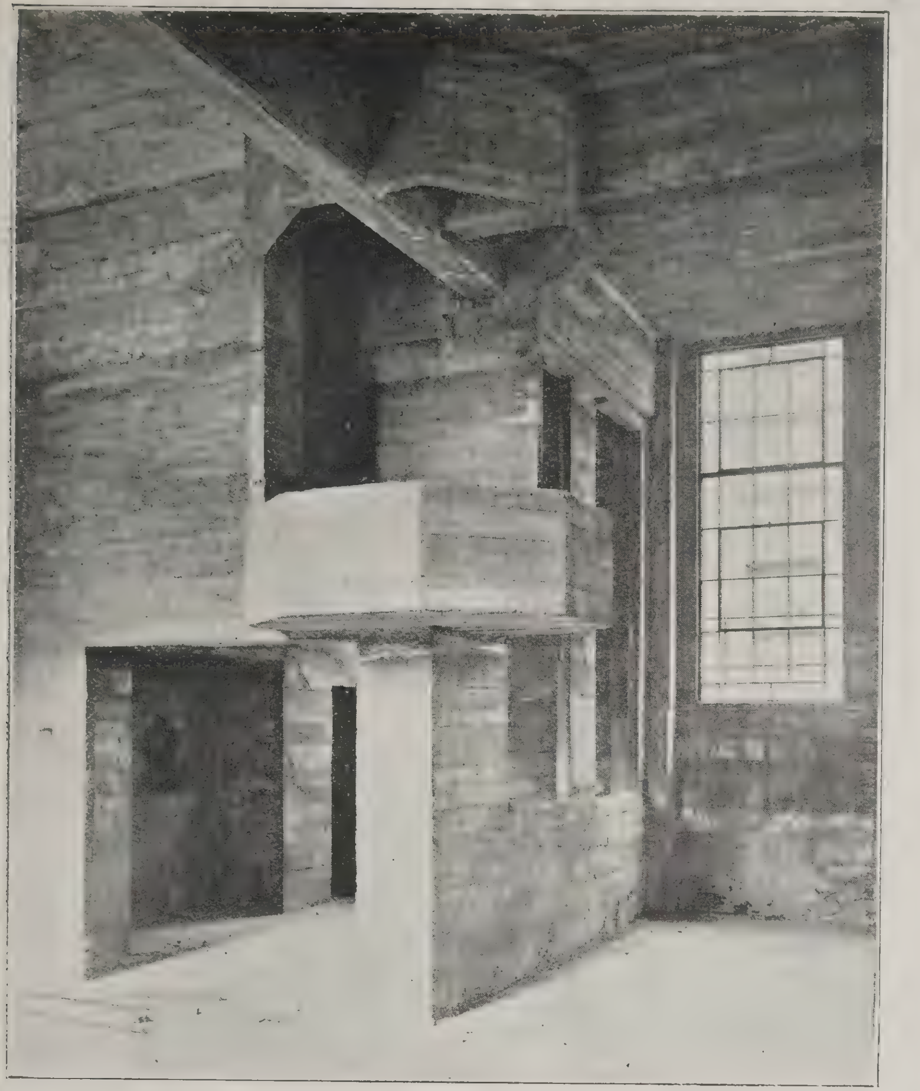


HOUSE FOR C. J. HEFFER, ESQ., AT SUTTON, SURREY. H. D. SEARLES-WOOD, F.R.I.B.A., ARCHITECT.



MUNCEAL. DELT.

"HILLRIDGE," SUTTON, SURREY. H. D. SEARLES-WOOD, F.R.I.B.A., ARCHITECT.



IG. 3.—THE NEW WESTERN DISTRICT POST OFFICE, WIMPOLE STREET, LONDON, W. DETAIL OF WATCHING GALLERY.

This is a detail of one of the supervision galleries which are erected on each floor. These galleries are rather remarkable; the gallery is entirely in cantilever, and has no bracket support whatever.

Buildings in Progress and Completed.

CARDIFF.—A new mission hall, to seat
o people, in connection with the City Mis-
on at Milton Street, has been opened.
essrs. Spiers and Bevan are the architects,
d Messrs. Tucker Bros. the builders.

CHESTER.—A new Freemasons' Hall is
ing erected in Hunter Street at a cost of
out £3,000. The building will be built of
abon pressed bricks, with Cefn stone dress-
gs. The floor of the entrance hall will be
black and white marble squares, laid
mond pattern. The principal rooms in
building will be the lodge-room and ban-
eting-room, each 45ft. by 35ft., but the ban-
eting-room will be capable of being ex-
ded to 55ft. by 35ft. It will have a spring
or. In addition to these large halls there
l be four entertaining rooms, which can
used as committee rooms, or for whist
ves, small meetings, etc. The kitchen
ommodation is on most modern and con-
ient lines, while there are to be well-ap-
nted lavatories on each floor. The
mises are to be heated by hot water. The
ge-room ceiling will be coved, while the
queting-room ceiling will be panelled and
iched with cornices. The basement will
useful at some future time for conversion
either a large billiard-room or clubroom.
building, which is to cost £3,000, has
n designed by Bro. Arthur F. Davies
essrs. J. H. Davies and Sons), the present
Senior Warden of the "Travellers'" Lodge, and the builder is Bro. McLellan (Messrs. McLellan Bros.), the W.M. of the same lodge.

DERBY.—New Sunday schools for St. Augustine's Church are being erected. The first portion to contain 352 girls and 300 infants has been let to Mr. Henry Chattle, of Empress Road. The architects are Messrs. Naylor and Sale, FF.R.I.B.A., of Market Place, Derby.

GLASGOW.—The new Free Church in Crow Road is to be built of white freestone, and will accommodate 450 persons. At the rear will be a small hall to seat 100 persons, with vestry, ladies' room, a large class-room and lavatory accommodation. The architects are Messrs. Alex. Pirie and Son, 134, Wellington Street.

LONDON.—The rebuilding of the Duchy of Cornwall property in North Lambeth is to be proceeded with immediately. Contracts have been entered into amounting to £30,000.

Messrs. Patman and Fotheringham, Ltd., have obtained the contract for a large block of chambers at Brick Court, Temple, for the Honourable Society of the Middle Temple. Sir Aston Webb, R.A., and Mr. H. J. Wadling are the joint architects.

PRESTON.—Messrs. W. Croft and Sons, Ltd., of Preston, are the successful contractors for the erection of new offices for the Preston Shelley Assurance and Burial Society. The building is estimated to cost £5,000, and will be of polished granite up to the first floor level and brick and stone above. Mr. E. J. Andrew is the architect.

THE CONCRETE INSTITUTE.

Mr. Bamber on "The Setting of Portland Cement."

The fifth general meeting of the Concrete Institute was held on Thursday evening, May 27, at the Royal United Service Institution, Whitehall, S.W. Mr. Wentworth Shields presided, and among the numerous members present were:—Messrs. Wells (hon. treasurer), H. K. G. Bamber, F.C.S., Bertram Blount, F.I.C., D. B. Butler, Assoc.M.I.C.E., F.C.S., W. H. Stanger, W. Lawrence Gadd, C. S. Meik, J. N. Yourdi, Dr. Siegmund Rosenfeld, etc., etc.

The Chairman announced that, through indisposition, Mr. Hatch, who was to have taken the chair that evening, was unable to be present. The membership of the Institute had now reached the satisfactory number of 740, and he thought that showed that not only was the Institute doing good work, but also that the members of the various professions were beginning to recognise the fact.

Mr. H. K. G. Bamber then read a paper on "The Setting of Portland Cement," having first expressed his regret that, owing to the interdiction of the authorities, he was unable to bring a cinematograph into that building, with which he had intended to illustrate his remarks. The following is a short abstract of the paper:—

For the best cement, the total percentage of lime (CaO) present was confined to very narrow limits—i.e., 63.5 to 65 per cent. The amount of silica (SiO_2) varied from 21 to 22.5 per cent., and alumina (Al_2O_3) from 5 to 6 per cent., so that the ratio of lime to silica approximated 2.8 parts lime to 1 part silica, the formula for which might therefore be written as $3CaO\ SiO_2$, and any attempt to vary this ratio to any extent resulted in a material which had not the good properties of a true Portland cement.

The theories as to the setting were somewhat vague and uncertain; but it was generally assumed that the action was brought about first by the hydration upon the addition of water, and subsequent crystallisation of the calcium aluminates present, which occurred with great rapidity, constituting what was known technically as the "initial set," causing cohesion of the mass of cement and the intermingled aggregate. This was followed by the hydrolysis of the calcium silicates, the latter being slowly decomposed and broken down into the more simple form of mono-calcium silicate, with the consequent liberation of calcium hydrate ($Ca\ OH_2$), which being in excess of that required to form a saturated solution partially crystallised out—this cycle of operations continuing over long periods during the hardening of cements.

A thoroughly well-made Portland cement clinker, ground to normal fineness, was always very quick-setting, almost equal to that of plaster of Paris, but this property of rapid setting could be somewhat delayed by mixture of other foreign substances.

It was difficult satisfactorily to explain why the admixture of the fuel ash should have the effect of retarding the setting time somewhat, unless it was that it contained an amount of sulphates derived from the oxidised sulphur compounds originally present in the fuel used, and these sulphates having a similar effect on the cement as the addition of a similar amount of gypsum—or it might be that owing to the less perfect burning of cement in the past, cement always contained free lime in the amorphous, as distinct from the crystalline condition—this lime being quickly dissolved in the water used for gauging, which becoming saturated, prevented the solution of the calcium aluminates, and thus somewhat retarded the set.

During recent years, and upon the introduction of new methods, more particularly that of the rotary kiln, none but this pure character of clinker was produced, containing practically no free lime in the amorphous condition—the system being such that the ash from the fuel, the latter in quantity being in itself at least 33 per cent. less, to a very large extent passed away with the effluent gases from the kiln. This also applies largely to the sulphur compounds in the raw material and coal, which, being decomposed, passed out of the kiln as sulphurous acid with the other gases. The clinker thus produced was practically pure, and resembled those portions of picked uncontaminated clinker from the intermittent kiln and like that, had, when finely ground, an almost instantaneous set, and with a lime content on analysis in both cases ranging between 64 and 65 per cent.

Very elaborate and costly experiments, extending over a long period, had been carried out, in which the calcined clinker, after passing the clinkering temperature, was kept at a red heat for a considerable time before final cooling, imitating, it was thought, the slower action of the old intermittent kiln process; but the results were negative.

Experiments were also carried out to test the concentrated action of carbonic anhydride upon these various aluminates, this being the principal ingredient in the atmosphere which, together with water, brought about the natural process of aeration of cement. It was found that the aluminates containing the higher proportion of lime were less affected by this treatment with CO_2 than the lower aluminates, which it was thought might be the explanation why rotary cement was less affected by exposure to the atmosphere than cement made in intermittent kilns. The presence of even small proportions of calcium aluminate would cause a very rapid initial set of the whole mass.

Various methods of prolonging the setting time of cement without having recourse to the mechanical addition of retarders to the finished cement had been attempted, such as the injection of solutions of the alkalies and alkaline earths, and such like, upon the hot clinker during its passage through the cooler, but all these had met with only limited success, the results obtained being in many cases evanescent, and in others creating further mechanical difficulties in the grinding of the clinker, which rendered such processes physically and commercially undesirable.

The product of the present-day rotary kiln, calcined in small particles at a uniform temperature and in the absence of fuel ash, consisted, as one would expect, almost entirely of pure clinker. The only methods known to the ancients of retarding the setting time of this heterogeneous mixture of silicates and aluminates was by exposing such cement after grinding to long periods of aeration or by the addition of gypsum in one form or other. The first process was only successfully applicable in the absence of added gypsum, and the effect of prolonged aeration of such cement was the absorption by the uncombined lime and the loosely combined silicates and aluminates, etc., of water derived from the moisture in the atmosphere, and subsequently carbonic anhydride from the same source. In this manner a considerable quantity of the material became carbonated and inert, depriving the cement of a not inconsiderable portion of its former chemical activity and thus causing a prolongation of the setting time. Such a method must be most imperfect in its action, and required a considerable length of time to enable the moisture and the carbonic anhydride in the atmosphere to find its way into the interior portions of the heap, by which time the outer portions would be considerably over-aerated and become practically inert. The old method of simple aeration in bulk to retard the setting time could not be applied with any degree of the former success to the product from the rotary kiln, and this would also seem to be evidence that the cement manufactured by the more modern process was of a much more stable and reliable character that that formerly put upon the market.

In view of the fact that this simple method of aeration in bulk could not be successfully applied to cement manufactured on the new system, many attempts were made to accomplish the most important part of natural aeration, i.e., the absorption of water, by artificial means, such as passing the ground cement through a moist atmosphere, or by blowing moist air through the cement in bulk.

These methods, however, were not found to be wholly successful, first, from the physical and mechanical difficulties which presented themselves by reason of the partial setting of the finest portions of the cement, with the consequent blocking of any apparatus used for the purpose, such as revolving drums, distributing discs, conveyor screws, and scrapers, and the like; and secondly, in the author's opinion, for the much more important reason that, in order to accomplish the desired result in a short space of time, it was necessary to submit the cement manufactured by the rotary process (all of which consisted of finely reduced particles of the pure calcined clinker) to a moist atmosphere at a comparatively high temperature, as distinct from the normal temperatures under which all the previous attempts at artificial aeration had been carried out. A process was introduced in which advantage was taken of the peculiar construction of the mills chiefly used for completing the reduction of the cement to a fine powder in enclosed revolving cylinders, known in the trade as "tube mills," which contained as their grinding media a heavy charge of steel balls or flint pebbles. The friction due to the action of the attrition of the steel balls or flint pebbles against themselves, the sides of the mill, and the passing cement, caused the temperature in the tube mill to be still further increased, and it was at this point where moisture was introduced in the form of a regulated supply of steam, which still further increased the temperature and enabled it to be maintained at a point above 180 degrees Fahr., preferably about 200 degrees Fahr., at or above which temperature the operation is most successfully conducted, and the cement operated upon was made to take up uniformly throughout an amount of water, in practice about 1 per cent., or a little under, with which it combined chemically, and which could not be expelled except by ignition.

With cement containing sulphates equivalent to about 1.5 per cent. SO_3, derived from the sulphur compounds in the fuel, it was generally sufficient to add 1½ per cent. of gypsum to obtain a slow-setting cement; the effect, however, in most cases was only transient, as aeration, even when the cement was packed, almost invariably resulted in such cement returning first to its original quick-setting condition before subsequently becoming slow setting, and largely inert through excessive exposure to the atmosphere. This peculiarity of cements slowed by gypsum had been the cause of much difficulty to the manufacturer, and many conflicting theories were propounded as to the cause of such reflex action.

It was difficult to give any definite chemical or physical explanation of the fact that the presence of as little as 1 per cent. of combined water in cement, which had been taken up at a high temperature, should not only in itself have the effect of appreciably slowing the setting time, but that when present in conjunction with even small percentages of gypsum the slowing effect of the combination was maintained. The presence of 1 per cent. of combined water had also an enormous influence on the action of cement when tested for soundness under the boiling test, more particularly under the method invented by Le Chatelier and now usually adopted, by which method and with which apparatus it was thought the actual expansion of the cement could be measured.

By means of the steaming process the proportion of gypsum required to be added to produce a slow-setting cement was much reduced, and if advantage were taken of the greater solubility of plaster of Paris ($CaOSO_3 \frac{1}{2} H_2O$) over that of raw gypsum ($CaOSO_3\ {}^2H_2O$) the quantity of SO_3 introduced into a cement might be reduced to a minimum.

The period of immersion before boiling stipulated in the Le Chatelier test was a very important factor in effecting the results, and appeared to be entirely arbitrary. It might be that certain cements, perfectly sound in cold and in boiling water, and especially those of a very slow-setting character, would fail to pass if boiled twenty-four hours after gauging, whereas at thirty-six or forty-eight hours, or even longer, the results might be perfectly satisfactory.

The expansion of certain cements when boiled might be due to (1) an insufficient reduction and amalgamation of the raw materials (2) incomplete or irregular calcination, or (3) a predominance of small unground particles of clinker in the finished cement. The mere reduction of the clinker to a fine powder did not in any way change the chemical composition of the cement, and if any difference was noticeable under the Le Chatelier boiling test between a finely ground and the same coarsely ground clinker, the former being perfectly sound and the latter showing expansion, this expansion must be due to the action of water at a high temperature on these particles. In the author's opinion the conclusions drawn from the results of tests under the Le Chatelier method, brought about through this latter cause, might be misleading, because it was assumed that these particles causing expansion consequent upon hydration at a high temperature, would equally expand at normal temperatures, which had yet to be proved. While cement manufactured from clinker chemically well balanced and thoroughly calcined would expand when submitted to the Le Chatelier test, it would not expand under the same conditions if it had been previously treated by the hydrating process.

Attempts had been made to use other materials for regulating the setting time, such as calcium chloride, sodium carbonate, etc., etc., but as far as the author was aware these methods have not proved commercially successful. At the present time the processes employed were practically confined to watering the clinker, hydrating by means of steam during grinding, and the addition of gypsum. With these methods individually, or with a combination of same, cement could be produced having setting times suitable for all requirements.

At the conclusion of the paper, the Chairman remarked upon the interest and importance of Mr. Bamber's experiments and conclusions.

Mr. Bertram Blount said that the paper was a serious and a solid contribution to a pressing matter. The notion current a few years ago that there was some inherent difference between cement from a rotary kiln and cement from the old fixed kiln had been exploded many times, and the *coup de grace* had been given by Mr. Bamber. There was a most ingenious and useful suggestion in the paper, where the notion was put forward that the adjustment of a combination of aluminates and silicates in the cement might depend upon a number of conditions, influenced by the rate of cooling, or by the maximum temperature reached, influenced in such way as to decide which of the two acid bodies would ultimately get hold of the lime. With regard to the temperature at which hydration occurred the more easily, Mr. Bamber, by his own ingenious method of putting steam through a tube mill, had discovered that hydration proceeded more controllably and systematically, and was a far better ultimate result when the average temperature was about 180 degrees to 200 degrees Fahr. That would show that if they wished to control the setting time of cement which was inconviently quick, it was better done in a bath at about that temperature, even if the apparatus was stationary. He joined issue with the author on the subject of the Le Chatelier test as now practised. He acknowledged Mr. Bamber's large experience with his own cements, but he (Mr. Blount) could claim an even larger experience with cements of the world, and he said without hesitation that, although there might be some cases in the use of the Le Chatelier test which would puzzle the best of them, notwithstanding in its present form it was a satisfactory and a fair test, and a test that was accepted by users, engineers, and manufacturers alike, and until someone came forward and provided a better, he for one should stick to it.

Mr. D. B. Butler said that in research of this kind the two great difficulties were time and expense. It was no small matter of expense to find the apparatus for this work, and he thought that this was a matter which could be properly taken up by the National Physical Laboratory. We were behind our cousins over the Atlantic in this respect. With regard to the Le Chatelier test, it was a fact that cements which were unsound would show large expansion in the Le Chatelier test, but it was also a fact that hundreds and thousands of cements which had given perfectly satisfactory results in actual work had shown very large expansion. Why was that? If those cements were unsound, the work should have gone wrong.

Dr. Siegmund Rosenfeld said that Mr. Bamber had stated that by adding 2 per cent. of gypsum the cement showed very great expansion. He had found that even adding up to 4 or 5 per cent. of gypsum the cement remained perfectly sound, so long as the raw materials were properly prepared. The expansion of cement was caused by the formation of the tricalcic sulpho-aluminate, but that happened only if there was tricalcic aluminate present, and this tricalcic aluminate could only be formed if there was an excess of lime present, and that again occurred only when the cement was badly prepared. He contended that if the raw materials were properly prepared, and it was reduced to a very fine state, one could have up to 4 or 5 per cent. of gypsum without showing any great expansion.

Mr. G. N. Yourdi said that in spite of what they had heard that evening with regard to gypsum, he was still a firm believer in aeration. When he was in a fix in the summer he conceived the idea of filling his cement with hot steam, and in that manner he succeeded in aerating his cement in less than a fortnight, whereas before it had sometimes taken from three to six months. Notwithstanding what Mr. Bamber had said, he thought he should still stick to aeration.

Mr. W. H. Stanger and Mr. W. Lawrence Gadd also contributed to the discussion.

The Chairman said that as it was rather late, and as there were several gentlemen who still wished to say something with reference to the subject of the paper, he suggested that they should adjourn the discussion till a later date He asked those present to hold up their hands if they would rather hear Mr. Bamber's reply at once.

No single hand was shown, a fact which caused considerable amusement in view of the manner in which chairman had put the question; and it was decided to adjourn the discussion and Mr. Bamber's reply to a later date, which will be duly announced

Mr. Bamber said he would like to say that, in spite of his criticisms of the Le Chatelier test, he believed it to be the best they had at the present time, and that its insertion in specifications had done more to improve the quality of cement in Great Britain than any other test they had heard of.

In a treatise on earthquake-resisting construction ("La Casa Antisismica"), Signor Giuseppe Torres advances the theory that circular forms ought to be adopted, to the exclusion of all others. He points out that Nature affords numerous examples proving the resistance of round forms to sudden horizontal pressure. In the last disaster in Sicily and Calabria, the circular parts of buildings usually resisted the shock, whilst the rectangular parts were completely destroyed; and the author cites as examples the cathedral of Messina, the Church of the Rosary at Reggio, and the ancient towers of Bagnara and Reggio. Signor Torres therefore concludes that cylindrical and domical forms are best capable of resisting shocks and of transmitting vibrations uniformly throughout the structure. He shares the general belief that reinforced concrete is the best material to employ, as it is "homogeneous" (as we should say, monolithic), and offers "the minimum of thickness with the maximum of lightness." The book is published in Rome.

Fire Prevention Notes.

Legislation for Fire-prevention. Fire insurance companies offer a special inducement to the erection of substantial fire-resisting buildings, in the shape of the reduced premiums which they agree to take on this class of structure. The arrangement works very well between the various offices and the public; but it is questionable whether, from a national point of view, this is a sufficiently enlightened attitude to take. At present the good builder is rewarded and the indifferent one penalised. But as a nation we ought not to regard fire-resisting construction as entirely a matter of adjustment between the fire offices and their clients. To some slight extent the by-laws have made for better, and therefore more fire-resisting, methods of construction; but for the general safety, and for the better protection of public buildings and buildings of historic and artistic interest, there ought to be more stringent regulations in regard to fire-resisting construction generally. The question of premium rates is not a matter of public politics or social well-being; but as a possible limit can never be set to the extent of a fire, it is the more desirable that our important buildings should be protected from possible ravages. We have many laws on the statute book devised for the protection of human life from risks other than fire, for the compensation of employees injured by defective buildings and fixtures; but we endanger the lives of many thousands of people by the erection of inflammable buildings, and have no legislative enactments to meet the evil. Human life must always play the largest part in our consideration of fire prevention; but beyond that we ought to take measures to prevent possible damage to, or the irreparable loss of, many important buildings which are endangered through the neighbouring structures not being constructed in a fire-resisting manner. This conclusion has been the more forcibly impressed upon us by seeing a city warehouse, in which goods of a particularly inflammable nature are stored, and which was recently burnt out, reinstated with naked stanchions and open boarded floors as in the old structure.

Fire Loss in America. It has been computed that the average weekly destruction by fire in the United States of America includes the burning of three theatres, three public halls, twelve churches, two hospitals, two asylums, two colleges, twenty-six hotels, three department stores, six apartment houses, two gaols, and one thousand six hundred dwellings. It is not surprising therefore that in face of this enormous loss business men in America should be devoting their attention very seriously to the subjects of fire-resisting construction and fire-prevention. In some years the loss by fire in the United States has reached the tremendous sum of £120,500,000, or 25s. per head of the population, and these figures do not include loss consequent on the dislocation of business, or the loss of profits occasioned to a business while it is temporarily suspended. The annual fire loss per head of the population in the United States is estimated at about 10s., while that of all the European countries combined does not exceed 1s. 4d. While these figures are very flattering to the progress of building construction in Europe there is little doubt that the Americans are greatly hampered by the immense number of wooden and other combustible buildings which exist all over the United States. The great forests which fell an easy prey to a population on the look-out for an extensive supply of cheap and serviceable building material, are no doubt responsible for this condition of things, but the erection of so many wooden buildings—and in many of the surburban districts of the big cities all the houses are of wood—has necessarily greatly increased the fire-risks. Given a good big starting fire and a favourable wind, and the great conflagrations with which American fire history is associated are not merely easily explained, but appear almost a normal outcome and occurrence. Fortunately the evil of wooden buildings has brought its own cure eventually. The great depletion of the American forests, and the movement for the conservation of what remains, are making timber dearer and reducing its advantage in point of cost over other points of construction.

Fire Prevention and Progress. We are more or less accustomed to the view of the American Press that a great conflagration, such as the wiping out of a whole town, is an incentive to progress, inasmuch as the rebuilding of the town will probably be carried out on improved lines both as regards its layout and the construction of its buildings. The advantage on this side seems illusory and something akin to a child building structures with a box of bricks, which are knocked down to be replaced by other erections, and so on *ad infinitum*. The acuteness of the intelligent American business man has now been directed to the problem, and he is beginning to ask himself whether the game is worth the candle—whether, in fact, progress is really served by a supine attitude concerning preventable fire damage. It may be said that a very cursory examination has convinced him that nothing is served by taking big fire-risks, except perhaps a childish craze for the novelty in the rebuilding of towns and the preparation of new town plans; and on the other hand, as American insurance offices "are not in business for their health," he and all his fellow-countrymen, are paying heavily for the doctrine of *laissez-faire*, in the shape of enhanced premiums on their policies. It is fairly safe to say, however, that the increased price of timber has been the main factor in inducing the United States citizens to take a more enlightened and progressive view of fire-resisting construction.

Popularising Fire-prevention. The effort to popularise fire-prevention has yet to be made. Big and costly buildings are now, as a rule, constructed on fire-resisting principles as regard the main structure, though the fittings too often fall short of the high standard observed in walls, roofs, floors, casements, and doors. The big things seem, for the moment, to receive the utmost attention, while the little things, which are nevertheless little things that count, seem to be strangely neglected. In the great wholesale houses, as well as in the smaller retail shops, highly inflammable woodwork, loaded with still more highly inflammable goods, is found at every turn, the whole forming a well-laid train of combustibles that seem to invite the ignition that may occur at any moment in any one of a thousand different ways. Fire, like disease, is in nine cases out of ten preventable; and it is astonishing that the insurance companies do not insist more generally and more rigorously on the adoption of the elementary precautions for which, nowadays, the facilities are abundant. Fittings need not be combustible. Woodwork, and even fabrics, can by various means be rendered safe against the ordinarily swift effects of casual contact with flame; and why the insurers do not insist on the general employment of such means is one of the many little mysteries that baffle conjecture. They cannot, surely, be afraid that the popularisation of fire-prevention will ultimately result in a serious shrinkage of insurance business. It is true that, in the United States, complete confidence in the hollow-tile system of fire-resisting construction of dwellings is believed to have rendered householders careless of insurance; but, even when human ingenuity in fire-prevention has reached its limit, fires will continue to occur. But as they will be much less frequent, and individually far less costly, the companies will not be called upon to provide against the enormous risks upon which their premiums have been hitherto based. They will therefore be able to reduce materially their premiums, so as to make universal insurance well worth while, so that the popularisation of fire-prevention may possibly result in the popularisation of fire insurance. This is not so much of a paradox as at first sight it seems. The public conscience in this matter is awakening, and the public view is consequently broadening. The man who has become aware of the necessity for adopting the means of fire-prevention will have less hesitation in insuring himself against the contingencies that, as his better education in such matters will enable him to see with increasing clearness, can never be wholly eliminated; but having spent more on fire-prevention, he will justly expect to spend less on insurance; and the companies will surely see the wisdom of accepting much smaller premiums for greatly reduced risks.

A New Fire Extinguisher. In a new system of fire-extinction, which, while it is particularly adaptable for use on board ship, might probably with advantage be adopted in large premises on shore, the apparatus comprises a blower, a turbine engine, a cooler, and a distributor, all compactly arranged so as to occupy but little space. The extinguishing medium is flue gas, which is washed and cooled before being presented to the fire that is to be extinguished. At a recent demonstration, given in the yard of Messrs. R. and R. Green, of Blackwall, a large pile of faggots, burning fiercely, was extinguished in less than fifteen seconds by means of gas from an adjacent boiler chimney. Attached to the apparatus, which is the invention of Mr. George Harker, B.Sc., of Sydney, and Captain T. L. Grainger, marine surveyor, is a fumigator for killing infectious germs.

London Fire Brigade: New Chief Officer. The London County Council are inviting applications for the appointment of Chief Officer of the London Fire Brigade. This officer must be no mere man, but a superman. "He must be of robust health, strong and active, and his age, unless he is or has been an officer in the London Fire Brigade, must be not less than thirty and not more than fifty years on Thursday, 10th June, 1909. He must possess a sound knowledge of mechanics, and have had experience in dealing with men"—a sentence that reminds one of the absurdity of the now nearly obsolete habit of calling workmen "mechanics." Nowadays, however, no confusion is likely to arise in consequence of the nevertheless awkward wording of the sentence. The Chief Officer is to have £900 a year, with free quarters, coal, light, and medical attendance, with £12 a year for uniform clothing and boots. The latest time for receiving applications is Thursday, June 10th. at 11 a.m. There will be no dearth of applicants for the position, which is coveted by the right type of man because it is richer in honour than in emoluments, and because it offers rather more than an off-chance of a hero's death. It is certain that the man selected will be one of many "captains courageous;" but it is almost too much to hope that to pluck, endurance, and administrative capacity he will add the large and penetrative intelligence that enabled Captain Shaw, for instance, to add so much to the knowledge and the philosophy of fire prevention. The new chief, given a fairly long tenure of his onerous and honourable office, may possibly play an important part in a complete revolution of fire-prevention methods and organisation.

International Fire Service Council. Among the foreign delegates at the business meeting, recently held in London, of the International Fire Service Council were the following chief officers: Messrs. Meier (Amsterdam Fire Brigade), Reichel (Berlin Royal Police Fire Brigade), Westphalen (Hamburg Fire Brigade); the hon. secretary, M. de Marie (Luxemburg), and the hon. treasurer, M. Philips (Belgium). The International Fire Service Council comprises 100 delegates, representing thirteen countries. The executive, comprising fifteen members, have their offices at Amsterdam. Several of these gentlemen, as we reported in last week's issue, were present at the dinner of the British Fire Prevention Committee, where two of them made excellent speeches, Chief Officer Meier, of Amsterdam, making a characteristically gallant onslaught on the English language. While in London, the delegates naturally took the opportunity of visiting our chief fire stations, where, it is to be feared, they found more to admire in our men than in our methods. The interchange of visits between the fire officers of different countries should be fruitful of good results, since, where the common object is so broadly humanitarian, international or professional jealousy, or any kind of untoward secrecy or reservation as to appliances and practice, is quite out of the question; every zealous fire officer being, as a matter of course, normally constituted like Chaucer's Clerke: "All gladly would he learn, and gladly teach." The President (Chief Officer Meier, Amsterdam Fire Brigade), vice-presidents (Chief Officer Westphalen, Hamburg, and Mr. Edwin O. Sachs, London), and the members of the Executive of the International Fire Service Council concluded their annual business meetings in London last week. They have decided to prepare and issue a small technical pocket dictionary on fire service terms in English, French, and German, and also to publish in these three languages the results of a large number of the tests undertaken in London by the British Fire Prevention Committee, whose testing station they had an opportunity of visiting during their stay in London. They will also deal with the matter of obtaining reliable data on uniform lines as to the result of motor traction in fire brigades throughout Europe. A considerable amount of routine work was dealt with. Besides attending their meetings, the visitors have been twice entertained by the Lord Mayor at the Mansion House, and some of the party were also present at the Guildhall Banquet on Monday, May 24th. The British Fire Prevention Committee entertained the visitors on two occasions, and they have also been entertained by Captain de Courcy Hamilton, R.N.; by Mr. Edwin O. Sachs, F.R.S.Ed., Lieut.-Col. Fox, and Mr. Percy Collins, J.P. They had all facilities accorded them to see matters in which they were interested in London, and thus had both an instructive and agreeable stay in the metropolis.

Two Big London Fires. Of recent fires in London, two were rather extensive. One occurred in the basement of the premises of the Society for the Promotion of Christian Knowledge, in Northumberland Avenue, at the corner of Old Scotland Yard. Although it was energetically attacked by the firemen, was prevented from spreading to an adjacent hotel, and was extinguished within an hour, it caused damage that has been estimated at about £18,000. The goods that suffered were principally bound books. About a dozen of the society's staff were present when the outbreak occurred, but their efforts to cope with it were unsuccessful. The other fire broke out early last Thursday morning, at the premises of Messrs. W. N. Froy and Co., builders' merchants, King Street, Hammersmith. Adjoining premises, occupied by a firm of drapers and furnishers, soon took fire, and some men who were sleeping there could not be reached by the fire escapes, and were rescued with much difficulty by placing between two windows a plank along which they crawled to safety—a circumstance that seems to emphasize the need for renewed very careful consideration of the means of escape from fire. It is stated that in these premises special staircases were provided, and were used by many persons on this occasion, but that the men who used the plank were cut off from access to them. Such contingencies are among the most perplexing problems with which the architect of business premises has to deal. The damage caused by the Hammersmith fire is estimated at about £40,000.

THE DANGERS OF BREEZE CONCRETE.

By D. B. BUTLER, Assoc.M.Inst.C.E., F.C.S.

Summary of paper read before the Society of Architects.

(*Concluded from page* 417, *No.* 742.)

Breeze Sample No. VIII.—Described as "Sample of Coal Ash straight from Furnace of Paper Mills, burnt from Coal only." This sample was greyish-white in colour, and contained a considerable quantity of clinkers; the clinkers being more or less friable probably accounts for the larger proportion passing through the sieves. About 43 per cent. passed through a 1-10in. sieve, and 12 per cent. through a ¼in. sieve. Of the 45 per cent. remaining, about 20 per cent. was clinker, 23 per cent. coke, and 1½ per cent. coal. Reference to appendix X., shows that although the specimens left entirely in air developed little or no expansion, all the fractions except the coke and clinkers show rather marked expansion in water, the coal being very much the worst. Unfortunately, the quantity of coal found was so small that it was only possible to try it with one cement, but with the other fractions the results obtained with the two different cements practically corroborate one another, although Cement A develops rather more expansion in each case than Cement B.

Breeze Sample No. IX.—Described as "Sample of Ashes dropped from the Fire-bars of Furnace from Waterworks, from Coal and Coke." This sample was nearly all fine material, 4½ per cent. passing through a 1-10in. sieve, and 31 per cent. through a ¼in. seive. Of the 26½ per cent. of material remaining on a ¼in. sieve, 8.3 per cent. was clinkers, 7.3 per cent. coke, 7.48 per cent. coal, with a little ash and a few stones; as will be seen from appendix XI., the water test bars from all the fractions showed enormous expansion, the ¼in. 1-10in, and the average, expanding 4 or 5 per cent. within the first three or four days, and subsequently swelling so much as to break, and render further measurements impossible. The coal fraction expanded 3 per cent. within a week, increasing to 4 per cent. in 28 days, after which it appeared to remain practically constant. Several of the air specimens more especially of the fine material passing the 1-10in. sieve showed rapid expansion for the first day or two, and then remained practically constant, with, if anything slight subsequent contraction. It will be observed that the results obtained with the two different cements are practically identical, and corroborate one another fairly closely. The special value of the results obtained with this particular sample of breeze is that it shows very clearly that some kinds of ashes and furnace refuse are even more dangerous than coal.

Breeze Sample No. X.—Described as "Rough Ashes from Furnace of Electricity Works from Coal only." About 14½ per cent. of this material passed through a 1-10in. sieve, and 30 per cent. through a ¼in. Of the remaining 55½ per cent., 43½ per cent. was clinkers, 5½ per cent. coke, 4½ per cent. coal, and a few stones. The results given in appendix XII. show that only the finer material passing a 1-10in. sieve develops any appreciable expansion, i.e., about 1-3 per cent., which it attains in about a month, and thereafter appears to be constant. Several of the other fractions show measurable though negligible expansion ranging from .002 to .09 per cent.

A noticeable feature of the foregoing experiments is, that many of the specimens which show very marked expansion when placed under water as soon as set, expand very much less when left entirely in air. It therefore seemed a point worth determining as to whether exposure to damp or moisture would in any way affect these air set specimens at the end of the three months tests, i.e., after they had become thoroughly seasoned. One of the duplicate air bars from

* Breeze gauged with Cement B. † 2 months expansion, bar broken.

each series was therefore placed under water, the time elapsing between the date of moulding and placing under water ranging from 91 to 292 days. The results are given in appendix XIII. It will be observed that immersion had practically no effect upon those specimens which had previously shown no expansion when kept under water, but that it caused almost immediate expansion of a very serious nature with those fractions of breeze which had previously developed expansion when placed under water in the first instance. This clearly shows that the expansive agent, whatever it may be, is more or less dormant in the dry air-set block, and only requires to become damped to constitute a serious element of danger.

Referring now to the chemical aspect of the question, it was intended, when the experiments were first commenced, not only to analyse each fraction of each sample, to ascertain if it contained any deleterious constituent, but also to analyse each mortar both immediately after gauging, and again at the end of the experiments, to try and ascertain, if and when any expansion had occurred, whether there was any marked chemical difference between them, which would enable the cause of the expansion to be detected, and thus serve as a guide in the investigation of actual cases of failure. After analysing some thirty-six samples with entirely negative results, this idea was abandoned as involving too prodigious an amount of labour without any likelihood of corresponding reward; seeing, however, that some of the coal fractions caused enormous expansion while others caused practically none, they were examined chemically with the view of ascertaining the cause of this marked difference. The results showed that the coals from breeze samples Nos. 8 and 9 were highly bituminous, containing 35 per cent. and 33½ per cent. respectively of volatile matter, while those from samples Nos. 7 and 10 were more of the nature of anthracite, containing only 4 per cent. and 3 per cent. respectively of volatile matter. This indicates very clearly that bituminous coal is highly dangerous, while anthracite appears to be harmless. Apart from coal, the only analysis of the other fractions calling for comment is the fine material passing the 1-10in. sieve of sample 9, which was found to contain 3¾ per cent. of SO , which is doubtless partially responsible for the high expansion shown by this fraction, aggravated no doubt by the presence of some fine coal.

Taken as a whole, the experiments as far as they go seem to point to the fact that as regards subsequent expansion, there is not much danger to be apprehended from good clean coke or clinkers, or even anthracite coal, but that some kinds of ashes and furnace refuse are highly dangerous, while any considerable quantity of bituminous coal is absolutely fatal. One noticeable feature of the experiments, however, was, that most of the coke breeze mortars, had a tendency to more or less seriously attack the iron moulds in which the Bauschinger Bars were made, causing them to rust during the short space of twenty-four hours between the moulding of the specimens, and their removal from the moulds; the author is unaware if such results have been found to any appreciable extent in actual practice, but samples of breeze concrete sent him for examination a short time ago, showed distinct marks of considerable rusting having taken place where the concrete had been in contact with the rolled joists. If such prove to be the case, it might in the end prove a very serious matter as affecting the life and strength of the steel work.

Altogether the experiments previously described represent some two years' work, and include the preparation of about 300 test pieces involving some 5,000 measurements, to say nothing of the sifting, sorting, and preparation of the breeze samples; the author is only too conscious of the fact that they are far from reaching finality, indeed, they only touch the fringe of a wide field of research in which there is a vast amount of work to be done; having ascertained, however, that certain materials constitute a serious source of danger, and probably account for many of the "Breeze" concrete failures which he has met with, he trusts that the danger signals most unmistakably displayed by the foregoing researches may prove of value to his hearers and tend to prevent the recurrence of such failures in the future.

Since the inception of these experiments, the following translated extract from the "Tonindustrie-Zeitung," dated April 25th, 1908, shows that the importance of the subject has at all events begun to be appreciated in Germany.

"Use of Coal Residues for Concrete."

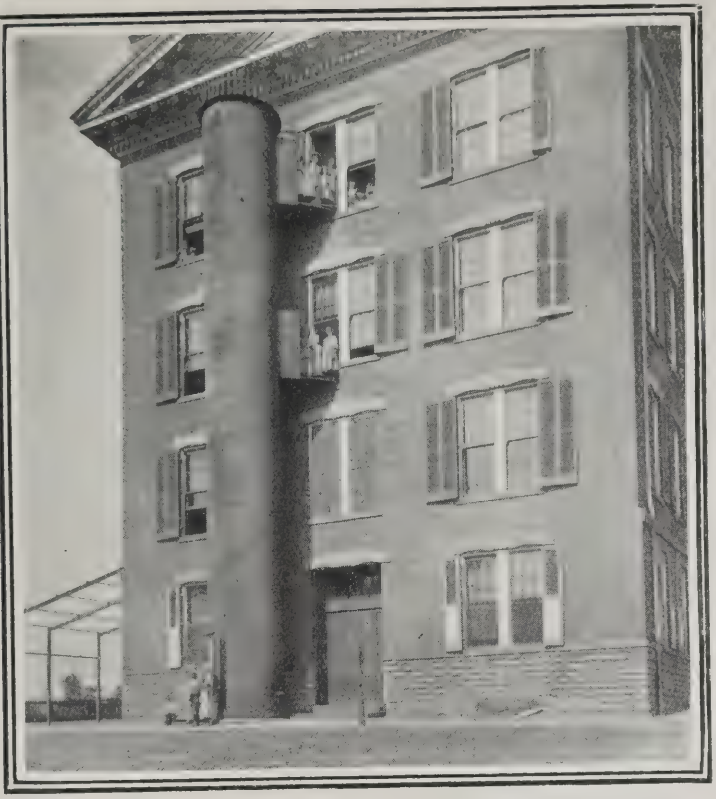
"The Minister for Public Works has on the 25th March, 1908, issued the following circular addressed to the Departmental Presidents of the Government:—

"After having received the report of the German Board of reinforced concrete, I recommend the prohibition of the use of breeze as an aggregate for concrete for the erection of reinforced concrete buildings in general, also in ceilings and beams wherever tensile stresses may occur. The use of breeze for other kinds of concrete. will only be admitted in such cases where there is no danger of its coming into contact with the supporting ironwork, nor of people being hurt by the falling concrete."

In conclusion, the author wishes to thank those firms who kindly supplied him with the various samples of breeze experimented upon; his thanks are also due to his two assistants, Messrs. G. J. Fenwick, A.R.C.S., and A. T. Faircloth, for the careful and painstaking manner in which they carried out the experiments under his direction.

Discussion.

Mr. Henry Adams, in proposing a vote of thanks to Mr. Butler, said there were points in his paper which might be open to discussion. He had spoken of the expansion of the mass of concrete, which in itself was a very serious matter. When a large warehouse floor was laid in concrete the expansion in many cases had been very serious, and was not altogether prevented by the use of expansion boards. The mischief, Mr. Butler had told them, was undoubtedly due in most cases to the coke breeze. They were apparently using a combustible material and expecting it to resist fire, but the result of the experiments formulated by their Chairman (Mr. Marsland) was of course sufficient



THE NEW AMERICAN FIRE ESCAPE.

The curious and ugly automatic fire escape shown above is being applied to all school buildings in America. Pupils enter the escape from each floor and slide down the interior by means of a spiral chute. Some of them are seen emerging at the bottom. It was after the recent terrible fire at Collinswoods school near Cleveland, Ohio, that these fire escapes were ordered to be placed upon all schools,

authority for their acceptance. Whether they were made under practical conditions he did not know. The lecturer had cited a case where coke breeze had been used in concrete for a boiler setting and had stated that it actually took fire. Until he saw the enlarged diagram, he was not clear as to what was meant by the lecturer's reference to his fractions of "breeze." It appeared that samples of breeze were divided up into certain portions, one consisting of coal only, and in order that they might be properly tested, a portion of the material was passed through a ¼in. sieve, and another a 1-10in. sieve. The lecturer had also said that the results of the tests of the concrete bars under water showed expansion to be negligible, while those kept entirely in air showed slight contraction, and with that in view one would expect fireproof floors to show contraction rather than expansion. He would be interested in knowing whether there was any reason why floors should show expansion rather than contraction when the small tests showed the opposite. He also heard that a fireproof floor at any time would be subject to expansion if it got moist, it remaining constant until moisture reached it. He would like to know whether it would contract again when the moisture had evaporated. Regarding the lecturer's remarks on Breeze Sample No. VIII., where he said that about 43 per cent. passed through a 1-10in. sieve and 12 per cent. through a ¼in. sieve, he took it to mean 12 per cent. of the original bulk was retained after the 43 per cent. had passed through the 1-10in. sieve. The author had told them that "the expansive agent, whatever it might be, was more or less dormant in the dry air-set block, and only required to become damped to constitute a serious element of danger." That was a very important point as regards failures, because it might be due to a leaky tank or something of that kind causing expansion. Another important point was the tendency of coke breeze mortar to cause rusting of the iron moulds, a point which should be taken into account when using metal as a reinforcement. The corrosion of the metal in the concrete was one of the questions under special consideration by the Concrete Institute.

Mr. Edwin J. Sadgrove, F.R.I.B.A., said he had given up using that particular aggregate after witnessing an incident in which the workmen engaged on some work having nothing wherewith to cook their food, obtained a piece of so-called "fireproof flooring," lit their fires and cooked their dinners with it. He had always thought that coke breeze was hungry enough to take anything, and a mixture of 1.3 was, he thought, hardly sufficient. With more cement than coke breeze they might get the stuff to hold together, and he associated himself with the German Minister for Public Works, who, after having "coke breeze" before him as a prisoner, and hearing all the expert evidence for and against, found it "guilty" with no recommendation to mercy. He supposed coke breeze was really only seriously thought of when lightness of construction was necessary, and he could not see why they could not use some other light material for concrete.

Mr. H. K. G. Bamber regretted that, although Mr. Butler had given them instances of failure under his series of tests, he had not given them any opinion as to the cause of those failures. He could quite understand the great difficulty in formulating any theory as to what chemical action might have taken place between the breeze and the cement, but he was inclined to believe that the cause of expansion was probably due to the presence of sulphur in the form of sulphides. In the analysis given the lecturer said that the breeze contained 3¾ per cent. of sulphuric anhydride; he thought that in all probability the sulphur was not present in the form of an anhydride, but probably in combination with other metals in the form of a sulphide, and being in that unstable condition was the direct cause of the expansion. Any compound in cement, or in the aggregate used in cement, which was of such unstable character and liable to oxidation, forming various compounds with the other ingredients present, was a very undesirable thing to be there. He also thought that the presence of sulphides was borne out by Mr. Butler's statement that the breeze concrete showed a "tendency to more or less seriously attack the iron moulds in which the Bauschinger bars were made;" this, he thought, was distinct evidence of the presence of an unstable compound which had started some action after the cement had set.

Mr. Max Clarke, F.R.I.B.A., said he was one of those unfortunate people who had had considerable failures with coke breeze concrete, and he had tried to find out the cause. He made investigations at a gas works as to the difference between "Pan" breeze and "Coke" breeze, a matter which many architects did not know. "Pan" breeze was the material which fell into the water pan from the furnace, while "coke" breeze was the refuse which was drawn from the retort after the gas was extracted. He had a sample of each analysed, with the result that it was evident that both contained an appreciable amount of sulphur, pan breeze being the worst, and that the samples were unsuitable as aggregates for concrete. Since then he had avoided "coke" breeze. He did not agree that breeze concrete was inflammable; he was almost certain that it was not. He possessed a sample of coke breeze concrete which had been experimented upon by the British Fire Prevention Committee. This particular piece was underneath an iron joist, and about 2in. thick. It was subjected to more than 1,500 degrees Fahrenheit, and on the side which was in contact with the joist was a piece of coal, which was not in the slightest degree burnt. They found that coke breeze floors became incandescent on the under side, but they did not show the slightest tendency to burn or to flame, and when broken down, the concrete in the centre was just as good as when put up. In his opinion it was sulphur which caused these expansions; in fact he thought he saw along the edge of the cracks in the concrete bars shown on the screen, certain marks denoting the presence of sulphur. Mr. Butler had said that the expansion shown on some of the diagrams was negligible; but supposing they had a warehouse 100ft. long and the coke breeze was to expand one per cent., it would hardly do to have an expansion of a foot. The danger would then be considerable, and even if the expansion was 1-10 per cent., it would cause serious damage. The speaker exhibited drawings showing a coke breeze roof over a small strong room. The dimensions of the building were—length 19ft., average width 6ft., and the coke breeze roof 14in. thick. All round between the coke breeze and the wall was a 1¼in. space. The walls were built of 14in. brickwork, with two courses of hoop-iron at every joint, so that they were practically stable. At the end of about nine months, at the weaker end of the building, the walls on both sides cracked to the extent of ¾in. from top to bottom. These cracks were cut out and repaired, but after another period again opened out about half-an-inch. Of course, one per cent. expansion would do such things as that. Another case was that of a large warehouse about 150ft. long, 60ft. wide, and one storey high, where the owners wished to insert a floor about 10ft. from the ground. There were rows of stanchions put up and longitudinal joists. The coke breeze floor was isolated on two sides and one end projected from the building. It was exactly 60ft. long when put up, and four months afterwards it was 60ft. 4in., and they could see on the under side where the cross joist had originally been at the free end. He had put in coke breeze floors 150ft. long more than once, and although they had been up from ten to fourteen years, the buildings did not show any cracks, but he would point out that none of the buildings had concrete roofs. Damp was a great factor in causing these cracks. Porches and such like cracked very badly indeed from that cause. He always had his cement tested, and endeavoured to get what he called "pure" coke breeze, although he felt it was practically an impossibility. If they could have the coke breeze broken up and washed, they would have more exactly the stuff that they wanted. The material which came from the retort cost about 4s. 3d. a cubic yard, that from the pan about 2s. 3d. a yard, and if they added to that the cost of breaking and washing, then coke breeze would be out of court. They only used it because it was light.

Mr. Chas. F. Marsh suggested that instead of coke breeze, "destructive clinker" should be tried. It would, he thought, be free from some of the disadvantages of coke breeze. He had always known that concrete when it sets in air contracts, and when it sets in water expands, and had frequently heard architects complain of the expansion of floors, but he supposed that they were generally, in fact probably always, made of breeze and not of the other aggregates.

Mr. H. E. Hawker had had a good deal of experience in putting down concrete floors and roofs, and his trouble had not been caused by expansion but by contraction, and he found that floors and roofs went on all right for four or five months, when they suddenly developed a crack. He had, however, overcome his difficulties by reinforcement either with wire or expanded metal. He was not scientific enough to explain why that should be so.

Mr. G. L. Anderson submitted the result of the Associated Portland Cement Manufacturers' tests, showing the relative tensile strength of mortars made with same cement, but using various sands and aggregates. The same proportions were used in each case, viz. :—1 part of Portland cement by weight to 3 parts of aggregate. The following suitable and unsuitable aggregates were used in the tests, and taking the three months old tests as corresponding with Mr. Butler's figures, the relative tensile strengths were as follows :—

With *suitable* aggregates :—

	Tensile Strength.
Standard Leighton Buzzard sand	555 lb. to the sq. in.
Crushed granite	650 ,, ,,
Fine silver sand	442 ,, ,,
Average building	405 ,, ,,

With *unsuitable* aggregates :—

Earthy sand (25% of soil) ..	230 ,, ,,
Loamy soil	260 ,, ,,
Breeze, containing sulphides	Test pieces disintegrated completely.

He mentioned these figures as bearing upon the question of the sulphur content of the breeze being possibly the explanation of the failures referred to, but, whatever the cause, it certainly was expedient for all those who were dealing with reinforced concrete work to avoid breeze or slag which had any suspicion of a high sulphur content

Mr. R. B. Ling said some reference had been made to the use of destructive clinkers in concrete, but from his personal experience he had found the material unsuitable. The clinkers contained bits of leather and animal matter which did not properly burn, and after a few months these foreign matters caused "blowing" and cracking.

Mr. Ellis Marsland said the whole question seemed to turn on the moral that when they specified coke breeze they should see that they got it. The diagrams showing the result of experiments dealt with what could hardly be called "breeze." His definition of breeze would be the refuse of small coke, and it was those other materials imported as breeze which caused all the trouble. Some remarks had been made with regard to coke breeze not being a good fire-resistant, and an instance given of a man who set his boiler upon coke breeze blocks. The latter was, of course, a very foolish thing to do, for if the boiler had been set on any other concrete the result would have been just the same. He thought it would be a very useful thing if they could have some experiments made with larger samples, not altogether laboratory tests, but practical tests, with say a block a yard long and six inches square, then he thought they would arrive at a more practical result. The idea that coke breeze was not a suitable material for fireproof floors was quite erroneous. The hut used by the Fire Prevention Committee in carrying out their tests had a roofing of coke breeze concrete which had been subjected to from 1,800 to 2,000 degrees of heat for from two to four hours, with the temperature alternating, and was as good now as when first put up. The under surface, he admitted, was often incandescent, but that was no indication that coke breeze was not fire-resisting. Any other concrete tried in their tests had always been incandescent at the conclusion of the test.

Mr. D. B. Butler in acknowledging the vote said that with regard to Professor Adams' remarks, the samples of breeze in a great many cases consisted of fine and coarse particles, ranging from 2in. in diameter down to 100th part of an inch, and since it was impossible to hand pick such very fine material, he took that stopping in the ¼in. sieve as the finest which could profitably be sorted out. The material going through this sieve he again differentiated somewhat by passing it through a 1-10in. sieve. That retained on the ¼in. sieve was all hand picked as stated. Floors which expanded with moisture would not, he thought, contract again when the moisture had evaporated, his experiments showing that the expansion took place within the first week or so and remained permanent. With regard to the rusting of the iron bars used as reinforcement with coke breeze, he had heard of cases where coke breeze concrete was used for enclosing iron water pipes and considerable rusting had occurred. With regard to Mr. Anderson's remarks as to the different strengths of mortars composed of desirable and undesirable sands, it was very unfortunate that Mr. Anderson could not give them some idea of the amount of sulphur in the breeze he used. He thought that when they specified coke breeze they should see that they got it, and the proper definition of breeze was "fine coke."

Federation News.

PRESTON ASSOCIATION.

Secretary: John Tomlison.

The half-yearly general meeting of the Preston Association was held at the Board-room, in the new premises, Mount Street, Preston, when the president (Mr. T. B. Garnett) was in the chair, and there was an attendance of about ninety members.

The minutes of the last meeting having been read and approved, the chairman called attention to the half-yearly report, which spoke of the continued progress and success of the society, and detailed at some length the work of the past six months.

The representatives of the Executive and Trade Committees of the County Federation were then appointed, and also the representatives on the Local Conciliation Board.

The proposal to appoint a solicitor to the association was next considered, and the committee's report on the subject was read. Three names were submitted to the meeting, and a ballot taken, with the result that further negotiations with the selected gentlemen were left in the hands of the committee.

It was decided that the association cease paying the expenses of Federation officials or delegates to National and other meetings after September 30th next, unless and when they are specifically elected to represent this association, or the committee by special resolution agree to pay such expenses.

A proposal that in future the representatives on the local committee shall be nominated by the branch trades was defeated, and an amendment carried leaving the election of the representatives in the hands of the branch trades.

It was also decided to print the Federation rule on the subject of arbitration between sole and sub-contractors in cases of business disputes as a local rule, and to register the new premises as a club.

This completed the formal business.

During the past month or two, the question of a uniform discount to members on goods supplied to private parties, etc., that members have to fix, has been dealt with by the plumbers' and painters' branch, and the subject is still under consideration.

The General Committee have had under consideration the desirability of amending the National form of contract, and have submitted their proposals, which were of a somewhat comprehensive character, to the Federation.

BARNSLEY ASSOCIATION.

Secretary: J. Denton.

At the monthly meeting (May) of the Barnsley Branch of the Federation of Building Trade Employers, which was held at the King's Head Hotel, the president (Councillor G. Haigh) was supported by fifteen members.

The branch was further strengthened by the unanimous election of two new members in the Plumbers' Section.

The report of the last Yorkshire meeting was submitted by the senior vice-president (Mr. E. Broley). The new sub-contract form of agreement, as amended at the Yorkshire monthly meeting held in Dewsbury, received unanimous approval.

It was resolved that the annual drive and cricket match, "Builders' Section" versus "Rest of Federation," be held in June. The "Whist Drive" balance sheet was submitted by the secretary, and unanimously approved.

The election of the employers' representatives on the Local Conciliation Board resulted in the following gentlemen being unanimously elected, viz.: Messrs. Councillor G. Haigh, C. D. Potter, H. Medley, C. W. Squire, P. Dalby, T. Lindley, J. Smith, and F. Goodyear.

WAREHOUSE, ORMEAU ROAD, BELFAST.

PATENT VULCANITE ROOFING

FIRE RESISTING.

The best covering for FLAT ROOFS of wood or concrete construction.

Complies with the London Building Act and Local Regulations.

No expense of maintenance. Guaranteed for long periods.

SPECIFIED BY LEADING ARCHITECTS AND ENGINEERS.

Tested by the British Fire Prevention Committee.

Also Manufacturers of Asphalte and Bitumen Dampcourses and various classes of Sheetings for light Roofs. Samples free.

For Full Particulars, Catalogues, Detailed Sketches, and Estimates, apply to

VULCANITE, LIMITED,

London Offices: 118, Cannon Street, London, E.C. And at Belfast and Manchester.

From North of England, Scotland, and Ireland, please address to Belfast.

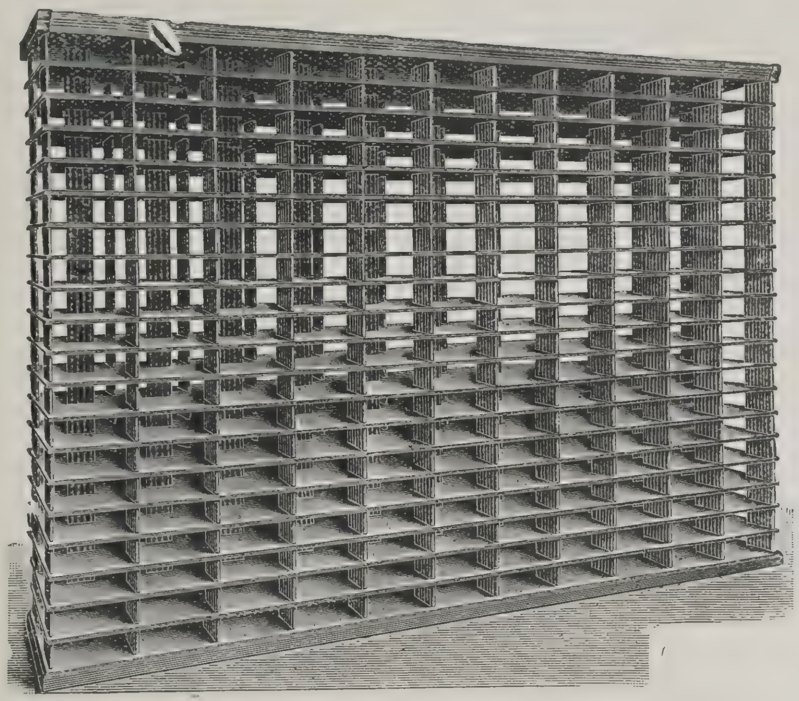
THE ADJUSTABLE SHELVING AND METAL CONSTRUCTION

COMPANY, LIMITED.



PATENT COLLAPSIBLE DOUBLE-SIDED STORAGE STACK.

This stack contains 20 shelves of steel about 1/25th of an inch in thickness instead of 5/8th of an inch, which would be necessary if wood were used. The saving in space is therefore as follows:

$117/200 \times 20 \times 11 \times 2 = 21$ ft. 5 in.

which is about equal to another 60 divisions.

Manufacturers of

Patent Steel Constructional Work,

AND

Steel or Wood Fittings,

For Stores, Warehouses, Libraries, etc.,

WITH

Fixed or Adjustable Shelving

(Patented all over the world).

Leading Features of our Adjustable Shelving.

Easy and rapid adjusting of the shelves, even when fully loaded.

Greatest economy of space, the usual supports being dispensed with, the sideplates only require sufficient clearance to prevent chafing.

Free access of air and light, owing to the absence of the usual partitions. No corners where dust can collect. Pleasing appearance.

Contents visible at a glance. Erection and dismantling perfectly simple, only a spanner and screwdriver required.

Interchangeability of all parts. Great saving in time and cost, when removal is necessary.

Our stacks are suitable for Shops, Warehouses, etc., as well as Libraries, Archives, etc.

Complete Space-Saving installations for Libraries, both Public and Private, Government and Insurance Offices, Banks, etc.; Museums, Collections, etc.; Shops, Warehouses, Showrooms and Book Stores, Business Houses and Factories.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the **contract, which requires them to pay the rates of wages current in the district.**

BUILDING.

June 9-18. **HOLT.**—Erection of a new school at Holt, for the Norfolk Education Committee. Names by June 9, to Olley and Haward, architects, 5, Queen Street, Great Yarmouth, at whose office plans can be inspected, and from whom quantities can be obtained on June 11. A deposit of £1 1s. will be required. Tenders must be delivered to Thos. A. Cox, secretary, Shirehall, Norwich.

June 14. **NEWBURY.**—Erection of new offices for the Newbury T.C. Particulars may be obtained at office of S. J. L. Vincent, A.M.Inst.C.E., borough surveyor, Mansion House Street, and quantities on deposit of £5 Bank of England note. Only builders residing within five miles of Newbury are invited to tender.

June 14. **HALIFAX.**—Various trades in alterations at sundry schools, painting, etc. (at the public libraries and museums), for the Education and Public Library Committee. Plans and specification etc., of James Lord, M.I.C.E., borough engineer, Town Hall, Halifax, on deposit of £1. Tenders to be sent to W. H. Ostler, secretary. Fair wages clause.

June 14. **PORTSMOUTH.**—Erection of a teachers' room and a cloakroom at the George Street council school (girls' department), for the education committee. Form of tender, specification, etc., of the surveyor, A. H. Bone, Cambridge Junction, Portsmouth. Tenders to be sent to the Committee's Offices, Town Hall, Portsmouth. Fair wages clause.

June 14. **NELSON (LANCS.).**—Masons', joiners', plumbers', plasterers' and slaters' work in the erection and completion of the new Palace and Hippodrome, Nelson. Plans and specifications and bills of quantities of Mathew Watson, Landless, and Pearse, architects and surveyors, 2 and 4, Nicholas Street, Burnley, and 21, Dale Street, Liverpool, to whom tenders must be sent.

June 14-29. **WALTHAMSTOW.**—Erection of a junior mixed school, to be erected on the playgrounds of the Coppermill Road school, for the Education Committee. Names to the architect, H. Prosser, M.S.A. Applications for bills of quantities must be sent to the architect, accompanied by deposit of £5. Tenders to be sent to T. W. Liddiard, Secretary to the Committee, High Street, Walthamstow.

June 15. **BARGOED.**—Erection of a bungalow at Bargoed for P. Williams. Plans and specifications of Idris Leyshon, architect and surveyor, Hanbury Road, Bargoed, to whom tenders are to be sent.

June 15. **BALLYMOE.**—Additions and alterations to Ballymoe Church for the Very Rev. James Martin, P.P. Plans, etc., can be seen at the Presbytery, Ballintubber, or at office of William H. Byrne and Son, architects, 20, Suffolk Street, Dublin.

June 15. **CAERAU (WALES).**—Alterations and additions to 90, Tonna Road, Caerau, for Alfred Webb, 1, Protheroe Street, Caerau, to whom tenders are to be sent. W. M. Llewellyn, architect and surveyor. Plans and specification may be seen at 40, Brynmawr Place, Maesteg.

June 15. **DOWLAIS.**—Alterations and additions to Bethania Chapel, Dowlais, and erection of new school, etc., in connection therewith. Plans and specifications and bills of quantities, of E. A. Johnson, F.R.I.B.A., architect, Merthyr Tydfil, on deposit of £2 2s. Tenders to be sent to the secretary, Geo. Hicks, 26, Victoria Street, Dowlais.

June 15. **MIDDLESBROUGH.**—Alterations and additions at Middlesbrough Station, for the North-Eastern Railway. Plans and specification upon application at the station master's office, Middlesbrough. Quantities and further information from William Bell, the Company's architect, at York. Tenders to be sent to R. F. Dunnell, secretary, York.

June 15. **LANGLEY PARK, BEAMISH AND COLD HESELDEN.**—Erection of new Council Schools for the Durham C.C. Plans, specifications, and general conditions, may be seen, and bills of quantities obtained for (1) Langley Park school (600 scholars) and Beamish school (450 scholars) of W. Rushworth, Shire Hall, Durham; and for (2) Cold Heselden school (264 scholars), of J. W. F. Phillipson, architect, Murton Chambers, 8, Grainger Street, Newcastle-on-Tyne. Tenders to be sent to A. J. Dawson, Clerk to the Education Committee, Shire Hall, Durham.

Duties on Land Values.

The immediate effect of the proposed duties on land values will naturally be that holders of land likely to be considered liable to the new taxation will have to consider their position, and such persons will call a halt of preparations in connection with land and building schemes until they have done so. This halt will probably act as a temporary check on the anxiously awaited revival of building. The important question is as to the permanent effects of the new taxation. Take the case of present holders of undeveloped land possessed of a site value. Up to the present time such holders have had to consider whether present prices obtainable will show a margin over the capital invested and the accrued interest less any revenue derived from the land in its undeveloped state. They have also had to consider whether the prospects of increased site value were such as would pay them to continue to hold the land, or whether it was preferable to sell as soon as possible to save a probable loss of either interest or part of the principal. In the former, there is no pressure to sell; in the latter, there is: but in this case, precisely because the prospects make it desirable to sell, they also make it undesirable to buy, so that the demand is slack. Upon these two classes of landholders the new taxation will probably have a different effect; the former will continue to hold if the indications are favourable to his recouping ultimately the capital invested, accrued interest, and accrued taxation on the site value; and provided these anticipations are realised, the effect of a new taxation will be to increase the cost of the land, and consequently the cost and revenue-producing power of the buildings ultimately put on it. The effect will, however, be of a remote character; the latter class of holder will see his present possible margin of profit on his investment diminished, possibly in danger of being extinguished, by the new taxation, and will be under pressure to that extent to sell. But his land will not be desirable by other holders unless sold at a sacrifice, because, for the reason given above, demand for development work is slack. The effect of the new taxation on this class of holder will be detrimental to him, and will tend to reduce the site value of the land to a point at which a demand for it will arise. But demand only arises because houses or other buildings are required owing to growth in the locality, and some localities remain stationary for long periods. In such cases, although the land may be deemed to have a site value greater than its agricultural value, and so be taxed, the taxation may be in effect only piling up the sunk capital value without increasing the site value. Such holders can only get out at a loss. In the neighbourhood of large cities, the former conditions are likely to prevail, but about small towns the latter conditions are more likely. The net result, so far as the building trade is concerned, seems to be that in the former case building will be checked; while in the latter case it will not be stimulated, for although the land may be thrown on the market at a cheap rate, there is not the necessary demand for houses, etc., to cause it to be built upon. Probably the best policy for holders of land having a small site value and for the moment unsaleable for building on, is to let it out or sell it for allotment and small-holding land. As such, it would probably escape taxation for its site value, if this value was but slightly in excess of the value of agricultural land, because the whole value due to agricultural use is deductable from the site value, and the tax is only payable on the difference, and the agricultural value of allotments is in excess of that of ordinary farm land. In the case of land let on long leases, the tax falls on the leaseholder, who stands in place of the owner. Such land would be probably in course of development as a building estate; and similar considerations to those already shown to apply to holders of site value land would apply to the builder or speculator having the estate in hand; but as his having the estate in hand presupposes a good demand for houses, it would appear to be his best policy to develop the estate as rapidly as possible. Once developed, the land comes under the increment value tax; so that, one way or the other, all land will have to bear increased taxation, and it seems to be merely a question of circumstance whether the burden falls on present or future owners, and whether the conditions of supply and demand enable it to be covered by higher rent or cause it to be paid out of capital. In any case, the new taxation is likely to prove detrimental to the building trade, and indirectly to tend to prolong the already long period of trade depression through which this industry is passing.

A Root Principle.

Tityrus, reclining in spite of the ungenial weather) under the wide-spreading beech, has reconstructed for the benefit of the select few who have leisure to read the leaders in the "Times" the well-worn comparison between architecture and trees. Some have held that the dim cathedral aisles were conceived in imitation of avenues of trees; others, reversing the spell, see in the flecked and traceried avenue of trees the cathedral of Nature. The resemblance may be accidental, but it is of ancient notoriety. "Only at the climax of a long process of development, when the builders had learnt to make interiors that seemed to triumph over the earth's attraction, did any likeness to an avenue of trees appear; and if the builders of Amiens or Bourges ever noticed such a likeness, we may be sure that it pleased them only as a happy accident." Yet, having brushed aside the argument from design, the writer proceeds to develop the analogy: "The great tree trunks soar out of the earth and bear all their spreading branches as lightly as a flower is borne by its stalk; and in the same way the great columns soar, branching out into arches, and at last into the fans of the vault which they seem to bear no less lightly. There is also this further resemblance between them—that in each case the appearance of lightness is produced by an elaborate concealed structure. There are all the spreading roots of the tree underground; and outside the church there are all the buttresses and flying buttresses. The interior tells nothing of these except to the instructed eye; and we take the roots of the tree for granted only because we know that all trees have roots. A great part of our delight in the tree's soaring lightness comes from our æsthetic ignoring of the fact that it is all produced by a system of underground engineering." These and sundry other poetico-philosophical reflections appear to have occurred to our Tityrus in contemplation of "a great beech tree in mid-May sunlight." "If you lie under it and look up, you are moved by the same contrast between soaring strength of structure and glittering multiplicity of ornament as in a great Gothic church." There is, he discerns, in each case the same intimate relationship between structure and ornament; but what seems to be ornament "is only the beautiful performance of a necessary process." These tongues in trees and sermons in stones convey to our Tityrus the gospel so insistently preached by William Morris, that men should put joy into their work. The art that deliberately aims at beauty and nothing else is never the greatest art: "it is commonest when art is most completely divorced from life, when men have lost the power of doing or making things with delight, and therefore beautifully." Art is then most apt to become a stale convention; and herein it seems to us are suggested the chief danger and the greatest difficulty in the training of the architect. But our Tityrus, recumbent under his beech, has adumbrated for us a root principle. How to apply it is a problem for educationists.

Æsthetic Paris. Ugly buildings in Paris! Is it possible? One had become accustomed to think that the Parisian's taste was so instinctive and ingrained that it would be impossible for him to achieve an absolutely ugly building, even if he tried very hard. Yet we are informed that ugly buildings are positively being erected in Paris. It is probably some alien or outer barbarian who is guilty of this sacrilege. The wording of the announcement of the misdeed certainly leaves us this loophole, for it is distinctly stated that "The Parisian has been recently scandalised by the erection in his beloved city of enormous buildings—often on the finest sites—which are not only ugly in themselves, but entirely out of harmony with their surroundings;" and the Parisian, having no Puritanical history behind him, is hardly the man to be scandalised by his own actions. One is further relieved to find that the Parisian is not going to take it lying down. He has invoked the aid of his rather autocratic Municipal Council, who have graciously hearkened to his exceeding bitter cry. The regulations with regard to height and architecture are to be rigidly enforced. Although one of the offending buildings has been nicknamed the *gratte-ciel*, nothing approaching either to the dimensions or to the uncomeliness of a skyscraper will be suffered to sully the beauty of what is still the fairest city of Europe. A building in the Place de l'Etoile that exceeds by 80 centimetres the regulation height is to be brought within the rules. Moreover, the decree of 1902 that permits the erection of buildings 100ft. high is to be abrogated, and public opinion is warmly supporting this decision of the Council. The Parisian is bestirring himself not a moment too soon, for it would seem that the authorities had allowed themselves to become somewhat lax in the exercise of their plenary powers—a contingency that is very apt to arise where restrictions are so numerous and minute that it must be rather difficult to recollect them all. In the Place Vendome, for instance, fine examples of eighteenth-century architecture are much disfigured by aggressive and unauthorised shop signs. Now that they have got upon the sensitive nerves of the æsthetic Parisian, they are likely to receive short shrift; for the French official, when once he has received the word of command, is sudden and swift in its drastic execution. Paris is contemplating the expenditure of 792 millions of francs on what hitherto would have been called street improvements, but what may now be more appropriately termed an heroic essay in town planning; and apparently she is approaching the task with æsthetic sensibility.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION
July 9	STOKE-UPON TRENT. Additions to Town Hall including large hall to seat 3,000 people, police court, etc. Premiums of £100 and £50 for second and third designs respectively. Assessor nominated by Pres. R.I.B.A. Conditions and particulars from Jno. B. Ashwell, Town Clerk, Town Hall, Stoke-on-Trent,
July 17	NEW PUBLIC BUILDINGS, BURSLEM. The Architect whose design is placed first by the Assessor will be appointed to carry out the work. Premiums of £100 and £75 to authors of second and third designs, respectively, Conditions and plan of site from F. Bettany, Borough Surveyor. Deposit, £2 2s., returnable on receipt of *bona fide* design.
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby. (See Note below.)
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
No date.	WALLASEY U.D. COUNCIL. CARNEGIE LIBRARY in Earlston Road, Liscard, Chester. Limited to Architects practising in Lancashire and Cheshire. Particulars from W. H. Travers, A.M.I.C.E., Public Offices, Egremont, Cheshire. Deposit £2, refunded on receipt of designs, or on return of all papers and intimation of non-participation within seven days of obtaining same.

Middlesbrough Library.

It is credibly stated that "sheaves of letters" from architects who took part in this competition were read at a meeting of the Free Library Committee, held on June 9th. Some of these correspondents stated, in effect, that they had actually prepared sketch plans on similar lines to the arrangement adopted, but had reluctantly abandoned them in order to comply with the conditions. It was decided that the Town Clerk should be instructed to inform the correspondents that their letters had been submitted to the assessor. It was also stated that a memorial protesting against violation of the conditions (the terms of the protest were given in our issue last week), and signed by 108 of the competitors, had been received by the Town Clerk, who reported that a copy of it had been forwarded to the assessor, who replied by telegram as follows:—"I consider the objections of the architects frivolous and vexatious, and regret that any body of architects could so act in a public matter." Messrs. Russell and Cooper, the successful competitors, forwarded a letter in which they denied that they had violated the conditions of the competition. The chairman (Mr. J. S. Calvert) emphasised the point that a clause in the conditions stipulated that the assessor's award should be final. Everything had been done in perfect order, as far as he could see. They had appointed an assessor in whom they had every confidence. He had given his assessment, and they had proceeded on the assumption that he had acted strictly in accordance with instructions. Councillor Roberts remarked that, so far as they as a Council were concerned, they had received the recommendation of the assessor, and therefore it was final; and any of the aggrieved architects who wished to should, in his opinion, communicate with the assessor, and not with the Middlesbrough Council or the Free Library Committee. This view was shared by the majority, who decided on the course stated above. Several councillors, however, shared the view that the competitors had good ground for complaint, but it was not disputed that the most suitable design had been selected. In the letter from Messrs. Russell and Cooper which is printed on the opposite page, those gentlemen point out that the chief ground of objection among the aggrieved competitors seems to be the fact that the authors of the premiated design adopted an independent interpretation of the word "adjoining." If, as they claim, this word is capable of the construction they have put upon it, *cadit quæstio*; but should the conditions have been so loosely worded as to admit of diverse interpretations? At any rate, the case, as another correspondent contends, "should help to convince the R.I.B.A. of the necessity and the possibility of reform."

Model Village near Stafford.

The result of a limited competition instituted by Messrs. Chance and Hunt, Ltd., for a model village near Stafford, has been announced as follows:—1st, Messrs. Buckland and Haywood-Farmer, Birmingham; 2nd (£20 premium), Mr. Geo. H. Wenyon, Dudley.

Grimsby Town Hall Extension.

At a meeting of Grimsby Town Council, held on Friday, June 4th, when the minutes of the various committees came up for confirmation, Councillor Easton moved an amendment "that that part of the Finance Committee's minutes relating to the appointment of Sir Alfred Gelder as assessor of the plans submitted in the competition in connection with the Town Hall extension be not confirmed." This amendment was carried by 18 votes to 13. It was pointed out, however, that the committee's resolution had been already acted upon, the minutes of the Finance Committee having been confirmed at a full Council meeting. It was further complained that the vote refusing to confirm the minutes was really a snap-vote, the attendance being very small. A councillor who desired to postpone for twelve months the whole question of the Town Hall extension (possibly with the object of giving the Council time in which to achieve the apparently difficult feat of making up their minds, or to indulge in the diversion of further see-saw "decisions") was told that such a motion would be out of order.

Correspondence.

[*The Editor declines responsibility for the statements made by correspondents.*]

Middlesbrough Library Competition.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—The Middlesbrough competition again brings us face to face with one of the natural and inevitable results of our absurd conduct of competitions. Such a result may possibly annoy, but it can hardly surprise us, as it is exactly the result we have carefully arranged ourselves.

You rightly point out the difficulty of the position in which the assessor is placed, but we must not forget that although he may have accepted the position, the competitors created it. The heroic course for the assessor may be to resign, but the obvious course for the competitors—entailing no heroism—is not to compete. Then the position would not arise. But the position having arisen, I think we must admit that the public interests, and the interests of architecture, are bound to override all other considerations.

Your communicated article seems to hit the nail on the head in eight words, "They should not make hard and fast conditions." This is the root of the whole trouble. No competition should have—in the very nature of things it cannot have—any other absolute conditions affecting the design than those inherent in the nature of the case. To invent any others is to stultify the whole idea of the competition, and gratuitously to look for trouble. The site, the money, the accommodation, are the facts of the case—the materials with which we work—but there is no reason why even these should be made absolutely binding conditions in every case. Indeed, no more than two of them can be absolutely binding in any case—the site and the money, or the site and the accommodation, as the case may be. All else affecting the design should be by way of suggestion and information only, and the more information the better.

Perhaps this extremely hard case may help to convince the R.I.B.A. of the necessity and the possibility of reform.

Westminster. A. R. Jemmett.

To the Editor of The Builders' Journal.

Sir,—Our attention has been attracted to the statement that we violated the conditions of the above competition in the preparation of our design, and that a protest signed by a large number of the competitors has been lodged against the award.

While we have no concern with this protest, which is a matter between the Corporation, assessor, and the competitors, we desire to make our own position clear regarding the manner in which we interpreted the conditions, and we shall be obliged if you will insert this letter.

Our chief cause of offence appears to be the way we understand the word "Adjoining." We read this with its context as follows:—"The general lending and reference libraries are to be placed in the northern part of the block (of buildings already existing) adjoining the dwelling houses in Dunning Street," and these rooms were so placed by us.

If it was the intention that these rooms should abut against the dwelling houses, we should have expected the conditions to read that they should be "at the north end of the site adjoining the houses."

FROM THE DRAWING BY W. E. BARKER

With the exception of the Tower of London and its immediate neighbourhood, there is no part of the City of more historical interest than the district around the old Priory Church of St. Bartholomew the Great in West Smithfield. The illustration shows the ancient gateway which has for nearly 600 years formed the principal entrance to the church. The gateway is of the Early English period, with dog-tooth ornaments and four gracefully moulded orders. At present it is partly covered on one side by a stationery store, and a large board advertising edibles overshadows the apex of the arch. The engraving is reproduced from an original pencil drawing.

Regarding the door communicating between the news room and the staircase hall, this was labelled pass door on the drawings, and dealt with as such in our report. The door can be blocked up, if desired, but the passage must still remain for access to the janitor and unpacking room.

Russell and Cooper.

Dampness and Efflorescence in Walls.

To the Editor of The Builders' Journal.

Sir,—I was surprised that in the article on the above subject, in your issue for June 2 (p. 524) no mention was made of the fact that sand—or its substitute—used in the making of mortar or plaster, is frequently the culprit in producing that disagreeable damp appearance on papered walls, and the efflorescence on distempered walls.

Where this occurs at the seaside, one generally puts it down to sea sand having been used; the salt in the sand being so sensitive to a damp atmosphere as to show that floury whiteness whenever the humidity reaches a certain point. Here in the north-west London district, I have come across another material that is used in the mixing up of plaster that will produce the same effect as sea sand, and this is boiler-flue dust, or sweepings from chemical works. The dust is very fine, reddish in colour, and has a certain amount of sharpness. In one case I came across, the builder had to strip the walls and re-plaster five rooms in a new house to get rid of this objectionable material. During moist weather the paper on the walls had a very damp appearance, which in drying had the look of fine flour. The paint on the bath-room walls would not dry—or rather, after drying, became moist and sticky, while the distemper on the frieze resembled a spring frost.

In recently investigating a complaint of dampness in a new house, I found the concrete over the site, and the walls under the ground floor, perfectly dry, the damp course perfectly in order, yet the plaster on the party wall in the front room on the ground floor, and also that in the front bed-room, were undoubtedly damp. I examined the wall in the roof, and found the bricks and mortar to be dust-dry. This state of dampness I found only occurred in two out of six houses, and, after making further enquiries, I came to the conclusion that the cause of the dampness was that flue-dust had been used in the plaster of these particular houses.

I remember a case in the north where the efflorescence came out on the dado of the hospital wall. Keene's cement had been used to face up the Portland cement dado, but here I failed to ascertain the cause, though I had a shrewd suspicion that some chemical action had taken place between the two cements.

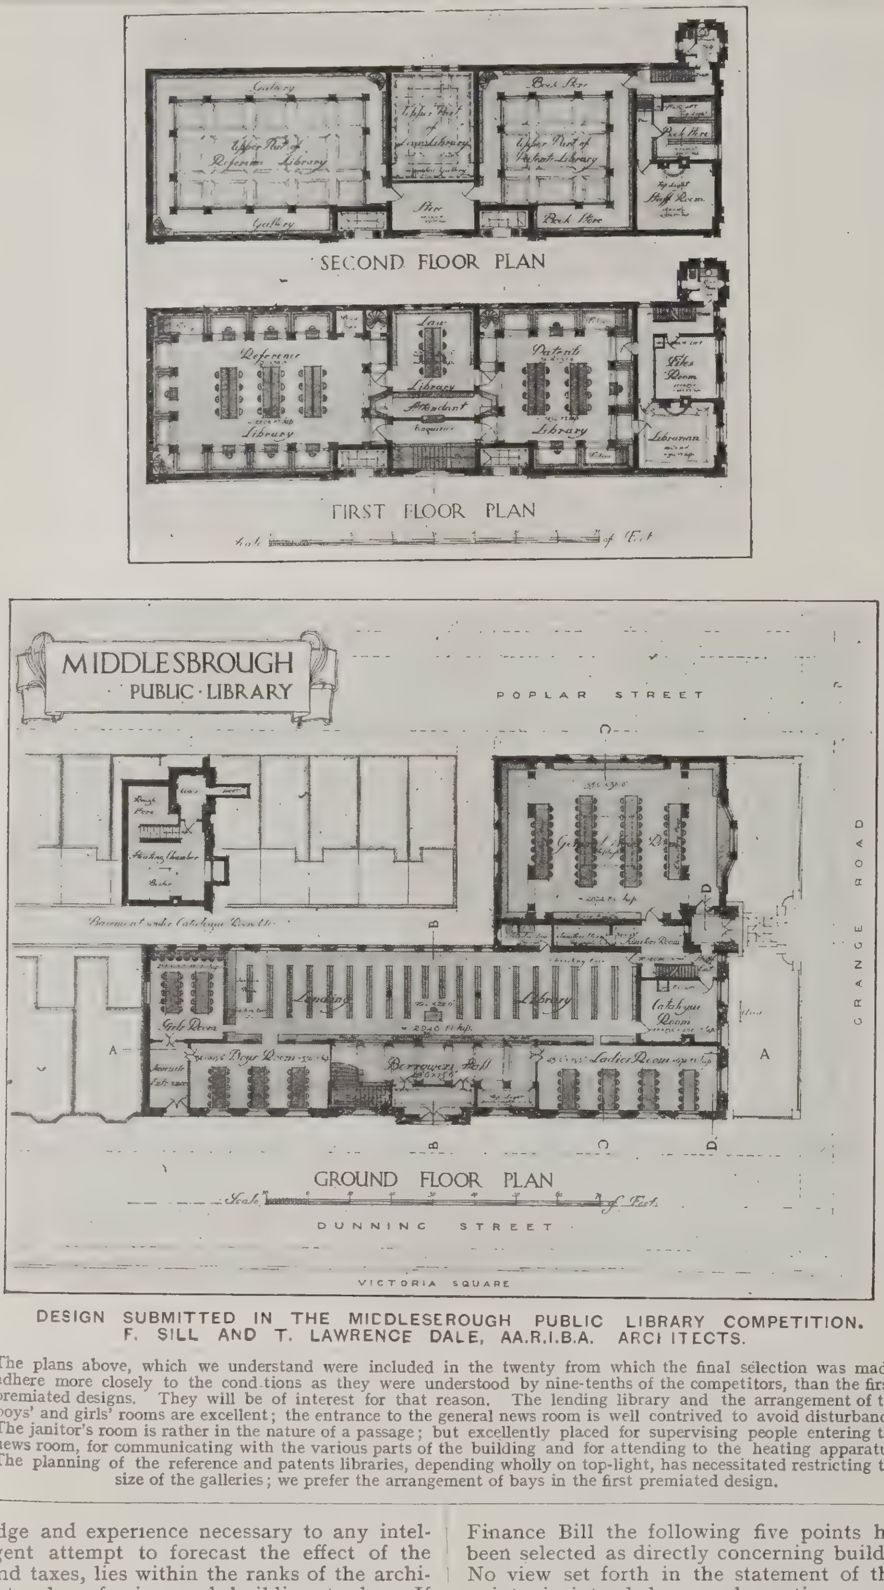
It is quite evident to my mind that we are still short of information on the important subject of mortars, plasters, and cements. We know what the ideal constituents of these are, but unfortunately idealism and commercialism do not always run together, and one cannot condemn a thing just because it is not the ideal material; yet, on the other hand, one wants to be in a position to condemn when a material is proved defective or objectionable. G.H.G.

Architects, Builders, and the Land Taxes.

To the Editor of The Builders' Journal.

Sir,—One reason why builders and others have not responded more fully to your invitation to discuss the land taxes is, no doubt, the intricate nature of the provisions of the Finance Bill. Another probable reason is the remoteness of the actual application of a great part of the new taxation. We may wait till a new long lease has expired before being asked for reversion duty. A transfer must be effected after an appreciable rise in value has taken place, before we can feel the weight of the increment duty in cold cash. Nevertheless, as the novel and drastic proposals contained in the Budget alter the relation of the people to the land, they must have a powerful and an immediate effect on values, and for good or ill on the building industry.

A great portion of the practical know-



DESIGN SUBMITTED IN THE MIDDLESBROUGH PUBLIC LIBRARY COMPETITION.
F. SILL AND T. LAWRENCE DALE, AA.R.I.B.A. ARCHITECTS.

The plans above, which we understand were included in the twenty from which the final selection was made, adhere more closely to the conditions as they were understood by nine-tenths of the competitors, than the first-premiated designs. They will be of interest for that reason. The lending library and the arrangement of the boys' and girls' rooms are excellent; the entrance to the general news room is well contrived to avoid disturbance. The janitor's room is rather in the nature of a passage; but excellently placed for supervising people entering the news room, for communicating with the various parts of the building and for attending to the heating apparatus. The planning of the reference and patents libraries, depending wholly on top-light, has necessitated restricting the size of the galleries; we prefer the arrangement of bays in the first premiated design.

---

ledge and experience necessary to any intelligent attempt to forecast the effect of the land taxes, lies within the ranks of the architectural profession and building trades. If the Finance Bill is not adequately canvassed and discussed by these bodies, it will, in a sense, not be considered at all. In this case we shall be luckier than we deserve if we escape the natural reward of easy indifference.

The undeveloped duty must have an immediate effect on the market where the builder seeks the land he needs. The increment, reversion, and stamp duties must have an immediate effect on the value of the houses he is trying to sell; as well as affecting the subjects of much of his contract work. Along with landowners, lenders, and architects, builders are directly affected. They will only be doing their duty to themselves and to the community in considering and communicating their views. For this is a matter which cannot be properly discussed without their help.

From the wide field covered by the Finance Bill the following five points have been selected as directly concerning builders. No view set forth in the statement of these points is intended as a dogmatic assertion of opinion, the terms of its expression notwithstanding. They are merely suggestions for your prospective correspondents' consideration:—

(1) Will the ½d. duty on undeveloped land cheapen building sites by forcing them on the market? Let us consider a suburban plot of one acre which the owner reasonably expects to let for building within the next few years at a ground rent of £100. A present capital value might be adjusted with the assessors of about £1,800, with a deduction of £300 on account of expenditure on roads and drains and other preparatory work. The owner would then have to pay annually until the development took place ½d. per £ on the net value of £1,500, or £3 2s. 6d. This would absorb the greater part, perhaps the whole, of the free revenue which would probably be drawn from an agricultural rent of about £5. The owners of plots wholly in this position will be pressed to develop their land at the earliest possible moment, but the owners of larger plots not wholly ripe for immediate building will not be pressed to the same extent. For the lower capital value of their less ripe land must lessen the average burden of the duty in proportion to the agricultural revenue. The financial strength or weakness of the landowners will become a greater element in the market than it is now. With wealthy men holding and poorer men pressing their land for development, wide fluctuations in the price of equally desirable ground may be expected.

Builders should consider also whether the 10 per cent. reversion duty on the benefit accruing to the lessor will not diminish the ground offered on lease, and increase that offered on sale. It seems also reasonable to suppose that reversions will fall in both rank and value as investments.

(2) Who will ultimately bear the 20 per cent. increment duty? This is a question of vital import to builders, which should materially influence their attitude in the controversy. It is one of the most difficult problems that could be propounded, but its solution must be attempted lest we stumble blindly into difficulties. If the owner already referred to has held his acre for a few years and sold it to a builder for £2,400, or let it at an equivalent, he will then, the original value being £1,800, pay 20 per cent. increment duty on £600 or £120. The writer will merely advance with due reserve this general theory for the consideration of your readers: that when business is brisk or landowners strong, the builder, and ultimately the occupant, will pay; and where business is slack or landowners weak, the landowner will be forced to forego his profit to that extent. Applying the same principle to old properties, the buyer will pay when the demand is great, and the seller when the demand is small.

(3) How will lenders regard the taxation of land? Is it not reasonable to suppose that some lenders will take the broad view that a substantial increment duty on their improving securities, without any corresponding compensation on their deteriorating securities, along with the reversion duty and increased stamp tax, renders house property a less desirable security than formerly? If lenders regard the proposals in this way, builders will find that the amount of money available for their operations is less, and that the rates of interest are higher.

(4) With the changed needs of new occupants, a great volume of contract building follows the transfer of old properties. The prospective seller will not be so "willing" as in time past, for he must now surrender one-fifth of any increase accruing since April 30th of this year. The prospective buyer will hesitate, knowing that he too if he sells or lets, and his heir, inevitably must undergo the same taxation. And both will pause and contemplate the doubled stamp duty. Before the Budget, a property bought for £1,000 and sold afterwards for £1,200, was subject to a stamp duty of £6. After the Budget, the same transaction will cost for stamp duty £12, in increment duty £40, £52 in all, or over eight times the former Imperial taxation. It may be urged—possibly with some reason—that those who make such profits can well afford to pay. But returning to the "heads-I-win" "tails-you-lose" nature of the increment duty, and the increased stamp duty, will the effect not be to discourage transfers, constrain people to remain content as they are, and so to diminish the volume of business of this class?

(5) Most of the taxation in question is new in principle. If it passes into law and the principle is established, it will be a simple matter for any future Government to increase the rate of any or all of the taxes. Consideration should be given to the question as to whether fear of such future increase will diminish values beyond the point that the taxes, as now proposed, may be reasonably computed to do.

Victor D. Horsburgh.

THE NEW PRESIDENT AND VICE-PRESIDENTS OF THE ARCHITECTURAL ASSOCIATION.

The new President, who is the son of Sir Henry Tanner, I.S.O., the Chief Architect to H.M. Office of Works, was born in 1876, educated at the Merchant Taylors' School, and matriculated at London University. Mr. Tanner was articled to his father, and afterwards entered the office of Sir Aston Webb, R.A. He also studied at the Royal Academy Schools, where he won the travelling studentship in 1900. He was elected an Associate of the R.I.B.A. in 1899, and a Fellow in 1907. The President has been connected with the A.A. since 1896, and in 1903 was appointed hon. secretary, a post he occupied for four years; for the last two sessions he has been a vice-president.

As a result of much study and careful measuring and sketching throughout the country, he brought out in 1902 a volume of measured drawings, entitled "English Interior Woodwork." He was joint author with Mr. H. Inigo Triggs of "Some Architectural Works of Inigo Jones," and also (with Mr. W. Galsworthy Davie) of "Old English Doorways." He has not however ceased his literary efforts, for he is at present one of the editors of the "Purple Patch."

He has designed several important works in London, chief among which are Oceanic House, the new offices for the White Star Line in Cockspur Street; Craven House in Kingsway; flats, business premises, and a large garage in Wardour Street, and some factories at Homerton. In the country he has carried out several large alterations and additions to the following:—Club House, Royal St. George's Golf Club, Sandwich; Crawley Grange, Bucks, for Irvine J. Boswell, Esq.; Aston Hall, Staffordshire, for J. Guy Knight, Esq.; also various new buildings in town and country for business and domestic purposes. He has had considerable experience in what may be termed the legal side of the profession with regard to questions under the Building Act and dealing with light and air.

Photo: Stereoscopic Company.

MR. HENRY TANNER, F.R.I.B.A.
THE NEW PRESIDENT OF THE A.A.

Like the retiring President, Mr. Cave, he is a good sportsman. At school he was several years in the cricket XI. and the football XV., and afterwards played football for the Old Merchant Taylors. He has been a keen golfer for some time, and is a member of the Royal St. George's. His election as President for the coming session is a fitting reward for six years' hard work in connection with the A.A., and although probably the youngest President for many years, few who have occupied the chair can show a longer record of continuous work in its service.

Mr. F. Dare Clapham, who proceeded from the Associateship to the Fellowship of the Royal Institute last week, is a partner in the firm of Mountford and Clapham, architects of the New London Sessions House, the Lancaster Town Hall, and other public buildings. Like his fellow vice-president, Mr. C. Wontner Smith, Mr. Clapham has taken a prominent part in the A.A. Plays, and, indeed, has been one of the mainstays of them since their inception. Their election as vice-presidents is a well-deserved honour.

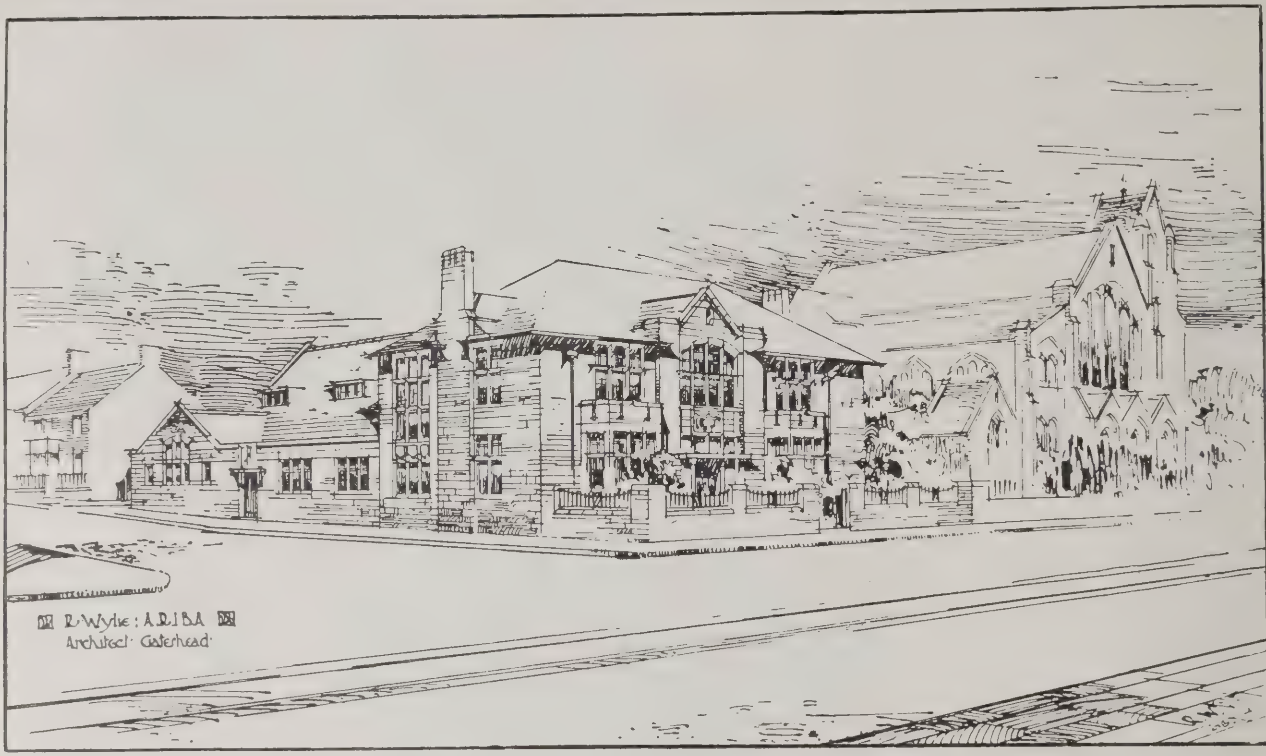
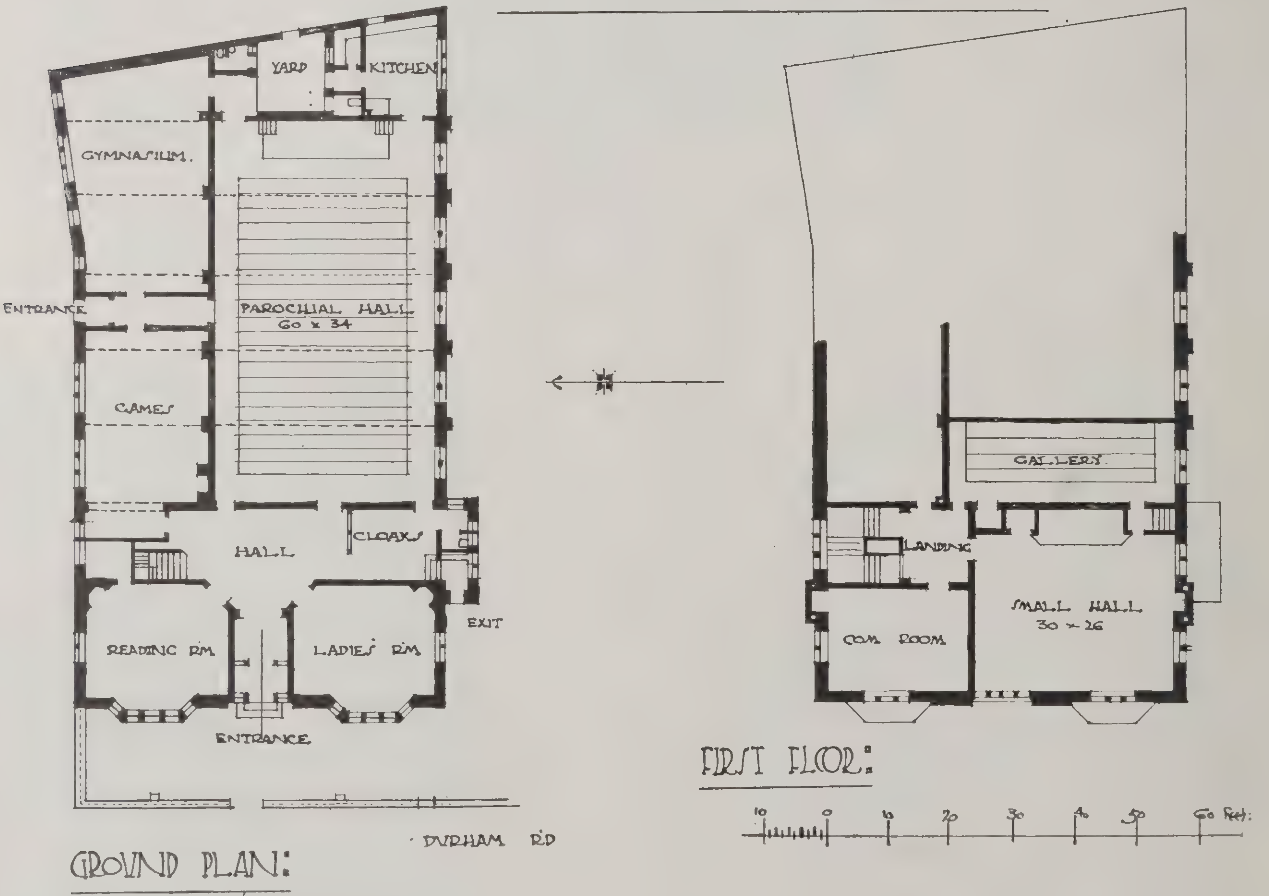
MR. C. WONTNER SMITH, A.R.I.B.A.
New Vice-President o the A.A.





ST. GEORGE'S PAROCHIAL HALL AND BUILDINGS, GATESHEAD. RICHARD WYLIE, A.R.I.B.A., ARCHITECT.

The design for these buildings was selected in competition.

The front block of the new buildings is two storeys in height, with a small basement in addition for heating purposes, while the rear portion is of one storey, and includes the Parish Hall. The principal floor has a spacious front entrance, 9 feet wide, and large crush hall, from which the principal rooms are entered. On the left is a ladies' room, 20ft. by 17ft., and cloak-room and lavatory, and, on the other side, a reading room, 20ft. by 17ft., and games room about 26ft. by 17ft., from which side also the main staircase ascends. The Parish Hall, 60ft. by 34ft., has three exits at this end into crush space, and has seating accommodation, exclusive of platform, for 340 people, with provision for possible future gallery, and 80 others. A gymnasium,, 36ft. by 18ft. with open roof, is placed at the north-east corner of the buildings, with separate entrance and exit, as may be needed. On the first floor there is a large upper hall, 20ft. by 10ft., with room 30ft. by 26ft., for small meetings, having a small platform (screened off when not required), and with a direct emergency exit, which would also serve as a possible gallery to parish hall. A committee room, 20ft. by 17ft., is also entered from upper hall, and a storage room for seats, etc., is placed over games room. The buildings are of coursed rock-faced stone walling to main fronts, with chiselled bays and dressings, covered with grey slates. The floors to entrance hall and vestibule are of patent composition on cement, and to Parish Hall wood blocks on a similar foundation. Fire-resisting materials are used as far as possible in all staircases and other constructional parts. The dadoes to games room and gymnasium are of cement, and to large hall of redwood cleading, the latter to have also open hammer-beam roof. Heating is on the hot-water low-pressure system, with radiators to entrances and principal rooms, and fire-places are in all rooms. Natural ventilation is relied upon, with separate vent. The style of architecture of the new buildings is of a simple Gothic character in harmony with the adjoining St. George's Church; the cost, exclusive of furnishing, being estimated at £2,800.

SUBURBAN STATIONS AND TOWN PLANNING.

The extensive reconstruction of stations on the Underground Railway reminds one rather forcibly of the fact that the suburban railway station will have to be reckoned with in any well-considered scheme of town planning. It is remarkable how almost immediately upon the first arrival of railways the great terminus stations were raised upon an ample scale, and each provided with the indispensable adjunct of an hotel, reached directly from the platform, and, as a rule, a handsome building. In the suburbs the type of building was that of Loudoun Road, a chalet-like structure with the light Tudor detail then so much in favour, containing the booking office, the station itself being on a low level beneath. In the middle of the late reign, brick buildings on a larger scale, like that of Highbury, with its forecourt, began to arise; some years later, the general re-introduction of red brick helped towards the creation of a species of suburban station which may be seen at Finchley Road (Metropolitan); it is of low elevation—showing how tenacious is the English mind of the tradition of low and spreading architecture wherever space admits of such treatment: a little terra-cotta begins to appear, too, and a clock illuminated at night is placed, as it should be in every station, over the entrance. The station, the surrounding villas, the open flagged space, and the neighbouring church, all make up an effective picture; but here commendation must end, for the inferior is dark, and so are the waiting rooms, a defect which is rendered worse by the dismal tones of colour of that period; tones whose inventors chose to call them "æsthetic."

Passing on to West Hampstead, we find another Metropolitan station, of a newer type, with abundance of light given by large arched windows, and a roof broken by the inevitable and uncompromising dormer. It is a station built on a bridge, and within a few yards are stations of the Midland and the London and North Western, all of whose lines run under it; from several points a singular and not uninteresting view is obtained. In the background rises the long outline of Hampstead Hill, crowned by the little green spire and red-brick tower of Hampstead Church, built by Flitcroft in 1745, but all the foreground is occupied by railways; no fewer than four great lines traversing the great open space, and all disappearing into tunnels which penetrate the hill at points not very far apart.

On the whole the suburban station answers its purpose fairly well, but more might be made of it, and its comforts could be easily increased if a little foresight were used in planning suburbs whose growth indeed can easily be foreseen. The great terminal stations are so well appointed as to be almost luxurious—save for the mistake made in the newest of them of abolishing the cheerful open fireplace in the waiting rooms—but suburban travelling is now so important that the station has become the recognised centre of each neighbourhood; a covered approach, a restaurant, or at least a "tea shop,"—now much wanted as suburban "shopping" grows in popularity; a letter box and where possible a post and telegraph office, should be among the recognised adjuncts of a suburban railway station. The "tea-shop" is being added to most of the more central stations on the Metropolitan line.

The fortuitous, patchwork sort of arrangement of even important suburbs tends not only to inconvenience but to ugliness as well. One of the most prominent features of the suburb we are speaking of is a ragged growth of telegraph poles, confused, untidy collection of gaunt, dismal looking things, so high as to dominate all the foreground near the station, and sustaining a maze of wires. Here, as in other centres of population, the first severe winter which happens to include a heavy snowfall will compel the adoption of some less exposed and more sightly arrangement.

Of another disfigurement, for which far less justification may be pleaded—advertisements—it may truly be said that the suburbs are emulating the town, and in each case it is not the advertisement proper so much as the immense size and needless repetition of names which produces such an offensive and bewildering confusion, running across vertical lines and destructive of all sense of design. West Hampstead is not the only suburb which deserves better treatment in this matter, and it is a pity that no means exist apparently for abating this plague of letters.

R.I.B.A.

The following further results of the annual elections have come to hand:—

Representatives of Allied Societies.—Frederick Batchelor, A.R.H.A. (Royal Institute of the Architects of Ireland); George Bell (Glasgow Institute of Architects); George Thomas Brown (Northern Architectural Association); Arthur Stansfeld Dixon, M.A.Oxon. (Birmingham Architectural Association); Thomas Edgar Eccles (Liverpool Architectural Society); Mowbray A. Green (Bristol Society of Architects).

The Standing Committees.

Art.—Fellows: Walter Henry Brierley, F.S.A.; Edward Guy Dawber; William Flockhart; James Sivewright Gibson; Henry Thomas Hare; Professor William Richard Lethaby; Edwin Landseer Lutyens; Edwin Alfred Rickards; John William Simpson; Paul Waterhouse, M.A.Oxen.—Associates: William Henry Bidlake, M.A.Cantab.; Arthur Thomas Bolton; Sidney Kyffin Greenslade; Thomas Geoffry Lucas; Walter John Tapper; Septimus Warwick.

Literature.—Fellows: Alfred William Stephens Cross, M.A.Cantab.; John Alfred Gotch, F.S.A.; George Hubbard, F.S.A.; Halsey Ralph Ricardo; Professor Frederick Moore Simpson; Professor Ravenscroft Elsey Smith; Richard Phené Spiers, F.S.A.; Henry Heathcote Statham; Charles Harrison Townsend; Paul Waterhouse, M.A.Oxen.—Associates: William Curtis Green; Herbert Passmore; Arthur James Stratton; Harry Inigo Triggs; William Henry Ward, M.A.Cantab.; Percy Leslie Waterhouse, M.A.Cantab.

Practice.—Fellows: William Henry Atkin Berry; Max Clarke; Alfred William Stephens Cross, M.A.Cantab.; George Hubbard, F.S.A.; Sydney Perks, F.S.A.; Alfred Saxon Snell; Henry Tanner, jun.; Thomas Henry Watson; William Henry White; William Woodward.—Associates: Edward Greenop; Edwin Gunn; Edwin Richard Hewitt; Harry John Pearson; Horatio Porter, M.A.Cantab.; Augustus William Tanner.

Science.—Fellows: Harry Percy Adams; Max Clarke; Bernard Dicksee; William Dun; Matthew Garbutt; Francis Hooper; Charles Stanley Peach; Sydney Perks, F.S.A.; Herbert Duncan Searles-Wood; Lewis Solomon.—Associates: Henry William Burrows, F.G.S.; Edwin Richard Hewitt; Alan Edward Munby, M.A.Cantab.; Digby Lewis Solmon, B.Sc.London; Ernest William Malpas Wonnacott; Ernest Alexander Young.

Auditors.—John Hudson; Charles Edward Hutchinson.

At the meeting on June 7th, the following gentlemen were elected:—

As Fellows.

A. T. Bolton (Soane Medallist 1893, Institute Medallist (Essays) 1895), London.

F. D. Clapham, London.

H. A. Crouch (Tite Prizeman 1896), London.

J. S. Heath, London.

E. Skinner, Colombo, Ceylon.

P. L. Waterhouse, M.A.Cantab., London.

As Associates.

D. Macpherson Gordon, Montreal, Canada.

J. C. Morrell, Melbourne, Victoria.

H. B. Richards, Detroit, Michigan, U.S.A.

W. A. Rigg, London.

THE ENGLISH CHURCH PAGEANT.

It would be difficult to say what impressed us most in this striking pageant, which lasted, with an hour's intermission, on the opening day, from just after three o'clock to close upon midnight. With such a feast of colour, with the movement of the crowds, the solemnities of regal pomps, the austerity of the old church music, the delicacy of the child dances, it would be hard if the spectacle failed to move the many thousands of people who have found their way to the beautiful grounds of Fulham Palace. Of the nineteen episodes which set forth the most stirring and epoch-making events in the Church's history, we are inclined to place the sixth scene, Part I. (St. Dunstan and the Monks) as the most dramatic; the tenth scene, Part I. (the miracle play and Pilgrimage) as the most dainty; the second scene, Part II. (funeral procession of Henry V.) as the most impressive, and the fifth scene, Part II. (Coronation procession of Edward VI.) as the most resplendent. The finale, in which the whole of the 4,000 performers troop in from various parts of the beautifully wooded 9-acre stage, holding lighted torches, advance towards the spectators in one great phalanx, slowly retire and at a given signal simultaneously extinguish the lights, terminating the pageant in intense darkness, is one of the most vivid and beautiful effects we remember to have seen. It is an old saying that one volunteer is worth two pressed men, and the voluntary actors and actresses have made the success of the pageant in spite of much physical discomfort occasioned by the heavy rains and cold winds which marred the early days of the pageant, should be accorded every praise for their zeal and hard work. If what we hear is true, many of them have been ill-requited by bad colds and attacks of pneumonia. The spectators' stand, which holds some 7,000 people, was we may mention, designed by Mr. A. O. Collard, F.R.I.B.A. It would be impossible to enumerate all the numerous gentlemen through whose efforts this great spectacle has been produced. The organisation, commenced by Mr. Frank Lascelles and completed by Mr. Hugh Moss, was excellent, as witness the first performances which went through without a hitch, albeit they were too long. Since the first day the blue pencil has been used with some effect, and the whole pageant now plays "closer" and with better grip. There are still three days in which to see it, and we would advise those who can to make a point of going to see it.

The Climbers. "Resolved—That the Borough Surveyor obtain tenders for dashing up the walls of this property, and submit same to the next meeting."—"Local Paper." We beg to submit a tender of five pounds to see him do it.—"Punch."

* * *

The state of Winchester Cathedral is still a subject of anxiety. Mr. T. G. Jackson, R.A., and Mr. Francis Fox, advise that it is necessary to erect buttresses in order to ensure the safety of the cathedral. Mr. Jackson reports that all the tests on the cracks of the wall of the south nave aisle have broken successively between December, 1906, and April, 1909, the older tell-tales now showing fissures of one-eighth of an inch or more, while the south doorway, which is modern, and was built upright into a leaning wall, now inclines outwards 1in. in 14ft. It is therefore evident that movement in this wall is still continuing, and Mr. Jackson thinks that instead of underpinning the wall and inserting iron ties across the aisle, as at first proposed, it would be far better to buttress the wall. Mr. Fox agrees that the external buttresses designed by Mr. Jackson should be adopted and will give the required strength. This provision will necessitate an additional expenditure of £800.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

Repairing Portland Stone Work.

LONDON, S.E.—RETSBEW writes: "Can you give me a recipe for a mortar to be used in refacing Portland-stone strings, cornices, and mouldings, where spalled or deteriorated? It is understood that Portland-stone dust and Portland-cement, with the addition of a chemical compound, have been found very successful. The proportions of the mixture and the name of the chemicals used would oblige."

I do not know the mixture referred to, but possibly the manufacturers of Portland cement who advertise in this journal may be able to give you the information, as they have a connection among people likely to know. Chipped stone is sometimes repaired by fixing the piece broken off with mastic; at other times a rectangular portion is cut out, and a new piece let in, and in special work the whole stone is cut out and another put in its place. HENRY ADAMS.

NEW PATHOLOGICAL BLOCK, ST. BARTHOLOMEW'S HOSPITAL, LONDON. FRONT ELEVATION.
E. B. I'ANSON, F.R.I.B.A., ARCHITECT.

This building has a frontage of 90 feet to Smithfield, and occupies an area of 4,450 superficial feet. The floors and roof are of fire-resisting construction, and the fronts are faced with Portland stone, with grey granite plinth.

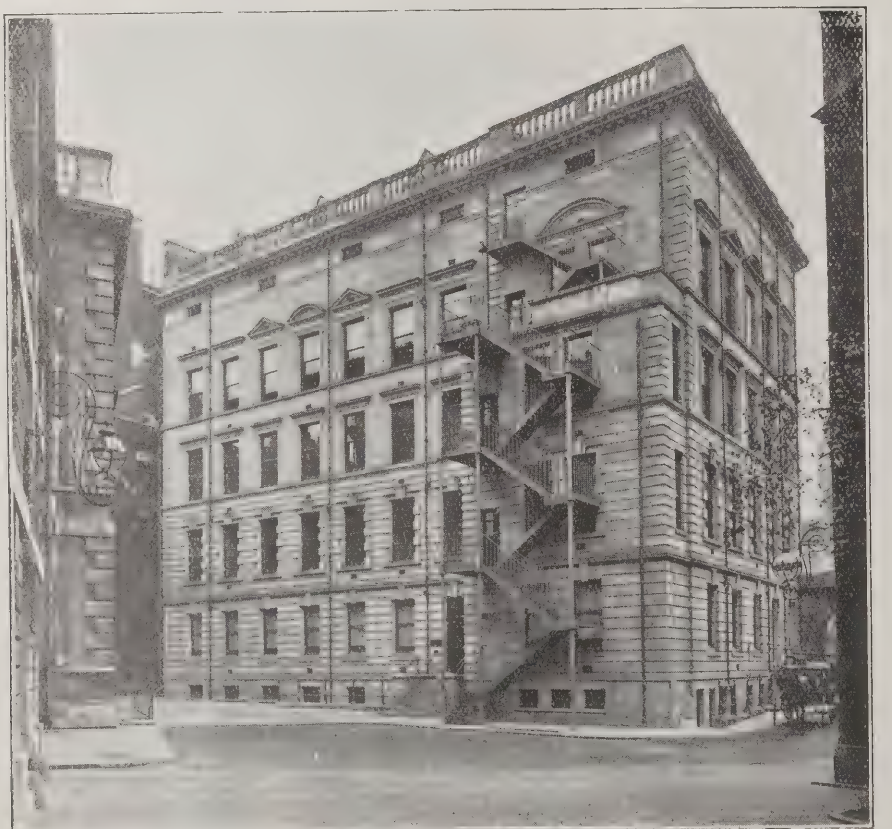

Photo: *Topical.*

NEW PATHOLOGICAL BLOCK, ST. BARTHOLOMEW'S HOSPITAL, LONDON. BACK ELEVATION.
E. B. I'ANSON, F.R.I.B.A., ARCHITECT.

The building is warmed by low pressure ventilating radiators, and air extraction is effected by fans electrically driven. Electric lighting has been installed throughout, and the building is in telephonic communication with other departments of the hospital.

Board of Education Examination.

BASINGSTOKE.—STUDENT writes: "Having sat for Stage 3 in Building Construction, I understand it is necessary to pass an examination in Architecture before sitting for honours."

"Student" is correct in understanding that it is necessary to pass the Board of Education's examination in Architecture before being allowed to sit for their examination in the Honours Stage of Building Construction. The syllabus of the Architecture examination includes the influence of construction, materials, and social conditions on the styles, and students are advised to study from actual buildings by sketching and measuring, mouldings and details being specially emphasised. The examination includes questions on Greek, Roman, and English architectural styles, and the meaning of architectural terms. Full particulars are published as follows:—Syllabuses of all Science and Art subjects, price fourpence; and Examination Papers in all Art subjects, price sixpence, exclusive of postage. These can be obtained from Messrs. Eyre and Spottiswoode, East Harding Street, E.C. The examinations are held each May in connection with almost all the technical and art schools in the country, and inquiry should be made of the master of the nearest school of the kind in "Student's" own district. Probably he would sit at the same centre as for his previous examination in Stage 3 of Building Construction. B. and B.

Validity of Conditions of Land Purchase.

BIRTLEY.—BRICK writes: "I bought 4½ acres of building land some 9 years ago. One of the conditions was that no houses in flats should be built on the land. Can the vendors enforce this condition?"

Certainly the vendors can enforce such a condition as this if they so wish. Moreover, if they have sold their estate in lots, all the lots carrying the same restriction, the vendors have no powers to allow any one purchaser to depart from the conditions. If they did so, the other purchasers might suffer an injury. Building regulations are intended for the mutual protection of all the parties, and are not for the vendor's benefit only.

F.S.I.

Books on Land and Estate Agency.

STOCKPORT.—W. T. G. writes: "I should be extremely obliged if you could give me a list of suitable books on land and estate agency, collection of rents, etc., etc."

The Surveyors' Institute issued a very good list of books suitable for the use of students, and a letter to the Secretary, at 12, Great George Street, Westminster, with a remittance of 1s. 6d., would secure you the syllabus of examinations (including this list). It is a little difficult in a short space to name just the books you require, but I select (as having used them myself) for land agency, "Curtis' Estate Management," published at the "Field" office at 10s. 6d. For rents and payments, Mitchell's "Rates, Taxes, etc.," published by E. Wilson, 54, Threadneedle Street, E.C., at 3s. 6d. For law of landlord and (tenant, Houldsworth' "Landlord and Tenant," published by Routledge and Co., at 1s. There are, of course, many other textbooks which may be consulted with advantage, though some of them are rather expensive.

F.S.I.

Surveying Plots of Land.

CO. CORK.—PLOT writes:—"In surveying half-acre or acre plots, how would you find the required area or position of new fences or boundary required?"

To set out a certain area upon the ground, one would first survey the existing fences, or other physical features, plot them to a fairly large scale upon paper, and then set out, by trial, on the plan, the exact area required. After this, it becomes merely a matter of calculation (or scaling) of the lengths and positions of the sides which are to be staked out upon the ground. The instances you submit are quite simply worked out this:—(a) A half-acre (=50,000 square links) plot with all its angles rectangular, and having a frontage of 1.25 chains, will have a depth which will be equal to:— 50,000÷125=400 links,

∴ stake out the frontage first, erect perpendiculars by means of a builder's "square" or by the chain method, and stake out the side lines each four chains in length. (b) A rectangular plot containing an acre (100,000 square links) with one corner cut off and having the length of one frontage given. Calculate the length of the required side in the same way as in case (a), and as though the plot were simply rectangular; then (from the plan) calculate the area of the triangular piece (base × half the perpendicular), which is not included in the actual plot, and add a narrow strip on the straight side of the plot to make up the missing area. (c) This problem may be solved in almost exactly the same way as described for (b), working similarly from the plan to the ground.

F.S.I.

Fireplace Openings.

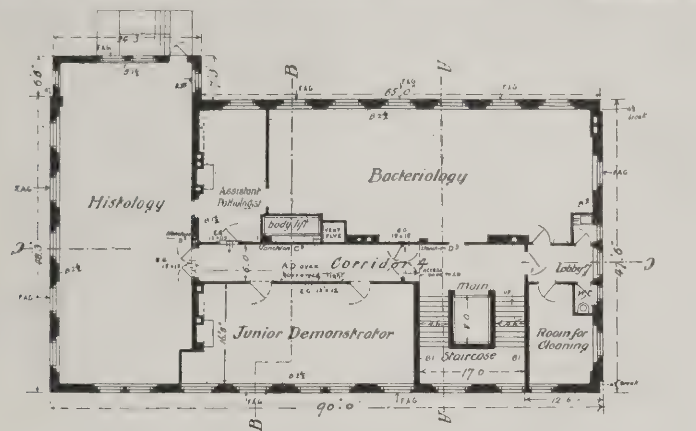
CO. CORK.—PLOT writes:—"What is the proper size for a fireplace opening and flue for an open-hearth fireplace, with a blower and hanging crane, for a farmer's house? Should the flue be straight?"

I know of no "proper size" for an open fireplace, and as a matter of fact, in the South of England we have them of widely varying sizes. From 2ft. 6in. to 4ft. deep, and from 5ft. to 10ft. wide are quite usual dimensions in this district (Sussex). The flues are usually nearly straight, being merely a little curved, in order to prevent the rain falling directly on to the fire, and I am bound to confess that these fireplaces almost invariably smoke badly, and are being rapidly superseded by modern grates. I can suggest no improvement in the design of the open hearth you submit, except that 1ft. 11in. for the depth appears to be small (perhaps you have a projecting hood increasing this). The defect is of course that of insufficiency of draught (you no doubt find that if the door and window be opened, the smoke will go up the chimney as it should), and this defect is, I fear, a fatal one—it can only be remedied by contracting the opening at the base of the chimney (which practically means putting in a close fire-grate)—no good whatever can be done by pots or cowls—in fact, in ninety-nine cases out of a hundred the fault causing a smoky chimney is at the foot and not at the top of the flue.

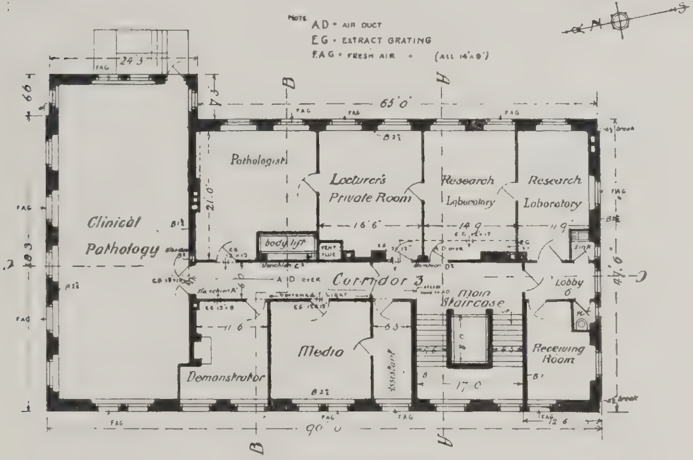
F.S.I.

Rejection of Materials.

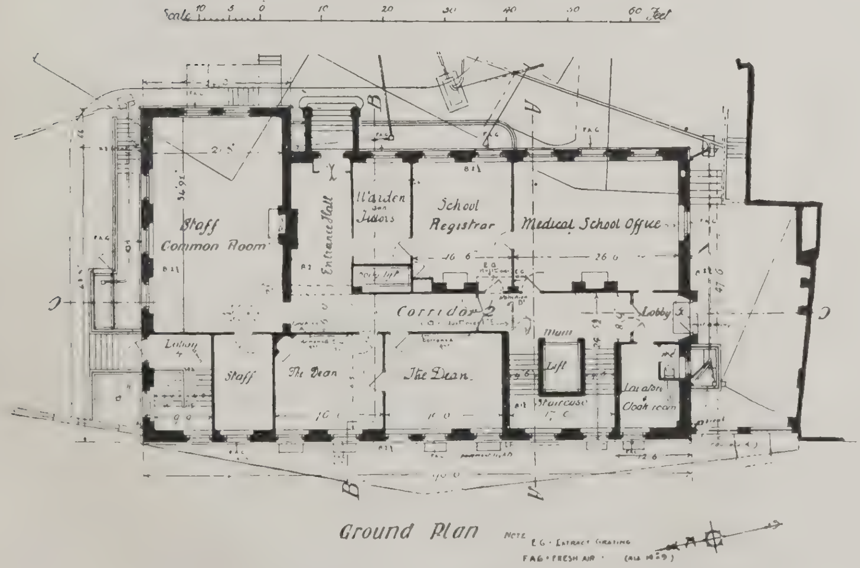
PROVINCES.—H. E. B.—In answer to this correspondent, a contributor writes: "It depends on the wording of the contract. If querist's clients are employing an engineer, and the conditions give the engineer power to reject any material which he considers not up to the standard, I fear you have no remedy; but in view of your offer to submit the pipes to a much higher test than that imposed by the conditions, I think that the committee are acting unreasonably. It very much depends on the nature of the contract you have with them."



Second Floor Plan



First Floor Plan



Ground Plan

NEW PATHOLOGICAL BLOCK, ST. BARTHOLOMEW'S HOSPITAL, LONDON. PLANS.
E. B. I'ANSON, F.R.I.B.A., ARCHITECT.

The Mortuary Chapel and the Mortuary are in the basement, cut off from the other part of the building, and approached from without by a separate entrance and staircase. The ground floor is occupied by certain administrative offices, and on the first, second, and third floors are Laboratories for Clinical Pathology, Special Research, Histology, Bacteriology, and Chemical Pathology. On the third floor there is a Pathological Library. The Laboratories are fitted with all the most modern appliances and scientific apparatus. The Post-mortem room is on the top floor, and an electric lift puts it into direct communication with the Mortuary, and there is also an electric passenger lift in the well of the staircase.

Construction to Header Arches.

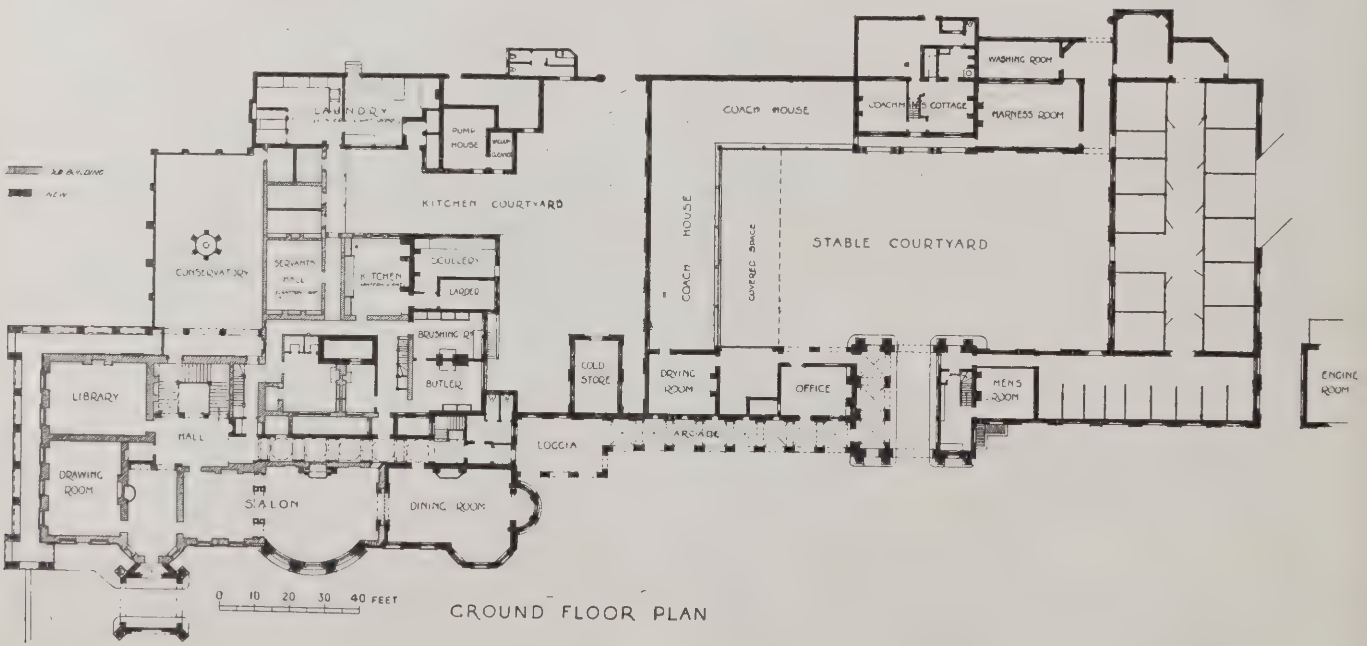
NEWPORT (SALOP). — HEADERS writes: "Please describe the method of constructing the exterior arches that are shown on drawings as header bricks. What carries the brickwork above?"

The header arches are sustained by a cement joggle formed by grouting between the bricks with liquid cement, the frog of the brick forming the requisite key on one side, and a rough sinking being formed with a chisel on the other side. The headers either rest on the window head (if solid frames are used) or on a temporary turning piece, and the construction is quite sound, and capable of independently maintaining the triangle of brickwork above, up to a span of about 4ft. 6in. Beyond that span a relieving arch should always be used, and the bricks are also sometimes threaded on an iron rod or supported by an angle iron, as sketch B, but neither of these expedients is really good construction. If casements with stout mullions are used, however, there is no good reason why wider openings should not be spanned in this way, as the frames are equal to carrying the brickwork over, if the latter is only of the thickness usual in ordinary domestic work and has the ordinary rough arch inside.

Our Plate.

Sennowe Park, Norfolk.

Extensive additions and alterations to Sennowe Park have been in progress, to fit it for the residence of Mr. T. A. Cook. The view which we illustrate this week shows the nature of the work on the east, or entrance, front, commencing with the carriage entrance to the stable courtyard, and the arcade leading to the loggia connecting the stables with the Hall; and in the background rising from the trees is seen the upper part of the water tower and belfry stage. From the plans, the scheme will be seen to embrace not only very large additions to the Hall itself, but the complete rebuilding of the stables and coach-houses, provision for motor garage and electrical plant, and an entirely new winter-garden, laundry, etc.; but, beyond these very large extensions, the terrace gardens have been greatly added to, and the whole of the entrance forecourt has been formed; the gardens have been enlarged by an extensive rose garden, and, beyond this, a water-garden leading to a pergola, thus connecting the principal grounds with a rhododendron walk running near the trout stream, crossing it, and extending itself quite round the other side of a newly formed lake of some 8 or 9 acres in extent. All the drives have been practically re-formed, and new approaches have been made through the plantations to the Hall, connecting them up to the pine avenue which leads from the Hall past the gamekeeper's cottage to two new lodges known as the "Ryburgh Gates." In an opposite direction an entirely new avenue, some three-quarters of a mile in length, and of a width of about 120ft., with double sets of elms and grass galloping tracks on either side of the broad carriage road, leads from the park to the entrance known as the "Norwich Gates," where two other lodges have been built. The whole of the building is now in a very advanced stage. The main reception rooms are being finished off in oak and hard woods, and a saloon some 55ft. long is being carried out in Italian walnut. Mr. George Riches, of Cromer, is the general contractor for the work, whilst the whole of the stonework has been carried out by Mr. E. W. D. Potter, of Norwich. The exterior stone carving has been executed by Messrs. Farmer and Brindley, of Westminster; the carved oak staircase by Messrs. Martyn, of Cheltenham; and the decorative figure painting for the interior by Mr. George Murray and Mr. W. J. Neatby, both of London. Sculptured work in the conservatory and gardens has been carried out by Mr. H. C. Fehr. The stable fittings and heating were carried out by Messrs. Musgrave and Co., of Belfast and London. The iron gates at the Ryburgh entrance have been made by Messrs. Singer, of Frome, and the Norwich Gates by Messrs. Hardman, Powell and Co., of Birmingham. Messrs. Wm. Paul and Son, of Waltham Cross, have carried out the whole of the garden works. The formation of the lake, the terrace gardens, and the whole of the road work, has been carried out by Messrs. Mornement and Ray, of East Harling. The whole of the undertaking, including the gardens and road works, as also the interior decorations, is being carried out from the designs and under the superintendence of Messrs. George J. Skipper, F.R.I.B.A., and F. W. Skipper, architects, of Norwich.



ALTERATIONS AND ADDITIONS TO SENNOWE HALL, NORFOLK. G. J. AND F. W. SKIPPER, FF.R.I.B.A., ARCHITECTS.

The extensive additions and alterations to the Hall at Sennowe Park are indicated on the plan above, and in the view shown on our Centre Plate. Very extensive works have also been carried out in the Park, including a new rose garden, water garden, and lake, some eight or nine acres in extent. The drives have been re-formed, a new avenue formed, and two new lodges built, known as the Ryburgh Gates. The Park surrounding the house is very beautifully wooded.

THE SOCIETY OF ARCHITECTS' TRAVELLING STUDENTSHIP (1909). DESIGN PLACED FIRST. C. H. HUDSON, ARCHITECT.

We append the criticism on this design taken from the "Journal of the Society of Architects":—"Many of the competitors have taken a considerable amount of trouble to ascertain the general requirements and usual methods of planning for a building of this character, while others have seriously failed in this particular, one of the most general mistakes being that of placing the manual instruction room in the main block. No. 23, to the author of which the Studentship has been awarded, avoids this mistake, but on the other hand so places the assembly hall that it has to serve as part of the main corridor. The rooms for the headmaster and headmistress are placed on either side of the principal entrance in the centre of the main front, while the scholars enter from the side rooms. The corridors are well screened from draught, and the sexes are properly separated, while the conveniences and covered playing courts on both sides, and the manual instruction room on the boys' side, are reached by covered ways; the teachers' rooms, placed at the top of the staircases, give proper control, and overlook the playgrounds, and the laboratories are most conveniently planned; but the cookery room is not so completely isolated as it should be to prevent the smell of cooking entering the building. Notwithstanding minor defects such as this, the plan is an exceptionally good one. The elevation is generally suitable without showing any striking architectural ideas, but it is somewhat marred by an eccentric design for the entrance. The oak panelling of the hall is unnecessarily costly for a school of the class, and is more suitable for a County Hall or some such public building."

A SIMPLE PLANIMETER.

By A. E. Fletcher, M.S.E.

The instrument herewith illustrated is designed to measure areas bounded by curved or irregular lines, and is on the same principle and similar to one which the writer saw described in a Continental manufacturer's list. The original was of sheet copper, and was constructed for metric units, but a little investigation soon revealed the principles of its design, and the one shown was cut out in thin hard card, from the ordinates calculated and given on the diagram (Fig. 1). The method of using it is as follows:—A pin is put approximately in the centre of the area to be measured, as in Fig. 2, or in such a position that when the square is turned round it will reach to all parts of the figure. Starting from any position, the perimeter is marked with a pencil, where it cuts the edges of the figure on both sides, and then it is moved forward till the back edge coincides with the last mark, and another mark is made. In this manner the perimeter is divided all round, and were lines to be drawn to the centre the figure would be divided into a number of triangles, all of which are of equal area. This area is a constant depending on the construction of the planimeter.

For the square shown in Fig. 1, and of the dimensions there given, this constant is 2½ins. when used to a centre, or 5ins. when used to a base line.

Fig. 3 illustrates the method of using the square for measuring areas bounded on one side by a straight base line; but each of the rectangles marked off has an area of twice what would be given if the instrument were worked from a centre point within the boundary of the figure. The constant for the rectangles for the square shown is therefore 5ins. Should it be found when dividing up the perimeter that there is a fractional space between the first mark made and the last one, it is estimated by taking it off with dividers as a decimal fraction of the last space marked; or, more accurately still, as a decimal part of the mean width of the spaces on either side of it.

For example, let it be supposed that in Fig. 2 the square has marked off 42 divisions on the perimeter, and a remainder which is estimated as the decimal .3 of the divisions on either side of it. The area of the figure would then be=42.3×2½ins. (constant)=105.75 sq. in. Assuming the drawing to represent a field plotted to ¼in. scale, its area would be= actual area × scale 2=(4^2)=1692ft. super. In the other (Fig. 3), where, measuring from a base line, the constant is 5ins., the area in feet super. of the figure represented would be = number of rectangles × constant (5) × scale 2 in parts of an inch to one foot.

The accuracy obtainable with these squares is probably greater than most people would secure by the frequently used method of averaging the curved lines, and it depends upon the care with which the curve is set out, the exactness of marking the divisions, and the largeness of the scale worked to, and it is greater in proportion to the smallness of the divisions on the perimeter.

For the ordinary small scales used by surveyors, a much smaller square would be proportionately more accurate, set out to give constants of say ½in. and 1in, when used respectively from a centre, or on a base line. Such setting out is an exceedingly simple matter when the principle which the properties of the square depends upon are understood. The curved sides of the figure are hyperbolic curves, and the use of the square depends upon a property of the hyperbola which Fig. 4 will recall to the reader.

$XY=XY=xy$; i.e., any ordinate multiplied by its abscissa X will give a constant area (equal to XY) and y therefore for any abscissa will equal $\frac{XY}{x}$.

The ordinates of a figure bounded by a hyperbolic curve can thus be easily calcudated by simple division to give a constant of xy=any given magnitude, and it is easily seen that such a figure will mark off at different distances x ordinates y of such proportionate breadth as will give rectangles of constant area, indicated in Fig. 4 by the figure *abcd*, or equal triangles of half this area *bcd* if we are measuring from a point *d* instead of a base line. For convenience we plot the ordinates y, when calculated, evenly each side of a centre line.

To make the matter quite clear, the method by which the square shown of constant 5 was calculated is as follows. It was plotted on squared paper in tenths of an inch. Starting from the zero point z, the ordinates at point 10, which is 10-tenths of an inch or 1, must be $\frac{5}{1}$ or 5ins., which is divided on each side of centre line, 2½ins. each side. The ordinates at abscissæ less than 1 (7, 8, 9, tenths), would of course be more than 5, but it is assumed that in no case the perimeter will come nearer to the base line than 1; and at this point the square is cut off straight to the base line. It is extended a little beyond the actual base line to permit of cutting a notch for the pin to rest in, so that it shall come right on the base or zero point. At abscissa No. 20, viz., 2ins., the ordinate will be 5/2=2½ins. spaced 1.25 each side of centre line. At 2.5ins. it will be 5/2.5=2ins.; at 3.6 it will be 5/3.6=1.38; set off .69 each side of lime, and at 102=5/10=.5in., or .25in. each side. The points of the curves are plotted in this manner for each tenth of an inch, except for the higher abscissæ, where the curvature is so small that points ½in. apart are sufficient. The points are then joined in a fine curve. When plotting, it will be understood that the squared paper is used as a scale of decimal parts, the ordinates being easily picked off; and although this description is necessarily tedious, the plotting of such a square is really a very easy and simple matter; and the instrument when made is a very useful possession.

The earthquake that occurred in Provence on Friday night last destroyed five villages, but the particulars at present to hand are very meagre with respect to the buildings that have been reduced to ruins. Fortunately, the district affected contains no large towns. It is stated that in the old quarters of Lambesc, which are very congested, not a house is left standing whole. At St. Cannat, the belfry of the village church falling, caused the death of two men, and it is feared that the loss of life, of which full details have not yet been ascertained, has been very considerable.

Trade and Craft.

Kerno Specialities.

A booklet issued by Messrs. Kerner Greenwood and Co., timber importers, King's Lynn, has on its cover a sketch of a cottage in which the half-timbering and fencing are treated with light-brown Kerno, the barge-boards and bay with the same in light green, the gate and posts with blue-green, and the wood shingles with red. Kerno is described as a strong antiseptic fluid, which, when brushed on to any kind of timber, penetrates into the pores of the wood, coagulates the albumen, and renders impossible the existence of vegetable matter. It is not merely an agreeable stain, but a preservative and disinfectant. Kerno mastic is described as an effective damp-proof and rust-proof solution for use on all ironwork and steelwork, and for application to very damp walls. It is a brilliant shiny black.

Instruments, Appliances and Materials for Surveyors and Draughtsmen.

A comprehensive catalogue of surveying instruments, drawing instruments, drawing materials, photo processes, photo apparatus, and office stationery, has been issued by Messrs. Norton and Gregory, Ltd., of Castle Lane, Buckingham Gate, Westminster, and 34, Robertson Street, Glasgow. The section devoted to surveying instruments includes the firm's new pattern solid uprights for theodolites. For these uprights it is claimed that not only are they more rigid than the old open-frame kind, but, being made all in one casting, are less likely to get out of order through the loosening of screws, wearing of parts, etc. With the same object in view, the firm have introduced the solid-base engineer's level, in which the base and telescope are cast in one piece. Other new lines in this department are the bamboo ranging poles, which are commendable for their lightness, and the patented new marking of steel measuring chains and tapes. Among the drawing instruments and appliances are listed some ingeniously constructed adjustable drawing tables, a patent roller-bearing drawing cabinet, extra-thick violet-tint transparent celluloid goods, and the patent Roto-Rule, a small pocket calculator that is not liable to get out of order. The drawing materials section includes a very complete list of drawing papers, tracing papers, and tracing cloths, as well as the Velography system of reproducing plans, etc., in facsimile. Notable also in this section are the ferro-carbon papers and ferro-Prussiate linen. The list of sundries appears to include everything of the kind that can be required for office use, and the catalogue as a whole is extremely serviceable.

Views and Reviews.

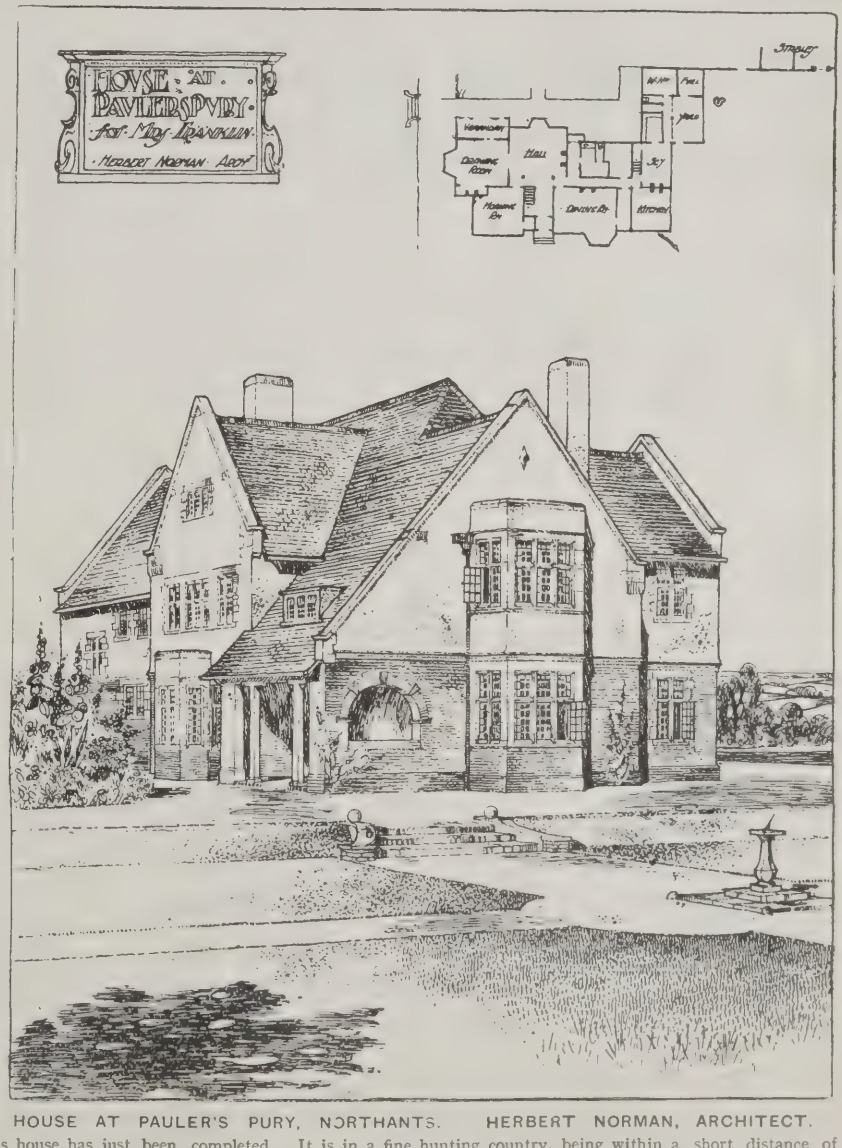
A Handbook on Marble and Marble Working.

Marble and Marble Working. A handbook for Architects, Sculptors, Marble Quarry Owners and Workers, and all engaged in the Building and Decorative Industries. By W. G. Renwick. With numerous illustrations and coloured plates. Pages xiv.+226. Price 15s. London: Crosby, Lockwood and Son, 7, Stationers' Hall Court, Ludgate Hill. 1909.

It is doubtless owing to vastly improved facilities for transport that, during comparatively recent years, the use of marble has extended prodigiously. It is to be feared that many of the architects who specify the material know but little about it, and hitherto their excuse has been that the sources of information have been lacking. Mr. Renwick's book invalidates this plea. It puts the architect in possession of all that he can be reasonably expected to know about marble—what it is how and where it is quarried, and how its selection for various uses should be governed.

What is marble? The geologist may hold that the definition includes nothing but metamorphosed limestone; but Mr. Renwick, while recognising the limitation imposed by the man of science, is constrained to adopt the less stringent view, which will be found generally acceptable for practical purposes, that the term marble includes "any natural stone that is of less hardness than granite, having a sufficiently close texture to take and retain a polished face, and being produced in such quantity as to be available for use for decorative purposes." The fundamental element in geological marbles is calcium, which, in combination with carbon dioxide and oxygen, forms the mineral calcite (C_aCO_3). The natural process, effected by heat and strain, which is known as marmorosis, does not affect its chemical composition, but the metamorphosed rock becomes highly crystalline in structure and acquires increased density. Of course no marble is chemically pure; and it is the presence of foreign material, in the form of carbonates and oxides, that gives the figuring and veining of coloured marbles; the iron oxides giving the yellow, pink, and red shades; the bluish-grey to black being generally due to the presence of carbonaceous matter; the greens, to the intrusion of iron and copper sulphides, mica, and talc.

The use of marble is of great antiquity. The quarries of Carrara (of which the name derives from the Latin *Quarrariæ*) were being worked by the Romans about 173 B.C. The quarries from which modern supplies are derived are situated in almost every country in Europe—Italy, France, Belgium, Greece, Portugal, Sweden, Austria, Spain, Switzerland, and Germany, and several varieties are quarried in Devonshire, Derbyshire, Cumberland, the Western Hebrides, and the South and West of Ireland. America and the Colonies also add something to the supply. Many quarries, at home and abroad, and the methods of working them, are illustrated in the book; Chapter III. giving an interesting account of the machinery used, and compares the European and American systems of working, while in other chapters the systems of various countries are described with sufficient fulness and clearness, and quite copious illustrations. Marble working as a British industry occupies a whole chapter; another being devoted to practical points for the consideration of architects, and hints on the selection of marble. A list of marbles in ordinary use, with descriptive notes, and instances of the application of the different kinds of marble, fills thirty-five pages. Some of the most beautiful marbles are shown in fac simile in a series of excellent coloured plates. A chapter on marble substitutes and imitations is included; and among the very numerous illustrations are several views of buildings in which marble has been effectively used. The book is of great interest and of unquestionable utility, the information it affords being of the right quantity and the right kind for those who, like architects and sculptors, aim at no more than a fair general knowledge and an intelligent comprehension of the subject; while the descriptions of machinery and methods are, we suppose, sufficiently practical in character to render the book valuable to quarry owners and marble workers.



HOUSE AT PAULER'S PURY, NORTHANTS. HERBERT NORMAN, ARCHITECT.

This house has just been completed. It is in a fine hunting country, being within a short distance of the Grafton Kennels, and faces the old Watling Street, along which is a continuous stream of motor traffic. Consequently the house has been well set back from the road to avoid the dust nuisance. The brickwork is of small local building bricks, the upper part being roughcast on hollow walls, with brindle coloured tiles on the roof. The adjoining stabling gives accommodation for ten horses. The builder is Mr. A. A. Hawtin of Northampton.

ELECTRICITY IN BUILDINGS.
IV.

By Harold Hastings, M.I.E.E., A.M.Inst.C.E.

(Continued fom page 170, *No.* 708.)

Lamps.

The incandescent lamp is everywhere self-evident, and does not need description. The principle upon which it illuminates is that the current is passed through a filament of carbon which offers considerable resistance. In overcoming this resistance great heat is generated, and the carbon becomes white hot. If air were present, it would immediately burn away, but all the air is removed and the filament is hermetically sealed in a glass bulb so that it cannot be consumed. It is found that it gradually disintegrates and forms a black coating on the interior surface of the bulb as the lamps become aged.

The average life of a good brand of lamp is 1,000 burning hours. Towards the end of its life, the lamp often becomes so black that it is practically useless. This should not occur in a good lamp in less than 800 hours' burning. When ordering lamps it is necessary to mention the voltage of the circuit, the type of cap required (whether screw or bayonet), and the candle-power. The last may be 8, 16, 25, 32, 50, 100, 150, 200, 300, 400, 500, or 600.

There are 5 c.p. lamps, but as they consume practically the same amount of current as an 8 c.p. there is no advantage in having them.

It is always advisable to arrange for a large number of lamps of low candle-power rather than a few concentrated lights of large power. The more the light is distributed the better will be the illumination. Another consideration in favour of a large number of lights and plenty of switches is that much current can be saved by reducing the amount of light when the full brilliancy is not necessary.

When a lamp has become much blackened it is advisable to throw it away. It is still consuming the original amount of current and possibly only giving half the light. It is then a very expensive form of illuminant.

Arc Lamps.

Arc-lamps are made from 500 candle-power up to 5,000. The apparatus consists of mechanism which allows two carbon pencils to touch, and, when current is switched on, to separate a fraction of an inch. The current jumps the gap, as explained in the case of a fuse blowing, and the immense heat generated vaporises the point of the carbons. This vapour, under the action of the current, forms a highly incandescent globe around the extremities of the carbons. As the latter are consumed they are fed together by an automatic arrangement.

This form of light is useful for exterior and workshop illumination. It is very similar to the light of the sun, and can be used for photographic studios, or in shops where it is desired to match colours. Special wiring is required.

Arc lighting is very economical. A 10-ampere lamp will give 1,000 candle-power, and only requires a pressure of 45 volts. Hence it consumes 10×45=450 watts. An 8 c.p. lamp consumes 33 watts, and 14 of them could be lighted with 450 watts. In this way it is evident that 450 watts are equivalent to 8×14=112 incandescent c.p. Hence the relative value in illumination is as 112 is to 1,000, or, in other words, 1 to 9 in favour of the arc lamp. A circuit with 45 volts is seldom available, and the excess pressure has either to be wasted in resistances, or it is necessary to put several lamps in series. Thus, on a 200 volt circuit four lamps would be connected together in series, and only 20 volts wasted in a resistance. They must be all lighted and put out at the same time. There is a device for putting out one lamp only of such a series, but this is done by substituting an equivalent resistance.

Lamps of this type require trimming every 5 to 18 hours, according to their construction. With direct current the carbon on the positive side burns away twice as fast as the other, and is generally made twice as thick. With alternating current both burn at the same rate.

Enclosed Arcs.

Hitherto we have been describing "open" arcs which burn in the air without any protection except from gusts of wind. Another type is made having a glass globe, into which the carbons enter through glands. These are called "enclosed" arc lamps. They differ from the open type in that they work at a pressure of 75 to 90 volts, and take 2½, 5, or 7 amperes.

These lamps give a steady and well-diffused light, and are quite silent in working. They produce a nominal 1,000 candle-power each, with 7 amperes flowing. Thus they compare with the open arc as 560 is to 450, which means that they consume about 25 per cent. more energy. This is more than counterbalanced, however, by the fact that they only require trimming once every 120 to 200 hours. This consideration is of such importance that the real saving in expense is something like 60 per cent. on the open type.

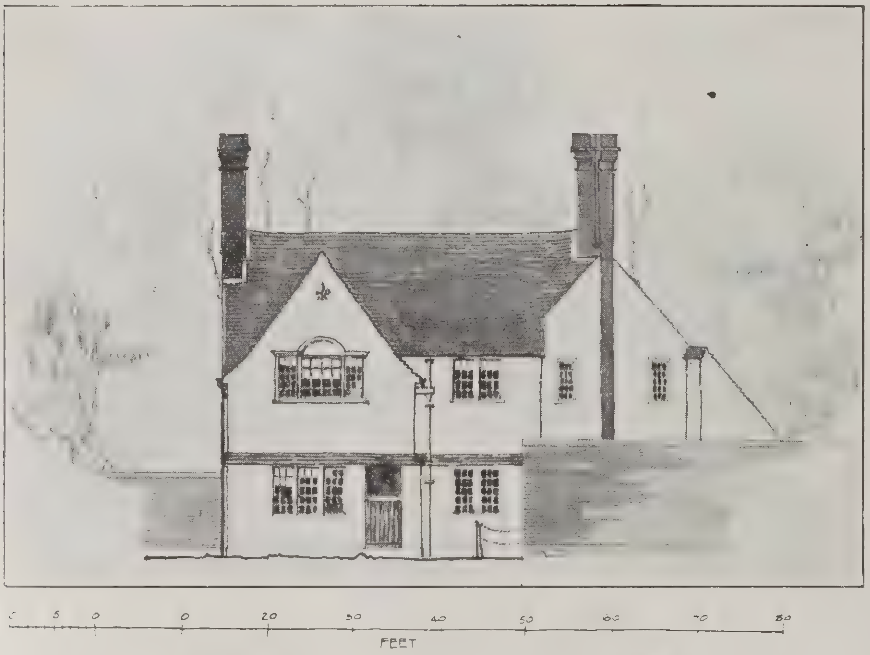
"Flame" Arcs.

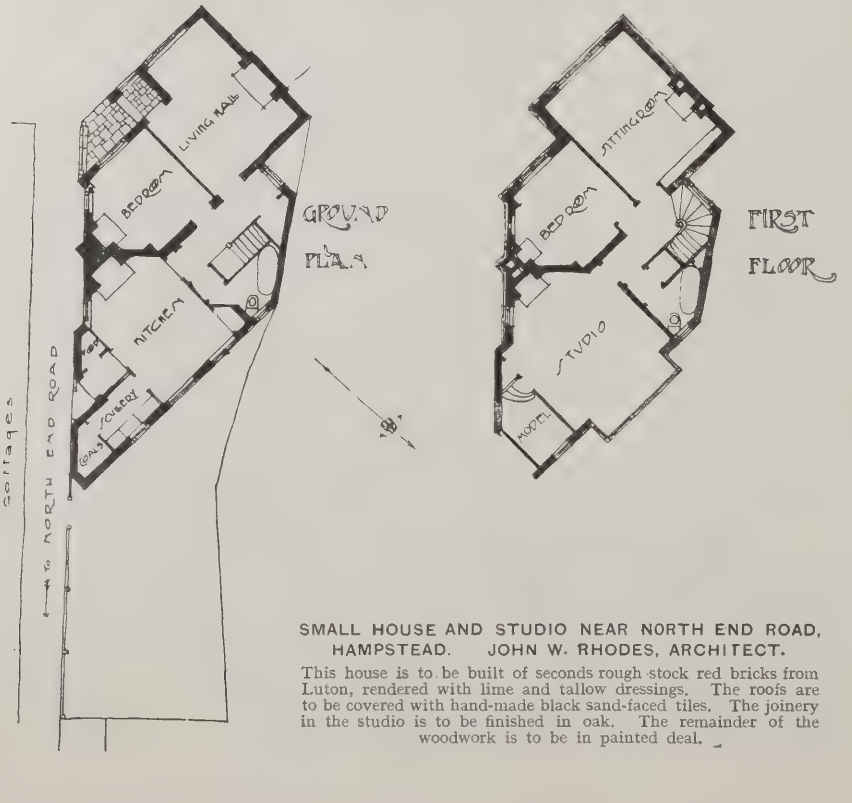
"Flame" arc lamps are a variation of the open arcs. In these the carbons are prepared with an admixture of calcium. They produce a vivid yellow flame in place of the blue-violet of the open arc. Their light is much more pleasant, and more penetrating in fog or mist.

When ordering arc-lamps it is necessary to say which type is required, the length of time they are to burn without retrimming, the pressure of the circuit on which they will be connected, and whether they will burn alone, or in series with others. The method of suspension must be closely looked into, and the means of retrimming considered.

Nernst Lamps,

Nernst lamps have lately come to the fore, and are very suitable for both interior and exterior illumination. The light is particularly soft and pleasant. They seem to be less satisfactory on alternating current than on continuous. They can be obtained for any normal voltage. The cost is greater than that of incandescent lamps, but new filaments can be obtained and are easily fixed. The energy consumed compares as 1 is to 3⅓ with ordinary incandescent lamps. They are, therefore, very economical. The lamps are known by the current they consume. On





SMALL HOUSE AND STUDIO NEAR NORTH END ROAD, HAMPSTEAD. JOHN W. RHODES, ARCHITECT.

This house is to be built of seconds rough stock red bricks from Luton, rendered with lime and tallow dressings. The roofs are to be covered with hand-made black sand-faced tiles. The joinery in the studio is to be finished in oak. The remainder of the woodwork is to be in painted deal.

a 200-volt circuit the following relation is approximately correct:—

A ⅛ ampere lamp gives 20 c.p.
„ ¼ „ „ „ 40 „
„ ½ „ „ „ 80 „
„ one „ „ „ 160 „

The lamps take about a minute to come to incandescence, the intermediate time being taken in heating the filaments by means of resistance coils.

Another new departure in lamps is the "Osmi," in which the filament is made from the rare metal osmium. They are very efficient, consuming 1½ watts per candle. The average life is about 500 burning hours. They cannot be obtained for high voltages, but three or four can be used in series in suitable places.

The Nernst and Osmi lamps, however, and even carbon filament lamps, are subject to the keen competition introduced by

"Osram" and "Tantalum" Lamps.

The filaments of the new lamps are made of rare metals (tungsten and tantalum respectively), and offer an enormous economy in current consumption.

Tantalum lamps are of two kinds—long life with higher consumption, and short life with low consumption. The cost of either class is rather more than double the cost of a carbon filament lamp, but this first cost is soon counterbalanced in the saving in current.

The consumption of a tantalum lamp having an average life of 800 hours is 1.7 watts per candle, whereas one with 1,600 hours' life consumes 2.2 watts per c.p. The variation in the amount of light when the lamp is new and at the end of its life is about 20 per cent.

There is a slight disadvantage by reason of the fact that lamps are not made for use on circuits above 130 volts, so that two or more lamps must be used in series on the most general supply systems in this country.

When ordering, it is necessary to state (1) the working voltage of each lamp; (2) the type of lampholder (bayonet or screw); (3) the shape of bulb (bell or spherical); (4) whether the bulb is to be clear, partly frosted, or wholly frosted; (5) whether the lamps are to work in series and, if so, the series letter: "H" or "L." (These two letters represent the efficiency of the lamps, "H" being high efficiency, namely, 1.7 watts per c.p., and "L" being low, namely, 2.2 watts per candle.)

We have already quoted the average figure of 33 watts per 8 c.p. for carbon filament lamps. This represents 4.1 watts per c.p., and compares very unfavourably with the consumptions given above.

A "Tantalum" Sun Lamp" is also made, giving 45 c.p. at 110 volts. This is a somewhat more expensive lamp, but has a long life. It is generally supplied with a special reflector, increasing the light in the most useful direction to the neighbourhood of 180 c.p.

The candle-power varies with the voltage. It can be seen at a glance from the table below.

Tantalum lamps are not recommended for use on alternating current. The varying direction imposes a greater strain upon the filaments, and the life is considerably decreased.

A broken filament can sometimes be repaired by gently tapping the lamp. The two ends may swing together again, in which case a spark occurs as the current again flows through the completed circuit, and the heat is sufficient to melt the metal at the point of contact and cause the ends to fuse together.

Osram lamps are of more recent introduction. They have all the advantages of Tantalum lamps with the following variations:—They are equally applicable to alternating and continuous currents; the consumption is 1.25 watts per c.p.; the average life is 1,000 hours; the decrease of light during this period is not more than 5 per cent.; the cost per lamp is more; the filament has little cohesion when hot, and must hang in a vertical direction, and not be subjected to vibration.

Osram lamps can be obtained for any voltage up to 130, so that these also are generally used in series. The makers give each lamp a "series number," and all the lamps of any one series must have the same number. The low-voltage lamps are not so fragile as the higher ones, and those up to 25 volts can be used with the same amount of rough handling as with carbon lamps. On alternating current systems a very convenient arrangement is to employ a small transformer for reducing the voltage to 25. At this pressure the lamps are cheaper, and the ordinary wiring can be used without adapting it to groups in series.

A main switch must be placed in a convenient position, controlling the transformer so that it may be switched out of circuit during the hours of daylight. A transformer takes an appreciable amount of current to keep it magnetised, so that much of the economy would be lost if it were kept on continually.

Osram lamps are supplied for 100 to 130 volts, giving 30, 50, or 100 candle-power; and at 25 volts giving 10 and 15 c.p. The order for lamps should state (1) the lamp voltage; (2) the series number; (3) the candle-power; (4) type of lampholder; (5) the shape of the bulb.

Special fittings can be obtained to fix in existing lampholders and carrying two or more "Osram" or "Tantalum" lamps in series. Special adaptor-holders are also supplied in connection with Osram lamps to enable them to hang vertically from lampholders which would otherwise support them at an angle other than the vertical.

Accessories.

Under this heading energy-consuming apparatus other than lamps may be dealt with. Among these

Radiators

take the first place.

Electric heating is never likely to be as cheap as older methods, such as coal or gas fires. The reason is that the whole of the heating element, in the case of electricity, has to be conveyed to the apparatus by means of the wires. With gas this is not so. Heat is produced by means of the union of 1 part of gas with 6 of air, so that only one-seventh of the heating elements have to be conveyed by pipes in the case of gas. The same reasoning applies to coal fires. On the other hand, the whole of the electrical energy brought into the apparatus is given out as heat fulfilling useful purpose, whereas the bulk of it has to be wasted in the other cases, to take the products of combustion up a chimney. Again, when air is used as one of the factors to produce heat, the space from which it is taken has to be refilled with a further quantity. This continual introduction of unheated air takes the form of innumerable draughts, besides giving the coal or gas fire more heating work to do. In spite of these facts it cannot be claimed that electric heating is cheaper, even though the supply companies give very low rates for current for this purpose. When the advantages are taken into account, however, electric heating can more than hold its own in the competition.

The "Glow" Radiator.

The "glow" radiator consists of a number of large incandescent lamps, only partially incandesced, so that a large proportion of heat rays is given out. The lamps are mounted on an ornamental fitting and give out *radiant* heat. The rays of this form of heat pass through the air and heat the objects upon which they strike without affecting the air temperature to any great extent. The immense advantage of this kind of heat will be at once appreciated. Directly the current is switched on, the heat is available, without first heating all the air in the room. Consequently it is not necessary to light the fire until it is actually needed.

The rays are very similar to those of the sun, and their heating effect follows the same lines as the sun's rays. They have been utilised by the medical profession with very beneficial results.

"Air-warmer" Radiator.

"Air-warmer" radiators are of less recent origin than the "glow," and their professed function is to follow the lines of gas and coal fires. They heat the air first in order to convey the heat to the human being, instead of delivering it direct. They are made in the form of screens, and are very ornamental. They have rather a bad habit of "open-circuiting," and the cause of fault is generally difficult to discover. In the glow type a faulty lamp is at once detected and easily replaced.

Radiators should not be placed in existing fireplaces unless the flue has been completely sealed with cement. They are for more useful in the middle of the room. As they cannot vitiate the atmosphere, there is no object in placing them in the fireplace. They should be placed where their rays have the best play.

Radiator lamps are usually made to take 250 watts, so that on a 200-volt circuit 1¼ amperes flow through each lamp. A very good heating rule, which errs on the generous side, is to allow one watt consumption for every cubic foot of space to be heated. Thus a room 10ft. by 10ft. by 10ft. equalling 1,000 cub. ft., will require four lamps. The radiator should be provided with switches to devide the lamps into two sets, as only on the coldest days would all four lamps be required. It is advisable, in large rooms, to supply two radiators of small size, rather than one large one. Those containing four lamps should be the limit in size.

Fans.

Next to radiators, in order of utility, come their exact opposites—fans. These are made in sizes and shapes suitable for any special use. The most common type is the desk fan, which has four blades, about 14ins. in diameter, running at a speed of nearly 2,000 revolutions per minute and consuming 50 or 60 watts. On hot summer days they are greatly in demand.

Another type, which is ousting hand-driven punkahs in India, consists of two or four sweeps. These run at a low speed, are perfectly noiseless, and have a diameter of some 56ins. They consume about 80 watts.

When ordering fans it is necessary to state the size and kind required, the voltage of the circuit, and whether the supply is alternating or continuous current.

If the quantity of air to be extracted from a room, or circulated, is known, it should be mentioned, as the manufacturers can judge the power required.

Other useful accessories are kettles, irons, glue-pots, shaving-pots, plate warmers, soldering irons, and similar articles, all of which can be heated by the application of the electric current.

Electric ovens have advanced the science of cookery into the realms of exactitude. The ovens are portable and compact, and can be used upon the kitchen table. The temperature is under perfect control, and there is no danger of the products of combustion contaminating the food.

Having now considered in detail most of the materials and apparatus which are likel to be found useful in application to buildings, we are in a position to study the details of their installation.

(*To be continued*).

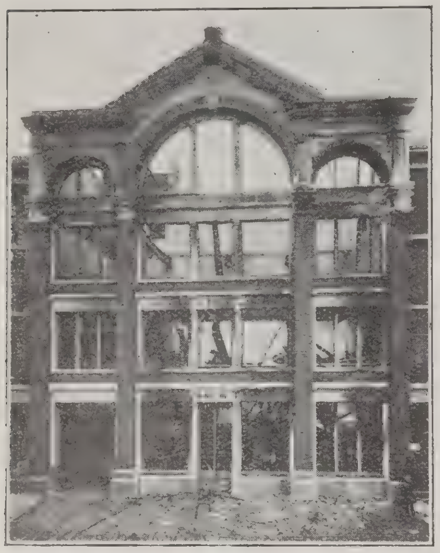
THE FIRE AT MESSRS. W. N. FROY'S.

Last week brief reference was made to the destructive fire at Messrs. W. N. Froy and Sons, Ltd., Brunswick Works, Hammersmith.



FRONT OF MESSRS. W. N. FROY & SONS' PREMISES AFTER THE FIRE.

The fire at these premises in King Street, Hammersmith, was one of the fiercest blazes seen in this part of London. The facade here shown is practically a tottering shell and has had to be shored up preparatory to being demolished. Traffic in King Street had to be diverted for two or three days, this occasioning much inconvenience.

We now present two photographic views that will serve to indicate the extent of the damage. About five o'clock on Friday morning, June 4th, a man passing by caught sight of smoke issuing through the front entrance. He immediately rang the alarm bell, at the same time rousing the caretaker, who made his way through the dense clouds of smoke, which seemed to be coming from the main centre building, to the private office of Mr. H. P. Froy, the managing director. He soon realised that the whole of the central building was in flames. The fire raged over a space of 250ft. by 80ft., this being, however, only the central and main front of Messrs. Froy's premises, which contained a great deal of inflammable material such as oils, paints, colours, brushes, and electric fittings. Then the paper showroom caught fire, and about four or five hundred thousand rolls of wall paper were destroyed. Fortunately, owing to the direction of the wind, the second and third warehouses, which extend over premises as large again as those burnt, were untouched. The fire having been at length got under, Mr. H. P. Froy speedily got the business into working order, and it was soon proceeding as if nothing had happened. The new showrooms remain intact. Messrs. Froy hope to commence rebuilding immediately the front and central premises, and will take the opportunity of enlarging them to meet the requirements of their expanding business as builders' merchants, etc.

Mr. E. F. Cobb, architect, has moved his office from No. 20, to No. 43, High Street, Rochester (first floor).

* * *

"Holidays Abroad," an illustrated booklet of a series of tours in the less-known districts of Holland, North Germany, the side valleys of the Rhine, the Belgian Ardennes, and the Tyrol, easily and inexpensively reached by the Great Eastern Railway Company's Harwich route to the Continent, has been issued from 30, Fleet Street. The illustrations are numerous, and there are several very handy route-maps. The booklet should certainly be seen by architects and others who contemplate spending their summer holidays abroad.

Federation News.

Northern Centre Board of Conciliation to the Building Trades.

The annual meeting of the Northern Centre Conciliation Board was held at the Grand Central Hotel, Briggate, Leeds, on Tuesday afternoon, May 18th, when Mr. T. Wilkinson, Middlesbrough, presided over a fully represented meeting.

Mr. Thomas Wilkinson, Middlesbrough, was re-elected chairman of the Board for the ensuing year, and Mr. David Richards, J.P., was re-elected to the vice-chair.

Messrs. James Denver (Manchester), and Councillor Alfred Gould (Hull) were re-appointed joint secretaries for the respective parties.

The minutes of the last annual meeting and of six special meetings held during the year, were taken as read, and were confirmed.

Several amendments to the Conciliation Board rules sent up by the Employers' Northern Centre Executive were considered.

The proposal to amend rule 2 was carried by 13 votes to 9.

The proposal to amend rule 13 to provide that at least two cross votes shall be required to carry a decision was considered at considerable length, but it was eventually agreed to withdraw the same.

The proposed new rule to provide for the fixing up of minimum periods for which decisions given by the various Boards shall endure was considered; but on being put to the vote was defeated by 18 votes to four.

The suggested new rule of procedure, allowing either side to retire for private consultation on any question, was unanimously agreed to.

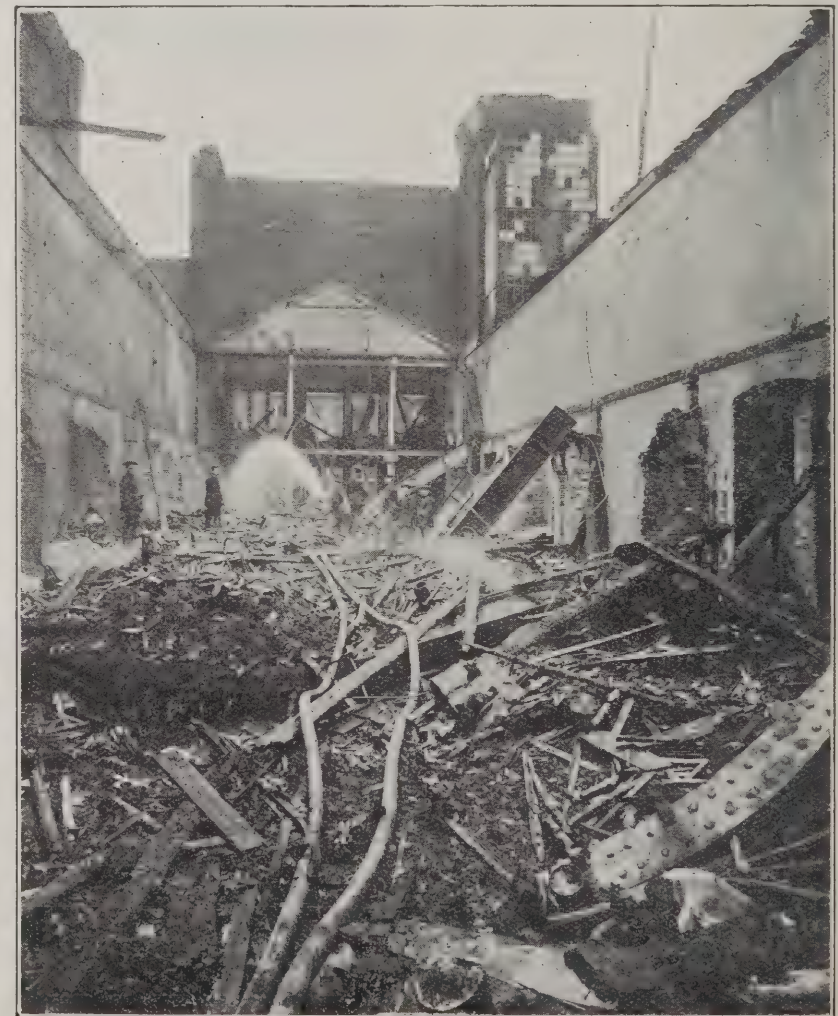
Some discussion took place on the question of other trades and the labourers being invited to join the scheme as per resolution passed at the annual meeting of this Board in May, 1907, and the employers' secretary reported the result of the endeavours of the National Federation thereon.

A rather lengthy discussion took place regarding the admittance of the builders' labourers, and the employers were requested to re-consider the same at an early date.

An appeal from the Liverpool local board was then heard in reference to a notice given by the employers of bricklayers for a reduction in wages of ¾d. per hour, alterations in the present working rules, and various amendments to rules; also a counter-notice from the operatives for an advance of 1¼d. per hour and various amendments to rules, and representatives were admitted to state their case.

After the witnesses had retired, a resolution was moved whereby the operatives would receive an advance in wages of ¼d. per hour and reduced working hours similar to those at present in operation with the joiners and masons of that town. Two amendments were moved, and, on being put to the ballot, each received equal votes. Ultimately the original proposition was put to the vote, and carried by two cross-votes.

The joint secretaries reported having received an appeal from the Manchester Local Board on a stonemasons' dispute, and it was agreed that the same be heard after Whitsuntide, the date of meeting to be left to the secretaries. — JAMES DENVER, Employers' Secretary, Cromwell Buildings, Blackfriars Street, Manchester.



INTERIOR OF THE GUTTED BUILDING AT MESSRS. W. N. FROY AND SONS' PREMISES.

The interior of this building after the fire is a striking illustration of the necessity for fire-resisting construction. The fate of the steel girders and stanchions can plainly be seen. In this building, Messrs Froy & Son', who are builders' merchants, warehoused about half-a-million rolls of wall paper.

SPECIALITY:
"ETERNIT" Terra-cotta Tiles, which neither break nor crumble, and at half the cost of Staffordshire Tiles, double the strength and about one-third of the weight.
Prompt delivery.
Speedy fixing.
No breakages.

G. R. SPEAKER & Co.,
ENGINEERS,

29,
Mincing Lane,
E.C.

For enduring roofing material and workmanship,

Architects, Engineers & Surveyors

are respectfully recommended to specify

ETERNIT REGISTERED TRADE MARK 1904,

Guaranteed and manufactured under Hatschek's Original Specification and to decline all substitutes. No other roofing tile is "ETERNIT." (Regd.)

WRITE FOR SAMPLES AND FOR TENDERS FOR FIXING.

Smooth on both sides. Roofs covered with "Eternit" Tiles weigh about 22 lbs. per square yard, or 66⅔ lbs. lighter weight per square laid than Bangor Slates. Greater mechanical and tensile strength. Non-Conducting. Non-Combustible. Impervious to sun, heat, frost and rain. Wind, dust and weather tight.

G. R. SPEAKER & Co.,
CONTRACTORS,

28,
MARK LANE,
LONDON, E.C.

GUARANTEED:
Tensile strength, 5781 lbs.
Crushing force 8,281 lbs.
Per Square Inch and always increasing with age.
Immunity from repairs.

Architects, Engineers and Surveyors are earnestly warned not to confound "Eternit" Tiles with so-called Asbestos Slates varying in quality, thickness and colour, advertised under fancy brands. "Eternit" "endures not for an age, but for all time."

THE HATHERN STATION BRICK & TERRA COTTA COMPANY, Ltd.,

LANCASHIRE, CHESHIRE AND NORTH WALES FEDERATION.

A special meeting of the Administrative Committee of the Lancashire, Cheshire, and North Wales Federation was held at the Board-room, Manchester, to receive counsel's report in the case of a Bolton member, and a special sub committee was appointed to deal with the same.

Correspondence was read between the secretary and the joint secretaries of the National Conciliation Board regarding the Rochdale Employers' Association refusing to carry out the Conciliation Scheme, and a deputation was appointed to visit Rochdale with a view to inducing them to adhere to the rules. This deputation have since visited the town, and it is pleasing to note that the employers there have now agreed to submit their case to the Board, and it is understood that a meeting is to be called for that purpose at an early date.

A case of a certain firm refusing to conform to a decision given against them by a local Conciliation Board was reported, and it was decided to deal with them under the rules.

The monthly meeting of the Administrative Committee was held in Manchester on Friday, May 14th, when Mr. William Bullen presided.

An application for membership from the Accrington Building Trades Employers' Association was before the meeting, and the new society were recommended to the Executive Board for admission.

Matters referring to the financial affairs of the Federation, organisation, treasurership, etc., were before the meeting, and resolutions adopted thereon.

In consequence of the importance of the business to be transacted at the annual general meeting, it was decided to alter the place of meeting from New Brighton to Manchester.

Several meetings of the Insurance Committee have been held during May, and their proposed amended agreement has now been submitted to the Insurance Association for approval or otherwise.

The quarterly meeting of the Master Plasterers' Trade Committee was held at the Temperance Institute, London Street, Southport, on Thursday, May 27th, when Mr. William Cooke, jun., occupied the chair.

Matters of branch trade interest were the chief business under discussion. Mr. J. B. Johnson, Liverpool, read a very interesting and instructive paper dealing with the N.A.O.P. Agreement and its amendments.

Owing to pressure of business, time did not permit of the consideration of the sub-contract form which Mr. Johnson had intended introducing into his paper, and it was ultimately agreed to call a special meeting of the committee in Manchester at an early date, to give the same full consideration.—John Tomlison, Secretary.

SHEFFIELD ASSOCIATION.

Secretary: Thos. Smith.

A further meeting of the Trades Committees was held at the Builders' Exchange on June 2nd.

The meeting was opened by the reading of a letter dated March 6th embodying the views of the M.B.A. in support of the proposed abolition of walking time, to which a reply (also read) had been received from the operatives dated May 25th, saying that the matter had been considered by the operatives of the societies concerned, who were of opinion that some concession should be made in lieu of walking time, and they requested that the wages of bricklayers and carpenters and joiners be increased ½d. per hour, and that lodging money be paid on all jobs distant over 4 miles from Sheffield Parish Church at the rate of 6d. per night or 3s. per week. The bricklayers also requested that one hour's notice should be given on leaving. It had often occurred that on getting to the pay table bricklayers had been discharged absolutely without notice, and had had to return to the job at considerable inconvenience to fetch their tools.

The Chairman said that very few men were paid walking time at the present time, and as the rule was so consistently ignored, and was productive of so much inconvenience where it was carried out, they had, after very careful consideration, come to the conclusion that it should be abolished, and if abolished it would inflict a hardship on no one, but would undoubtedly be to the best interests of both operatives and employers. Proprietors had a very great objection to men appearing on a small job 15 or 20 minutes after the officially recognised starting time, and at once began to reckon up how much time they were paying for for which no work was done. Outside employers who came into the town did not recognise these rules in regard to walking time, and the local contractor was therefore put at a considerable disadvantage. The outside contractor who was not a member of any association put down his plant on a job outside Sheffield and engaged men on the job, while if a member of the M.B.A. had the same job, he would be called on to pay walking time. In these times it was imperative that they be in as good a position as anyone else, and they asked the operatives to assist them. The counter demand which the operatives had set up, which would mean an increase in wages of say 2s. per week, would leave them no better off, and would absolutely defeat the object for which they set out. A study of prevailing conditions would show that the present tendency was to decrease rather than increase wages, and he might say that the association considered the demand as most extravagant, and one which, under no circumstances, could they give any consideration to, anxious as they were at all times to create a good feeling between employers and employees. The abolition of walking time did not decrease wages or reduce the earning capacity of operatives in the slightest: it simply meant that in some cases they would commence work in some cases 10 or 15 minutes earlier.

Mr. Lane asked if the employers had any suggestion to make in lieu of walking time, to which

The chairman replied in the negative, and in reply to Mr. Wood, he further said that the M.B.A. could not for one moment consider the question of raising wages.

Mr. Biggin said that so far as cheapening building operations in Sheffield was concerned, the proposed abolition would not affect it one iota. It was on the outside jobs where walking time was demanded where they were crippled, and he proceeded to refer to a job where Sheffield workmen worked for an outside contractor for 8d. per hour, while the same workmen would have been paid 9½d. per hour and would have in addition demanded walking time from a Sheffield contractor. The local contractor had not therefore the proverbial dog's chance. When men were sent from the contractor's place of business to work outside a 4 miles' limit, they were paid railway fares and lodging money without question, and they were anxious to continue that arrangement. He therefore proposed: "That lodging money be paid to men sent from the contractor's place of business to work on jobs over 4 miles from the Sheffield Parish Church: no lodging money to be paid men set on on the job."

Mr. Wilkinson said that in his 25 years' experience they had paid walking time, railway fares and lodging money to men sent from the shop, but on some outside jobs his firm had done, if they were to pay the same to men set on on the job, they would never get a job. He proceeded to quote another job where the difference if walking time had been paid would have averaged £7 10s. per week to them. He had never understood that walking time was paid to men other than those sent from the shop, but he might say that on a recent job outside Sheffield they paid their men 9½d. per hour, while men working on another job only 200 yards away were receiving 8d.

Mr. Evans said he would like Mr. Biggin's motion better if he would leave out the clause about men set on on the job.

Mr. Biggin, in reply, said that the matter would regulate itself in a period of good trade, because a man would not walk 4 miles if he could get a job within the city.

Mr. Stone held that it was unfair that if a contractor advertised for men outside the district and received applications from Sheffield men, that he should deprive them of the lodging money. He also objected to reference being constantly made to Corporation jobs, and held that they had brought several others before the Board. He also thought that Sheffield employers had paid 8½d. per hour.

Mr. Biggin said they did not want men to work for 8½d. They were contending for the Sheffield rate of 9½d., and it was better that men should be employed at this rate than accept 8½d. from an outside employer.

The Chairman remarked that it would be better to speak of generalities than to "spot" individuals. The fact was, however, that this question of walking time had been brought into special prominence on Corporation jobs. What they were contending for was that the Sheffield contractor should have any legitimate benefit there was which would be conceded to an outsider.

In reply to several queries, the Chairman said that in a job over 4 miles from the Sheffield Parish Church the fare out and return fare every fortnight would be allowed.

Mr. Stone suggested that Mr. Biggin's motion should be altered to read, "all men resident in Sheffield," but

Mr. Biggin could not accept the suggestion, and

The Chairman said they were prepared to pay expenses to all men they sent to the job, but in regard to men engaged on the job they thought they ought to have the advantage.

Mr. Wilkinson presumed a case in which 50 men were engaged on a job for 12 months and received lodging money. That would add £355 to his tender, and that was a very great consideration now when many tenders came within £10 or £20 of each other.

The discussion next turned on the average wages of a bricklayer, and the 2s. or so per week he might have to pay for tram or railway fares.

Mr. Wood asked if it was proposed to pay lodging money to men whether they elected to lodge or come home, and

The Chairman, in reply, said that lodging money would in his opinion be paid to such men as were sent from the shop whether they elected to come home or not. In summing up the discussion, he further remarked that the views of the operatives would be put before the M.B.A. at their next meeting. They were most anxious to settle the matter amicably, and to have a rule which was not complicated. The alteration would not affect 10 per cent. of the work, and was not such a "back-breaking" job as he was afraid Mr. Stone and others had attempted to make out. He could assure them that the matter would receive very careful consideration, and the result would be communicated to their secretary as early as possible.

With reference to the question of giving one hour's notice to bricklayers, the chairman said the matter had not been considered, but he did not think there would be any objection to it, provided that if they agreed, the hour must be worked.

On May 27th a committee of eight was appointed to arrange for the reception of the Belgian builders who will visit Sheffield on August 10th and 11th, and it was decided to form a guarantee fund. The amount guaranteed at the meeting was £31 10s., which has since been increased by further subscriptions to £45 15s. 6d. It is intended to give the visitors a right royal Yorkshire welcome.

After June 24th, the address of the Royal Sanitary Institute and Parkes Museum will be No. 90, Buckingham Palace Road, London, S.W.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 14-29. **WALTHAMSTOW.**—Erection of a junior mixed school, to be erected on the playgrounds of the Coppermill Road school, for the Education Committee. Names to the architect, H. Prosser, M.S.A. Concerning Competitions.

In the bitterness of heart engendered of recent events, some architects are just now denouncing competitions, lock, stock, and barrel, declaring that they are vicious in principle, wasteful in practice, and ought to be abolished. In their calmer moments, these immoderate censors will no doubt admit that such extreme views are unpractical, if not untenable. Upon a reasoned consideration, it is very obvious that competitions, properly managed, are by no means destitute of estimable advantages. It is true that the enormous waste of effort they involve, especially in the case of open competitions, cannot be denied. The aggregate cash value of the time vainly expended in an extensive competition—like that, for instance, at Middlesbrough—may possibly be reckoned at thousands of pounds sterling. Certainly, at the first blush, this looks like so much dead loss to the profession. But is it? We are inclined to suppose that most of the competitors enjoy a considerable rebate, made up of various more or less unconsidered trifles. The competitors strengthen their powers and enlarge their experience by the exercise, which teaches them valuable lessons that could hardly be obtained by any other available means. It is a commonplace that we may learn more from our defeats than from our successes, and, that sternly taught in this hard school, we may go on doggedly persevering until victory ultimately crowns our efforts. Then, again, competitions afford the architect the most considerable of his very scanty opportunities for enjoying a modicum of the publicity that, in some form or other, is esssential to prosperity. The public exhibition of his designs gives him a chance of showing what he can do, and it also affords the critic an occasion for offering him advice that, while it is not always palatable, is sometimes very profitable. The competitor casts his bread upon the waters, and it may return to him after many days, if he watches for it with intelligent alertness. But for the open competition system many an architect who now enjoys prosperity and fame might be languishing in poverty and obscurity. It discovers talent and distributes work more equitably, and that in itself is surely almost a sufficient justification of a system that nevertheless seems to lend itself with peculiar facility to many vexatious abuses. Not the least of these is the faulty drafting of conditions, which are commonly more fussy than informative, and too often suggest the lame and impotent conclusions inherently characteristic of committees, whose united wisdom is necessarily less than that of its wisest units. The conditions should be invariably revised in consultation with an architect—preferably by the assessor—who, as a rule, would know better than to impose restrictions that by cramping the efforts of the competitors would stultify the competition. But even then, very much would depend on the assessor's personal equation — a consideration that raises a number of delicate points which need not here be discussed in detail, such, for instance, as the natural tendency of competitors to "play up" to the personality of an assessor of strong individuality and marked predilections. The whole subject should be threshed out by a special committee of the R.I.B.A. The system, having grown up at haphazard, has developed so many inconsistencies and inconveniences, and is consequently causing such widespread discontent, that the central body would be amply justified in taking it in hand with a view to rendering its operations less fortuitous and casual, and therefore more satisfactory and more equitable to all concerned; and by this time sufficient material has been accumulated out of which to mould and model a common form as a basis of practice and a policy in the conduct of competitions; so that if thereafter everything is not done decently and in order, it will at least not be for want of authoritative guidance.

Architectural Skyscrapers.

The architectural treatment of the skyscraper has been pluckily attempted in the design of the new Metropolitan Insurance building in New York. This building has a tower, which is surmounted by a kind of spire, while the rectangular severity of the general structure is greatly mitigated by the introduction of arcading, balconies, cornices, pediments, and round-headed windows. Whether these decorative effects really improve the appearance of the building, or whether, on the other hand, they detract from the expression of uncompromising utilitarianism that gives this type of structure its unique character and provides its sole excuse is a moot point. To decorate it is to hybridise it by depriving it of its distinctive austerity without rendering it exactly a thing of beauty. It would hardly be possible to say quite as confidently of the new type as was said of the older, "In it American life is expressed with all its vulgarity, all its nobility, all its soaring ambition, all its utilitarianism, and all its tremendous energy." The genuine New Yorker, it would appear, loves and cherishes the ugliness of this distinctively American type of building, even as the Englishman prides himself on the hideousness of his bull dog: the object of affection in each case being indigenous, frankly ugly, strong, and businesslike: any attempt to modify the type or mix the breed of either of these national institutions being, one may well suppose, keenly resented. In each case, again, it appears to be only the form that must not be interfered with. In colour and "markings" a good deal of freedom is allowed. Marble is lavishly used, both inside and out, for the adornment of New York's skyscrapers, some of which, moreover, are very sumptuously adorned inside with onyx and rich woods. The preparation of plans of a skyscraper that is some day to be built for the Equitable Life Insurance Company has cost about £50,000 in fees to architects, engineers, and draughtsmen. Of course such sordid considerations have not the remotest bearing on the energy and ingenuity with which every properly constituted American architect is prepared to vindicate and extol the skyscraper! But it seems to us that the advent of the architecturally treated skyscraper robs his arguments of some of their point and force, and will necessitate a corresponding revision of his system of apologetics. But, as a rather daring essay in æsthetics, the architectural skyscraper is decidedly interesting.

Canada's Message of Hope.

About the first definite indication of a revival of industry comes from Canada. The welcome news was good enough to warrant a cablegram; and this, dated, Regina, June 9th, states that reports coming from various parts of the province show that the agricultural prospects are excellent. "First the blade, and then the ear, and then the full corn in the ear." It is added that, with a splendid harvest in prospect, business houses are working briskly, and the general trade outlook is very promising. Moreover, and what is more directly to our purpose, the building trade is feeling the full impetus of the movement. The many building schemes that had been suspended or postponed through financial stringency during the past two years are now being rapidly constructed, and the present year is expected to establish a record in the building activity of the city. Several large building blocks and more than a hundred large residences are being erected. This is a good hearing. We have no wish to exaggerate its importance; but in anticipation of the very natural feeling that it would have been more satisfactory to chronicle a similar movement nearer home, it may be pointed out that since the long and grievous depression has been world-wide, any decided indication of relief in any direction is of hopeful augury, and to spread the good news is an excellent means of extending and facilitating the general movement. We therefore feel in duty bound to place on record Canada's message of hope, and would strongly urge all whom it may concern to make the most of it as a blessed change from the deluge of dismal prophecies—and prophecy of any kind is apt to be self-fulfilling—after the order of Jeremiah, whose inauspicious ascendency is surely nearing its close. The wave of prosperity has far to travel before it reaches these shores; but at least it has started on its way.

Selby Itself Again. Selby Abbey, it is pleasant to note, is being rapidly and reverently restored to the usefulness of which it was temporarily deprived by the ravages of fire. When Mr. Oldrid Scott went down from London to view the then still smoking ruins, it was supposed that the necessary work would occupy at least five years; but such excellent progress has been made that the re-opening will probably take place on the third anniversary of the fire—that is, on October 19th of the present year. The fire has been regarded by some optimists as "a blessing in disguise," since in setting about the work of restoration it was discovered that the foundations were no better than bitter experience of the work of mediæval builders would have led one to suspect. It was found that the tower mainly depended for support on the adjoining walls, and that, in the picturesque and not too rigorously technical language of a recent observer, "its legs, the great heavy Norman piers, were, in three cases out of the four, really dangling free of foundations; for the heaps of rotten wood in a quicksand which lay beneath these masses of masonry could certainly not be dignified with the title of foundations." What would have happened if the fourth "leg" also had suddenly "dangled free" would possibly have amounted to a worse calamity than the fire, for it might have involved loss of life as well as destruction of the building; and the lesson of the discovery should not be lost on the custodians of ancient buildings. Of course, the foundations of Selby are now being overhauled and underpinned, so as to effect a radical cure of its ill-considered and rather disreputable habit of dangling its legs. By the way, the inventor of this graphic description raises a rather nice point. In commending the new carving work that is being done in the interior, he adds this curiously conceived point of criticism: "Several corbels and capitals have been left in the rough, because they will be hidden by the new organ. In the old days the sculptor exerted his skill with just as much care in an out-of-the-way dark corner, where nobody was likely to see his work, as in the most conspicuous position. This, however, is a utilitarian age, and the rough-hewn corbels will remain to a future generation, in contrast to the beautiful work that has been achieved all about them, as a memorial of this age of inconsistencies." As some slight atonement for inability to perceive the nature of this particular inconsistency, we hasten to point out that the critic's chosen models of consistency, the mediæval builders, did his comparison an ill turn when they did the hidden part of their work—the foundations—so badly as to set those legs a-dangling; and we certainly think that it would be inconsistent with economy—and perhaps with commonsense—if an actor playing Othello were to black himself all over, or if the sculptor who is adorning Selby Abbey had elaborated the corbels that the organ will conceal. It may, therefore, be respectfully submitted that, with regard to this charge of inconsistency, the critic, unlike the tower of Selby Abbey, has not a leg to stand on; or that, like the tower, he is dangling his legs over a very questionable foundation.

Art and Parsimony. An almost incredible statement has been made—but so far as we are aware, it has not been contradicted—with respect to the Victoria Memorial in the Mall. It is to the effect that, owing to the enhanced price of marble, the quantity required would have had to be skimped if Mr. Thomas Brock, the sculptor, had not generously given a substantial portion of his own fee to make up the deficit. What is incredible is not Mr. Brock's generosity, but the parsimony and shortsightedness of the Government. It is further stated that it is doubtful how far the original plans for the memorial have survived the want of money. It is to be fervently hoped that this doubt has no foundation in fact, but is merely engendered of bitter experience in the past with similar undertakings—the Wellington Memorial in St. Paul's Cathedral being a conspicuous monument to the mean views with respect to art that have characterised us as a nation. If the Victoria Memorial is indeed in danger of falling short of the conceptions of its authors, surely it would be more effectual than humiliating to make a frank confession of the fact, and, if necessary, to make a public appeal for additional funds. If the prospect of losing a Dutch painting could move a single private person to pay the princely ransom of forty thousand pounds, surely an explicit statement with respect to shortage of funds would save us from the national disgrace of stinting the glory of a noble monument to a noble queen. There are already in existence enough monuments to the national niggardliness, without adding this as a crowning example. The spectacle of the richest of nations showing the poorest possible regard for art must make the Italians—who are almost at diametrical extremes in these respects—fairly stare and gasp.

The Prepotency of Gothic. In Mr. G. Gilbert Scott one would expect to find a valiant defender of the faith in Gothic. His lecture delivered to the Architectural Society of the University of Liverpool does not disappoint this anticipation. Mr. Scott admits, somewhat superfluously, the unfitness of Gothic for secular uses, but he claims for it an overwhelming superiority, as compared with Renaissance, in the "power to express true religious feeling," and he supports what he calls "the current feeling" that Gothic "undoubtedly possesses characteristics appertaining to the Christian religion that may not be claimed by the other style." So long as the field of vision is confined to Gothic and Renaissance, Mr. Scott's decision in favour of the former as the superior means of expressing religious feeling is not exactly a daring postulate. It is hardly more provocative of controversy than the statement that fire burns and ginger is hot i' the mouth. That the real rivalry is between Gothic and Byzantine, the general admiration of Westminster Cathedral bears eloquent testimony. Mr. Scott's unsympathetic reference to St. Paul's Cathedral and its "general irreligiously impressive atmosphere of imperial magnificence" was therefore rather beside the mark. That a fine Renaissance church appears as a product of the intellect while a fine Gothic church impresses as a product of emotion, is perhaps, as he seems to suggest, an absolute phenomenon of artistic perception; or it may be, as he seems disposed to deny, a mere matter of association of ideas. Absolute affinity is no doubt quite possible, and might account for the departure from the earlier Roman and Romanesque forms, beginning with the basilicæ; but is it not at least equally probable that we in England are, or have been, biassed in favour of Gothic because of its venerable and historical association with the introduction and progress of Christianity in these islands? If so, the preference is not instinctive and absolute, but accidental and casual. The style has become consecrated by its many and ancient associations, and this fact would be quite sufficient, apart from any assumption of inherent virtue or fitness, to account for its abiding and overwhelming popularity, upon which even the tremendous influence of the Renaissance, the unexampled opportunities and unrivalled energy and skill of Wren, could only act as a temporary check. Ecclesiastical Gothic hardly needed Mr. Scott's defence as against Renaissance; and if, as he suggests, it can be given a fresh impetus by means that are legitimate and logical, the eternal craving for something new will be easily satisfied on Gothic lines, and in that case the rivalry even of Byzantine need not be feared.

R.I.B.A.

THE INSTITUTE PREMISES.

A special general meeting, summoned by the Council under Clause 22 of the Charter and by-law 60, will be held to-day, Wednesday 23rd June, 1909, at eight o'clock p.m. precisely, for the following purpose:—

To consider a resolution authorising the Council to purchase on behalf of the Institute the leasehold interest in parts of Nos. 9 and 11, Conduit Street, and No. 23A Maddox Street, adjoining those at present occupied by the Institute, and to raise out of the funds of the Institute the moneys required for carrying out and completing the said purchase and making the necessary alterations to the premises and paying the costs of the purchase.

THE R.I.B.A. FORM OF CONTRACT.

The Council of the R.I.B.A. desire to call the attention of members to the following letter from the Secretary of the National Federation of Building Trades Employers of Great Britain and Ireland:—

31 and 32, Bedford Street, Strand,
April 28th, 1909.

To the Secretary R.I.B.A.,—

DEAR SIR,—I am desired by my Committee to invite the attention of your Council to what appears to be a growing practice of stating at the beginning of bills of quantities that the conditions of contract will be those agreed between the R.I.B.A. and the Builders' Institute, the while subsequent conditions are inserted in the quantities which vary the said agreed conditions of contract.

As those subsequent conditions are probably repeated in the specification there is danger that a confusion will arise which would make it extremely difficult to say what are the exact terms of the contract between the parties.

My Committee deprecates such a practice, and hopes your Council will agree with the view that it should be stopped, and will use influence accordingly wherever practicable.—Yours faithfully,

A. G. White, Secretary.

SCHOOL OF ENGINEERING, GIZA.

Vacancy for Assistant Lecturer in Architecture.

Applications are invited for the post of Assistant Lecturer in Architecture and Building Construction at the School of Engineering, Giza, Cairo. The salary offered is £E450 per annum; unfurnished bachelor quarters provided in the school. Extra month's salary paid after arrival in lieu of travelling expenses. The appointment is for a period of three years dating from 1st October, 1909. Applications in the first place to be made to the Secretary R.I.B.A., 9, Conduit Street, W.

Societies' Reports.

Birmingham Clerks of Works and Builders' Foremen's Association.

By the kindness of the architects (Messrs. Ashley and Newman, of Gray's Inn Square, London), and of the contractor, Mr. Thos. Rowbotham, a party of members of the Birmingham Clerks of Works and Builders' Foremen's Association visited the new Art Gallery and Council House extension now in course of erection for the City of Birmingham. The party were conducted over the works by the clerk of works, Mr. H. J. Bennett, and by Mr. Thomas Hayes, the general manager.

It was generally recognised that the system of ventilation is decidedly ingenious. One notices that there is an extensive use of reinforced concrete.

One of the most interesting features of the building in its present state is the glazed brickwork, which is an excellent specimen of that class of work. The Aberdeen granite work was also greatly admired.

Birmingham Architectural Association.

The concluding lecture of the winter series arranged by the Birmingham Architectural Association was delivered by the hon. secretary, Mr. G. Salway Nicol, A.R.I.B.A., his subject being "Rome and Paris: their Architectural Relations." Many of the drawings of famous buildings and architectural studies made by Mr. Nicol during his tour as Tite Prizeman of the R.I.B.A. were exhibited. The lecture was also illustrated by lantern slides, showing the influence of Early Roman buildings on the architects of Italy and France during the great revival of art. This Italian influence was very much assisted by the establishment of the Ecole des Beaux-Arts in Paris, and of the French Academy in Rome, in the reign of Louis XIV.; and, in England, by the work of Inigo Jones and Sir C. Wren.

Institution of Gas Engineers.

At the annual general meeting of the Institution of Gas Engineers, which was held last week at the Institution of Mechanical Engineers, under the presidency of Mr. Thomas Glover, the three medals offered annually were awarded by the Council—the London Gold Medal to Mr. H. W. Woodall, of Bournemouth, for his paper on "Continuous Carbonisation in Vertical Retorts"; the Institution Silver Medal to Mr. F. J. Bywater, of Birmingham, for his treatise on "Refractory Material"; and the Institution Bronze Medal to Mr. A. F. P. Hayman, of Berlin, for his contribution on "Recent Experience with the Dessau Vertical Retorts." In his presidential address Mr. Glover said that of the £10,000 required for the Livesey Memorial Fund £9,970 had been raised. The remedy for the smoke nuisance might be found through the enterprise of gas undertakings, which at the present time were providing the public with smokeless fuel equal to 7¾ million tons of coal a year. With better lights, inverted burners, and more artistic fittings, the days of gas-lighting were by no means over.

At a recent meeting of the Clive Memorial Committee it was unanimously decided to give to Mr. John Tweed the commission for the bronze statue of Lord Clive to be erected on the steps at the end of Charles Street, Whitehall, and the marble statue to be placed in the Victoria Memorial Hall at Calcutta. The sketch model for these statues has been submitted by Mr. Tweed to the King at Buckingham Palace. The new stairway at the end of Charles Street, overlooking St. James's Park, will be so adapted as to provide a pedestal and base for the statue.

An exhibition organised by the National Association for the Prevention of Tuberculosis, opened in the Art Gallery, Whitechapel, on June 3rd, by the Right Hon. John Burns, M.P., President of the Local Government Board, included several features of architectural interest. There were pictures of various sanatoria—Midhurst, Davos, etc.—and there were full-sized models, representing (a) a dark and dirty room, in such as which consumption is likely to be bred, and (b) the room as it ought to be—light, airy, and clean. The exhibition, which was free, remained open until June 19

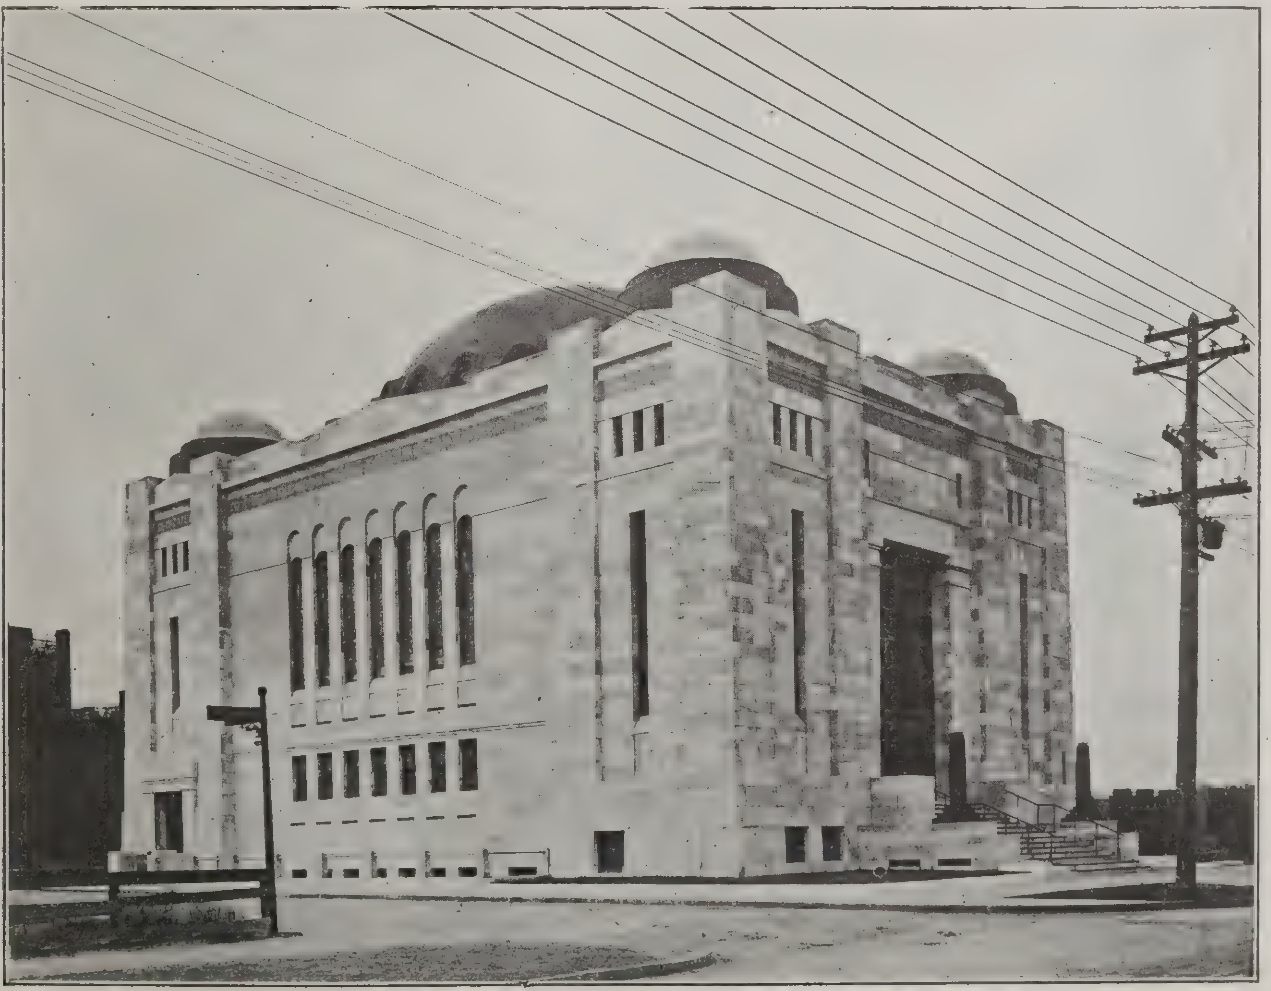

Photo: Topical.

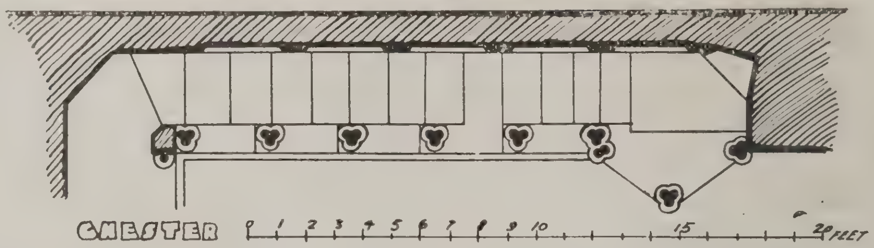
NEW SYNAGOGUE AT BOSTON, MASSACHUSETTS, U.S.A.

This building is a very happy example of the monumental work that is being done in America in connection with buildings of even such moderate scale as that shown above. The building is also interesting constructionally by reason of the fact that the domed roof is constructed of reinforced concrete.

FOUR READERS' PULPITS.

By Edwin Gunn, F.R.I.B.A.



Plan of the reader's pulpit in the Refectory of the Benedictine Monastery of St. Werburgh, now part of Chester Cathedral. The entrance is in the east return wall at the angle of the Refectory, the stairs mounting steeply behind a stepped arcade of five arches in the south wall of the pulpit.

These refectory pulpits, which have survived among the monastic remains of England, well illustrate the flexibility of mediæval art, and form an interesting comparison; curiously, three are of thirteenth century date. In each case the scheme is generally similar, or would appear so if a merely verbal description were given, but considerable variety is apparent in the treatment.

A small doorway at floor level, leading to a narrow vaulted stairway in the thickness of the wall (the latter arcaded next the refectory and pierced with windows externally), is the means of approach, the pulpit being considerably elevated above the floor level.

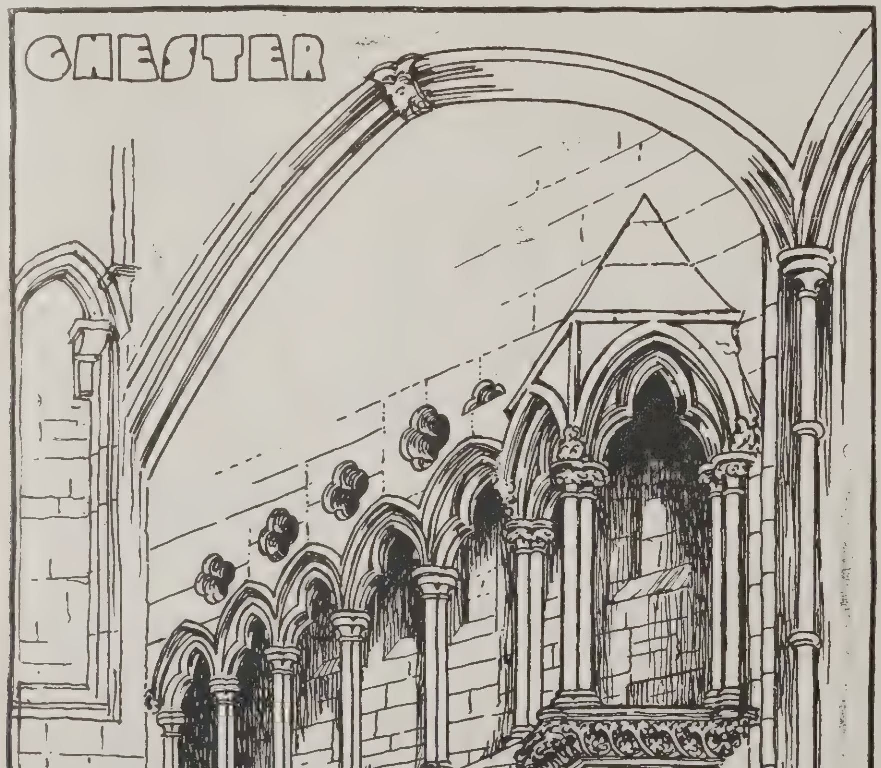
The example at Chester is the best preserved, and is in the south-east corner of the refectory of the Benedictine monastery, dedicated to St. Werburgh, of which the church is now Chester Cathedral. Complete measured drawings appeared in "Ancient Pulpits" by F. T. Dollman, and a sketch is in Prior's "Gothic Art in England." A plan and sketch are given below from which it will be seen that the entrance is in the east return wall at the angle of the refectory, while the stairs mount steeply behind a stepped arcade of five arches in the south wall, to the pulpit, which has a triangular corbel surmounted by a canopy in continuation of the wall arcade. As the refectory ranges in the Benedictine manner alongside the cloister walk, the rise is a steep one, in order, probably, that a window might be introduced above the cloister roof, to light the pulpit.

At Beaulieu, in the New Forest, the refectory of a former Cistercian Abbey (founded by King John in 1204) is now in use as the parish church. The pulpit is approached by a wall passage and very low pitched stair, the treads being 16ins. and the risers 6ins. This is rendered possible by the Cistercian custom of placing the refectory at right angles to the cloister, so that the long sides stood free of other buildings, and could be pierced for light, enabling the wall arcade in this case to run level for four bays, with a single rise by a stilted arch at the first of the two remaining bays.

The actual pulpit is a modern restoration, only the corbel with its conventional foliage carving, and the fine wall-arch and window being original. Most of the shafts in the wall arcade (one Purbeck marble) are also modern. The treatment is less rich than at Chester, and has all the Cistercian austerity in moulding and lancet arches. Complete measured drawings appeared in the A.A. Sketch Book, First Series, Vol. 5, and further illustrations in the Glasgow A.A. Sketch Book, Vol. 2.

Of the Premonstratensian Abbey of Tupholme, in Lincolnshire (founded in 1160 by Alan and Gilbert de Neville) a portion of the refectory wall is the sole remnant, and for the photograph of this I am indebted to Mr. Allen Foxley, B.A. It will be seen that the pulpit is somewhat earlier in date than either of the first-mentioned examples, the detail being of Transitional character, and it is altogether a less extensive affair. The rubble arches evidently indicate an undercroft, and the refectory floor level appears to be shown by the worked stone visible at the foot of the pulpit stair. The latter is therefore less elevated than either of the preceding examples, and perhaps for this reason does not project.

The scanty remains of another fine refectory pulpit on a very grand scale are at Rievaulx in Yorkshire, and a lovely example of fourteenth century date at Shrewsbury Abbey, Shropshire (also illustrated in Dollman's "Ancient Pulpits") now stands in a private garden. Fragments of the walls are attached, from which it appears that this pulpit, which is a complete octagon on plan, formed a sort of turret projecting as to three of its faces internally, and three externally (these latter glazed), while of the remaining two one was blank and the other the entrance, approached by a similar wall passage and stair to the other examples given.



This reader's pulpit is one of the best preserved examples in the country, and is in the south-eastern corner the Refectory of the Benedictine Monastery of St. Werburgh, of which the church now forms the Cathedral Church of Chester.

Mr. Wm. Collins, of Green Lane, West Vale, has been appointed Clerk of the Works on the New Elementary School Buildings, Elland.

* * *

At the Paris Salon this year two medals have been awarded to Englishmen—one to Mr. Edgar Bundy, R.I., in painting; the other to Mr. John W. Simpson, F.R.I.B.A., in architecture, for a drawing entitled "The Roedean School, Pensionnat de Jeunes Filles à Brighton."

* * *

The Honorary Committee of the Exhibition of Chosen Pictures at the Grafton Galleries have issued an invitation to the members of the R.I.B.A. to a special reception to view the exhibition on Wednesday, June 30th, from 3 to 6 o'clock. The members will be admitted without payment on signing their names in a book provided for the purpose.

* * *

Messrs. E. A. Roome and Co., builders, etc., of 36, Basinghall Street, E.C., have appointed Mr. F. J. Gayer as manager. The partnership hitherto existing between Mrs. G. A. Roome and Mr. J. E. Whiter having expired by effluxion of time, the business will be carried on by Mrs. Roome.

A PATENT SYSTEM OF EARTHQUAKE-RESISTING CONSTRUCTION.

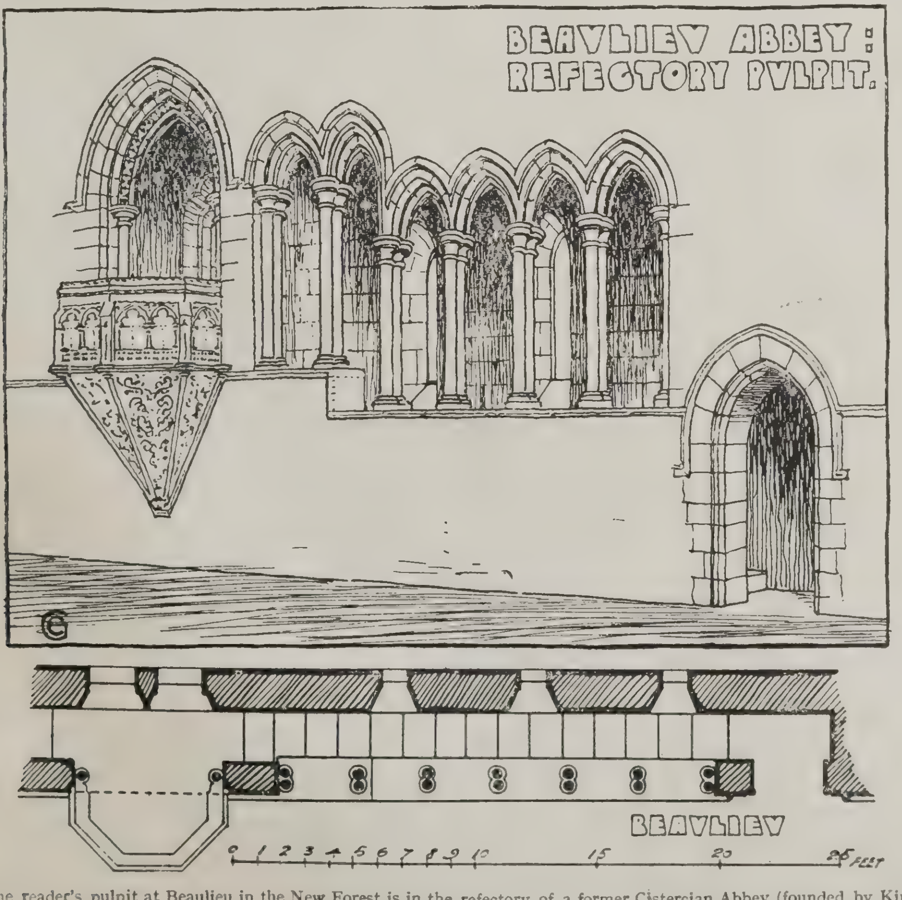
A system of earthquake-resisting construction of which the complete specification has just been issued, has for its fundamental principle the absence of binding material between the superstructure and the foundation. The foundation is built to the ground level or thereabouts in the usual manner, and the top of the foundation wall is faced with strong, solid material of a non-resilient character, with a perfectly smooth upper surface. On this are deposited layers of smooth material, such as plates of talc or mica, each layer being well dusted with powdered talc, mica, kaolin, soapstone, steatite etc.; or the plates of talc or mica may be dispensed with, and sand, or asbestos powder, or mats substituted. The physical properties necessary in the selection of substances for this purpose are that they should be imperishable; that they should not adhere together, or to the surfaces, nor cohere under the weight of the superstructure; and that under the influence of earthquake vibrations they should be capable of free interstitial or sliding movement by the attrition of their meeting surfaces or otherwise, and so act as a lubricant between the two surfaces. Upon the prepared zone or layer are deposited strong slabs of granite, stone, iron, or other suitable material of a non-resilient character, having a perfectly smooth under surface, and well bound together horizontally. The superstructure is laid upon this, and the building completed, care being taken that the upper line of slabs or plates is securely fastened or bound in such manner that the whole building above the non-resilient shock-absorbing zone is solidified, or forms practically a solid block; but there must be no binding together of the upper and lower line of blocks—that is to say, there must be of necessity a non-resilent free joint, or a non-resilient meeting of surfaces which will allow of unrestrained sliding movement under the impetus of earthquake shocks.

Under the influence of earthquake, the foundation of a building so constructed will obviously be subject to the tremors of the earth like any other, but these rapid vibrations will only cause a sliding movement of the smooth, slippery non-resilient plates or surfaces one upon the other; and the non-resilient shock-absorbing zone or layer being adequately thick, little if any motion will be communicated to the solid walls of the superstructure.

Photo: Allen Foxley.

TUPHOLME ABBEY, LINCOLNSHIRE. REFECTORY PULPIT.

This fragment of the refectory wall, showing the reader's pulpit, is the only portion remaining of the Premonstratensian Abbey. It is of earlier date than the previous examples, being a Transitional example. The refectory floor level is indicated by the rubble arches, there evidently being an undercroft or basement under it.



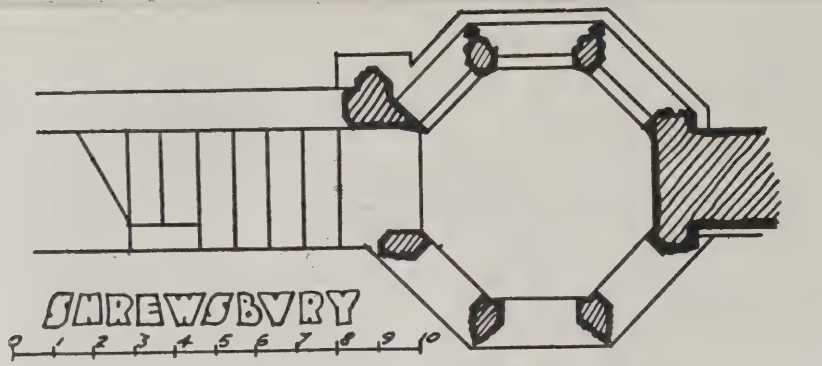
BEAVLIEV ABBEY: REFECTORY PVLPIT.
BEAVLIEV
0 1 2 3 4 5 6 7 8 9 10 15 20 25 FEET

The reader's pulpit at Beaulieu in the New Forest is in the refectory of a former Cistercian Abbey (founded by King John in 1204), and now in use as the Parish Church. The actual pulpit is a modern restoration, but the corbel and wall arch are original.

For securing the stability of columns, it will be necessary to use, in addition, bars, girders, or joists, so disposed in connection with the other elements as to form a lateral and vertically non-resilient strengthening device, which will be required for the foundation as well as for the superstructure.

The security of water and gas supplies against the effects of earthquake is also provided for by means of an arrangement of coils and spirals, the joints being secured in a firm and watertight manner, with thick bituminous sheeting, which allows of a slight movement at the joints without breaking the pipes. It is claimed that during an earthquake there will be no disturbance of the relative positions of parts, and therefore no fracture of the pipes can take place. The danger of fracture at the point of junction between the ground and superstructure is provided against by the use of flexible coil and other arrangements. The patent, No. 10254, 1908, was accepted on May 12th, 1909, and the patentee is Dr. J. A. Calantarients, of 8, Alma Square, Scarborough. It is claimed that the system would be equally efficient for resisting typhoons.

We regret to announce that Mr. Alfred Liebert, who held the position of manager to the Calmon Asbestos Slate Co. for a great many years, and was highly esteemed by all who came in contact with him, died on Tuesday, June 8th, after a very short illness.



REFECTORY PULPIT AT SHREWSBURY.

This fine example of 14th Century work stands in a private garden at Shrewsbury. Fragments of the walls are attached, from which it appears that the pulpit, which is a complete octagon, had three faces open to the interior, and three glazed to the exterior. The stair approach and a blank wall account for the other two sides.

Correspondence.

[*The Editor declines responsibility for the statements made by correspondents.*]

Efflorescence in Walls.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to the correspondence that has taken place in your columns, may I be allowed to point out that the chief cause of this appearance has been for years attributed to the iron pyrites present in some clays, converting the lime in the plaster covering the bricks into sulphates; and the better the outward appearance of the brick—the smooth and glossy surfaces referred to in your issue of June 2nd—the more likely are such bricks to contain these pyrites. The sulphur acids from ordinary house fires have a like effect on lime plaster, and it is doubtless for this reason that we frequently find dark efflorescence lines on plaster in the vicinity of glues.

I may mention, for the information of your readers, that I have had many cases of the kind, and my experience has always been that the only effectual cure is to cut out the lines down to the brickwork to a width of about half-an-inch—to damp well the rough chase so cut—to fill in with Keene's cement, and to paint the making-good with two coats of good oil colour.

The remedy may appear drastic, but I find it is the only effectual one—ordinary painting, damp-proof paper, or brown paper, being useless.

WALTER MARKHAM.

London, N.

Columbia Fir.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—With reference to the reply to a correspondent on p. 484 of your issue for May 19th, allow me to state that the Society of Architects visited the Surrey Commercial Docks on June 11th, and among the objects of interest pointed out to them by Mr. Davies were several stacks of Columbia pine. This is stated to be botanically a "Douglas Fir," and occurs in large scantlings of very clean appearance. It is largely used by the War Department for tent poles, and appears to be well suited for roof trusses and other constructional work. It was understood to be rather tough under the plane, and more like pitch pine than Baltic fir.

HENRY ADAMS.

ARCHITECTURAL COPYRIGHT

The Council of the Royal Institute of Architects having been invited to give evidence to the House of Commons Committee appointed to examine and report upon changes proposed in the law of artistic copyright, with a view to its being brought into conformity with the revised Convention of Berne, which was signed at Berlin in November last, appointed Mr. John Belcher, R.A., past-president, and Mr. John W. Simpson, vice-president, to represent them. These gentlemen have gone into the matter with great thoroughness, and they were assisted by many members of the R.I.B.A., to whom a circular letter was addressed, inviting members who had had reason to complain of the unauthorised reproduction of their drawings, or of their executed work, whether as regards plan-arrangement, elevation, or otherwise, to communicate brief particulars. Expressions of opinion from the councils of allied societies were also invited; and in response to these requests much valuable and striking information has been forwarded, and the effect of this evidence is strengthened by the materials that Mr. Simpson has obtained from continental sources, by his deductions therefrom, and by his and Mr. Belcher's able and lucid statements of the case.

Mr. Simpson is strongly in favour of according to architectural work similar protection to that given to sculpture, and Mr. Belcher is entirely in agreement with him. The case for architectural copyright was summarised in our issue for May 26th, on p. 493, and is in substantial agreement with the representations of Messrs. Belcher and Simpson.

Mr. Belcher confirms the statement that the most notable representatives of the profession in every country have continually urged the need for protecting the work of architects in the same way as that of painters and sculptors. In his opinion, the art would advance more rapidly, and the public taste be further improved if all architectural works were protected, as he holds that the public taste is lowered by speculating builders and incompetent men who have copied and adapted in mutilated form the designs of architects. "The architect," he says, "who has devoted years to the study of his art, and who has given time and thought to the development and working out of his design, is at present unprotected. His designs can be reproduced, and his building caricatured. . . The facility with which copies of designs can be obtained," he argues, "is a temptation to the inexperienced man to adapt the designs of a more experienced architect. . . By such courses the public are deceived, and the mass of adapted reproductions of contemporary architectural designs becomes the standard of public taste, or represents to them the prevailing fashion which must be followed." Thus, he contends, not only is the advancement of architecture hindered, not only are the public imposed upon, but the architect is defrauded of his property so long as it is unprotected.

The Town Clerk of Leeds (Mr. R. E. Fox) has asked the Government for an explanation of the special clause in the Housing and Town Planning Bill relating to the erection of back-to-back tenement dwellings. The original clause forbade the further erection of back-to-back houses, but subsequently there has been added a proviso that the clause should not apply to back-to-back tenements if such were properly ventilated in accordance with the judgment of the medical officer. The Leeds authorities, however, are in doubt as to what is meant by "back-to-back tenements," and they require a clear definition of the phrase.

Notes on Competitions.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

DATE OF DELIVERY.	COMPETITION.
July 9	STOKE-UPON-TRENT. Additions to Town Hall including large hall to seat 3,000 people, police court, etc. Premiums of £100 and £50 for second and third designs respectively. Assessor nominated by Pres. R.I.B.A. Conditions and particulars from Jno. B. Ashwell, Town Clerk, Town Hall, Stoke-on-Trent,
July 17	NEW PUBLIC BUILDINGS, BURSLEM. The Architect whose design is placed first by the Assessor will be appointed to carry out the work. Premiums of £100 and £75 to authors of second and third designs, respectively. Conditions and plan of site from F. Bettany, Borough Surveyor. Deposit, £2 2s., returnable on receipt of *bona fide* design.
July 19	WHITLEY BAY PUBLIC ELEMENTARY SCHOOL for 600 scholars, for the County of Northumberland Education Committee. *Limited to Architects practising in the County and in the City and County of Newcastle-on-Tyne.* Particulars and plan of site from C. Williams, Secretary to the Education Committee, The Moothall, Newcastle-on-Tyne.
July 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
Sept. 1	BRANCH LIBRARY, NEW CROSS, for Deptford Borough Council. Limited to Architects practising in the City or the County of London. Assessor: J. S. Gibson, Vice Pres. R.I.B.A. Premiums, £52 10s., £26 5s., and £10 10s., for three selected designs, and will be awarded in accordance with the conditions contained in the instructions to competitors. Site plan and copy of instruction from Vivian Orchard, Town Hall, New Cross Road, S.E. Deposit £1 1s., refunded on receipt of *bona fide* design or if instructions are returned within 21 days.

Agricultural Hall, Leeds.

The Leeds Corporation are considering the erection of an Agricultural Hall. It has been decided to institute a competition among Leeds architects, and it has also been proposed to offer prizes of £50, £25, and £15. The site is in the North Street Recreation Ground.

Messrs. Arthur L. Gibson and Company, 19, 20, and 21, Tower Street, Upper St. Martin's Lane, London, W.C., announce that their new factory, Radnor Works, Strawberry Vale, Twickenham, is now in running order, and that in future all orders received for their Kinnear patent steel rolling shutters will be filled from that address. Their offices and warehouse will remain for the present at their old address, as given above.

MIDDLESBROUGH LIBRARY COMPETITION.

The following memorial has been sent to the President of the R.I.B.A.

"To the President R.I.B.A.

"Sir,—We beg to enclose herewith copy of memorial, which was sent to the secretary R.I.B.A. on the 2nd inst., and which has been signed by 111 out of a total of 193 of the competing architects in the above competition, and presented to the Middlesbrough Free Library Committee at their meeting on the 9th inst., together with copy of letter accompanying same. [Not here reproduced.]

"In addition to this memorial, several individual competitors wrote direct to the Council protesting against the award, and these were all submitted to the Assessor prior to the meeting.

"In reply thereto he is reported to have said that he saw nothing in the conditions which would have prevented any of the competitors sending in plans on the lines of the first and second premiated designs, and that the plans had been carried out in accordance with the general conditions, and the authors of the successful plans had complied with the spirit as well as the letter of the conditions, and that he failed to see why any reasonable objection could be taken to the award.

"Also in regard to the memorial, 'he considered the objections in architects' petition frivolous and vexatious, and regretted any body of architects could so act in a public matter.'

"The fact, however, that about 98 per cent. of the competitors rigidly followed the very stringent conditions proves, it is thought, that there was no doubt or ambiguity as to the meaning of the committee, and that 111 architects, a large percentage of whom are members of the Institute, have signed the petition, shows very clearly . . . that this action has been taken in anything but a frivolous or vexatious spirit.

"We have every reason to believe that many more architects would have signed the memorial, had the time to obtain the signatures not been limited to four days in order to present it to the Library Committee at the before-mentioned meeting, and had they had an opportunity of viewing the drawings.

"The accompanying schedule tabulates our grounds of dissatisfaction.

[In paragraphs 1 and 2, it is asserted that this schedule shows that the competitors who adhered to the conditions were at a disadvantage, and among the points presented for "serious consideration" are the following]:

"3. That in the interests of the profession generally, and of the competitors in particular, the reason the instructions were ignored by the assessor in making his award be made clear to the Institute.

"4 That the Institute hold an independent inquiry into the whole matter, and issue a definite statement.

"5. We, therefore, ask, on behalf of the large body of architects whom we represent, that you give the matter your careful and serious consideration, as it is felt that this matter must be carried through to a definite conclusion.

"Should you wish for a list of the architects who have signed the memorial, we shall be glad to send it you.

"We are, sir, yours faithfully,

HOSKINS AND BROWN, Court Chambers, Darlington.

KITCHING AND LEE, Houndgate Chambers, Darlington, and Middlesbrough.

W. H. BOURNE, Houndgate Chambers, Darlington."

"June, 1909."

IN DEFENCE OF OLD BATH.

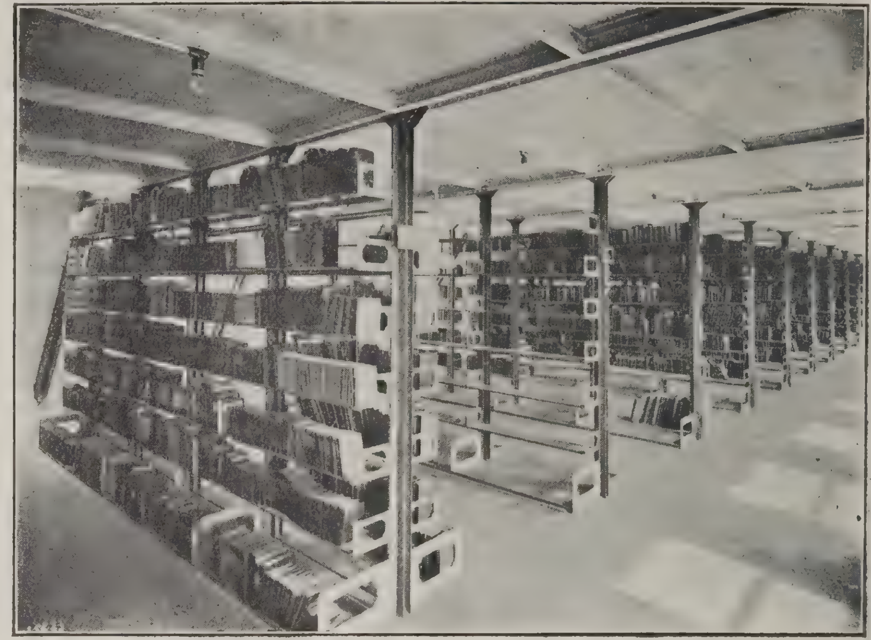
The Old-Bath Preservation Society have issued two pamphlets dealing with the Bath Street controversy. In the first are given a history of Bath Street, with views of the buildings that are in danger of destruction, a report of the meeting of protest, and the opinions of various architects and other art-lovers. Bath Street, one of Bath's most characteristic thoroughfares, was designed by Thomas Baldwin, city surveyor and architect from 1784 to 1792. An Act of 1789 enabled the corporation to make extensive street improvements, and Baldwin had the opportunity of superintending what was, for the period, a really considerable adventure in town planning. Bath Street, which was included in the scheme, was begun in 1791. Towards the end of February of the present year, it became known that the city council might pass a resolution that would involve the destruction of the north side of Bath Street, and a deputation, headed by the Rector of Bath (Prebendary S. A. Boyd), waited on the council to urge the claims of Bath Street as "a bit of old-fashioned Bath," and the desirability of maintaining it intact. The council, however, showed but little sympathy with the sentimental and æsthetic views, and entered into an agreement which would permit a firm of hotel proprietors to destroy the colonnade in order to erect a modern hotel. The general tone of the council was purely commercial, and it is doubtful whether they realised the significance of the protest. The second pamphlet is mainly occupied with a restatement of the case for preservation in answer to the council's manifesto in defence of the scheme. The pamphlets have been printed for Old-Bath Preservation Society at the offices of the "Bath Daily Chronicle," where presumably they may be obtained.

INSTRUCTIONS. (Issued to Architects.)	QUERIES. (Asked by Competing Architects,)	REPLIES. (Sent to Competing Architects by Town Clerk.)	SELECTED DESIGN.
1. The General Lending and Reference Libraries are to be placed in the Northern part of the block adjoining the dwelling-houses in Dunning Street (par 3, page 4).	100. Are the positions of Lending Library and News Room absolutely unalterable?	100. Yes.	Lending and Reference Libraries' separated about 37ft. from houses in Dunning Street, by Boys and Girls' Reading Rooms.
	106. Are the positions for the various rooms to be absolutely adhered to?	106. Paragraphs 3 and 4, page 4 of Instructions must be adhered to.	
	72. Must the Lending Library and News Room occupy the relative positions prescribed for them?	72. Yes.	
2. Secondary Entrance from Grange Road East (par 3).	75. Whether entirely distinct Entrances from the two Roads, Dunning Street and Grange Road East are desired for the Lending Library, &c., and News Room?	75. See 2nd and 3rd paragraphs on page 4 of the Instructions issued to Architects.	No Secondary Entrance in Grange Road, but one provided in Dunning Street.
	84. Should there be two Entrances from Grange Road, viz. :—One for the General News Room and one for Secondary Entrance to Lending and Reference Libraries?	84. Yes, but secondary Entrance not necessarily to Lending and Reference Libraries.	
3. Boys and Girls' Reading Rooms to be divided by glazed partitions, running from the Service Counter.			Two Counters and two partitions provided.
4. Juvenile Book Store to have steel gallery.	49. Would a gallery of sufficient width for one row of wall-cases be enough in the Juvenile Book Store?	49. Yes.	None provided.
5. Catalogue Room to be on ground floor.	53. May the Repairing Room be on first floor and separate from Receiving and Catalogue Room?	53. No.	Catalogue Room separate from Repairing and Receiving Room, and placed on first floor.
6. The General News Room to have Entrance from Grange Road East.	81. Must the direct communication asked for between Grange Road and Dunning Street be by means of Corridor, or would it be sufficient to have a door in the General News Room, communicating with the main Hall and Stairs?	81. No communication other than for Janitor between News Room and other parts of Building.	9ft. Corridor, shown with Swing-doors communicating between News Room and Main Building.
	80. Should there be access for the public between the General News Room and main Buildings without going outside the Buildings?	80. No.	
7. Patents Library and Extension Lavatory and W.C.s. for male and female staffs, corridors, &c., Area. 1,739 sq. ft.	92. What is meant by "Extension" in connection with the Patents Library?	92. A room for Library Extensions. when required.	Area provided about 850 sq. ft. No provision for Extension.
8. Furnace, Boiler and Coke Store to be on ground floor.	55. May the Repairing Room be in the Basement?	55. There is no basement, so must be on ground floor, as set forth in the Instructions.	Placed in Basement.
	61. May the Furnace Boiler and Coke Store be in the Basement, as there is no basement mentioned in Conditions?	61. No basement provided for.	Placed in Basement.
9. The General Reference Library should be entirely lighted from the roof direct; there must be no glass ceiling lights.	66. By the lighting of the General Reference Library from the roof direct, it is presumed that either skylights, a lantern light or dormer windows are suggested and that the prohibition of glass ceiling lights refers to false lights below a skylight?	66. Refers to false lights.	Side windows provided. Not lighted from roof direct at all.
	69. Lighting of Reference Library. Are skylights wanted and no side windows?	69. See Instructions.	

ECONOMICAL LIBRARY CONSTRUCTION.

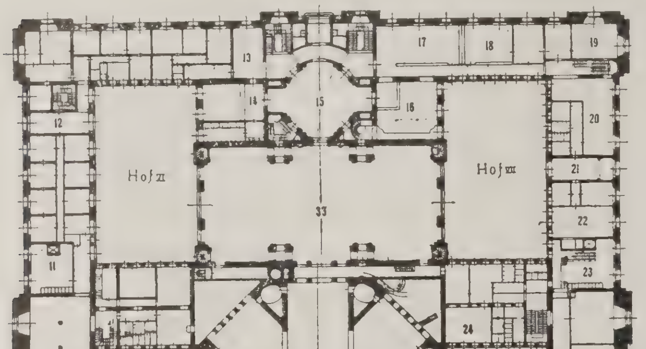
Libraries form no inconsiderable part of architectural practice in this country. The rise and growth of the public library movement has been remarkable, and the architectural profession observing the opportunities afforded by public competitions for such buildings have displayed much interest in the subject of library design. The practical purpose of such a building is of primary importance in the design of such buildings, and the architect has therefore to subordinate his artistry and systematic use of materials to the housing of the books and the planning of the public rooms. Such buildings have as a rule to be planned with strict economy, and it is of first importance to store the books they contain in as little space and as cheaply as possible, with due regard to ease of classification and access.

The design of bookshelves and bookcases has occupied considerable attention, and has received much consideration, and various solutions of the problem have been offered. There seems more and more tendency, especially in large libraries, in the direction of metal shelving, for by the use of metal not only is space cut down to the utmost limit, but the construction is non-flammable and fire-resisting. There are methods of constructing fixed metal shelving, for books

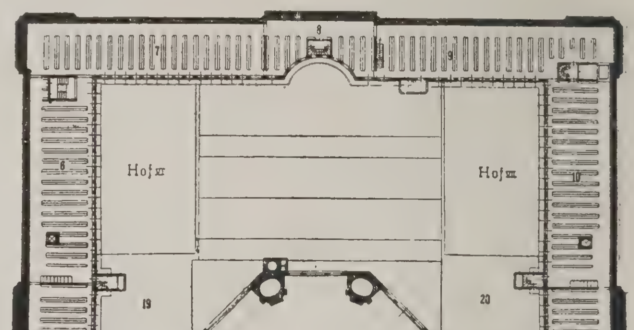


THE ROYAL LIBRARY, BERLIN. VIEW OF ONE OF THE UPPER FLOORS.

This view shows the ingenious method of shelving books mentioned in the article on this page. The shelves can be moved vertically up and down; or a whole shelf can be moved bodily to another fixture.



THE ROYAL LIBRARY BERLIN. GROUND FLOOR PLAN.



THE ROYAL LIBRARY BERLIN. THIRD FLOOR PLAN.

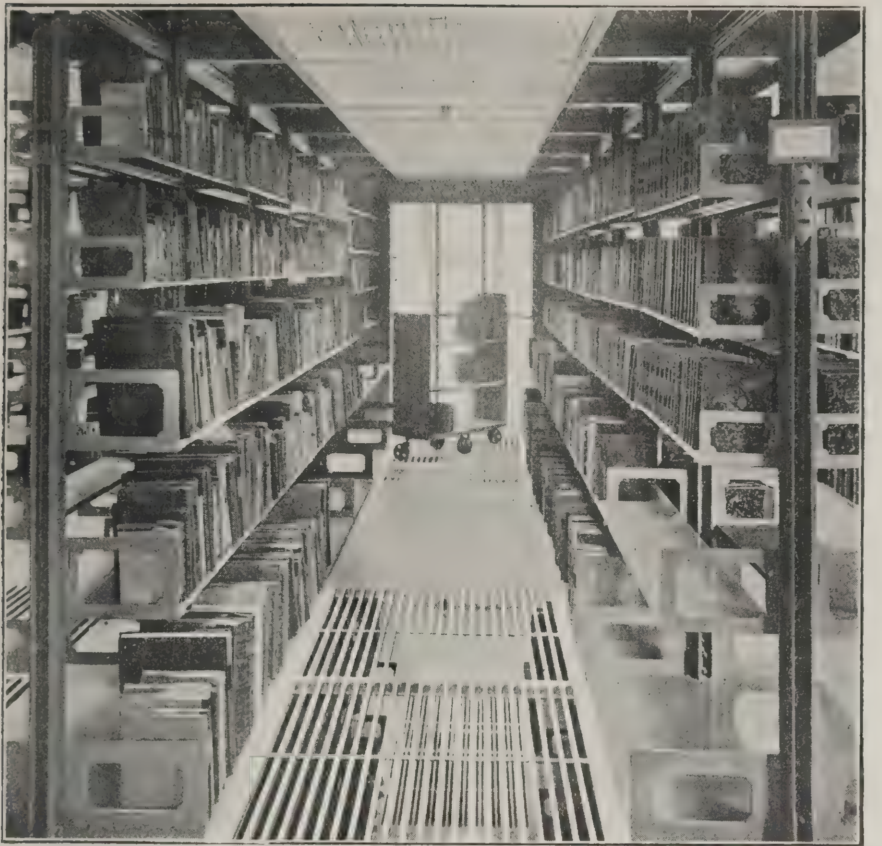
REFERENCE TO ROOMS ON GROUND-FLOOR PLAN.

1. Entrance for officials and business purposes; 2. Approach to the business rooms; 3. Cloak-rooms for officials; 4. Bookbinding department; 5. Temporary shelves; 6. Main catalogues and enquiries office; 7. Firemen and police; 8. Surgeon; 9. Passage leading to yard II.; 10. Book exchange; 11. Elevator room west; 12. Passage leading to yard VI., surrounded by officials' quarters; 13. Refreshment room; 14. Cloak-room; 15. Entrance hall; 16. Lending-room; 17—18. Catalogues; 19. Management; 20. Approach; 21. Passage leading to yard VII.; 22. Bookbinding department; 23. Elevator room east; 24. Professors' room; 25. Reserved for Institutes; 26. Entrance to yard III., official quarters adjoining; 27. Refreshment room; 28. Cloak-room; 29. Main entrance; 30. Landing-room; 31. Export and packing room; 32. Book store and rails for book trollies; 33. Reading room.

REFERENCE TO ROOMS ON THIRD-FLOOR PLAN.

1. Photographic studio; 2. Speech-room, with cloak-room, etc.; 3. Separate book shelves; 4—7.* Book stores; 8—9.* Book stores; 10—12.* Book stores; 13—15. Rooms for future storage; 14—16. Stores and special shelves; 17. Study for scientists (handwriting department); 18. Part of card collection department; 19—20. Rooms for future storage; 21. Air and ventilating space of the large reading-room.

The rooms marked * are already being used during the building operations.

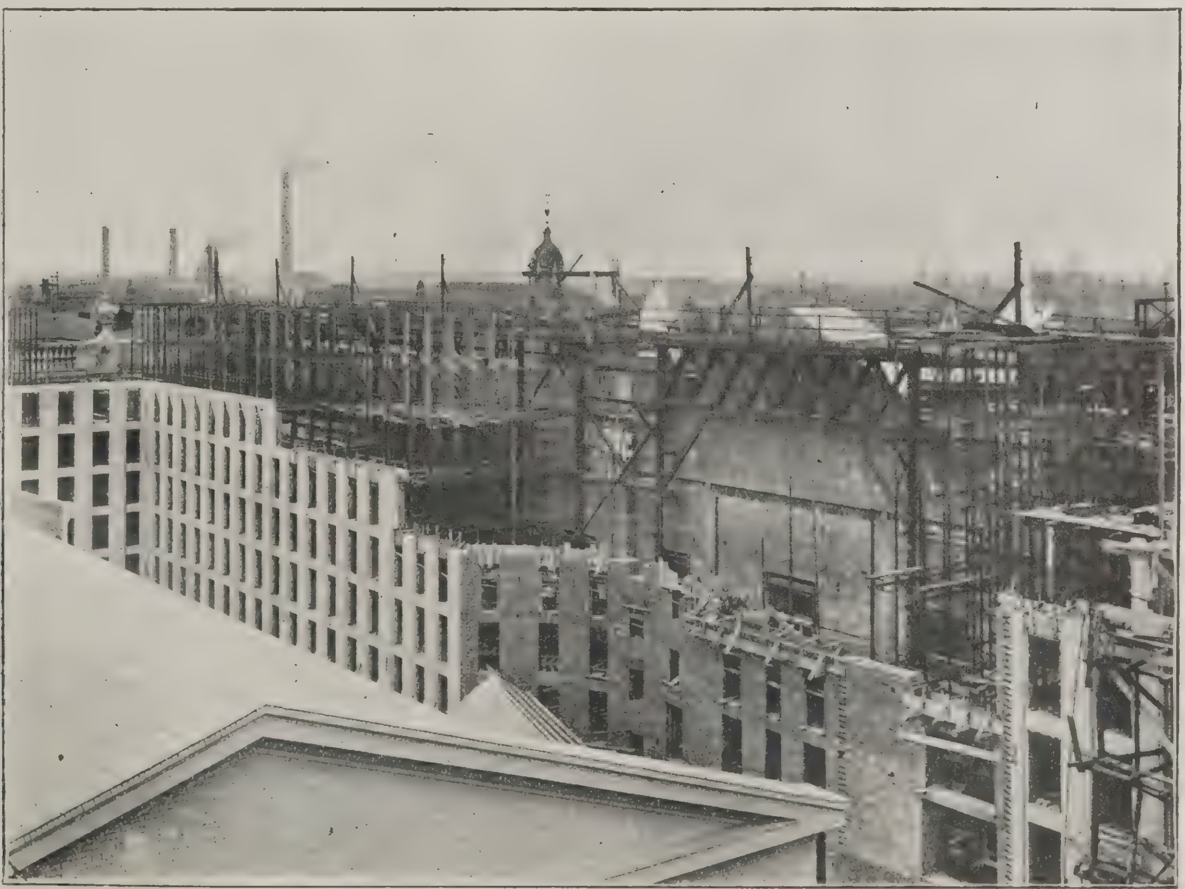


THE ROYAL LIBRARY, BERLIN. VIEW IN ONE OF THE STOCK ROOMS.

This is a view looking down one of the stack bays. One of the particular advantages of the system of storage adopted here is the elimination of heavy girders, floors, walls, and stanchions, thus allowing the maximum amount of space for storage.

that vary in detail, but fixed shelving is often inconvenient and wasteful of space. Libraries are continually growing, with need for continual re-arrangement. If the shelves can be shifted up and down, space can be saved, the small books being only allowed just sufficient space for them.

A system of library construction has been perfected in Germany that offers many advantages, and saves a very great amount of space. It has been employed throughout the new building of the Berlin Royal Library, which includes the libraries of the University and the Academy of Science, and is the largest library in the world. This building we illustrate by several views in this article. The plans of the principal floors are interesting as regards plan, but the construction of the actual library shelving is even more so. We give some views whereby it can be seen how the shelves are arranged stack upon stack, and the remarkable thing is that the whole interior is practically one mass of books from top to bottom. The floors are extremely thin, only a few inches in thickness, and the books enter right close up to each other without the space occupied by the floor even being lost between, for the floors only exist between the book stacks, and do not extend under them. The bookstacks are supported independently of the walls on a steel skeleton or frame construction. The stanchions are, however, much reduced in size, and even made to serve as the racks on which the shelves are arranged and supported. The saving of space is indeed wonderful, and by the adoption of this shelving in place of the ordinary style, practically another large library has been added to the building. The Berlin Royal Library is erected on a rectangular site, 558ft. long by 348ft. wide, and is 13 storeys high, and can accommodate about 5,000,000 volumes. The construction consists of steel racking with a sort of saw-tooth edge thereon. This racking is riveted to a steel plate, and the whole serves as a stanchion. If the construction is several floors high, the stanchions are strengthened by hav-



THE ROYAL LIBRARY, BERLIN, NOW APPROACHING COMPLETION.

This building is fitted with an ingenious system of shelving, and by this construction the maximum of space is obtained for book storage. In the illustration the steelwork for this can be seen in course of construction.

ing channels riveted thereto. Also each floor is braced by corrugated struts horizontally connected to the stanchions, and these carry the flooring, which may be made of portable slabs of wood, concrete, etc., or of metal gratings. The shelves are of wood or metal, and held by runners of sheet metal formed in a very ingenious manner. These latter have projections which fit into the teeth of the rackings before mentioned, and can be adjusted at any height in a second or two. The view shows the general arrangement, and the remarkable saving of space is clearly visible.

The saving of cost at the Berlin Library by the adoption of this system has been very considerable. The whole of this construction has been carried out by the Adjustable Shelving and Metal Construction Co., Ltd., who have opened a London office at Gwydir Chambers, 104, High Holborn, W.C. The firm has carried out other large libraries in similar construction all over the world, and it also has systems of fixed metal shelving (built of corrugated plates which afford great strength and rigidity), cupboards, cabinets and similar constructions. There seems a great future for this patent system of shelving in this and other countries. It is logical and ingenious, and is economical both in first cost and of space.

Buildings in Progress and Completed.

LONDON.—The new Institute of Physiology at University College, erected on the site of University College School, was opened on Friday last. The new building, which has cost £20,000, was designed by Professor F. M. Simpson, F.R.I.B.A. It has three floors, and consists practically of six large rooms, each about 62ft. by 41ft., which are divided into smaller rooms by means of Mack partitions. Thus at any future time it will be possible at small expense to entirely re-arrange the rooms on any floor according to requirements. The main entrance on the ground floor is approached by a double flight of steps from the playground. The ground floor is devoted entirely to physiological chemistry. To the right of the entrance is a large students' laboratory about 62ft. by 40ft. It contains 96 working places, and there is a small balcony at one end for open-air work. The east side of the ground floor is devoted to laboratories for research in physiological chemistry. On the first floor experimental physiology is mainly to be carried on. The theatre has seating accommodation for about 200 students. On the west side of this floor the series of rooms are known as the "Thomas Webb Research Laboratories." to commemorate the legacy of £5,000 by Mr. Thomas Webb to the college for the purpose of research. The second floor is devoted to the departments of histology and of neurology, and to the aseptic departments. The whole of the west wing of this floor is taken up with a large students' class-room for histology and experimental physiology. There is a demonstration theatre in the south wing. The rest of the rooms on this floor are devoted to research.

The Chapel of the Queen Alexandra Military Hospital, Millbank, will be opened by the King to-morrow (Thursday). The Queen and Princess Victoria will accompany His Majesty. The new chapel is a plain red-brick building in the classical style, with apse-shaped chancel. It will afford accommodation for 150 worshippers, besides the choristers. It is lighted by four long windows on each side and by three stained-glass windows above the altar. The cost of the chapel, the east windows, and the other two tablets has been borne by anonymous donors. The communion-table, sacramental plate, reading desk, credence table, and harmonium were presented in 1905 by Sister Georgina Mary, of Clewer. The altar frontal is the gift of the matron (Miss E. M. McCarthy), sisters and staff nurses of the hospital. The kneelers at the altar rails were worked entirely by some of the patients. The Army Council gave the site of the chapel and the services of the Clerk of Works (Mr. E. Peers), and also sanctioned the offer of the Director of Barrack Construction (Mr. Hy. B. Measures, F.R.I.B.A.) to act as honorary architect. The contractors are Messrs. J. and M. Patrick, of Wandsworth; the windows, memorial tablets, and fresco have been designed by Messrs. James Powell and Sons, Whitefriars Glassworks; and the furniture and fittings have been supplied by Messrs. Whippell and Co., of Duncannon Street. The chapel is connected with the main building by an inclined corridor, along which it will be possible to wheel patients upon their couches.

Hengler's Circus, Argyle Street, is being converted into a variety theatre for the London Theatres of Varieties, Ltd., of which Mr. Walter Gibbons is the controlling manager. The building when completed will hold 4,000 people, and will be called the "Palladeum." Mr. Frank Matcham is the architect.

A new chapel is being added to the Church of St. Michael and All Angels, Bedford Park, at a cost of £1,300. Mr. Maurice B. Adams, F.R.I.B.A., is the architect.

MANCHESTER.—The large additional block of buildings now being erected for the Refuge Assurance Company, in Oxford Street, is steadily progressing. Mr. Paul Waterhouse, M.A., F.R.I.B.A., of London, is the architect, his father, Mr. Alfred Waterhouse, R.A., having designed the existing block. The facade of the new building is in dark red terra-cotta in harmony with the existing building, and the interior facings are of white glazed brick relieved with glazed bricks in green, red, brown and green-grey. Floors and staircases are of fire-resisting construction. A central tower introduced to hold the new and old parts together will be 220ft. high. Messrs. W. Brown and Sons are the contractors for the superstructure, and Messrs. Normanton for the foundations and basement. Mr. W. Robson is the clerk of the works.

UPPER TWICKENHAM.—The Church of All Saints' has been opened. The new building, erected from the designs of Messrs. Greenaway and Newberry, of 21, Queen Anne's Gate, S.W., is 95ft. long and 30ft. wide, and has been arranged with a view to its use as a parish hall when the permanent church has been built.

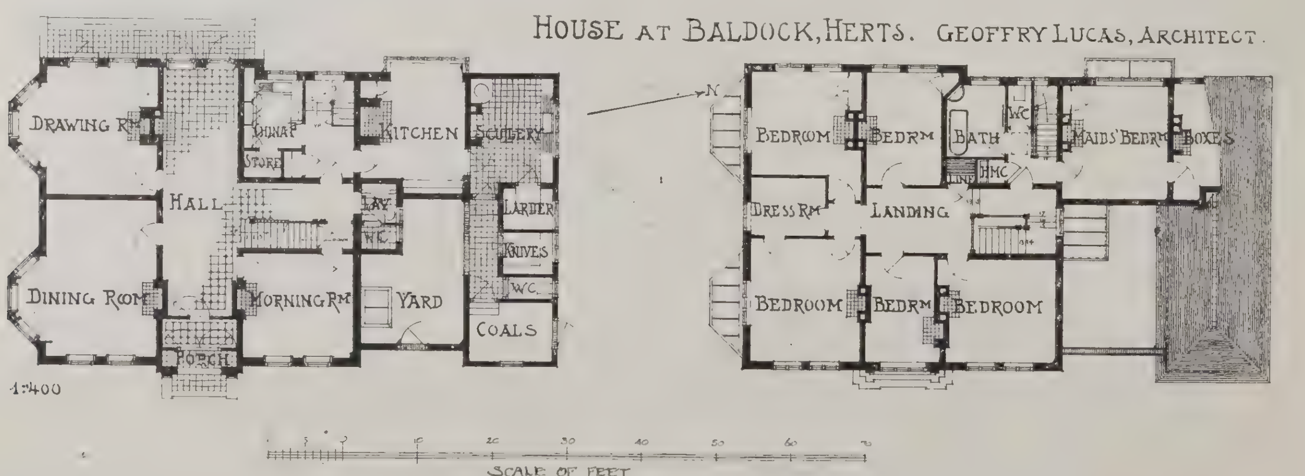
WALLASEY.—The Cheshire County Education Committee has accepted the tender of Mr. Huxley, of Malpas, at £15,430, for the erection of the secondary school here.

WEST LINTON.—A new public school, for 200 children, has been erected at a cost of £5,000. Mr. A. R. Scott, of Peebles, was the architect.

Our Plate.

House at Baldock, Hertfordshire.

This house has just been completed at Baldock for Mr. William Sale. The ground floor has a large hall (running right through the house), drawing-room, dining-room, morning-room, principal and servants' staircases, china pantry, kitchen, scullery, cellar, and offices arranged round an enclosed yard. On the first floor are six bedrooms, dressing-room, and bathroom, box-lofts, etc. The materials are unpicked red bricks, from Ransom's brickfield at Hitchin, with the joints raked out with an oak slip, giving a very good effect. The roof is covered with hand-made red tiles, the woodwork is painted white, and there are whitened cement cornices to the bay windows and entrance porch. There are modelled cement spandrels to the porch, and lunettes over the doors and windows of the garden side of the house, which are whitened over, and were supplied by Mr. G. H. Cox, of Leicester. Heaped fires are used throughout, supplied by Messrs. Bratt, Colbran and Co., of Mortimer Street, W.; the kitcheners being supplied by Messrs. F. Edwards and Son, of Great Marlborough Street, W. Messrs. N. F. Ramsey and Co., of Victaria Street, Westminster, supplied all the ironmongery, and Messrs. Bolding and Son, of Davies Street, W., the sanitary goods. On the south front of the house there is a wall sundial made to the architect's design, which was arranged and made by Messrs. F. Barker and Son, of Sundial House, Clerkenwell Road, E.C., and the hall is paved with black and white marble paving supplied by the Art Pavements Co., Ltd., 7, Emerald Street, W.C. The general contractors were Messrs. T. Raban and Sons, Baldock, Herts, and the architect was Mr. Geoffry Lucas, A.R.I.B.A., of 14, Hart Street, W.C., and Hitchin, Herts.



This house, of which a view is given on our centre plate, is faced with local unpicked red bricks, with the joints raked out with an oak slip, giving a very good effect. The roof is covered with hand-made red tiles, the woodwork is painted white, and there are whitened cement cornices to the bay windows and entrance porch.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

THE NATIONAL GALLERY ADDITIONS.

By H. Colin Allen.

The accompanying photographs, taken by the writer just before Whitsun, show the main features of interest of the work of the roof to the additions to the National Gallery. In Fig. 4 is seen the long ventilating gallery in the roof over the largest of the new rooms. Eighty-five feet in length, and made up of walls 4ins. in thickness, it is carried on two 5in. by 12in. reinforced beams, one on each side in the direction of its length.

These beams, in their turn, are supported by twelve elliptical ribs, 14ins. thick at their springing by 5ft. deep, and diminishing to 12ins. thickness and 4ft. 6ins. in depth. (In the centre of the ribs, these dimensions alter to 11ins. and 3ft.) The height of the top of this gallery is about 50ft. above the floor.

There are three similar but smaller ventilating galleries, respectively 35ft., 35ft. and 28ft. in length, with similar ribs (Figs. 1 and 3).

The dome is of 32ft. span, and its underside is 60ft. above the floor (Figs. 2 and 3).

Supported on four reinforced beams, 1ft. 1in. by 3ft. 3ins., are eight smaller beams, 8ins. by 1ft. 9ins. (forming an octahedral figure on plan), from which spring the hips supporting the turret and forming the roof. These hips are reduced from 12ins. in thickness to 8ins., where the circular ring, the underpart of the turret, is met. This concrete ring is 8ins. in thickness and 3ft. 3ins. in height, with 1ft. 9ins. as its internal diameter.

Above this ring just described is an octagonal cill, 8ins. by 8ins., on which are mullions of the same thickness and 1ft. 9ins. in height, supporting a head 8ins. thick. Above this is a 4-in. cover.

Bolts have been left in the concrete to enable grounds for fibrous plaster and blind fittings to be fixed. Also rebates have been left, steps made on the drum, and gutters formed.

The centering to the longest roof is especially noteworthy for its economical construction. To a certain degree, its efficiency depended on the skilful manner in which it was erected.

The whole of the ferro-concrete work (Kahn reinforcement) has been done by Messrs. Wm. Moss and Sons, of Meadway, Hampstead Garden Suburb, N.W., and Loughborough, whose foreman-in-charge is Mr. T. O. Vine.

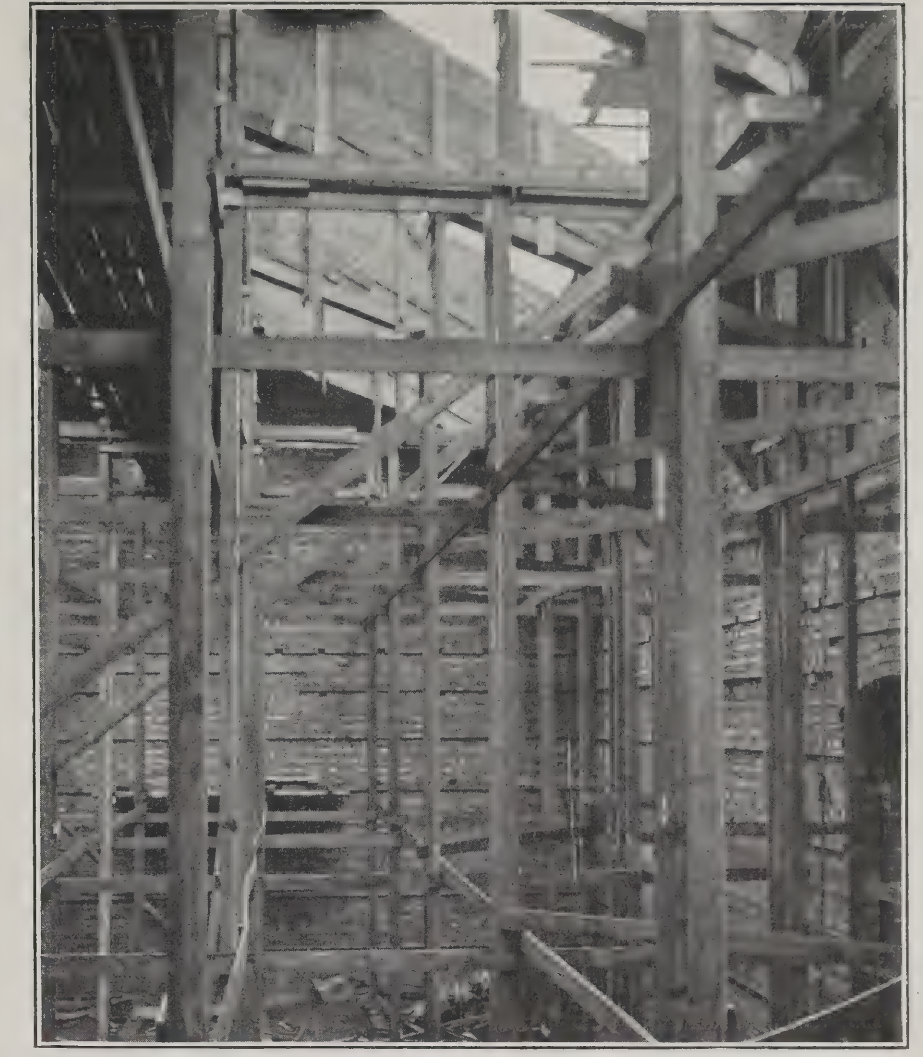

FIG. 1.—ADDITIONS TO THE NATIONAL GALLERY, LONDON.
This is a view of the new main gallery; through the archway on the right is another smaller gallery.

It is satisfactory to learn that the Office of Works will have the roof of the present buildings of the National Gallery rendered fireproof also, as was at one time suggested, and orders for the galleries to be closed a few at a time, so that the works may be carried out, have been circulated.

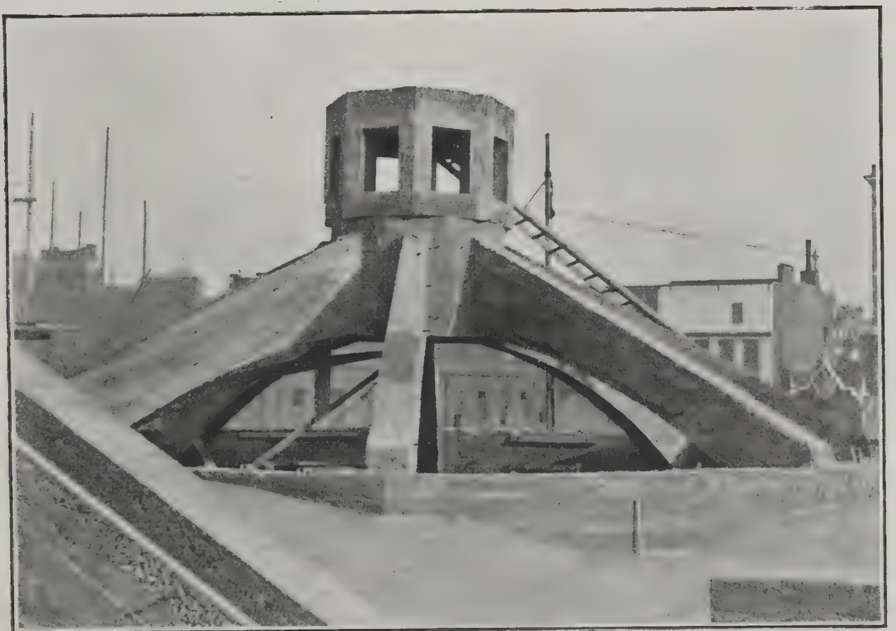

FIG. 2.—ADDITIONS TO THE NATIONAL GALLERY, LONDON.
This is a view of the reinforced concrete dome roof. The dome has a span of 32 feet, and its underside is 60 feet from the floor.

Proposed New Buildings.

BANFF.—A new higher grade school is to be built here to accommodate 200 pupils at as near a cost of £3,500 as possible. Mr. Clyne has prepared the plans.

BELFAST.—The Corporation have received sanction from the L.G. Board to a loan of £75,000, for additional buildings at Purdysburn Asylum.

BURY, LANCS.—The Bury Guardians have decided on an extension of the workhouse to provide 150 beds at a cost of about £7,000.

GLASGOW.—The following plans have been approved:—Additional ward accommodation at Western Infirmary of Glasgow. Four tenements of dwelling houses, Westmuir Street, for Messrs. G. and W. O. Dunsdale, of 11, Dalmarnock Road. Portion of new buildings in John Street, for Glasgow and West of Scotland Technical College. Tenements at junction of London Road and Dalmarnock Road for Mr. E. A. Tait, Verona, Nithsdale Road, Pollokshields. New buildings for the Savings Bank of Glasgow, 101-107, New City Road, and 12-16, Shamrock Street. Reinstatement, after fire, of premises, 50, Kelvinhaugh Street, for Hutson and Sons, Ltd. Five self-contained dwellings at Dinmont Road, Shaylands, for Mr. G. Eadie, 406, Mathieson Street. Three tenements and shops, Great Western Road, for Mr. J. Anderson and another, 27, St. Vincent Street. Five tenements, corner of York Drive and New Street, forming a continuation of Lauderdale Gardens, for Mr. R. A. McCowat, of 8, Brisbane Street.

GLASGOW.—Approval has been given to the following building proposals:—The Alexandra Park Property Company, 65, Bath

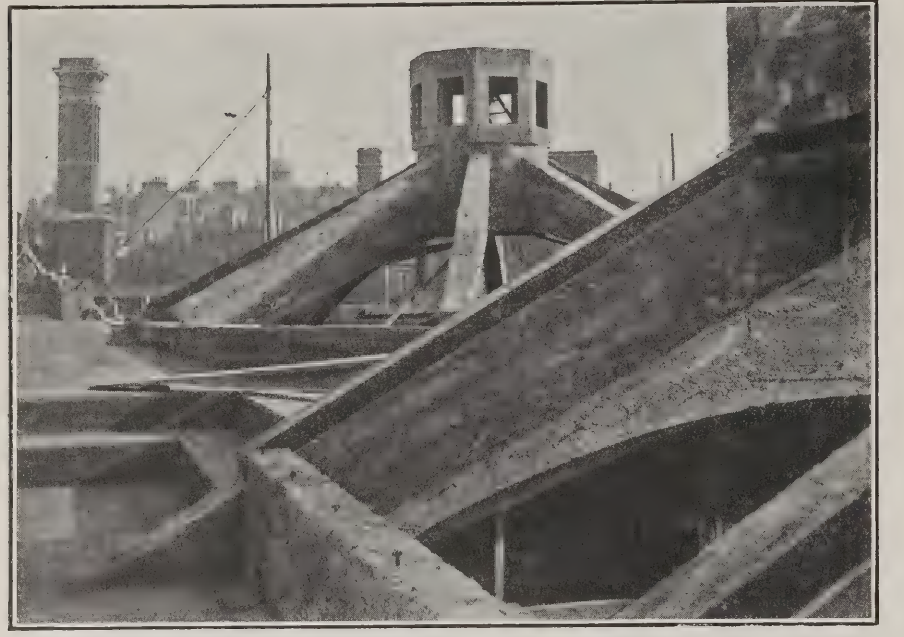

Photo: H. Colin Allen.

FIG. 3. ADDITIONS TO THE NATIONAL GALLERY, LONDON.

Another view of the octagonal dome, showing in the foreground part of the roof of one of the smaller ventilating galleries.

Street, seven tenements of dwelling houses on the east side of Aberfeldy Street, off Cumbernauld Road. William Hollins and Co. (Limited), Boden Street, new dining-rooms in Boden Street. John Smellie, builder, South Street, Whiteinch, eight self-contained lodgings on the south side of Redlands Road, Kelvinside. John Marshall and Sons, builders, Bishopbriggs, two semi-detached villas on the west side of the public road leading from Glasgow to Kirkintilloch. Rev. William F. Knox, M.A., 31, St. Andrew's Drive, Pollokshields, and others, trustees of St. Mark's Episcopal Church, a church and temporary hall in West Scotland Street. Edward Macbean and Co. (Ltd.), 23, Howard Street, buildings in Mary Street, Port-Dundas. James Smith Gray, 74, Osborne Street, warehouse and stores as an extension of the existing buildings at the west corner of Osborne Street and New Wynd. George Eadie, builder, 405, Mathieson Street, three tenements of dwelling-houses on the north side of Kirkcaldy Road, Maxwell Park. Brownlie and Murray (Limited), engineers, Possil Ironworks, Possilpark, alterations and extensions to existing buildings at 64, Denmark Street, Possilpark. The Scottish Automobile Club, 163, West George Street, per Sir J. H. A. Macdonald, K.C.B., and others, alterations and additions to subjects at 11, Blyswood Square. Heinrich Lindeman, 104, West George Street, and others, trustees for the German Evangelical Congregation, a church at 202, Renfrew Street.

HULL.—L.G. Board enquiries have been held into applications by the Town Council to borrow £9,500 for widening and improving Southcoates Lane; and to borrow £5,020 for the purchase of land in Mill Lane and near Perth Street, for the purpose of small holdings and allotments.

Plans for the following have been passed: Garden Village, Ltd., 123 houses, Garden Village; E. W. Waudby, 13 houses, Westcott Street; J. B. McMaster, 6 houses, Cottingham Road; W. Garbutt, 12 houses and shop, new street, Marfleet; W. Garbutt, 20 houses, new street, Marflett; F. W. Lewis, 77 houses, new street, Stepney Lane; J. Kirby, house and stable, Stepney Lane; R. Robinson, 2 houses, Hymers Avenue; Mrs. P. Smith, 12 houses, Brindley Street; G. T. Spruit, 28 houses, Westcott Street; Norman and Cooper, 12 houses, Telford Street; W. Burkes, house and shop, 59, Hessle Road; H. Vokes, 7 houses, Plane Street; A. Bond, 12 houses, new street, Marfleet; A. Botham, 35 houses, Buckingham Street and Derwent Street; F. West, 9 houses, Richmond Street; Garden Village, Ltd., house, Garden Village; E. Singleton, houses, Heathcote Street; J. T. Taylor, 7 houses, Southcoates Avenue and Whitworth Street; A. N. Whincop, 3 houses, Hessle Road; Corporation of the Trinity House, alterations, 33, Posterngate; F. Atkin and Co., Ltd., extensions, Dairycoates; Moors' and Robson's, Ltd., Maltklin, Marlborough Terrace; Marton's, Ltd., alterations, Grand Theatre.

INVERNESS.—The District Asylum Board is considering the advisability of building a sanatorium in connection with the asylum.

LIVERPOOL.—A scheme is on foot for erecting a hall in Liverpool for performances by amateur dramatic, literary, and other societies, and suitable also for concerts, lectures, and recitals. It is thought that the hall will cost about £14,000.

LITHERLAND.—A new church, to be erected out of the sum of £10,000, generously given by Miss Willox in memory of her brothers, is to be erected here in that part of the parish of St. Philip, locally known as "Klondyke."

LEEDS.—The City Council are to purchase 2,700 sq. yds. of land adjoining Armley Park at 7s. a yard, as a site for the proposed special school for mentally defective children.

LONDON.—The Marylebone Borough Council propose to erect new depot buildings, stables, etc., in Grove Road, St. John's Wood, at a cost of £14,214. Application is to be made for a loan, subject to the sanction of the L.C.C.

MANCHESTER.—A L.G. Board enquiry has been held into the application of the Corporation to borrow £5,300 for a new branch library at the corner of Cheetham Hill Road and Kitchen Bank, Crumpsall.

NAPSBURY.—It is proposed to erect additional buildings at the Middlesex County Asylum to accommodate 582 persons. The cost is estimated at £65,475.

NOTTINGHAM. — The Notts Standing Joint Committee have decided to reinstate the Shire Hall after the fire, and add to it—at an estimated cost of £4,000.

PORT GLASGOW. — Messrs. George Arthur and Son, architects, Airdrie, have submitted plans for the reconstruction of the first section of the bay area, and these are now under the consideration of the Town Council.

PRESTON.—The Town Council has decided to erect a new grammar school at Moor Park.

SLEAFORD.—Buildings, estimated to cost £10,000, are projected for a beet sugar factory.

SMETHWICK.—A L.G. Board enquiry has been held respecting an application by the Council to borrow £10,000 for the erection of a depot in Rolfe Street.

SWANSEA.—Mr. G. T. Hine, F.R.I.B.A., has furnished estimates for a fully equipped asylum on a site at Cefn Coed. For an asylum of 800 patients complete his estimate is £184,000, land £16,060, and equipment, at £20 a bed, £16,000—total £216,000. For an asylum with an administrative department for 800 but accommodation for 600 patients, the total is £189,160. For an asylum with an administrative department for 600 and patients' quarters for 400, the total estimated cost is £144,060.

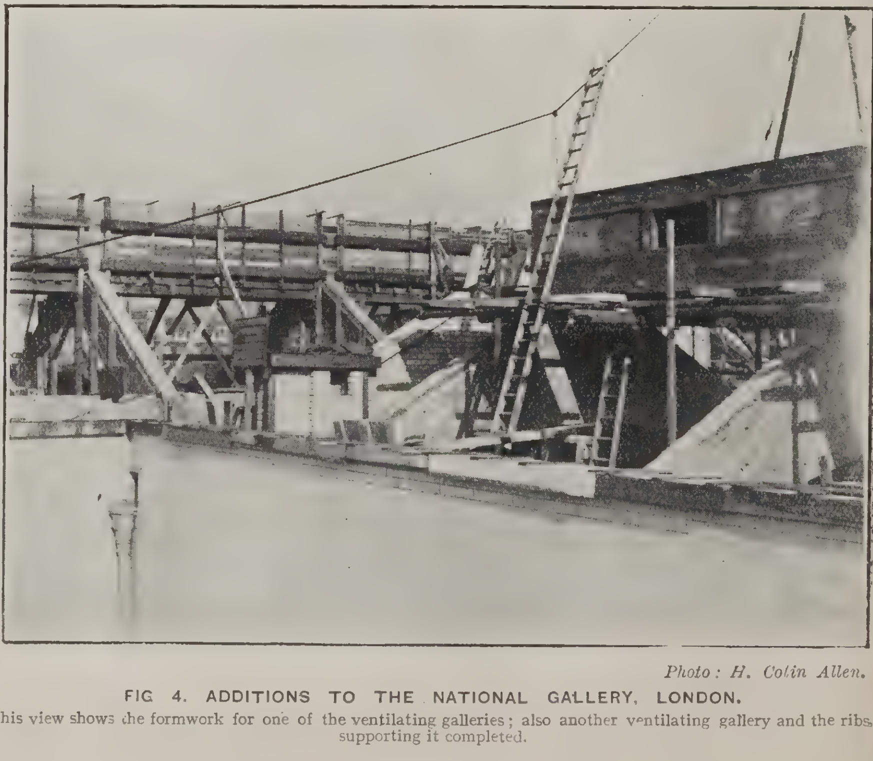

Photo: H. Colin Allen.

FIG 4. ADDITIONS TO THE NATIONAL GALLERY, LONDON.

This view shows the formwork for one of the ventilating galleries; also another ventilating gallery and the ribs supporting it completed.

CONCRETE AND STEEL SECTION.

(MONTHLY.)

Is Reinforced Concrete Economical? Reinforced concrete possesses many advantages—one of which, namely, resistance to shocks, we refer to below, and these advantages would compel its adoption even if its cost were greater than that of other methods of construction. But those advantages, such as fire-resistance, monolithic character, resilience, ductility, resistance to shock, damping of vibration, equability of temperature, durability, resistance to weather, adaptability and pliability, etc., have hardly been sufficiently emphasized, and are not generally clearly realised by the architectural and engineering professions. The chief advocates of reinforced concrete have referred to its economy as compared with other current methods of construction. The economy may be small in certain circumstances, and may not be very apparent at first sight, as it depends on a number of factors; whereas usually first cost is thought to be everything, and the first cost of a reinforced concrete structure may sometimes be relatively high. Efficiency ought to be considered in assessing economy. Rather too much emphasis has been laid upon cheapness—reinforced concrete is not always cheap. An architect listening to that cry sometimes thinks he will test it on his next job. When that job comes along to the specialist, it is found to be really either quite unsuitable for reinforced concrete, or perhaps can be cheaper, though not so efficiently or so economically done in that material as by ordinary steel or brickwork construction. A price and design are, however, submitted in the hope of getting the order, but the architect, finding it higher than what the ordinary method would cost, immediately assumes that reinforced concrete as a whole is dearer than earlier methods of construction, and dismisses it from his mind for future work. That is to be regretted. We can only say to such people that though reinforced concrete is acclaimed by some advocates as superior for every purpose, there are some things which it will not do. However, though it may not in all peculiar circumstances be cheaper in first cost, and may be unsuitable in certain circumstances, it possesses much intrinsic merit, and in the majority of cases affords economy and efficiency, and possesses certain indubitable advantages that cannot justly be claimed for any other material or method of building.

Construction and Commonsense. Commonsense in structural design is a requisite of which many designers really are in great need. We suppose that the deficiency arises from a too theoretical training, as a rule, but a good deal of it is attributable to the teachers and writers of text-books being men with very little practical experience, and untrained to employ scientific ways of thought—analysis and synthesis. The most impracticable proposals are put forward by eminent professional men—even by supposed experts. Often professional schemes are nipped in the bud by hard-headed business men, and there are great resultant heart-burnings, and the clients are called interfering and pettifogging ignoramuses, unable to appreciate the wonderful originality and cleverness of the architect or engineer. But really we have seen some most ludicrous examples of misapplied energy and want of commonsense. Too much knowledge is almost as dangerous to some men as too little, because then the designer goes on theorizing and forgets just to look at the problem in an elementary way, when he might see that he had omitted to consider a factor that entirely upsets his calculations. Many common errors are due to want of acquaintance with materials. Often professional men are confirmed book-worms, and when they go on a job they see nothing but what they have been taught to look for, and see only the surface of things. If they only tried to do things for themselves, looked closely into the actual operations, and studied the materials, tested their assumptions, and stopped on jobs for several days at a time seeing all the operations performed, perhaps we should not hear of so many vexatious mistakes. Yet it is surprising how much can be done by men with the most rudimentary theoretical attainments, provided they have had a little experience and exercise a little commonsense. In fact, we have no hesitation in saying that it is the latter which makes the eminent architect or engineer. There are many men who possess great ability in theoretical investigation, but who rank far below men who work by rule of thumb, with really little ability beyond commonsense. It should be the main endeavour of educationists to instil commonsense into the heads of students—that is far more important than any amount of theory or dry facts. Students chiefly require to be able to think clearly and logically.

Earthquakes and Reinforcement. The earthquake in the South of France has again served to call public attention to the importance of considering the design and construction of buildings with respect to resistance to earthquake shock. It has now been abundantly proved by the earthquakes at Messina and San Francisco that reinforced concrete is the only form of construction which seems to satisfy all the needs of buildings in such districts. Several ingenious theories and methods of design have been suggested, but example seems to show that a raft foundation is practically all that is needed in respect to the preservation of the building. It seems to us too much to hope that a solution can be found which will preserve the contents of a building against harm from vibration and shock. For instance, a building on a raft foundation may be secure in itself, but it may rock about so that the contents may be shaken up and down, and articles bumped against each other, so as to damage or shatter them. The theorists are chiefly concerned with the reduction of such damage rather than with the stability of the structure, for that problem may be regarded as solved.

The Financial Standpoint. Edwin C. Eckel, one of the best-known experts on the cement industry of the United States, the author of "Cements, Limes, and Plasters," the standard work on these materials, and, until recently, in charge of the cement work on the U.S. Geological Survey, has written a book entitled, "The Portland Cement Industry from a Financial Standpoint" (35, Nassau Street, New York; 2 dols.). As Mr. Eckel states in the preface, his book will have served its purpose if it aids either banker or investor to differentiate between securities offered against successful existing plants or sound projects, with reasonable prospects of success, and those issued against foolishly planned or recklessly promoted propositions. Mr. Eckel's book differs from any previous publication on the cement industry in that it devotes itself chiefly to the financial side of the subject. In fact, it is the first authoritative presentation of the financial side of the industry. Matters of purely technical importance are for this reason subordinated to the questions of financial methods and profits. Such subjects as raw materials and manufacturing processes are discussed, therefore, only as they have a distinct bearing on financial results. The opening chapters contain a brief discussion of the processes and raw materials on which cement manufacture is based, with very complete statistics covering the past history and production of Portland cement. The following chapters discuss the probable future trend of the U.S. cement industry, particular attention being paid to price-history.

A Guide to the Foreman and Clerk of Works. This ("Reinforced Concrete Field Handbook" by the Editors of "Concrete Engineering," Cleveland, U.S.A.; The Technical Publishing Co. Price $1), is a very useful little pocket book. It deals with the practical side of reinforced concrete construction, and it contains a great deal of information on the subject. It is just the thing for the foreman and clerk of works who have to deal with reinforced concrete, and it can be read with advantage by the designer of structures erected on that system. The book contains information about cement, sand, aggregates, steel, centreing, steel fabrication and placing in position, manufacture of concrete, and, finally organisation and field notes.

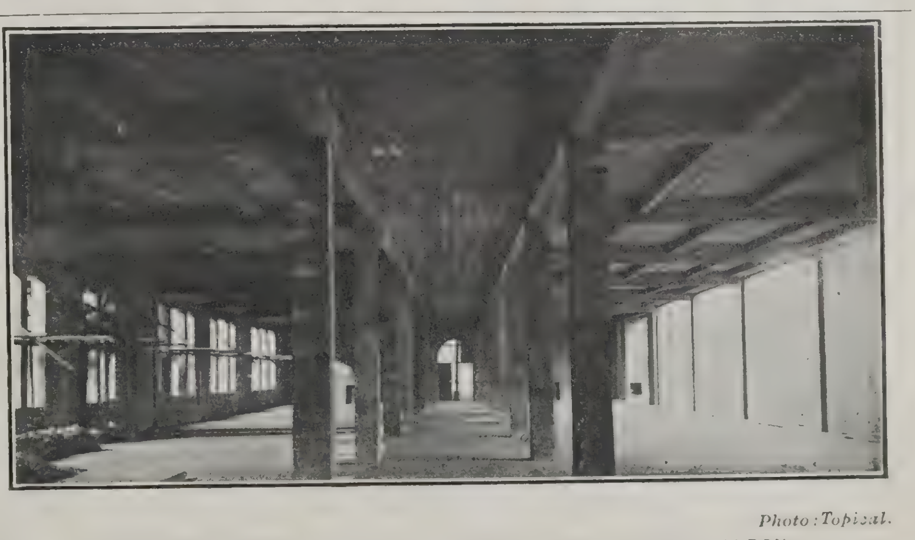

Photo: Topical.

THE KING EDWARD BUILDING, GENERAL POST OFFICE, LONDON.

This is a view of one of the floors in the sorting office block, which is over 300 feet long. The building is constructed entirely of ferro-concrete, and is a striking illustration of the lightness of construction obtainable by the use of reinforced concrete.

THE NEW "KING EDWARD BUILDING" OF THE G.P.O.

This building, of which five illustrations are here shown, consists of two blocks, namely, the public-office block, 210ft. by 54ft. by 80ft. high, and the sorting-office block, 312ft. by 212ft. by 75ft. high. Between them is a loading yard 200ft. by 60ft. The site, it will be remembered, is that on which formerly stood Christ's Hospital ("the Blue-coat School"). Adjoining it is a church; and in digging the 28ft.-deep trenches, the builders had therefore to provide against enormous pressure. A retaining wall of the old-fashioned type would have had to be 10ft. thick at the base; but Messrs. Holloway Brothers put up a ferro-concrete one, of which the general thickness was only 8ins., but it was stiffened with ribs 8ins. wide. Trenches 60ft. wide were dug round three sides of the basement. The construction of the beams is thus described: They are formed of "(1) horizontal rods near the floor level, (2) parallel horizontal rods over the crown of (3) a steel arch, whose ends project through the supporting columns and are embedded in the next beam, (4) a steel truss between the two systems of horizontal rods above referred to, (5) a series of vertical steel stirrups uniting the various members." There are fifteen acres of flooring in the building; yet, in floors, walls, and stanchions, only 20,000 cubic yards of concrete, and about 3,000 tons of steel have been used. With the wall thicknesses required under the old system of building, the floor-space would have been 50,000 superficial feet less than it will be now that the use of ferro-concrete has enabled the adoption of much thinner walls. Advantage is taken of the great tensile strength of ferro-concrete to form the cantilevers shown in the illustration. In the loading yard, it was desirable to form a recess into which the carts could be backed. Columns would have been obstructive, and therefore cantilever beams were adopted as shown. The architect is Sir Henry Tanner, F.R.I.B.A., I.S.O., Chief Architect to the Office of Works; the contractors are Messrs. Holloway Brothers (London), Ltd.; and Mr. T. A. Watson, Messrs. Holloway's engineer, has had charge of the work throughout.

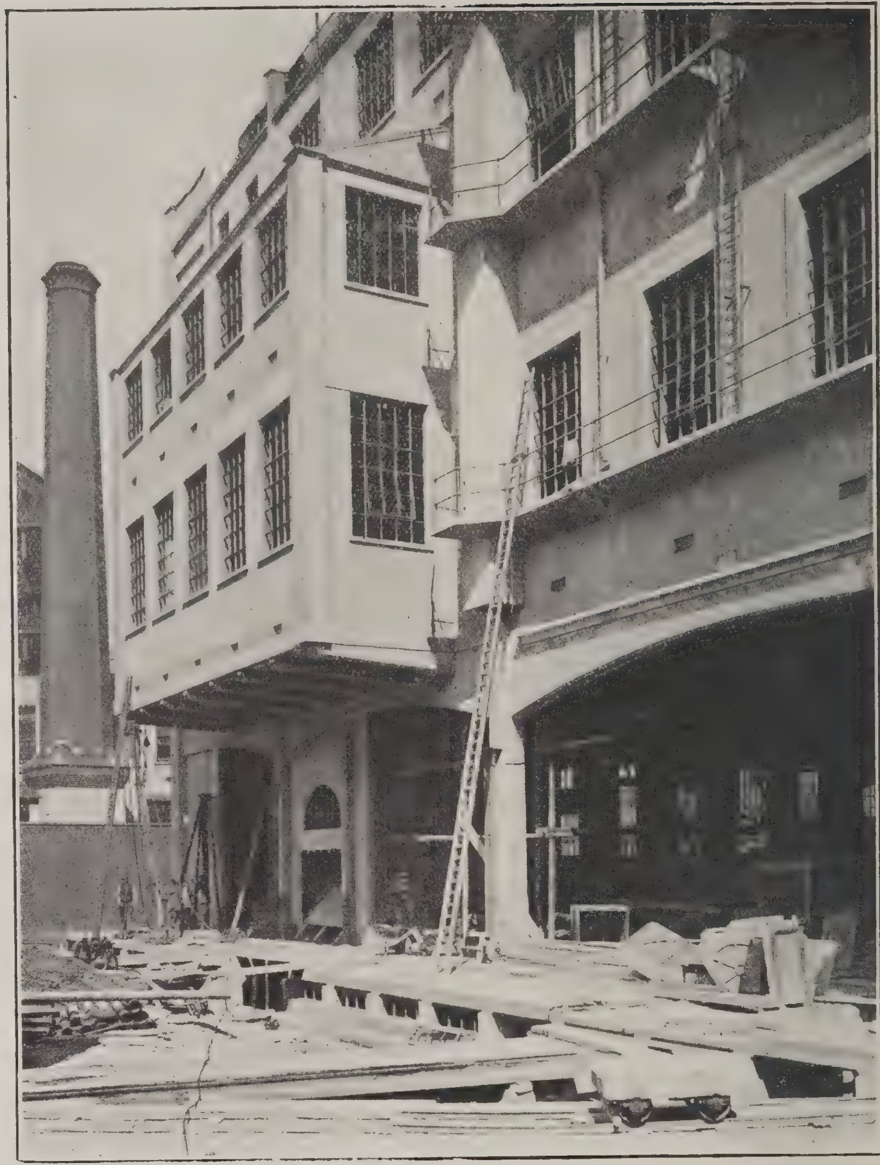

Photo: Topical.

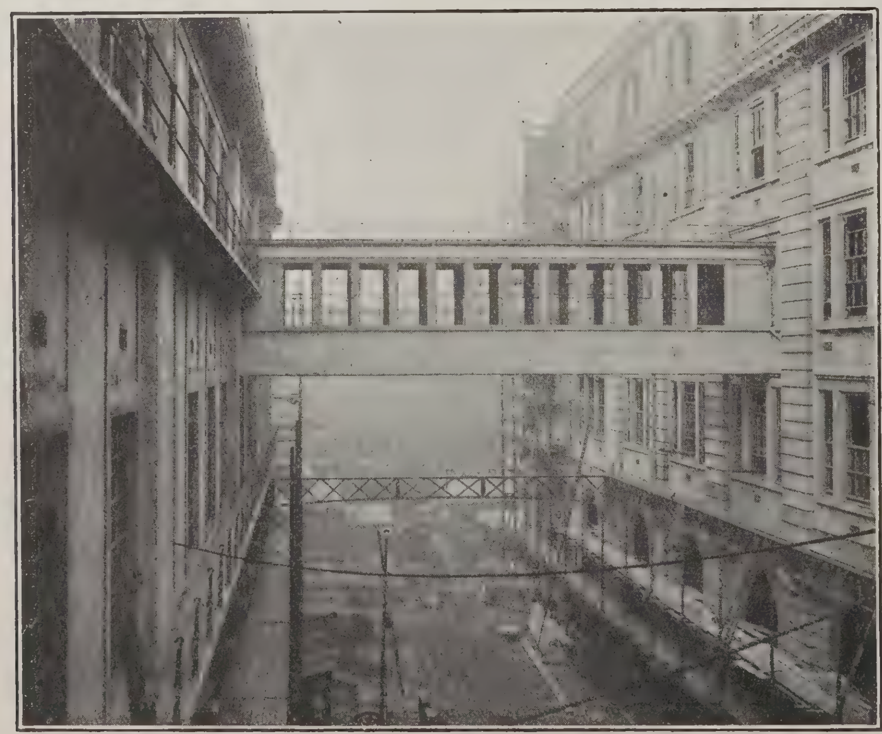
THE KING EDWARD BUILDING, GENERAL POST OFFICE, LONDON.

This is a detail view of the west elevation of the block, showing cantilevered portion projecting 12ft. 6ins.



THE KING EDWARD BUILDING, GENERAL POST OFFICE, LONDON.

This is a view of the loading yard between the Public Office and the Sorting Office blocks of the New General Post Office Buildings, Newgate Street, E.C., and shows clearly the bridge, 51 feet in span, connecting these two blocks. The left end of this bridge is supported on cantilevers projecting 12 ft. 6 in. in cantilever. Another feature is the cornice on the right hand of the picture, which projects 3 ft. 2 in. from the face of the 8.in. wall, into which it is tailed down by means of steel bars. This cornice has not been rendered, but was cast in situ, wrought centering being used, and specially prepared moulds, so that the surface should be smooth and of a good finish.

Concrete Views and Reviews.

A Reinforced Concrete Catalogue.

A Handbook for Engineers and Architects. L. G. Mouchel and Partners, 38, Victoria Street, Westminster.

The Hennebique system of reinforced concrete has been energetically pushed in this country for the past ten years, and in that time it has made great strides, for there are now 600 reinforced concrete structures in Great Britain and Ireland designed on this system. The success obtained with it is attributable to the facts, first, that it was one of the earliest to arrive from abroad, where the subject had been studied closely, and extensively adopted, though reinforced concrete was patented by Wilkinson in 1854; secondly, that M. Hennebique devised rules for calculating the strength of reinforced concrete, based on the results of experimental investigation which enabled the firm to produce and execute very economical designs; and thirdly, to the commercial ability of the late M. L. G. Mouchel, M. Hennebique's agent in this country. Some fine catalogues have been issued by Messrs. L. G. Mouchel and Partners, and these productions have been noted for the careful way in which they have been compiled, and for their excellent get up, with their many photographic illustrations. In those catalogues, however, the time was not ripe to discuss the theory of reinforced con-

Photo: *Topical.*

THE KING EDWARD BUILDING, GENERAL POST OFFICE, LONDON.

Here can be seen the erection of the stone walls of the facade around the ferro-concrete construction. The lightness of the main stanchion in the foreground is typical of the great strength which reinforced concrete possesses.

crete design and construction in great detail, though much information suitable for general consumption was provided, and even to this day M. Hennebique and his agents do not divulge their own methods of calculation, nor can we expect them to do so. In the last few years, however, the subject has received much attention from a theoretical point of view, and much has been published on the subject. The Hennebique firm now find themselves assailed by many competitors, and they have recently published as a pamphlet their standard specification for reinforced concrete work constructed on their system, and now issue this pamphlet as a contribution to the theory and practice of the subject. Of course all catalogues of this nature contain partisan statements, and their arguments cannot in every instance be accepted without question. But from the criticisms they contain of each other's methods the outsider can often glean a good deal of information which will be of considerable assistance in enabling him to judge the real merits of rival systems —and, indeed, perhaps to enable him to discard all and devise his own design. In reviewing this pamphlet we might deal with each item of contentious matter in detail, but in the present state of knowledge of the subject it would be distinctly unwise to dogmatise, and where there is any doubt we prefer to leave the question open for time to determine the merits or demerits and the place of each system. We may, however, draw attention to a few of the salient points of the catalogue. In the earlier Hennebique

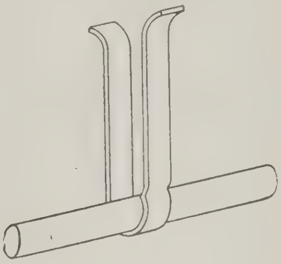


Fig. 1. Hennebique Stirrup.

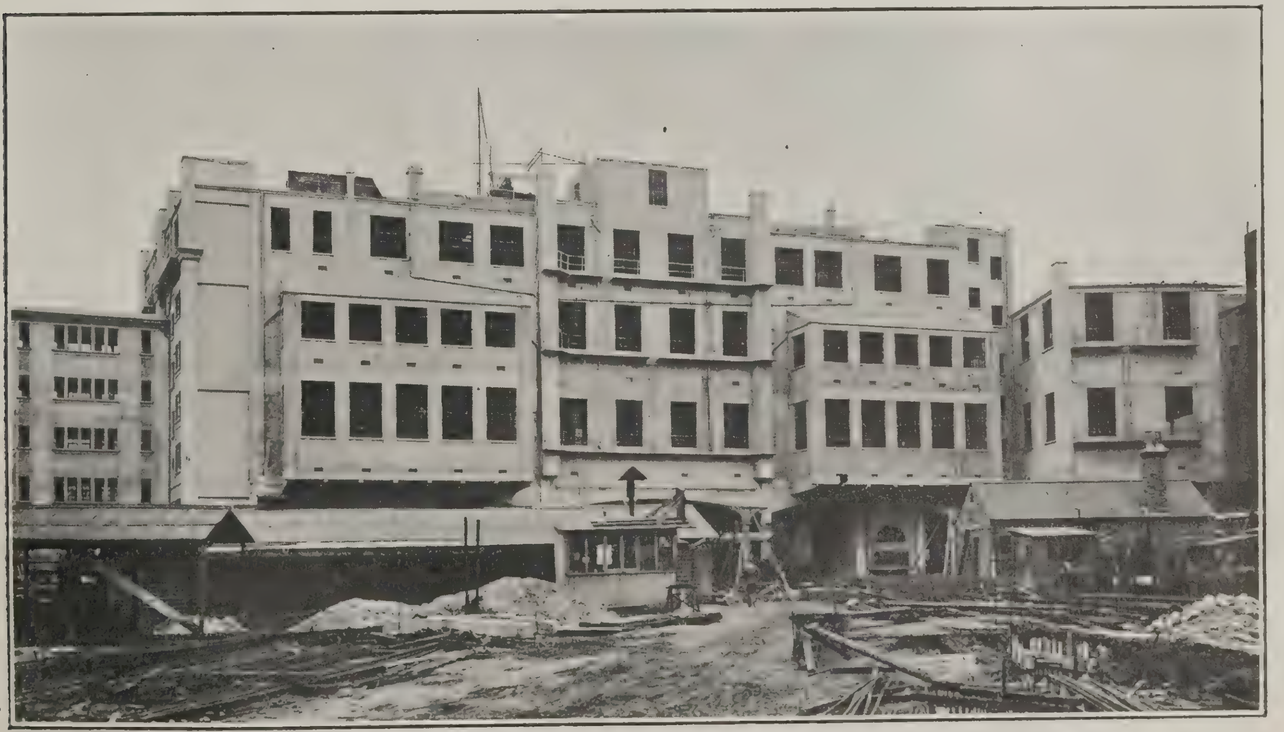
(*Continued on page* 590)



THE KING EDWARD BUILDING, GENERAL POST OFFICE, LONDON.

This is a view of the west elevation of the new G.P.O. in Newgate Street. The projecting portions are cantilevered out 12 ft. 6 ins. from the main face interesting to note that as these projecting portions will probably be some day connected up to another extension, the west end walls of same were built of b that they might be more easily pulled down than ferro-concrete work.

DETAIL OF BENT PLATE GIRDER.

These illustrations represent specimen shop drawings (of course, reduced for reproduction) of the steelwork used in the construction of the Selfridge Store. We have, in several issues, given authoritative illustrated descriptions of the constructive work, and the present diagrams are the last of the series. Considering the magnitude of the undertaking, the comparative novelty in this country of the system of construction, the ingenuity with which unusual difficulties have been overcome, and withal the artistic grace and dignity that have been imparted to a building in which those qualities, though eminently desirable, were by no means easy of

SHOP DETAILS FOR BEAMS.

ainment, we have felt justified in devoting rather extraordinary amount of space to subject; and our desire to present an equate account of what is from many ints of view one of the most remarkable buildings of modern times, has been most courteously facilitated by the proprietor (Mr. H. Gordon Selfridge), by Messrs. Waring and White, the general contractors, by Mr. R. Frank Atkinson, F.R.I.B.A., architect, and by Mr. S. Bylander, the engineer for the steelwork. Bent girders had to be introduced at the fourth floor, next to Somerset Street, owing to ancient light difficulties. The girder is of box section, and can carry two storeys.

(*Continued from p. 587.*)

work a simple U-shaped hanger of flat strip-metal was used to resist diagonal tension; we now find in this catalogue that this has undergone modification in detail, being given a dent at the side, as shown in Fig. 1 on page 587, so as to clip round the round-bars by its own springiness, for the purpose of preventing it getting out of place and being removed from close contact with the main bar by the operation of tamping the concrete. The pamphlet contains an argument that the vertical position of such web-members is the most efficient, both theoretically and practically, and it is argued that plain bars provide quite sufficiently for adhesion, though the additional precaution is taken by M. Hennebique against their slipping, of providing a bond at the ends of rods by splitting them open at these ends. In view of this it seems to us that the argument earlier in the pamphlet, that mechanical bonds cut into and damage the concrete might apply equally to the split ends. Information on the theory of pile design is provided.

Two Pamphlets on Reinforced Concrete.

Reinforced Concrete Construction. By W. Noble Twelvetrees, M.I.Mech.E., etc.; price 1s. London: "Local Government Officer," 36-38, Whitefriars Street, E.C.

Simplified Methods of Calculating Reinforced Concrete Beams. By W. Noble Twelvetrees, M.I.Mech.E., etc., price 6d. London: Whittaker and Co., 2, White Hart Street, Paternoster Square, E.C.

Two small pamphlets on reinforced concrete have been written by Mr. W. Noble Twelvetrees, who wrote "Concrete Steel" and "Concrete Steel Buildings." The first is on the general subject of such construction, and is a useful summary. We do not much like Mr. Twelvetrees's symbols, which he suggests are so much better than those of other authors. He has been trying to standardize symbols for calculations in reinforced concrete, but he is wrong to say, in the second pamphlet, that there is "no marked indication of approaching agreement to be found among theorists and practical enquiries of any individual nature in respect to standard notation and algebraical forms, and still less of any international movement in the same direction," for in England we are standardizing such notation, and also an international notation is being drawn up, and there is very great hope of agreement being arrived at very shortly. The first pamphlet contains some useful notes on practical construction, though there is nothing very new in them.

The United Kingdom Fire-Proofing Company's Catalogue.

The latest catalogue issued by the United Kingdom Fireproofing Co., Ltd., of 47, Victoria Street, London, S.W., is excellently produced. It contains isometric drawings of the various forms of reinforced concrete fireproof floors constructed by the company, and views of fireproof partitions, also an ingenious expansion block for preventing damage to walls by the expansion of solid concrete floors, working drawings of designs for reinforced concrete racecourse stands, tanks, baths, and a water tower. The main portion of the book consists of photographic views of works executed by the firm which have either been completed or are in course of construction. From these it is evident that though the company has only been in existence for a very short time, it has secured a great amount of work, and executed fireproof floors in many notable buildings. We reproduce in this issue some views of the new chemical laboratory at Cambridge in which the United Kingdom Fireproofing Co. executed fireproof floors, roofs, ferro-concrete main beams, lintels, and staircases, etc., for the architects, Messrs. Stevenson and Redfern. The floors were constructed of hollow concrete tubes supported on reinforced concrete beams, covered with a concrete filling; the hollow tubes were utilised for air ducts to radiators, cable trenches, etc. The floors were designed to carry a load of 2 cwts. per foot super, and the working drawing here reproduced shows the framing and detailed arrangement of this rather interesting, and by no means simple piece of work.

Concrete Construction.

This little volume ("Concrete Construction: Form Work, Estimating, Superintendence, Inspection, Cost, etc." Cleveland, U.S.A.: The Technical Publishing Co., Price 50 cents) deals with practical construction and the execution of works chiefly of reinforced concrete. The notes on centering and methods of executing large jobs are most valuable, and, carefully studied, should result in much economy to contractors.

Hotel in Reinforced Concrete.

Two pamphlets have been published by the Trussed Concrete Steel Co., Ltd., of Caxton House, Westminster, S.W. The first is an article on the new addition to Chateau Frontenac, Quebec, a famous Canadian Hotel. This building has been constructed of reinforced concrete on the Kahn system throughout the interior, the elevations being of stone. The work was of considerable magnitude, and this article by Mr. Gustave Kahn contains much interesting and useful information, with particulars of the design, contracting methods, and cost. The second pamphlet is a price list showing the use of Kahn bars for the construction of concrete lintels, giving standard weights of reinforcement, and sizes of lintels for various spans.

A French Work on Calculations.

The ordinary accepted theory for the calculation of reinforced concrete members is only varied in different countries by slight differences in the factors taken; the main principles remain the same. Thus the report of the R.I.B.A. committee

STEVENSON AND REDFERN, ARCHITECTS.

BRIDGE UNIVERSITY CHEMICAL LABORATORY EXTENSION. GENERAL VIEW OF THE FACADE. STEVENSON AND REDFERN, ARCHITECTS.

A noteworthy and interesting example of fire-resisting construction.

agrees with the official instructions of the French Minister of Public Works and of the German and Swiss Governments. The books of various theorists in all languages produced to-day are therefore in general agreement, and in this latest work of M. Séguéla ("Eléments de Résistance des Matériaux appliquée au Béton Armé." Par R. Séguéla, Ancien élève de l'Ecole Polytechnique, Paris: Librarie Polytechnique, Ch. Béranger, Editeur, 15, Rue des Saints-pères), we have nothing particularly novel. He performs good service, however, in so clearly and so succinctly summarising the methods of calculation in so a handy form. The book is illustrated with a few diagrams explanatory of the text, and the demonstrations are very well done. In reading such a work one sees the great advantage there would be in an international notation. A very valuable feature of the work are the examples used to illustrate each part of the work. Pieces subjected to compression, tension, bending, etc., are each taken in turn, and the book is concluded by tables to facilitate calculations.

The Concrete Institute Transactions.

The second part of volume I. of the "Transactions and Notes of the Concrete Institute" is now before us for review. It contains notes of the standing committees appointed and their constitution, and the petition of the Institute against the London County Council (General Powers) Bill now before Parliament for amending the Building Act, in respect to permitting structures to be erected of reinforced concrete. The volume also contains the balance-sheet for 1908, which shows the society to be in a strong position, and verbatim reports of papers read at general meetings by Mr. L. Serraillier and Mr. E. P. Wells, and the discussions that took place thereon. This volume is even more interesting and useful than the first. It contains a mass of information, Mr. Wells's paper alone serving as almost a text-book on how to mix and use plain concrete in bridge construction, with particulars of a most interesting series of tests. The Concrete Institute has now a very large membership, *i.e.*, over 750, and it is one of the most progressive and important technical societies. Its membership is growing rapidly, and for this the excellent work it is doing and the valuable papers read before it are no doubt in great part directly attributable. The Transactions are published at 1, Waterloo Place, Pall Mall, S.W.

Notes and News.

Mr. Edwin T. Hall has been appointed by the Council to represent the Institute at a Conference which is being organised by the Engineering Standards Committee to consider the desirability of a standard being adopted for stoneware, fireclay, and other similar pipes.

* * *

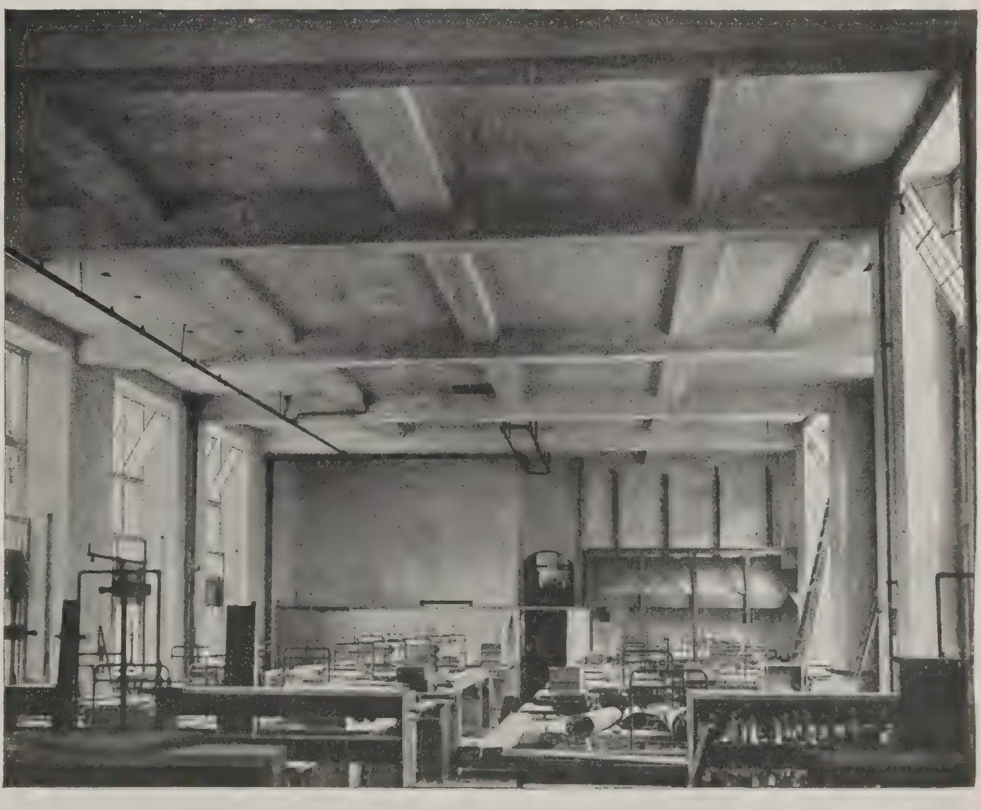
We are informed that rapid progress is being made with the huge building that is being erected at Liverpool for the Royal Liver Insurance Company. Messrs. A. and F. Manuel, of Gracechurch Street, London, are supplying and fixing the granite work, and the general contractors are Messrs. Nuttall and Son.

* * *

The "I.C.S. Student" for June, the organ of the International Correspondence Schools, Ltd., International Buildings, Kingsway, London, contains much interesting matter that justifies the sub-title, "A Journal of Inspiration to Self-Help." From this periodical it appears that the movement is flourishing exceedingly, and that the institution is successful not only in systematising study, but in organising the students, who, we observe, are encouraged to unite in social functions, such as concerts, as well as in educational effort, and the strenuous life.

* * *

An arbitration case between the Lambeth Borough Council and the London County Council, arising out of the erection of the new London County Hall, on the south side of the Thames, near Westminster Bridge, was opened at the Surveyors' Institution, Great George Street, on June 17th, before Mr. Samuel Walker. The site of the new County Hall, in respect of which claims have already been settled, will include that previously occupied by a large wharf owned by the Lambeth Borough Council, who accordingly claimed originally for a sum of about £180,000. Agreements had been arrived at in respect of compensation for disturbance, machinery, etc., and the revised claim to-day stands at £107,813 for land and buildings.



CAMBRIDGE UNIVERSITY CHEMICAL LABORATORY EXTENSION. INTERIOR OF ONE OF THE LABORATORIES. STEVENSON AND REDFERN, ARCHITECTS.

The floors are constructed of hollow concrete tubes supported on reinforced concrete beams, covered with a concrete filling.

With reference to the illustrated account of Sennowe Hall, Norfolk, appearing in last week's issue, we are informed that the metal casements and leaded lights to the new lodges were supplied by Messrs. George Wragge, Ltd., 152, 154, and 156, Chapel Street, Salford, Manchester.

* * *

A company has been formed, and a site has been secured on the Duke of Devonshire's estate, Carlisle, for the erection of a large roller skating rink. The preparation of the plans is in the hands of Messrs. Oliver and Dodshun, architects, Carlisle. Roller skating is fast becoming as popular in this country as it has long been in America. Many rinks are being constructed in London and the provinces, and we are informed that the proprietors are studying the safety of their patrons by the extensive use of fireproof Uralite in the construction of such buildings.

* * *

The Garden City Association has now concluded arrangements with the German Garden City Association for about two hundred members of the latter body to visit this country next month. Their first trip will be to York on July 7th, when they will inspect the cottages and garden suburb of Earswick, which have been built by Messrs. Rowntree for the benefit of their workpeople. On July 8th the party will pay a visit to Manchester and inspect the housing works there and at the Co-partnership Tenants' estate just outside the city. At Liverpool there are the extensive works of the Corporation in building model dwellings in place of slum cottages, and these will be seen on July 9th. In the course of two or three days in the neighbourhood the party will also see Port Sunlight, Messrs. Lever's model village, and on the 12th Birmingham will be also visited, and the town efforts at slum patching will be seen, while Bournville and Harborne will also be inspected. Letchworth (Garden City) will be visited on the 13th, Hampstead on the 14th, and Ealing on the 15th. The party will probably return on the 17th.

BUILT-IN BEAMS.

By R. D. Whitehead, A.M.I.Mech.E.

In dealing with the case of beams built-in at the ends, the writer discovered a simple method of obtaining the curve of bending moments, and of correcting the shearing forces, which he believes to be quite original, and which is applicable to all methods of loading. The method is here illustrated, with examples:—

General method:—

(a) Draw the diagram of bending moments and shearing forces, for a beam supported at the ends only.

(b) Convert the bending moment diagram into a triangle of equal area, on the same base as the bending moment diagram.

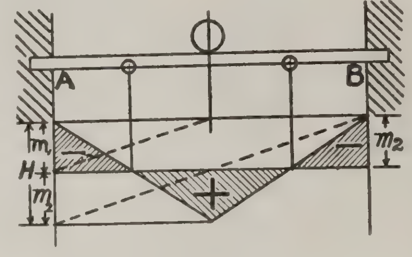
(c) Draw a vertical line through the centre of gravity of the load or loads.

(d) Project the height of the triangle found in (b) on to one of the abutments A or B.

(e) Join this point (d) to the opposite angle of the base of the bending moment diagram.

(f) From the point where the vertical through the centre of gravity of the load or loads (c) cuts the base of the bending moment diagram, draw a line parallel to the line found in (e). This parallel will divide the distance marked H in the diagrams into two segments, whose values m_1 and m_2 respectively, are the torques necessary to keep the beam horizontal.

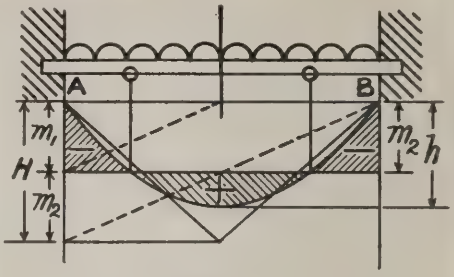
(g) Measure these values on their respective abutments, i.e., M_1 on A and M_2 on B, and join by a line. This line will divide the diagram obtained in (a) into portions of equal area, shown by the + and — signs; it also fixes the points of contraflexure as shown marked o.



EXAMPLE 1.

(h) If a line is drawn parallel to the line joining m_1, and m_2 from the pole of the polar diagram to cut the line of loads, this will fix the point from which the new base of the shearing force diagram must be drawn (shown dotted in examples III. and IV.

Example I.—A uniform beam of rectangular section, built in at the ends and carrying a central load W. Draw bending moment diagram.



EXAMPLE 2.

(a) The bending moment diagram is a triangle, with its vertex directly under W, whose altitude equals $\frac{WL}{4} = H$.

(b) is equal to H found in (a).

(c) This line passes through W.

For (d), (e), (f), (g), see diagram, and note that m_1 equals m_2. When this is the case the shearing force diagram requires no correction.

EXAMPLE 5.

Example II.—A uniform beam of rectangular section, built-in at the ends, carries a uniformly distributed load of w lbs. per foot run. Draw diagram of bending moments.

(a) The bending moment diagram is a parabola whose vertex is directly under the centre of the span, and whose maximum ordinate equals $\frac{WL}{8}$ equals h

(b) In this case H equals $\frac{4h}{3}$

(c) This line passes through the centre of the span. For (d), (e), (f), (g), see diagram, and note that m_1 equals m_2, as in Example I.

Example III.—A uniform beam of rectangular section, 20ft. span, is fixed at the ends. It carries a load of 10 tons at the centre, and one of 7 tons at 5ft. from one end. Draw the diagrams of bending moments and shearing forces.

(a) Draw by means of a polar diagram.

(b) Draw by applying a construction based on Euclid, Bk. I. Prop. 37, to find H.

(c) Find (c) from (a).

For (d), (e), (f), (g), proceed as in previous examples, taking notice that m_1 does not equal m_2, (h) draw as described in "General Method."

Example IV.—A uniform beam of rectangular section, 20ft. span, is fixed at the ends, and carries a load which varies uniformly from 1 ton at B, to 4 tons at A. Draw the diagrams of bending moments and shearing forces.

(a) Draw by means of a polar diagram. It will be found to approximate so closely to a parabola that we may, without appreciable error, treat it as such; then H equals $\frac{4h}{3}$.

(b) Altitude of triangle equals H.

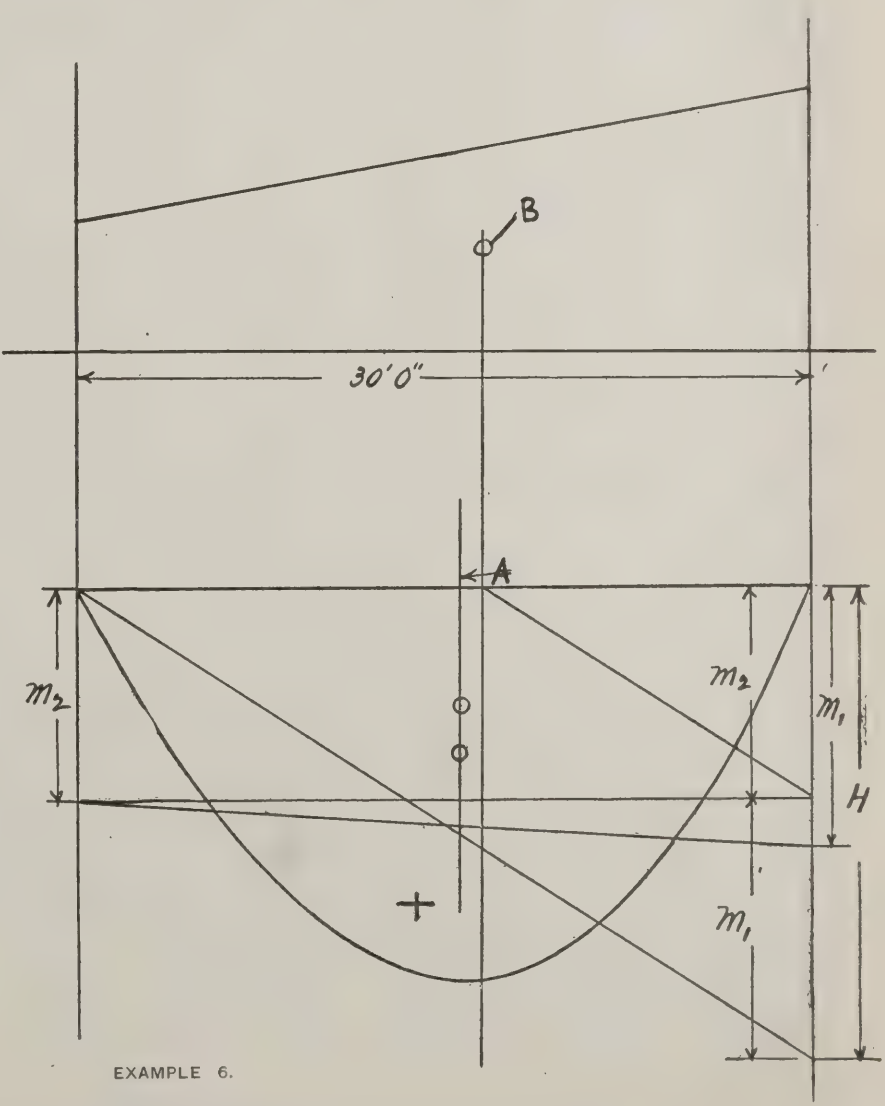
(c) Find the centre of gravity of the loading by a graphic construction.

For (d), (e), (f), fg), (h), proceed as in previous examples. Any other case must be treated in exactly the same way. If any particular difficulty is experienced in obtaining the height H of the equivalent triangle, measure the area of the bending moment diagram (a), using a planimeter. Then divide the area found by half the span; this fixes H. Also if the load diagram is very irregular, its centre of gravity can easily be found by cutting it out from thin cardboard, making a pinhole at a point near the edge. Then suspend the diagram in a vertical plane, on a pin, to which is attached a plumb-bob and line. Draw the line of the plumb-bob thread on the figure, and repeat this process from some other point; the intersection of the two lines so obtained is the centre of gravity of the load diagram.

The proof of the construction depends upon the fact that the centroids of the torque and bending moment diagrams fall upon the same vertical line. When this is the case, the − areas equal the + areas; as required in the case of built-in beams.

In Fig. 6, A indicates vertical through centroids of torque; B, centre of gravity of loads.

The writer does not object to anyone using this method by incorporating it in text books or pamphlets, provided due acknowledgement is made of the source.



EXAMPLE 6.

A. Vertical through centroids of torque and bending moment diagram.
B. Centre of gravity of loads.

Federation News.

MANCHESTER, SALFORD, AND DISTRICT ASSOCIATION.

Secretary: John Tomlison.

The monthly meeting of the General Committee of Manchester, Salford, and District Association was held at the Board-room, Manchester, on Thursday, May 20th, Mr. George Macfarlane presiding.

Four new members were elected into the association, bringing up the total to 198.

The half-yearly report and statement of accounts were considered and adopted for presentation to the annual meeting.

It was decided to issue the forms for making the annual return of men and apprentices employed to members, as supplied by the National Federation.

Several complaints were considered under the inter-trading rule.

The annual general meeting of the association was held immediately after the committee meeting, Mr. George Macfarlane presiding over a good attendance of members.

The committee's half-yearly report and annual statement of accounts were taken as read, and adopted for circulation to the members. The report, which is rather lengthy, is very interesting to members, inasmuch as three of the branches are, or have been, dealing with operatives for alterations in their working rules.

Mr. Samuel Gerrard, of the firm of Messrs. J. Gerrard and Sons, Ltd., contractors, Swinton, was elected president for the ensuing year.

A vote of thanks was passed to the retiring president, Mr. George Macfarlane, for his services during the past year, and was suitably acknowledged.

Mr. Harry S. Daniels (Messrs. Jas. Daniels and Sons, builders, Pendleton), and Mr. William Tinker (Messrs. Young, Tinker, and Young, builders), were elected senior and junior vice-presidents respectively. Mr. James Higson, J.P., plasterer and painter, Salford, was elected hon. treasurer, and Messrs. John Gibbons and W. Green were elected hon. auditors.

The General, Emergency, and Branch Committees were elected in the usual way, and also the representatives on the Lancashire and Cheshire Federation Executive and Trade Committees.

A long discussion took place regarding the desirability of enforcing the inter-trading rule, and after a very lengthy discussion, it was decided that the same come into operation in this district as from September 1st next.

A communication was received from the Master Painters' Association regarding the growing tendency of the Manchester and Salford Corporations to undertake building and other operations, and the same was referred to the General Committee for consideration.

The stonemasons' branch have met on two or three occasions to discuss their notice to the operatives for a reduction in wages and several alterations to the present working conditions, and the matter was referred to conciliation under the rules. (See below.)

The plasterers' branch have met several times during the month with reference to their proposed amendments to the operatives' working rules, and although the committee have interviewed deputations from the society on two occasions, and offered several concessions, they have been unable to settle the matter. Their notice, however, does not expire until June 11th, and it was hoped that something definite will be arrived at before that date.

At the annual meeting of this branch, held on May 11th, Mr. James Cadman, Swinton, was elected chairman for the ensuing year. The Joint Standing Committee under the N.A.O.P. Agreement was also elected at this meeting. It is regretted that this agreement in its recently amended form is not yet in operation, inasmuch as it provides for conciliation in disputes similar to the one at present pending, practically on the same lines as our National scheme.

The manufacturers of plaster partitions held a further meeting on May 24th for the purpose of considering the question of master plasterers fixing and finishing their partitions.

Manchester Board of Conciliation.

The annual meeting of the Manchester Board of Conciliation was held at the Employers' Board-room, Blackfriars Street, on May 13th, Mr. George Macfarlane in the chair.

Mr. George Macfarlane was re-elected chairman of the Board for the ensuing year, and Mr. T. R. Jones was elected vice-chairman.

Messrs. John Tomlison and J. M. Hughes were elected joint secretaries for the respective parties.

A notice of appeal from the employers and operative stonemasons, in which the employers had given notice for a reduction in wages of 1d. per hour, alterations in the summer working hours, and various amendments in the present working conditions, was before the meeting, and evidence was heard from witnesses from both sides. After hearing the witnesses, several resolutions were moved, with a view to attaining a settlement, but the ballot resulted on each occasion in equal voting; therefore the matter will go before the Northern Centre Board, according to rule.—JOHN TOMLISON, Employers' Secretary.

BARNOLDSWICK AND DISTRICT ASSOCIATION.

Secretary: J. C. Addyman.

A special meeting of the officers of Barnoldswick and District Association was held at the secretary's office, on Monday, May 24th, the president, Mr. E Smith, in the chair.

The meeting was called to consider a letter from the Yorkshire Federation secretary, and a telegram with regard to the proposed outing.

The Federation secretary's letter, suggesting that the Federation June meeting should be held at Skipton or Keighley instead of in Barnoldswick, was first dealt with, and after careful consideration it was resolved that the Federation secretary be written to informing him that, owing to many circumstances, the members could not accede, and urging that the meeting be held at Barnoldswick—if not in June, then at a later date—and intimating that the association is willing to send members to Skipton and assist in inaugurating an association if desired.

The secretary reported that a telegram had been received by the local stationmaster informing him that his company could not arrange for the saloon (required on the occasion of the annual outing to the Dukeries) to be sent nearer than Leeds, and, after due consideration, it was decided that under those circumstances all arrangements with the company with regard to the outing be at an end, and that the local stationmaster be informed to that effect.

BARROW-IN-FURNESS ASSOCIATION.

Secretary: J. Baker.

The monthly meeting of the Barrow-in-Furness Association was held on May 25th, when the question of binding apprentices was again under consideration, and it was decided to adhere to the rules as agreed upon by the masters and operatives. Two new candidates were balloted for membership, and accepted, and another was proposed for ballot at the next meeting.

The secretary reported that the master joiners had met and drawn up a list of prices to be charged for retail work, and it was arranged for the painters and plumbers to meet also for the same purpose.

The insurance under the Workmen's Compensation Act was under consideration, but was deferred for final decision at a special meeting to be held on June 8th.

WAKEFIELD AND DISTRICT ASSOCIATION.

Secretary: J. Beaumont.

A meeting of the Wakefield and District Master Builders' Association was held at the Bull Hotel, Wakefield, on June 3rd, Mr. Tom Lee (president) in the chair. A report of the meeting of the Executive Council of the Yorkshire Federation, held in Hull on May 20, was read, and Messrs. H. Fallas and G. Crook, who attended the meeting on behalf of the Association, made a supplementary report on various matters dealt with at this meeting. A long discussion took place on these reports, including the questions of priced schedules with tenders, and sub-contracting, inter-trading, and insurance against accidents. With regard to the insurance question, Alderman Judge asked for information as to the position of full contractors in case of accidents to sub-contractor's men, and the course to be adopted as to the insurance against accidents to these workmen. Mr. Fallas and Mr. Cook, in reply, stated that the Executive Council were taking legal advice on the matter, and that they expected it would be considered at the June meeting of the Executive Council.

During the meeting a new member was elected in the person of Mr. George Clements, builder, Featherstone, on the proposition of Alderman Judge, seconded by Mr. Scales.

LEEDS ASSOCIATION.

Secretary: J. Davidson.

The monthly meeting of the Leeds Association was held at the Grand Central Hotel on Tuesday, June 8th.

A letter was read from the Town Clerk of Leeds asking for information with respect to the usual practice in the building trade in regard to an allowance for walking time and payment of car fares, and whether payment was made to men who turn up for work but are unable to commence work for reasons over which they have no control. The secretary was instructed to state that as a general practice workmen are expected in Leeds, without allowance, to be on the job at starting time, and that no allowance is made for car fares or for men unable to commence work. The secretary was also instructed to point out that it was a generally recognised custom throughout the country, where employers and workmen were properly organised, to allow them to hear and determine upon all matters or disputes affecting rates of wages and conditions of labour. The conciliation arrangements with many operative societies engaged in the building trade afforded opportunities of this being done without resort to strikes and lock-outs. As the members of the association were required by the corporation to pay the standard rate and observe the recognised conditions of labour, and were under an obligation to observe the same for private as well as public work, they might be most materially affected by a decision of the corporation to depart from the conditions mutually agreed upon, and it was decided respectfully to ask the corporation not to set up any conditions of labour which are not in strict accordance therewith.

The secretary reported the result of his investigation of the accounts of the Education Committee for school repairs, and it was decided to leave the matter over for further consideration and attention.

A letter was read from the bricklayers' society calling attention to the fact that the erection of slabs for division walls was being carried out in some instances by plasterers, and claiming that this work should be exclusively done by bricklayers. After careful consideration, the members were unanimously of opinion that the matter was essentially one to be determined in the first instance between the operative societies directly concerned, and recommended that this procedure should be adopted.

The provisions of the Housing, Town Planning, etc., Bill in connection with the erection of back-to-back houses was also considered. It was felt that the strictures upon such erections which have been made in many quarters are not applicable to the style and character of houses erected in Leeds, and that the opponents of such houses did not appeciate the high standard and complete sanitary arrangements which such property affords. It would be disastrous to the building trade if any hindrance to the erection of workmen's dwellings at a reasonable cost was imposed in towns where land is freehold, and where rents have to be fixed to give a return for capital invested both for the property erected and also for the land occupied. Several members expressed the opinion, from their practical knowledge as builders and observation of properties in other towns, that there was no town in England where the working classes are so cheaply and efficiently housed as in Leeds. It was decided to send a letter to the Leeds Corporation hoping that their efforts to obtain either a substantial amendment or absolute withdrawal of the provisions of the Bill dealing with the back-to-back houses would be entirely successful, and promising to give such assistance as the corporation might deem expedient or helpful.

Several accounts were passed for payment, including further remittance on account of subscription to Yorkshire Federation.

The president invited the members to visit Ilkley on Monday, June 21st, and kindly offered to provide tea for them and their wives. The offer was unanimously accepted, and the secretary instructed to make the necessary intimation with a view to facilitating the arrangements.

Sheffield Building Trades Conciliation Board.

The annual meeting of Sheffield Building Trades Conciliation Board was held at the Builders' Exchange on May 17th, under the presidency of Mr. A. J. Forsdike. Mr. T. Smith was present as secretary for the employers, and Mr. T. Driver as secretary for the operatives. When the minutes of the meeting held on November 11th were submitted to the meeting, the vice-chairman objected that they were not a faithful record of the proceedings. Mr. Lindley said that the minutes unfairly favoured the employers' section of the Board.

Mr. Smith (employers' secretary) said that he entirely demurred from the remarks of Mr. Lindley. The operatives' secretary had approved the draft before they were finally typed off for the joint signatures, with the single exception in reference to an alleged promise of the chairman, about which they were unable to agree, and as the chairman confirmed his (the employers' secretary's) notes that no such promise was made, he refused to insert the paragraph in the minutes, and asked the operatives' secretary if he would sign the minutes, and cover his signature with a letter to the effect that he protested against the alleged omission, and on these conditions he had signed the minutes.

Mr. Driver (employees' secretary) said that the report had necessarily to be cut down. Generally speaking, the minutes were a faithful record, with the exception referred to. After some further discussion, the minutes were eventually passed with one dissentient.

The election of officers for the ensuing year was then proceeded with. Mr. A. J. Forsdike was again unanimously re-elected chairman, and Mr. F. Limage was re-elected vice-chairman.

The employers re-elected Mr. Thos. Smith as their secretary, and the operatives elected Mr. J. T. Welburn in place of Mr. T. Driver.

The method of paying overtime rates was next discussed, at the request of the operatives.

Mr. Lindley said that in several instances joiners, instead of being paid actual overtime rates, had been instructed to put down a certain amount of extra time to cover the extra rate of pay due to them, and if reference had to be made to the time sheets afterwards, it might appear that men had worked overtime at ordinary rates, and they thought that overtime should be paid for in accordance with the rules at time and a quarter, time and a half, or double time, as the case might be.

The Chairman said it was merely a question of method of reckoning, as the method complained of made not the slightest difference to the operatives.

The Chairman promised that the matter should receive the attention of the Master Builders' Association at their next meeting.

The question of a uniform holiday week, which was referred to last year, was again discussed, the Chairman remarking that the M.B.A. were anxious that something should be done in the matter.

Mr. Driver said that all the operatives' societies had reported to him as unfavourable to the proposal, and he thought the employers would not be willing to inaugurate a uniform holiday week this year in view of the destitution in the city.

Mr. Biggin spoke of the disorganisation caused by clerks and others taking their holidays throughout the summer months, and in reply to Mr. Wood, said that it was proposed to shorten the other holidays.

The Chairman said it was proposed to have only one day at Easter and one day at Whitsuntide.

The matter was eventually left over for further discussion by both parties.

The Chairman asked if the Joiners and Bricklayers' Societies had yet come to any decision in regard to their meeting on March 5, when the M.B.A. proposed the abolition of walking time.

Mr. Lindley said that the reports on the subject that had appeared in the local Press were unauthorised, and a resolution to that effect was unanimously passed.

Mr. Stone said that it was still the practice of some employers to make stoppages of 1d. or 2d. a week for Workmen's Compensation Insurance. He thought that every fair-minded employer would agree that the premiums were never intended to be paid by the workmen, and that the members of the M.B.A. should point out to their members that the practice was illegal. The Chairman promised that the matter should receive attention.—THOS. SMITH, Employers' Secretary.

EDINBURGH, LEITH, AND DISTRICT BUILDING TRADES ASSOCIATION.

Secretary: James Cameron.

The monthly meeting of the Executive of Edinburgh, Leith, and District Association was held in the Building Trades Exchange. 61, Lothian Road, Edinburgh, on Thursday. May 27th. There was a good attendance of members, presided over by Mr. David Mekie.

Two new members were admitted.

On the invitation of the Edinburgh School Board, Mr. Simon Slater, builder, and Mr. William Patterson, blind manufacturer, were elected as representatives to the advisory council in connection with the educational information and employment bureau.

Mr. Patrick Knox, plumber, and Mr. Alexander Macdonald, plumber, were appointed to represent the association on the Council of the National Registration of Plumbers.

The secretary reported that the Board of Trade arbiter had now given his award in connection with the Glasgow joiners' wages. The operatives had asked an increase from 9¼d. per hour to 10d., but the arbiter has fixed the wages at 9d. per hour—a reduction of ¼d. per hour, the change to take effect as from July 1st.

The meeting had also under consideration the schedules for a certain contract. At the end of the schedule the usual clauses are inserted for day's work and material, but an innovation has been introduced in respect that the architects issuing the schedules have inserted the rates they are to allow for time and material. It was pointed out that the rate allowed for several of the items was very much under the cost price of the material, and it was felt that the building committee and the law agents who had issued the schedules were not cognisant of how matters stood, and the secretary was instructed to address a letter to the law agents, protesting that some of the prices stated were below the actual cost of material, but that the principal objection to this innovation of inserting prices in a schedule is, that it is directly against fair competition, and that no architect or surveyor has any right to dictate to a contractor the price that he must do certain work for.

Arrangements have been made for the annual excursion to take place on June 23rd to Blairgowrie and Dunkeld.

OLDHAM AND DISTRICT ASSOCIATION.

Secretaries: Cowper and Dean.

After long and careful consideration by the Finance Committee of the Oldham Corporation, who held interviews with the representatives of the Oldham Master Builders' Association, and also with the Oldham Trades and Labour Council, the Oldham Town Council have at last accepted as a basis for construction of the new Fair Contracts Clause—the document reproduced below.

It will be noticed that, after strenuous opposition to the original clauses submitted from the Oldham Trades and Labour Council by the Oldham and District Master Builders' Association, certain objectionable clauses have been removed, such as giving the trades union the sole right to state what is the standard rate of wages in the several occupations, also the question of delegates being allowed on any of the contractors' jobs to collect subscriptions, etc. A further objectionable feature providing that workmen shall be paid compensation for *any* loss sustained out of the penalty has been removed; the loss is now strictly confined to *loss of wages* only. It is to be regretted that the maximum sum of £500 as a penalty has not been reduced, and it is further to be regretted that the Finance Committee have not seen their way to recommend the appointment of an independent arbitrator in connection with the clauses, which really leaves the Town Council, who are parties to the contract, the sole right to decide when a breach has been committed, and they are also empowered to impose penalty for same. The Oldham and District Master Builders' Association have done their utmost to remove this objectionable view, but without avail. This information will probably be interesting to other towns.

Basis for Construction of New Fair Contracts Clause, as Adopted by the Town Council.

Payment of the Standard Rate of Wages.

1. Contractors tendering for or executing work under this Council must pay to the whole of their workpeople the standard rate of wage in the several occupations and districts in which they are engaged. The rate recognised between the Trade Unions and the Associations of Employers shall be deemed to be the standard rate.

Observance of Trade Conditions.

2. Contractors shall observe the hours of labour and conditions and customs of employment prevailing in the several trades and districts, in regard to rates for overtime, extra work, apprentices, holidays, or other established conditions.

Responsibility in Sub-Contract Cases.

3. The contractors shall not assign or sublet a contract or any part of it without the consent of the Council, and in connection with any sub-contract work the principal contractor shall be responsible for the observance of the various conditions as though the contract was being carried out by the contractor himself. The sub-contractor shall be made subject by the Council to the conditions herein stated respecting any work he has undertaken.

Availability of Information regarding Contracts.

4. A list of rates of wages paid in the several trades in connection with work for the Council shall if required be provided by Contractors who are accepting contracts and shall be available for inspection by representatives of the Workmen's Societies.

Freedom as to Trade Union Requirements.

5. Contractors or sub-contractors must recognise the freedom of their workpeople to be members of Trade Unions and concede full liberty to fulfil the usual conditions of membership provided that the duties of workmen to their employers are not thereby interfered with.

Production of Proof when Demanded.

6. Should the Council have reasonable grounds in its opinion for believing that the conditions of the contract are not being com-

plied with, the contractor shall be required to produce, without delay, adequate proof to satisfy the Council.

Penalty for Breach of Conditions and Recompense to Workmen.

7. Failure on the part of contractors to comply with any conditions set forth in this clause shall leave the Council power to cancel the contract or call upon defaulting contractors to pay to the Council any sum not exceeding £500. From any sum so obtained payments may be made to workmen to cover any loss of wages which it may be proved they have suffered by breaches of any of the conditions herein stated.

Assent to Contract, and Application to Local Authority.

8. Clauses expressing these various conditions for contractors shall be inserted in all contracts for work to be done or goods to be supplied, and contractors shall be required to signify their assent to them in writing. The provisions of this clause regarding wages, hours, and other conditions named herein shall also apply to public work done by the Council itself.—*June 2nd*, 1909.

HULL ASSOCIATION.

Hon. Secretary: A. Peers.

The monthly meeting of the Hull Association was held at the Builders' Exchange, Posterngate, on Tuesday evening, June 15th, when upwards of forty members were present, Mr. E. Quibell presiding.

Reference was made to the death, after a long and painful illness, of an old and well-respected member of the association, Mr. J. Hunter, slater, Machell Street, Hull, the members rising in sympathy. It was resolved that a letter of condolence be forwarded to the widow and family.

The need for a more convenient morning train service from Bridlington to Hull was raised. It was decided that the association petition the North Eastern Railway Co. for an earlier and faster train service during the summer months. The suggested inter-trading rules from the Yorkshire Federation were again discussed, and the decision come to that the same be not adopted, and that the present rules be adhered to.

It was resolved that the monthly meeting be discontinued during the months of July and August, unless any special business arises; the Builders' Exchange to be closed for August Bank holiday week, which is the date arranged for the week's general holiday throughout the building trades of Hull.

The annual picnic of the Association will take place on Thursday, June 24th, to Pateley, about 10 o'clock. After hot luncheon has been served at the King's Arms Hotel, the party will be conveyed in carriages to Holstein Beck. A meat tea will be partaken of at Pateley on returning from the drive. At 8.15 p.m. a start will be made for Hull.

Views and Reviews.

Italian Architecture of the Renaissance.

The Architecture of the Renaissance in Italy. A General View for the Use of Students and Others. By William J. Anderson, Architect, Associate of the Royal Institute of British Architects. Fourth edition, revised and enlarged. With seventy collotype and other plates, and one hundred and ten illustrations in the text. Large 8vo, 12s. 6d. net. London: B. T. Batsford, 94, High Holborn. 1909.

This improved edition of a successful book is sure to find wide acceptance. It has been carefully revised by Mr. Arthur Stratton, A.R.I.B.A., of King's College, London, who gratefully acknowledges "the help and advice unsparingly given by Mr. R. Phené Spiers, F.S.A." Many fresh illustrations have been added, and several of them are from drawings by Mr. Leslie Wilkinson, A.R.I.B.A., to whose artistic skill our own pages have on many occasions borne witness.

Perhaps the chief value of the book for students, as well as for those who, while not disdaining to be still classed as students, have passed beyond the state of pupilage, consists in the fact that the author threw his work into a truer perspective than that with which the more pretentious works of Fergusson and Gwilt had made us familiar. Whereas these authors dealt at disproportionate length with the later periods of the Renaissance, Mr. Anderson endeavoured to see it steadily and see it whole, devoting four-fifths of his space to the early and culminating periods, and relegating Vignola and Palladio and the Barocco school to the last chapter.

The origin and character of the Renaissance, and the part played in it by Brunelleschi—"wherever the arts of form are understood and believed, the genius of Brunelleschi will not fail of honour and renown"—are set forth in the introductory chapter with keen insight and remarkable terseness; and although the contention that the Italian Renaissance was no mere reactionary copying of good forms that had been forsaken, but was unquestionably an embodiment of the temper of the time, seems now a little too insistent and perhaps rather superfluous, it may still serve to correct some lingering misapprehensions fostered by Ruskin and Fergusson; and the observation that possibly all ages of healthy human prosperity are more or less periods of revival, when men's minds wisely turn to the contemplation of the best traditions, represents the attitude of many who see in the impatient demand for a "new style" not strength and wisdom, but their opposites. Aggressive self-assertion in art and architecture, and the excessive straining and striving after originality, can only result in futile effects; and the Renaissance, Mr. Anderson is at some pains to show, was not of this kind, any more than it was the mere fanning of the ancient embers. The energy that led to the perception and choice of the best elements of earlier work was not exhausted in this effort; rather it grew with the exercise; and originality found free scope in fresh interpretations and re-combinations in accordance with the virile and valiant spirit of the times. The masters of the Renaissance were at once exuberant and scholarly, receptive and creative; and the Renaissance itself was, in a word, a wondrous expansion of evolution, in an extraordinary season of rapid and vigorous growth and of swift flowering and fruition.

Of this prolific period the author has rendered a faithful and just account; concise but not incomplete. His mastery of the subject, and his love of it, are apparent on every page; his commendation and his adverse criticism of the sagaciously chosen examples that he examines and compares are, one feels instinctively, alike inspired by entire sincerity of conviction, which is broadly and firmly based upon the conscientious ascertainments of an acutely judicial mind. One can respect his judgments even in the surprisingly few instances in which one does not feel bound to agree with him. The student will find no sounder or safer guidance in the study of the most stupendously important period in the history of architecture. The book is well and copiously illustrated; and the pictures alone, being chosen with taste and discrimination, and including as they do all that is most profitable for contemplation (as well as one or two examples that are perhaps hardly quite worthy of the august company), are a priceless boon to the earnest student. Extremely useful addenda are a chart of the chief buildings of the Renaissance, and a select list of books relating to the subject. The book is produced in the ecellent style that is customary with the house of Batsford.

Coming Events.

Monday, June 21st—Saturday, June 26th.

Annual Congress of French Architects, Paris.

Wednesday, June 23.

Special General Meeting R.I.B.A. to consider a resolution authorising the council to purchase leases of additional premises for the Institute. 8 p.m.

Saturday, June 26th.

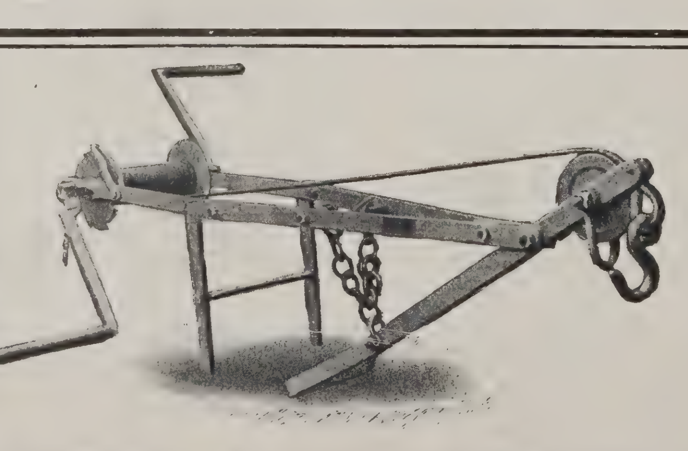
Edinburgh Architectural Association, 117, George Street.—Visit to Dunfermline, leaving Waverley at 1.20 p.m.

Wednesday, June 30th.

Members of the R.I.B.A. view the "Exhibition of Chosen Pictures," at the Grafton Galleries, 3 to 6 p.m., on the invitation of the hon. committee.

Monday, July 26th—Friday, July 30th.

Institution of Mechanical Engineers,—Summer Meeting, Liverpool.



A HANDY, PORTABLE
and instantly adjusted Tackle for raising and lowering
LADDERS, SCAFFOLDING MATERIALS, &c.
A valuable addition to Contractors and Builders' Plant.
SAVES TIME AND LABOUR.
Best English Make. Fitted with galvanized steel wire rope.
Price £5 5 0.

L. & C. HARDTMUTH'S

KOH-I-NOOR PENCIL

Is the most economical Pencil made. It lasts six times as long as an ordinary pencil. But it is the velvety smoothness of the lead that is the great charm of the Koh-I-Noor. There is no other pencil that nearly approaches its quality. The lead of the Koh-I-Noor is specially prepared by a perfected process which gives it a firmness yet delicacy of touch that cannot be imitated. The Koh-I-Noor is made in seventeen degrees to suit all pencil purposes.

Koh-I-Noor Pencils are **4d.** each, and **3s. 6d.** per dozen, everywhere. Of Stationers, Artists' Colourmen, Photographic Dealers, &c. Booklet free from

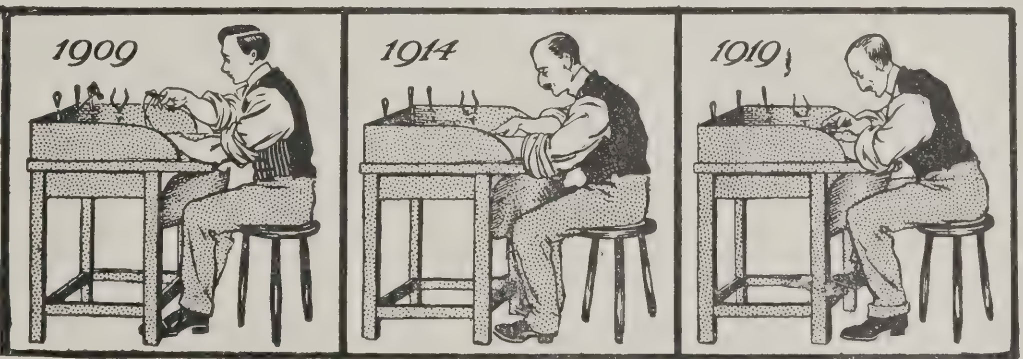
BRANCH—St. Albans.
WORKS—Tredegar Works, Bow, E.

Telephone: WESTMINSTER 5907.

Don't let it be "the same old grind."



5 years — 10 years — 15 years hence.

The man who is content just to go on "waiting" for advancement, "wishing" for a more congenial position, "hoping" for more money, finds himself still at the same old job at the same low pay as the years roll over his head—unless, indeed, he finds himself displaced altogether!

Don't let this hopeless record be yours. You have ambition—give rein to it.

Get the training which will promptly fit you for a better post

and secure you successive advances as the years pass on. It's not a difficult matter to get this training. The International Correspondence Schools will bring it to you in your own home, in your spare time, and on terms to suit your pocket. This institution was founded 18 years ago for the express purpose of enabling ambitious men to improve their prospects. Its record is a brilliant one. As typical of our students' successes, read the following:—

"Edinburgh.

Before enrolling in the I.C.S. I held a very humble position of junior fitter in the...........Branch of the...........Company. I was advised to take up your course in Telephone Engineering. I commenced studying at night from 6 till 10 p.m. although employed during the day. In six months I completed the course. I was placed in a responsible position on the new switch board without delay. Within a few weeks I was given the position of Assistant Traffic Superintendent, with the promise of rapid promotion. (Signed) J. A. J. HAY."

Send for particulars of our training, also of the

Free assistance in the matter of employment

rendered by our "Students' Aid Department," which is in touch with employers in every district, and furnishes I.C.S. students with introductions, recommendations, etc.

Mark the coupon or write us about any special career which interests you—NOW.

Residents of the following Countries should address the respective I.C.S. Branches:—

CANADA—Toronto.
INDIA—Fort, Bombay.
SOUTH AFRICA—Cape Town.
NEW ZEALAND—Wellington.
AUSTRALIA—Sydney.
ITALY—Naples.
CHINA.—Shanghai.
P.I.—Manila.
HONOLULU—Honolulu.
PANAMA—Ancon.
BERMUDA—Hamilton.
STRAITS SETTLEMENTS—Singapore.
PORTO RICO—San Juan.
JAMAICA—Kingston.
MEXICO—Mexico D.F.
ARGENTINE REPUBLIC—Buenos Aires

Registrar, INTERNATIONAL CORRESPONDENCE SCHOOLS, Ltd., 88
(Dept. B·), International Buildings, Kingsway, London, W.C. And at Manchester, Birmingham & Glasgow.

I am interested in your System of Technical Training and desire to increase my earning power. Please send me, post paid free of charge, the Book covering the subject before which I have marked **X** on the Coupon, and full information showing how I can succeed in same.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about **five days** after the date of this issue.

Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

June 23—July 5. **GREAT YARMOUTH.**—Erection of a new children's ward at the General Hospital, for the Committee. Builders desirous of tendering should send their names, together with postal order or cheque for £1, to Olley and Haward, architects, 5, Queen Street, Great Yarmouth, by first date above. Tenders are to be sent to R. F. E. Ferrier, Hon. Secretary, 33, Hall Plain, Great Yarmouth.

June 24. **WIMBLEDON, SURREY.**—Extension of the technical institute at Wimbledon, for the Surrey Education Committee. Drawings and conditions of contract may be seen on application to the Architests, Jarvis and Richards, 10, Queen Anne's Gate, Westminster, S.W. Names to sent to the Secretary, Surrey Education Committee, County Education Office, Kingston-upon-Thames, together with deposit of £2 2s.

June 25. **MANCHESTER.**—Construction of a battery house at Dickinson Street generating station, for the Corporation. Forms of tender, etc., of F. E. Hughes, Secretary, Electricity Department, Town Hall, Manchester, on deposit of £2 2s. Tenders to the Chairman of the Electricity Committee, Town Hall.

June 25. **LONDON.**—Erection of a bandstand, composed of wood and tiles, at Boundary Street Garden, Bethnal Green, for the L.C.C. Drawing and specification, form of tender, and other particulars, at the architect's department, 19, Charing Cross Road, W.C., upon deposit of 10s. with the cashier of the Council, at the County Hall, Spring Gardens, S.W. Tenders to be delivered at the County Hall, addressed to the Clerk of the L.C.C., Spring Gardens, S.W. Fair wages clause.

June 25. **ORMSIDE (near APPLEBY).**—Erection of an additional block, 97ft. in length, consisting of two wards with kitchen and nurses' room, lavatories, bath, w.c., etc., in connection with the Joint Infectious Hospital at Ormside. The building will be constructed of match boarding on brick foundations, and will be covered with corrugated iron. Plans and specifications by appointment of the borough surveyor, Appleby. Tenders to be delivered to Wm. Hewitson, clerk to Joint Hospital Committee, Appleby.

June 26. **CULGAITH.**—Erection of a new classroom at the Culgaith School. Plans and specifications, at the Vicarage, Culgaith, or at the offices of the architect, Jos. Graham, Castle Street, Carlisle.

June 26. **PENSNETT (near DUDLEY).**—Erection and completion of a new Council school for 250 children, and a cookery-room, at Pensnett, for the Staffordshire Education Committee. Persons desirous of tendering should apply to Graham Balfour, Director of Education, County Education Offices, Stafford, enclosing deposit of £1 1s., when quantities will be supplied.

June 26—July 1. **LONDON.**—Repairs and decorative work at the Infirmary, Lower Road, Rotherhithe, S.E., for the Guardians of the Parish of Bermondsey. Specification of A. H. Newman. F.R.I.B.A. Forms of tender, specification, and bills of quantities, etc., of E. Pitts Fenton, Clerk, 283, Tooley Street, S.E., to whom tenders are to be sent. £10 deposit (Bank of England Note) required.

June 28. SHARLSTON.—Erection of a central Sunday school, near S. Luke's Church, Sharlston; drawings and specifications may be seen at S. Luke's Lodge, Sharlston, near Wakefield, on deposit of £1.

June 28. **COTHERSTONE.**—Additions and alterations to St. Cuthbert's Grove, Cotherstone. Plans and particulars can be seen with Wm. Kidd, Red Lion Hotel, Cotherstone. Tenders to be sent to E. Stephenson, 14, North Lodge Terrace, Darlington.

June 28. **LLANFYNYDD.**—Execution of structural alterations to the Council School for the Flintshire Education Committee. Plans and specifications may be seen on application to Samuel Evans, County Surveyor, Mold. Tenders are to be sent to Fred. Llewellyn-Jones, Secretary, Mold.

June 28. **PENARTH.**—Re-erection of the tower at the public baths for the U.D.C. Plans and specification, etc., of the Architect, H. Snell, 13, Hickman Road, Penarth, on deposit of £1 1s. Tenders to be sent to J. W. Morris, Clerk to the Council, District Council Offices, Penarth.

June 28. **DORCHESTER.**—Repairs at the following schools, for the Dorset Education Committee:—Bothenhampton, Buckhorn Weston, Caundle Stourton, Charmouth, Gillingham, Handley, Lytchett Matravers, Lytchett Minster, Stour Provost, Stratton, Swyre, Yetminster. Tenders to be sent to the Secretary, County Education Office, Dorchester.

June 28. **DROXFORD (HANTS.).**—Taking up a stone floor and replacing same with wood, and certain other repairs, painting, etc., at the Droxford Workhouse, for the Guardians of the Union. Specifications may be had from the Clerk, or at the Workhouse, Droxford. Tenders to be delivered to Godfrey Pearson, Clerk, Bishop's Waltham.

June 28. **NORTHOP HALL (near NORTHOP).**—Reconstruction (after fire) of the Council School, for the Flintshire Education Committee. Plans and specifications can be obtained on application to Samuel Evans, County Surveyor, Mold, on deposit of £2 2s. Tenders to be sent to Fred. Llewellyn-Jones, Secretary, Mold.

June 28. **GREENFIELD (near HOLYWELL).**—Erection of a new Council School, to accommodate 350 children, at Greenfield, for the Flintshire Education Committee. Plans and specifications at the offices of Samuel Evans, County Surveyor, Mold, on deposit of £2 2s. Tenders to be sent to Fred. Llewellyn Jones, Secretary, Mold.

June 28. **BIGGLESWADE.**—Erection of a block of Church of England schools, Biggleswade, for the Foundation Managers. Bills of quantities and form of tender may be obtained of Thomas Cockrill, A.M.Inst.C.E., Architect, Market Square, Biggleswade, on deposit of £2 2s. Drawings, specifications and conditions of contract, may be inspected at the office of the Architect. Tenders must be delivered to P. A. Smith, Secretary to Building Committee, "Elmhurst," Drove Road, Biggleswade.

June 28. **GLASGOW.**—Execution of works:—1, digger, mason, brick, and steel; 2, carpenter, joiner, glazier, and ironmonger; 3, plumber; 4, plaster; 5, tile and marble; in connection with Glasgow Royal Infirmary reconstruction. Drawings at the office of the architect, James Miller, A.R.S.A., 15, Blythswood Square. Copies of schedules on deposit of £1 1s. with Peter Rintoul, secretary, 212, West George Street, Glasgow.

PAINTING.

June 28. **LIVERPOOL.**—Painting the exterior of the Kirkdale Homes, Westminster Road, for the Select Vestry. Specification may be obtained of H. J. Hagger, Vestry Clerk, Parish Offices, Brownlow Hill, Liverpool, to whom tenders are to be sent.

June 29. **OSSETT.**—Cleaning, painting, etc., the interior of Ossett Parish Church. Particulars may be obtained from J. Lockwood, 20, Springstone Avenue, Ossett, to whom tenders are to be sent.

June 29. **GUISELEY, near LEEDS.**—Making about 460 yards of 9in. stoneware pipe sewer in Kelcliffe Lane, Guiseley, for the U.D.C. Plans and specification and bills of quantities and full particulars of Joe Battye, Surveyor, Town Hall, Guiseley, on deposit of 10s. 6d. Tenders to be sent to M. Rennard, Clerk to the Council, Guiseley.

June 29. **NORWOOD, S.E.**—Internal cleaning and painting at the School at Norwood, for the Guardians of the Poor of the Parish of Lambeth. Specification will be supplied on personal application on deposit of £2. Tenders to be sent to James L. Goldspink, Clerk to the Guardians, Guardians' Offices and Board Room, Brook Street, Kennington Road, S.E.

June 29. **LEYTON.**—Cleansing, painting, and repairs at four schools, improvement of gas lighting at two schools, to be executed during the summer vacation, and hot-water heating apparatus, at Sybourn Street School, now in course of erection, for the U.D.C. Specifications, conditions and forms of tender of William Jacques, A.R.I.B.A., 2, Fen Court, Fenchurch Street, E.C., on deposit of £1 (cheques will not be accepted). Tenders must be delivered at the meeting of the council to be held on June 29, at 7 p.m. Fair wages clause.

June 29. **LONDON.**—Cleaning and repainting stations, etc., at the following places, for the Great Western Railway:—16, Stations at Coed Poeth, Brymbo, Plas Power, and engine shed at Croesnewydd, near Wrexham; 17, stations, at Baschurch, Rednal, Chirk, Cefn, and Oswestry; 18, stations etc., at Park Royal, Ealing, Southall, Trumpers Crossing, Brentford, and Uxbridge; 19, stations at Windsor, Cookham, Bourne End, Twyford, Wargrave, and Shiplake; 20, stations at Goring, Cholsey, Wallingford, Didcot, Upton, Churn, Hermitage, and Woodhay; 21, bridges between Oxford and Birmingham, etc.; 22, bridges in Worcester, Birmingham, and Wolverhampton districts; 23, stations at Coleford, Monmouth (May Hill), Monmouth (Troy), Raglan, Llandenny, and Little Mill; 25, stations at Church Stretton, Craven Arms, Plealey Road, and Pontesbury; 26, stations at Onibury, Bromfield, Ludlow, and Woofferton. Specifications and forms of tender and bills of quantities at the office of the Engineer at Shrewsbury for 16, 17, 25, and 26; at 7, Eastbourne Terrace, Paddington, W., for 18, 19, and 20; at Wolverhampton for 21 and 22; and at Gloucester for 23. Tenders to be sent to G. K. Mills, Secretary, Paddington Station, London.

June 30. **EDINBURGH.**—Execution of painters' work at George Heriot's School, the Heriot Watt College, and the Trust Offices. Specifications, etc., may be obtained from John Anderson, Superintendent of Works. Tenders to be sent to Peter MacNaughton, Clerk, 20, York Place, Edinburgh.

June 30. **HOLYHEAD.**—Execution of (a) external painting of the Cybi Council School, Holyhead; (b) certain alterations at the Park Council School (infants' department), Holyhead, and (c) painting and repairs to the Llangeinwen (Dwyran) Council School, for the Anglesey Education Committee. Specifications may be inspected at the office of Jos. Owen, F.R.I.B.A., County Architect, Exchange Chambers, Holyhead. Tenders to be delivered to R. H. Williams, Secretary of Education, Education Offices, Llangefni. Tenders for the work at either or all the schools may be submitted.

July 1. **KING'S LYNN.**—Cleaning, distempering, and painting the ground floor of the female ward at the Infirmary, for the Guardians of the Union. Specifications may be seen at the Workhouse. Tenders are to be sent to R. C. Coulton, Clerk to the Guardians.

July 1. **WALWORTH, S.E.**—Painting, cleaning, etc., work at the Southern Relief Station, Boyson Road, Walworth, S.E., for the Southwark Union, London. Specification, etc., of Sydney Wood, Clerk, Union Offices, John Street West, Blackfriars, S.E., to whom tenders are to be sent. Fair wages clause.

July 1. **EAST DULWICH.**—Painting, cleaning, etc., work at the Infirmary, East Dulwich Grove, S.E., for the Southwark Union, London. Specification, etc., of the Architect, A. W. Tribe, 120, Clapham Road, S.W., on deposit of £2 2s. Tenders to be sent to Sydney Wood, Clerk, Union Offices, John Street West, Blackfriars Road, S.E. Fair wages clause.

July 12. **BLACKBURN.**—Painting, etc., at various schools in the Borough, for the Corporation. Applications should be made to William Stubbs, A.M.I.C.E., Borough Surveyor, Municipal Offices, Blackburn, to whom tenders are to be sent.

July 13. **LONDON, S.E.**—Cleaning, painting, etc., at the Infirmary, Brook Street, Kennington Road, S.E., for the Guardians of the Poor of the Parish of Lambeth. Tenders to be sent to James L. Goldspink, Clerk, Guardians' Board Room and Offices, Brook Street, Kennington Road, S.E., to whom forms of tender and specification may be obtained on deposit of £2.

No Date. **ARMLEY.**—Painting outside 20 houses. Particulars may be obtained on application to 32, Cheltenham Street, Tong Road, Armley.

No Date. **BISHOP AUCKLAND.**—Painting the Waterloo Hotel, Bishop Auckland, and Fleece Hotel, West Auckland. Specifications to be seen on the premises. Tenders to be sent to E. I. Robinson, Bishop Auckland.

No Date. **ECCLESFIELD (YORKS).**—Painting and distempering at Provided Schools, for the County Council of the West Riding of Yorkshire. Specification may be obtained of W. Hague, Divisional Clerk, Education Office, Ecclesfield.

No Date. **WOODHOUSE.**—Painting and distempering at the Handsworth, Fence, Treeton, and Catcliffe Provided Schools, and asphalting Aston Provided School, for the County Council of the West Riding of Yorkshire. Applications for specification to be made to S. Abson, Divisional Clerk, Education Office, Woodhouse.

PLUMBING AND SANITARY.

June 26. **WINDSOR.**—Forming connections between house drains and sewers in the parish of Clewer Without from and after June 30, for the R.D.C. Conditions from the surveyor to the council, W. Menzies, Englefield Green, Surrey. Tenders must be delivered to J. E. Gale, clerk, 3, Sheet Street, Windsor.

June 28. **WANTAGE.**—Re-construction of drainage at the Workhouse, for the Guardians of the Union. Plan, specification, and quantities, on deposit of £2 2s. with Edwd. B. Ormond, Clerk to the Guardians, Wantage, to whom tenders are to be sent.

June 28. **ANSTON.**—Laying about 3,900 yards of 9in. and 6in. stoneware pipe sewers, construction of manholes, tanks, filters, and other appurtenant works at Anston, for the Kiveton Park R.D.C. Drawings and copies of the specification, bill of quantities, and form of tender at the offices of the engineers, Berrington, Son and Watney, Bank Buildings, Lichfield Street, Wolverhampton, and 28, Victoria Street, Westminster, S.W., on deposit of £5s. 5s. Tenders must be delivered to James Snow Whall, solicitor, Clerk to the Council, 66, Bridge Street, Worksop.

June 29. **NOTTINGHAM.**—Sanitary fittings and plumbing work, as follows, for the Education Committee:—1, Scotholme Council school, Southwark Council School, w.c. fittings; 2, St. Anne's Well Road Council School, Forster Street Council School, Ropewalk Council School, Carrington Council School, lavatory basins. Plans and copies of the bills of quantities and forms of tender from the office of the City Architect, Frank B. Lewis, Guildhall, on deposit of £1 1s. for each contract. Tenders to be delivered to W. J. Abel, Clerk, Education Offices, South Parade. Fair Wages Clause.

June 3. **WANTAGE.**—Construction of a sewer from Newbury Street to the Workhouse premises, a distance of one mile, 206 yards, for the U.D.C. Plans, specifications, and billse of quantities, can be seen with Edwd. B. Ormond, Clerk, Wantage, Berks, to whom tenders are to be sent.

June 30. **MANCHESTER.**—Construction of an underground lavatory for males at the Poultry Market, Shudehill, for the Corporation. Drawings may be seen and specification, bill of quantities, and form of tender obtained, at the office of the City Surveyor, Town Hall, Manchester, on deposit of £1 1s. with the City Treasurer. Tenders, addressed to the Chairman of the Lavatories Sub-Committee, to be delivered at the City Surveyor's office.

July 5. **STEPNEY, E.**—Construction of two underground conveniences in Horseferry Branch Road, by Commercial Road East, Ratcliff, E., for the Corporation. Drawings and bill of quantities, etc., of the Borough Engineer, M. W. Jameson, A.M.Inst.C.E., Municipal Offices, Great Alie Street, Whitechapel, E., upon deposit of £5 Bank of England note. Tenders to be sent to Geo. W. Clarke, Town Clerk, Municipal Offices, Great Alie Street, E.

July 6. **RAWTENSTALL.**—Construction, in Cowpe Road, within the Boroughs of Rawtenstall and Bacup, of a 12in. and 9in earthenware pipe sewer, together with manholes, lampholes, etc., for the Corporations. Plans and specification, bill of quantities, and forms of tender, on application to James Johnson, Borough Engineer, Municipal Offices, Rawtenstall, or William Henry Elce, Borough Engineer, Bacup, on deposit of £1 1s. Tenders to be addressed to James Whalley, Town Clerk, Rawtenstall.

July 10. **BELFAST.**—Internal plumbing work in connection with the Purdysburn Villa Colony Asylum (No. 1 Contract), for the Corporation. Specifications and particulars on application to the Architects, Graeme Watt and Tulloch, 77a, Victoria Street, on deposit of £1. Tenders to be sent to R. Meyer, Town Clerk.

ROADS AND CARTAGE.

June 26. **LEWES.**—Scarifying and steam road-rolling, for the Corporation. Forms of tender and further information can be obtained at the Borough Surveyor's Office, Town Hall, Lewes. Tenders to be left at the office of Montague S. Blaker, town clerk, Town Hall, Lewes.

June 26. **BEDWELLTY (WALES).**—Construction of a new road from Aberbargoed to Cwmsyfiog, and extension of road from Pengam to Fleur-de-Lis, for the U.D.C. Plans and specifications and forms of tender on application to the Council's Surveyor, J. H. Lewis, Assoc.M.Inst.C.E., Blackwood, Mon., upon deposit of £3 3s. Tenders to be delivered to T. J. Thomas, Clerk to the Council, Bargoed, Glam.

June 26. **ACOCK'S GREEN.**—Making up Douglas Road, Acock's Green, for the Yardley R.D.C. Plans, etc., of the Engineer and Surveyor, Arthur W. Smith, Council House, Sparkhill, near Birmingham. Bill of quantities and form of tender on deposit of £1 1s. Tenders to be delivered to Francis Ladbury Thompson, Clerk to the Council, Council House, Sparkhill, near Birmingham. Fair wages clause.

June 28. **ARUNDEL.**—Supply and delivery of 300 cubic yards of clean, hand-picked surface flints, for the Corporation. Form of tender, and particulars, may be obtained of the Borough Surveyor, E. F. Farrington, Town Hall, Arundel, to whom tenders are to be sent.

June 28. **DROXFORD (HANTS.).**—Hire of steam rollers and scarifiers, during the period ending March 31, 1910, for the R.D.C. Forms of tender and conditions of contract of the Clerk, or of A. V. Carter, District Surveyor, Droxford, Hants. Tenders to be sent to H. Godfrey Pearson. Clerk. Bishop's Waltham, Hants.

Compulsory Conciliation. According to Mr. William Scott, secretary of the Otago Employers' Association, the result of the Industrial Conciliation and Arbitration Act, in New Zealand, after thirteen years' experience, is that both employers and workmen consider it in the main a failure; the former, because it has been driven too far, and has endeavoured to accomplish too much; the latter, because it does not go far enough, and that to be a success it must provide a system of profit-sharing. During the years the Act has been in force, the Colony has experienced a period of great prosperity, owing almost wholly to the high price of its produce. The Act, therefore, has not been tried by a period of depression, and until so tried must be considered as merely an experiment. All the same, it has signally failed in creating better feeling between employers and workmen and in preventing strikes. As regards its effect on industries, the Act cannot be said to have made for better work, improved methods, or the fostering of trade. Indeed, it has had the opposite effect, and has greatly increased the cost of production, as has been amply shown in the evidence tendered before the Arbitration Court during the last year or two by the clothing, woollen, timber, and coal industries. The late Mr. Seddon, when Premier of the Colony, admitted "that the industries of the Colony had now more than they could carry; that trade was languishing and going back, and that the workers were no better off." The workers themselves have realised that the higher wages, shorter hours, and restricted conditions of work for which the Act is responsible have not improved their condition. The only remedy they see is either a high protective tariff or State control of production. It is admitted that the Act has operated beneficially as regards the remedying of sweating, but it is urged that this could have been equally well effected by an extension of the Factory Acts. It fails, however, in its larger object of preventing strikes. Mr. Scott asserts, as the result of thirteen years' experience as an employer and four years' experience as an employers' advocate before the Arbitration Court, that any method of regulating wages by Act of Parliament must in the end result in failure. Summing up, he says that the Act has "created strife, manufactured disputes, impaired the work, restricted the output, increased cost of production, put up the cost of living until a pound to-day goes no further than did 16s. in 1894, to the detriment of all. The latest statistics show the increase of wages to be from 8½ per cent. to 10 per cent., and the increased cost of living to be from 25 per cent. to 30 per cent." The example of New Zealand in this matter having been frequently urged upon the attention of legislators and employers in this country, it is only fair that Mr. Scott's indictment should be taken into account; and the interests in it of our builders, as almost the largest employers of skilled labour, is very obvious.

"That Vile Wall." (Shakespeare.) The late Mr. John Bellows, of Gloucester, who achieved considerable renown as an excellent printer, was also something of an antiquarian, and, in particular, had a keen nose for old walls. He "found, and identified, and preserved," beneath his printing works at Eastgate, Gloucester, portions of the east wall of the Roman town of Glevum. That very notable achievement should have sufficed him; but he must needs announce that under another shop, in the lower part of Westgate Street, he had found "proofs nine feet thick" of "one of the massive buttresses of the Castle of the West Gate of the Roman City of Glevum. There never was a more painstaking, conscientious, and correct printer than John Bellows of Gloucester. The proofs he was in the habit of producing were seldom susceptible of correction; but now Mr. St. Clair Baddeley has discovered that the "proofs nine feet thick" are sadly in need of revision. After careful examination, he finds that the said wall and buttress are no part of any Romano-British wall at all, but are portions of a sixteenth-century mansion belonging to Tudor Gloucester: a view in which the City Surveyor, Mr. R. Phillips, fully concurs, adding that "the structure may belong to any time between the fifteenth and seventeenth centuries." It is due to the memory of the late Mr. Bellows to say that he saw this wall only cursorily and by candle-light, whereas Mr. Baddeley has had the advantage of examining it by broad daylight, the site having been acquired by the Council, who are clearing the area. Naturally Mr. Bellows's most indubitable proofs were found in his own printing office; and, so far as we are aware, his own particular wall is genuine, plain, legible Roman. It might have been set up by the redoubtable Balbus himself. Given sufficient light, Mr. Bellows should have been easily able to distinguish between these vastly different types.

How Healthy Dwellings Tell. Does anyone still sigh for the days that are past, and grieve that this country is "going to the dogs," and that socially we have deteriorated and are still doing so? If so, let him consider the following hard facts taken from the Board of Trade publication on "Public Health and Social Conditions," and then take comfort in the unavoidable inference that the past fifty years has shown great social progress, and that there is hope that this progress will continue. Between 1851 and 1908 the population of the United Kingdom increased 63 per cent. The increase was greater in London and the large urban areas. For example, for every 100 persons living in London in 1851, there were 203 in 1908, and for 84 large urban areas the corresponding figures are as 100 is to 282. Hence we have a greatly increased density of urban population, which is a condition that admittedly increases the liability to disease and death unless it is corrected by improved sanitary conditions. The statistics, however, show that the average annual death rate in England and Wales has declined 29 per cent. in the period 1851 to 1907. This shows that, when the growth and distribution of population is considered, there has been immense progress in sanitation and social betterment. Infant mortality is one of the greatest difficulties incidental to a dense population; and from 1851 to 1900 but little progress seems to have been made in dealing with it, but since 1900 a fairly steady decline in the death rate of children under five years of age, and a more marked decrease in the case of children of between five years and ten years is manifest. Considering the period 1857 to 1907 as a whole, child mortality shows a decrease of nearly one-half. Another highly satisfactory feature, and one that is probably closely connected with the decrease of child mortality, is the marked decrease in child labour, which during the period 1851 to 1901 has also declined nearly one-half. From the particulars of unemployment, it appears that the applications under the Unemployed Workmen Act, 1905, which totalled 110,835 in 1905-6, declined to 87,001 in 1906-7, and again rose to 90,057 in 1907-8; but the number of persons who renewed their applications in successive years increased from 25,104 in 1906-7 to 30,257 in 1907-8. This increase in the number of successive applications is not a good sign, and should be very carefully watched. As regards Poor Law Relief in 1850 in England and Wales the number relieved equalled 56.5 in every 1,000 of the population, in 1908 it was 22.1 per 1,000, a fall of over 60 per cent. The decrease in London, however, was only about 47 per cent. The social betterment which these statistics show to have taken place has not been got without considerable cost to the community, as is shown by the average increase of local rates, which in 1867-8 were 3s. 3¼d. in the £, in 1889-90 3s. 8¼d., and in 1905-6 had risen to 6s. 1¼d. in the £, while during the period 1874-5 to 1905-6 the aggregate debt of local authorities increased from £92,820,000 to £435,545,000, without reckoning the capital of the recently formed Metropolitan Water Board. Vital statistics are the gauge of the enlightenment not only of the hygienist, the sanitarian, and the social reformer, but also of the architect and the builder, of whom at least the former, with his large powers of influence and control, can surely say, without undue self-elation, regarding this wonderful advance towards health and happiness, *pars magna fui*; for the improved health of the community is chiefly a matter of healthier dwellings

Legislation is Vexation. The annual report of the Chief Inspector of Factories, which was issued last month, speaks largely of a continuous advancement and improvement in the conditions of industrial life. Students of the legislation which during the last century has been concerned with the arts and productions of manufacture are of course well aware that the Parliamentary enactments which have become law have been created to minimise or altogether remove abuses and dangers which, not always foreseen, have grown up amidst changing economic conditions. A certain resentment against interference with the freedom of the individual was at one time felt, perhaps not unnaturally, but a clearer perception that the interests of both the employer and the employed are largely in accord has led to a better understanding. The Factory Acts may be said to achieve—or at least to aim at—a double purpose: first, they seek to assume something of the function of a brake upon the wheels of unlicensed industrial competition, and are at the same time something of a drag on the wheels of progress; and, secondly, they foster methods and conditions of work that, while they are no doubt less dangerous and less unhealthy than those that are not subject to legislative control, are often much more costly. So far as the building trade is concerned, the Chief Inspector notes that the Building Operations Bill had to be dropped after its introduction last year, owing to the pressure of Parliamentary business, but that it has again been brought forward for consideration this session. Beyond a slight exposition of the intentions of this Bill, very little mention of the building trade finds place in the report.

Honours and the Arts. In the King's Birthday Honours list, there is certainly a side glance at art, knighthoods falling to Mr. Merton Russell Cotes, who, besides being "the maker of Bournemouth" (which, on the whole, is by no means badly made), has got together a fine collection of art treasures, and has given them up, together with his residence at Bournemouth, as a museum; and to Mr. Hugh Lane, who has greatly enriched the municipal gallery at Dublin; but to architecture His Majesty's advisers appear to have been on this occasion stone-blind. Many of the total of thirty-five new knights, and perhaps one or two of the thirteen new baronets, appear to have been honoured less in their persons than in their professions; and in case several architects, with characteristic modesty, have shrunk from accepting these distinctions, they should be gently reminded that they have declined honours that would have adorned the profession in their persons. Recognition of this sort the State also owes to itself; for, as Dr. Holdsworth said the other day at Oxford, in introducing Mr. Thomas Brock, R.A., for a well-deserved D.C.L., "all States that wished their citizens to be educated in the Humanities must look with a favourable eye upon the liberal arts." It is perhaps in this spirit that knighthoods are bestowed upon actor-managers. But when the Mistress Art, whose creations are at least more enduring, is excluded from the category, her absence is rather conspicuous. Perhaps the "favourable eye" is only temporarily averted from her; for Sir Aston Webb has been honoured with a C.B. in recognition of his work for the Victoria and Albert Museum.

Shams. A writer in one of the monthly magazines has for his theme the common want of taste. He seems to think that the building and its contents are rendered contemptible by the craze for hurry and cheapness. He is disposed to blame those who minister—we rather think he writes "pander"—to this vice. The vendors are pretty heartily blamed for supplying "what the public want." The speculative builder, as usual, comes in for a liberal share of the lash. How wicked of him to build for gain, instead of building for glory! He imitates, in poor materials, the dwellings of the wealthy, in order to gratify the soaring ambitions of the pretentious poor. That is the kernel of the mischief—that people so are anxious to imitate their betters that they welcome the innumerable shams that seem to them to support this delusion. *Esse quam videri* would appear to them as a counsel of folly. If they cannot be what they wish to be, they will at least strive to look like it. They think it no shame to be a sham surrounded by shams, and hence they create a demand that it is commercially profitable and artistically sinful to supply. With regard to the masses, the case seems almost hopeless. They are a stiff-necked generation, not at all disposed to emulate the humility and simplicity of the Japanese; and as these two qualities happen to be of the essence of art, it must take yet another generation or two before the people become imbued with the principles of taste, and rise superior to their heritage of bad traditions. Then, as now, they will get the architects, the builders, and the buildings they deserve. It is entirely a question of "what the public want." The sad case of the vulgar rich is perhaps past praying for.

THE APPRENTICESHIP QUESTION: A LESSON FROM FRANCE.

There was held at Paris in April last a National Congress of Industry, Commerce, and Work, composed of representatives of employers, workmen, and Chambers of Commerce, to consider the crisis in apprenticeship in France.

We have previously referred to this question; suffice it to say, therefore, that it is generally admitted that there is such a crisis, and that it is imperative that something should be done to revive and reorganise a system of apprenticeship for the youth of that country.

The Congress represented 13 chambers of commerce, 7 associations of architects, 2 municipalities, 2 associations of property owners, 119 employers' associations, 67 workmen's unions, and 19 societies for instruction, besides a number of individual members.

In the opening addresses, stress was laid upon the following conditions, as accounting for the decline of apprenticeship; social necessity causing children to be set to earn as soon as they leave the primary school (in France this is at 12 years of age), while they are as yet too young to be usefully employed as apprentices. It was remarked that the intermediate years—12 to 15—were very critical for the young, and that habits of idleness and vagabondage were easily formed during that period, which would resist all subsequent efforts at reform. The great specialist on the subject of the protection of the youthful worker, M. Joly, was quoted as saying that his study of criminality between the years of 1839 and 1889 showed that the increase of criminality among minors of under 16 years of age was 140 per cent., and he did not hesitate to declare that among the causes of demoralisation he placed first the suppression of apprenticeship; other causes were — economic evolution, transforming methods of work and substituting machines for hand labour; and the state of the law, which will not permit apprentices to work in the same rooms as workmen who are working more than ten hours a day.

The deliberations of the Congress resulted in a series of resolutions to the following effect: That apprenticeship in commerce and industry be organised by the different professions, which, concurrently with the State, the departments, and the communes, will have to bear the cost. That a system of pre-apprenticeship be devised to prepare children for the choice of profession in the interval between leaving the primary school at twelve years and becoming apprenticed at fourteen to fifteen years of age. The chambers of commerce accept the mission of directing the systems of pre-apprenticeship and of apprenticeship itself, the details of the organisation to be confided to corporate societies recruited from each of the industrial and commercial bodies. That pre-apprenticeship tuition take the form of a preparatory workshop in connection with the primary school or otherwise (children to be admitted free without examination as soon as they leave the primary school), where they shall receive an elementary professional instruction which will enable them to choose an occupation with some intelligence. These preparatory workshops to be initiated by the employers' and workmen's associations acting under the patronage of the chambers of commerce, who will subvention them. That the law as to apprentices and workmen be modified to remove the anomaly mentioned previously. That the kinds of preparatory apprenticeship instruction to be taught in the various localities be fixed, by concerted action of the various chambers of commerce of the locality, as suitable to the local industries practised there.

A permanent committee was formed to carry on the work and to devise ways and means for carrying out the resolutions of the Congress, and to report to another Congress to be held next year.

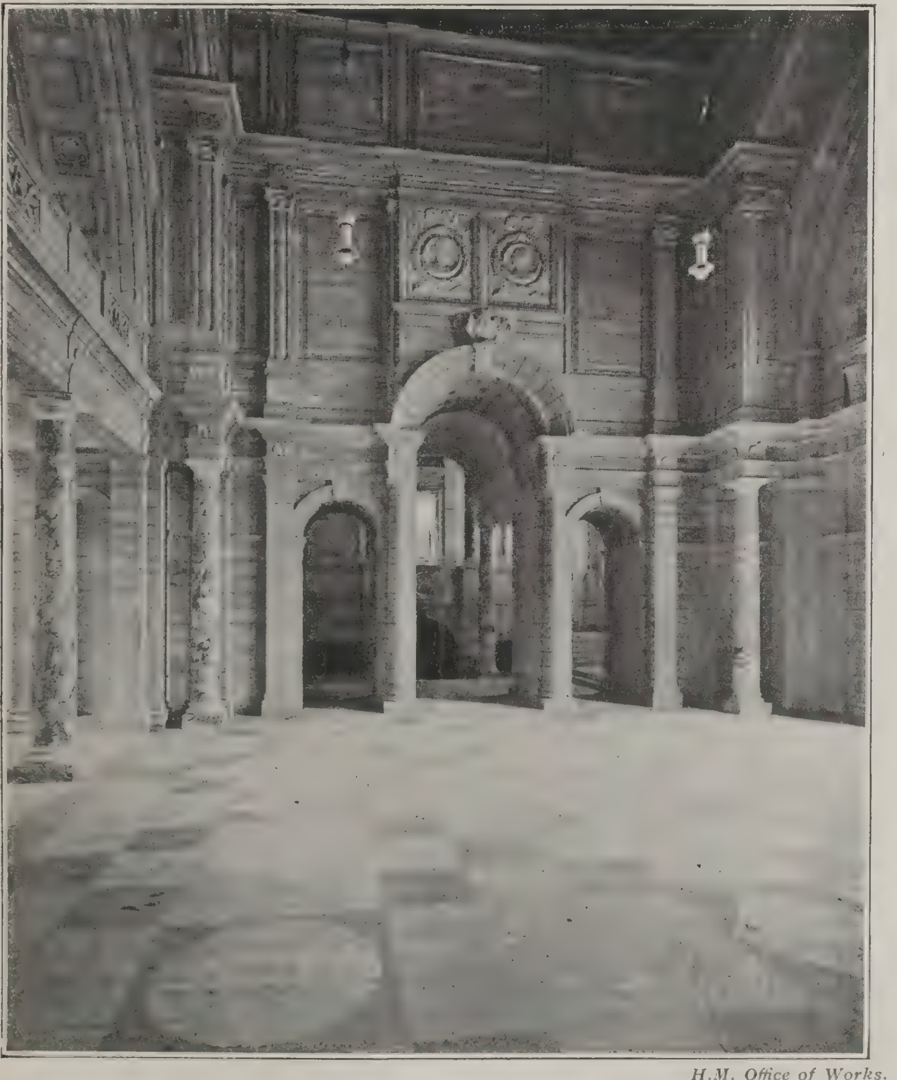
The building trade of France, and especially the Parisian builders, have the credit of having set this movement on foot. Bureaucracy in France moves with such exasperating slowness that the industrial and commercial classes have got out of patience, and are resolved to bring about a better state of things at their own cost rather than see the technical capabilities of their work men disappear in the way they threaten to do.

The question arises: are we much better off in this country in regard to preparing the young after they leave school for earning their own living? According to a report of the Royal Commission on the Poor Laws, between 70 and 80 per cent. of boys who are leaving school enter unskilled occupations. There is also overwhelming evidence as to the difficulty which such boys find in getting permanent work of a satisfactory kind. Boys of thirteen or fourteen easily find unskilled work involving long hours of deteriorating routine which lasts for a few years and then leaves the boy unfitted for or unable to enter a skilled occupation. Here we have one of the principal sources from which the "unemployed" are recruited.

Among the remedies suggested is the State regulation of boy labour by further raising the age of school attendance, or by a system of compulsory continuation schools. This suggestion agrees in the main with one we made some time ago to the effect that it is as much the duty of the State to see that every young person is taught to earn his or her own living as it is to see that they receive primary education, and that the system of apprenticeship training should be of a national and compulsory character.

SOCIETY OF ARCHITECTS.

The sketching party to Hatfield House on June 19th was even more successful than the visit to St. Albans in May, there being twenty-five ladies and gentlemen in the party, including two members of the council—Col. Leslie and Mr. Milnes Emerson. The party was first shown round the interior of the house, and the more energetic members made numerous thumb-nail sketches of the delightful Elizabethan details, and made roughly measured sketches of the mouldings. The so-called marble hall, with its beautiful minstrel gallery, was first visited. Thence the party was conducted through the corridor on the south front to the chapel in the north wing. Although the chapel contains much elaborate carving and painting, it is not particularly interesting either architecturally or historically, as it only dates back to 1837, having been rebuilt after the original had been destroyed by fire. Then the tour was made up the stairs in the west wing through the chapel gallery to the long gallery and library, and down the north-west stairs. The party then passed through the principal chambers of the east wing, and paid particular attention to the principal stairway. Passing out into the grounds through the south entrance, the party dispersed to settle down to sketch and photograph, and to enjoy the beauties of the gardens on the south and west front. A quantity of work was done with pencil, brush, and camera, and no doubt the society will be able to see the result of the work on the students' night, to be held during the winter months. Tea was served in the village at about 5.30.



H.M. Office of Works.

THE VICTORIA AND ALBERT MUSEUM, LONDON. THE VESTIBULE. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT

The vestibule, 40ft., by 40ft. runs up through two floors of the building. The walls are faced with Portland stone, and the ceiling is of teak, carved and inlaid with a holly motif. Right and left of the vestibule, the staircases leading to the three floors of the side-lighted galleries are lined with pavonazza marble in flat slabs. The columns are of Brescia and the steps of piastraccia marble.

The next visit, on July 17th, will be to Gatton and Merstham in Surrey. At the former place there is one of the most interesting little churches in the country. It has been fitted by a late incumbent with some fine canopied oak choir stalls of Flemish workmanship. The altar and pulpit are from Nuremberg, and are attributed to Albert Durer. At the west end there is a fine carved oak west-country screen, and the chancel is panelled with Burgundian carving, while there are portions of Elizabethan date. Merstham has also an interesting church, with work of all the Gothic periods, and good details and brasses.

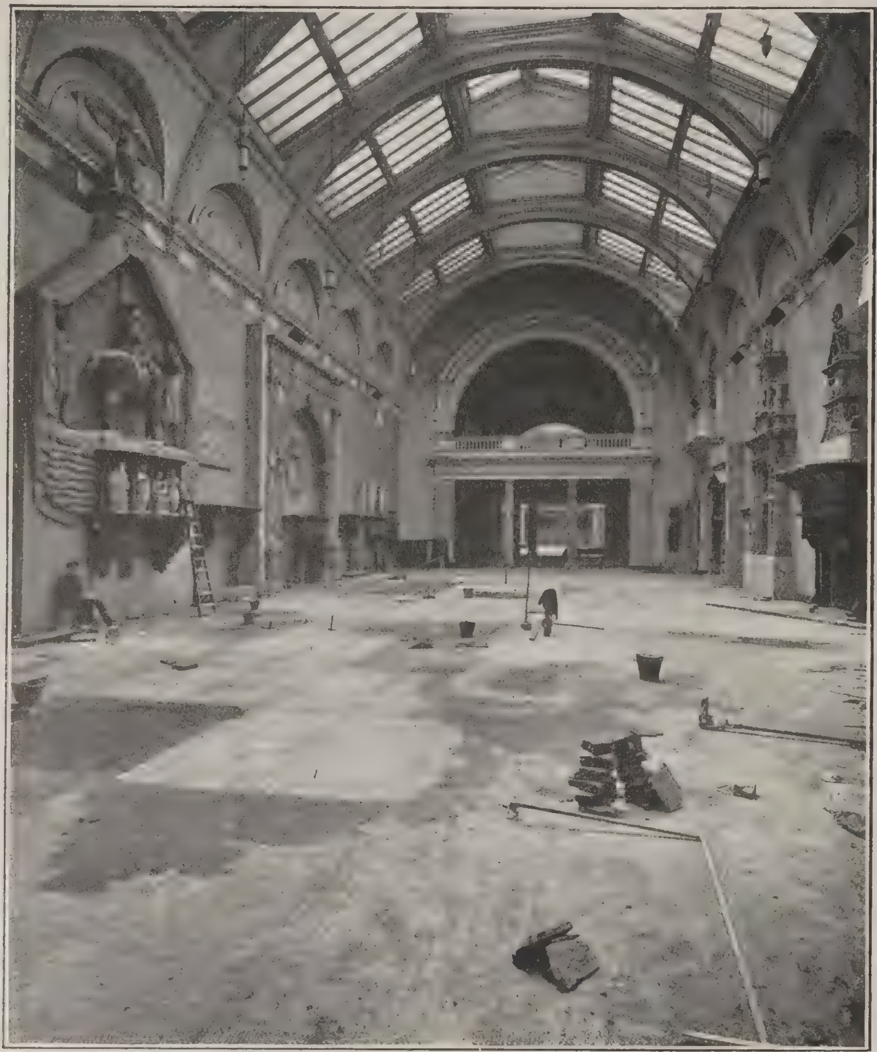
VICTORIA AND ALBERT MUSEUM.

Representatives of the Press were admitted on Wednesday last to view the interior of the Victoria and Albert Museum, which was formally opened by His Majesty the King on the following Saturday (June 26th). Designs for these buildings were invited in 1891 from six selected architects, and those submitted by Sir Aston Webb, R.A., were adopted. No decisive step was taken, however, until 1898, when the then Chancellor of the Exchequer, Sir Michael Hicks-Beach (now Lord St. Aldwyn), found himself in possession of a Budget surplus, from which he allotted a sum for the erection of the museum, and Sir Aston Webb was instructed to proceed with the plans. The foundation stone was laid by Queen Victoria on May 17th, 1899.

The new buildings have a frontage of 720ft. to Cromwell Road, and 275ft. to Exhibition Road. The total length of the perimeter of the site is occupied by three storeys of side-lighted galleries, the fourth-floor galleries being top-lighted, while the remainder of the site is covered with top-lighted courts. The total length of these galleries alone is three-quarters of a mile, and, including the long gallery of two floors that runs down the centre of the building, the galleries in the new building are just one mile in length, while the top-lighted courts have a superficial area of 6,500 square yards.

The Cromwell Road front, in the centre of which the main entrance is situated, is in a "flat" curve, following the line of the road, partly in order to secure a right angle at the corner of Exhibition Road, and partly to bring the building into line with the Natural History Museum. Other considerations that influenced the design were the great mass and height of the old Science building, which suggested the domes on the new, in order to preserve the scale; and the free Renaissance treatment "has been adopted as the one that best admits of the introduction of the very large amount of window space required in such a building, the balance between wall and void being provided in this case by the plain brick band round the building on the second floor." Over the front entrance is an opening lantern showing the outline of an imperial crown. The two turrets filling in the re-entering angles of the front, and supporting the central lantern, mark the positions of the two passenger lifts.

The front is faced with specially selected Portland stone, red brick being freely introduced in frieze and piers in sympathy with the buildings already erected. The sculptured decoration includes statues of thirty-two famous British artists and craftsmen, statues of ten craftsmen being on the Exhibition Road front, while facing Cromwell Road are, in the centre, ten painters; on the west flank, six sculptors, and on the east flank six architects. The statues of Millais, Watts, Leighton, and Constable were respectively executed by four students of the College of Art under Prof. Lanteri; and two each of the other statues were entrusted to the following sculptors: Messrs. Lynn Jenkins, Paul Montford, S. W. Babb, G. Bayes, A. Broadbent, W. S. Frith, J. Gamble, E. G. Gillick, A. H. Hodge, A. B. Pegram, J. W. Rollins, R. Shepherd, A. G. Walker, and O. Wheatley. The figure of



H.M. Office of Works.

THE VICTORIA AND ALBERT MUSEUM, LONDON. THE EAST HALL LOOKING TOWARDS THE CENTRAL HALL. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT.

This hall and its counterpart, the West Hall, are the two long galleries flanking the Domed Central Hall. They are fifty feet wide, top lighted, and are devoted to housing the larger Architectural Exhibits, some of which, as can be seen in the view, have already been placed in position.

Fame on the lantern, and the two figures in the buttresses below, representing respectively Architecture and Sculpture, are by Prof. Lanteri, while Mr. Alfred Drury, A.R.A., executed the statue of Queen Victoria, with her supporters, St. Michael and St. George; the statue of the Prince Consort, under the arch; and the figures of Knowledge and Inspiration, one on each side of the entrance; as well as the carved panels in the archivolt, each panel bearing, in letters of gold, a portion of a quotation from Sir Joshua Reynolds's Discourses: "The excellence of every Art must consist in the complete accomplishment of its purpose." The carved spandrils representing Truth and Beauty, are by Sir George Frampton, R.A.; the statues of King Edward VII. and Queen Alexandra by Mr. Goscombe John, R.A.; and the general architectural carving on the front has been done by Mr. W. S. Frith.

In planning the interior, the architect had by no means a free hand, as he was under the necessity of "linking up and adapting to the various levels of the old building." The vestibule, 40ft. by 40ft., runs up through two floors of the building. The walls are faced with Portland stone, and the ceiling is of teak, carved and inlaid with a holly *motif*. Right and left of the vestibule, the staircases leading to the three floors of the side-lighted galleries are lined with pavonazza marble in flat slabs. The columns are of Brescia, and the steps of piastraccia. The walls of the galleries and courts, being intended for the exhibition of objects, are of course kept perfectly plain, but "an attempt has been made to prevent weariness to the visitor by avoiding galleries of undue length, by providing vistas and glimpses through the building in passing, and by varying the sizes, proportions, and design of the various courts and galleries." The long gallery gives easy access to all the courts on each side, and the courts on the north side of the gallery neither oppose barriers to the visitor nor confuse him as in a maze.

Flanking the domed central hall are the long eastern and western halls, 50ft. wide, in which the larger architectural exhibits are being placed. The west and east central courts leading from the central court that forms the main entrance to the older portions of the Museum, have their naves and aisles divided by arcades of Basilican type. The naves have flat ceilings, and the aisles are vaulted. The great octagon court, which was the chief scene of the opening ceremony on Saturday last, is 110ft. in diameter and 65ft. high in the centre.

The galleries are 32ft. wide and 20ft. high, except in the lower ground floor, where they are 18ft. high. As Sir Aston Webb points out in his "Short Description of the Building," included in the official guide provided for the use of Press representatives, the windows are carried up close to the ceiling, and on this wall the glass area is equal to the wall area, so that the opposite wall is completely lighted. All the walls are lined with Cranham bricks, so that objects may be easily fixed to them, while all walls towards internal courts are built hollow as a precaution against damp.

The floors of the galleries are of polished teak, those of the courts being paved with marble mosaic, laid out in squares to facilitate the arrangement of cases and objects.

Naturally, the heating and ventilating arrangements have been devised with extreme care. The heat will be derived from six Lancashire boilers, which have been placed in the basement between the north-west entrance and the College of Science. The Atmospheric Steam Heating Co.'s vacuum system of heating has been installed. Ventilation is on a plenum system, by means of which the air can be changed four times an hour, or more frequently if necessary, and can be warmed or cooled at will.

The architect is Sir Aston Webb, R.A., F.R.I.B.A. The general contractors for the foundations and up to the ground floor are Messrs. Leslie and Co., of Kensington; and Messrs. Holliday and Greenwood, of Brixton, erected the superstructure, executed all the woodwork, including the fine teak ceiling, already mentioned, with its carved and inlaid holly decoration, and all the plumbing work.

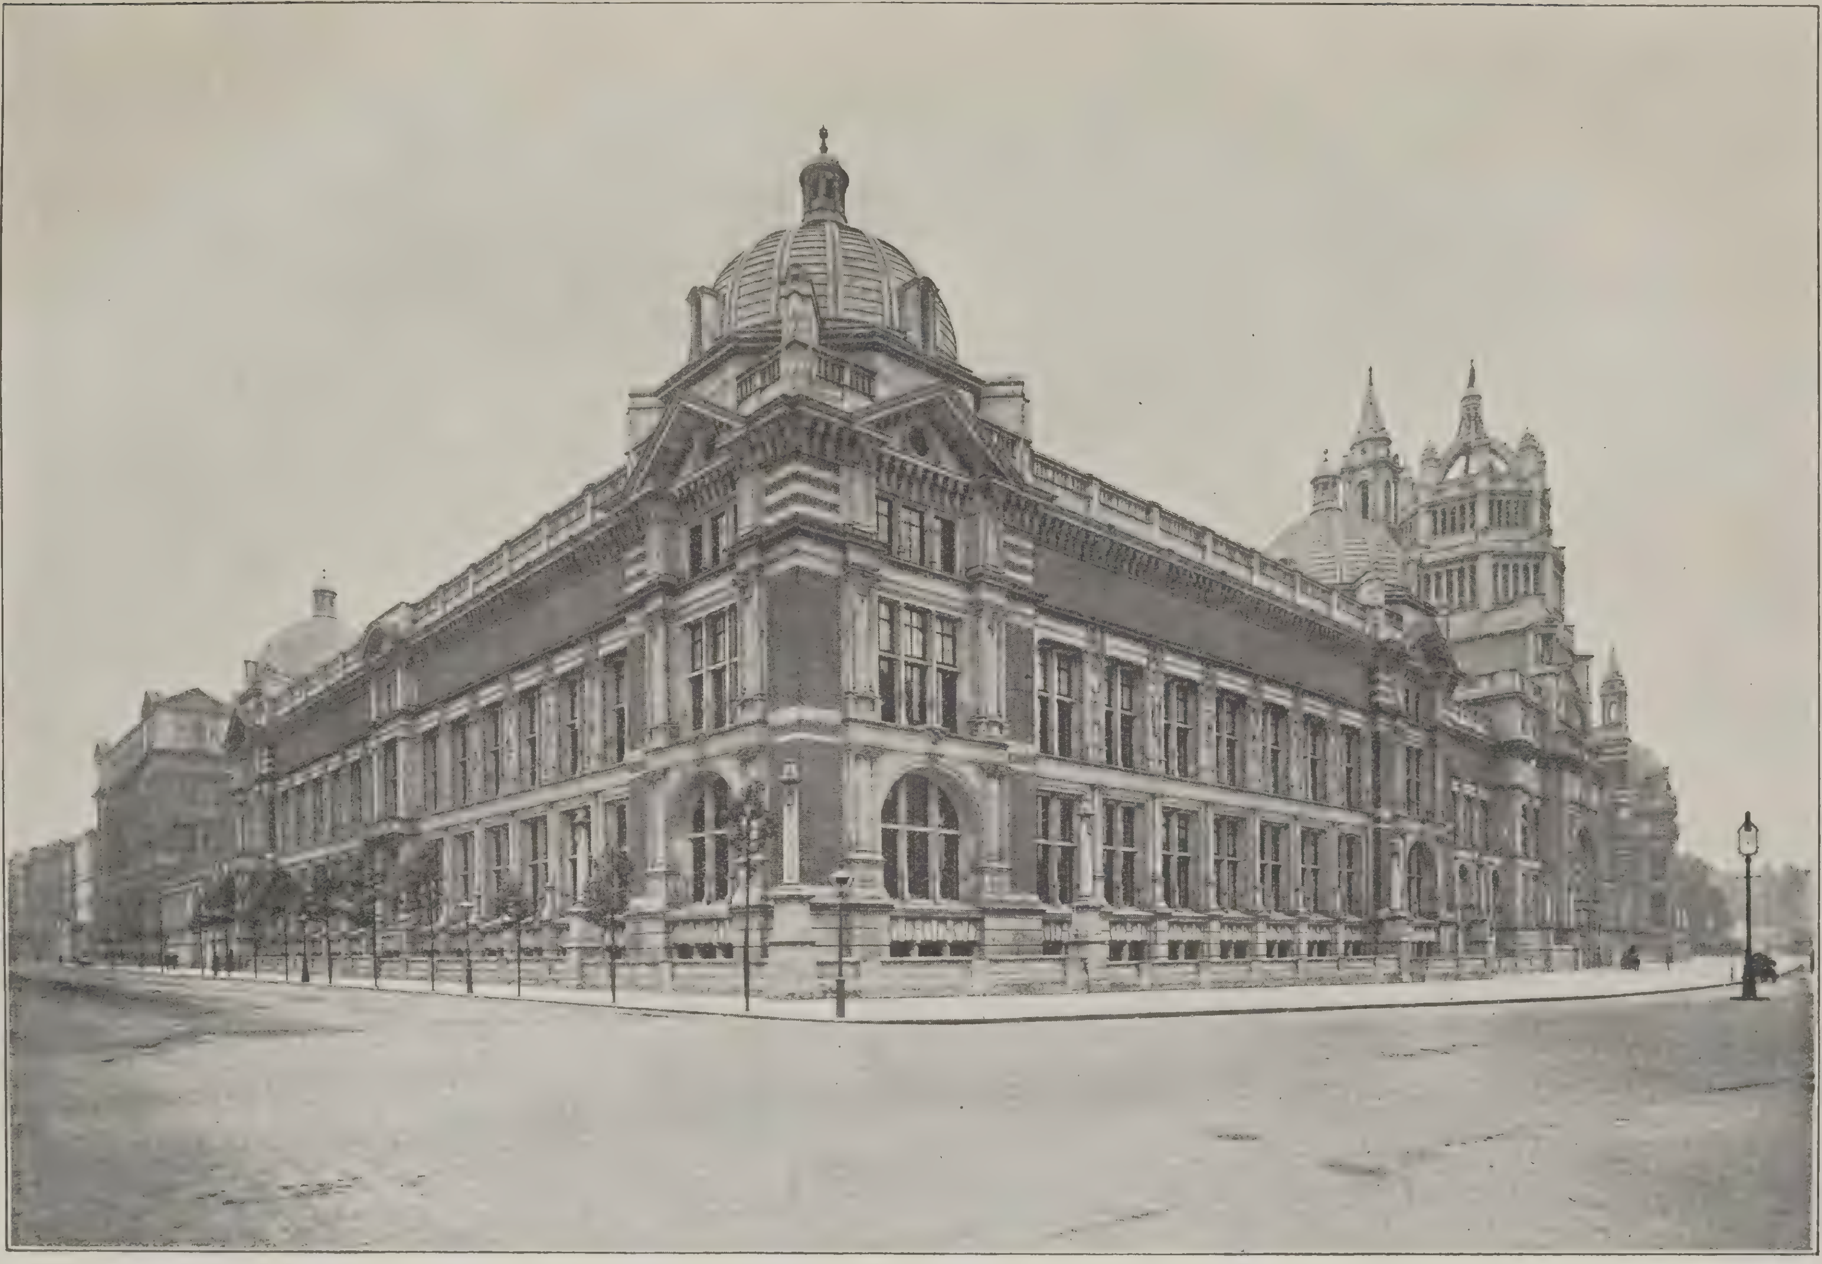
The chief clerk of works was Mr. H. W. Tanner; the general foreman, Mr. J. Farndon. The following are some of the subcontractors engaged on the work:—Marble work, Farmer and Brindley; Walton, Goody and Cripps; and Burke and Co., all of London. Mosaic work, Art Pavements and Decorations, Ltd.; ornamental plasterwork, G. P. Bankart; paint, etc., R. Gay and Co.; distemper, Silicate Paint Co., metalwork, Hart, Son, Peard, and Co.; glazing, W. E. Rendle and Co., London; carving, W. S. Frith, London; expanded metal for plasterwork, A. and J. Main, Ltd.; Mack partitions, J. A. King and Co.; Cranham brick partitions, J. H. Sankey and Son; heating, Atmospheric Steam Heating Co.'s system; electric installation, fixing, etc., T. Clarke and Co., London; electrical fittings, The General Electric Co., London.

Messrs. T. Clarke and Co. inform us that there are in the building approximately 5,000 lights, and that 75 miles of wire and 95,000ft. of screw galvanised steel tubing were used. A feature of the wiring is that any of the cables can be easily withdrawn and new wires substituted without interfering with the decorations or flooring. Arc lamps are employed for lighting the large courts and galleries, and the smaller galleries are lit by five-light fittings, with Osram lamps.

The opening ceremony was brief and simple. The Archbishop of Canterbury having read a special prayer for the occasion, and led in the Lord's Prayer, gave the Benediction. The Hon. Sir Schomberg McDonnell then carried the golden key of the building, on a red velvet cushion, to the foot of the dais, where Mr. L. Harcourt (First Commissioner of Works) took it from him and presented it to the King, who handed it to Mr. Runciman. As he did so the King said: "I have great pleasure in declaring the Victoria and Albert Museum now open."

Among the addresses presented to his Majesty at the opening ceremony was one from the workmen who have been engaged on the erection of the building. The King, in reply, expressed his pleasure at having had presented to him this address by the clerks of works, foremen, artisans, and mechanics, and said he was glad to have the opportunity of congratulating the workmen on the results of their labour. "I am informed," his Majesty said, "that all have worked with a high degree of skill, and with keen interest in their respective tasks, with the result that the construction, finish, and decoration of the building are in every way worthy of the architect's impressive conception."

A surprise of the occasion was the unexpected announcement made by Mr. L. Harcourt, Chief Commissioner of Works, who, in making the presentations to the King and Queen, said: "To receive the honour of knighthood, Mr. Cecil Smith." On Monday it was announced that his Majesty had been graciously pleased to confer upon Sir Aston Webb, R.A., a Companionship of the Order of the Bath.



THE VICTORIA AND ALBERT MUSEUM, LONDON. GENERAL VIEW. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT. *H.M. Office of Works.*

The Cromwell Road front, 720ft. long, in the centre of which the main entrance is situated, is in a flat curve, following the line of the road. The adoption of this curve, which prevents a sight of the full facade, has been criticised; but it was adhered to partly in order to secure a right angle at the corner of Exhibition Road, and partly to bring the building into line with the Natural History Museum. The front is faced with specially selected Portland stone, red brick being freely introduced in frieze and piers in sympathy with the buildings already erected. The sculptured decoration includes statutes of thirty-two famous British artists and craftsmen, statues of ten craftsmen being on the Exhibition Road front, while facing Cromwell Road are, in the centre ten painters; on the west flank six sculptors, and on the east flank six architects.

NATIONAL LIBRARY OF WALES, ABERYSTWYTH.

The assessor, Mr. Reginald Blomfield, A.R.A. (nominated by the President of the Institute), presented his report at the annual meeting of the council of the National Library at Aberystwyth, on June 4th, and after consultation with the president, Sir John Williams, and with the librarian, Mr. John Ballinger, the design of Mr. Sydney K. Greenslade, 11, Gray's Inn Square, London, was selected and unanimously adopted by the council.

Besides the successful competitor, the competition was limited to the following architects, to whom an honorarium of thirty guineas each was allowed:—Mr. Henry T. Hare, 13, Hart Street, Bloomsbury; Mr. Arthur Harrison, Council Chambers, 109, Colmore Row, Birmingham; Messrs. A. Marshall Mackenzie and Son, 13, Waterloo Place, Pall Mall, W.; Messrs. H. Percy Adams and Charles Holden, 28, Woburn Place, Russell Square, London; and Mr. R. Wynn Owen, 60, Castle Street, Liverpool.

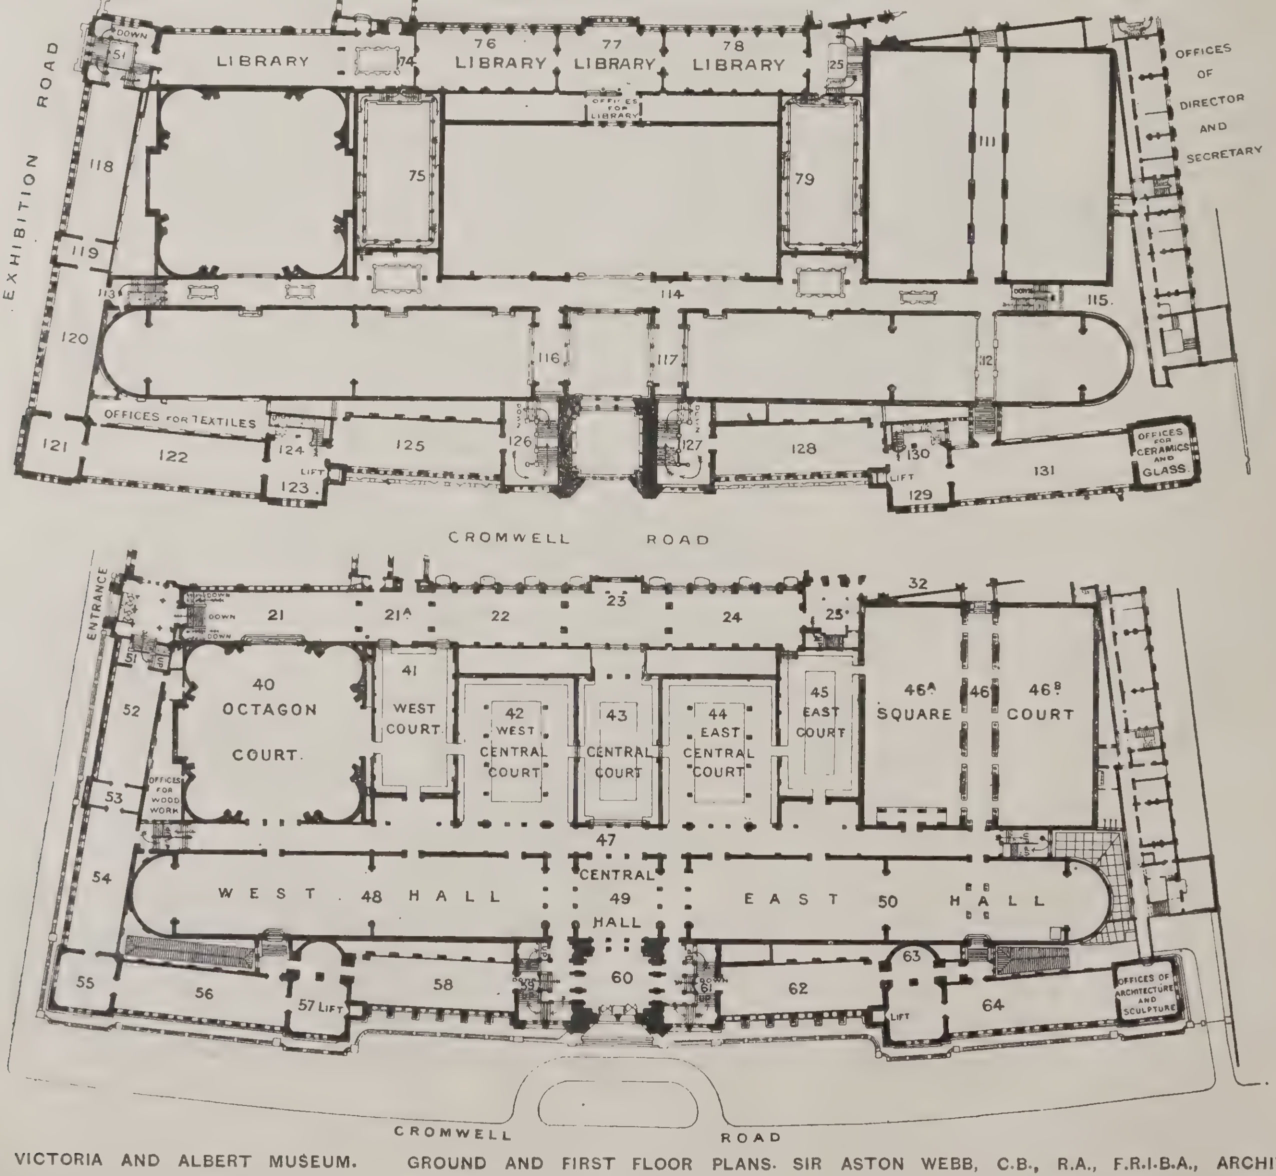
In the conditions, emphasis was laid upon the desirability of emphasising the national character of the institution, and of taking full advantage of the commanding position of the site. It was suggested that "strong, simple outlines, which will stand clear against the background of hills and sky," were desirable, and that uniformity of colour in the materials should be aimed at, "to contrast boldly with the surroundings."

The administrative block and library hall were to be designed on a scale not likely to call for extension at some future time. (The possible extensions were to be provided for in the book-stack and special rooms.) It was requested that the designs should include a general scheme for the approaches to the buildings from the main road, and for the disposition of the official residence or residences contemplated, and that provision should also be made for the introduction of memorials—in suitable sites and spaces—to benefactors and persons of literary eminence.

The drawings required were to be in black and white, and all to ⅛th scale. No perspective was admitted, and the front elevation was to be rendered in monochrome. The other drawings were to consist of floor plans, elevations of each part, and all necessary sections. A report accompanying the work of each competitor was also requested. The amount to be spent on the buildings, exclusive of bookcases and movable furniture, was to be, in the first case, £25,000, and ultimately about £45,000.

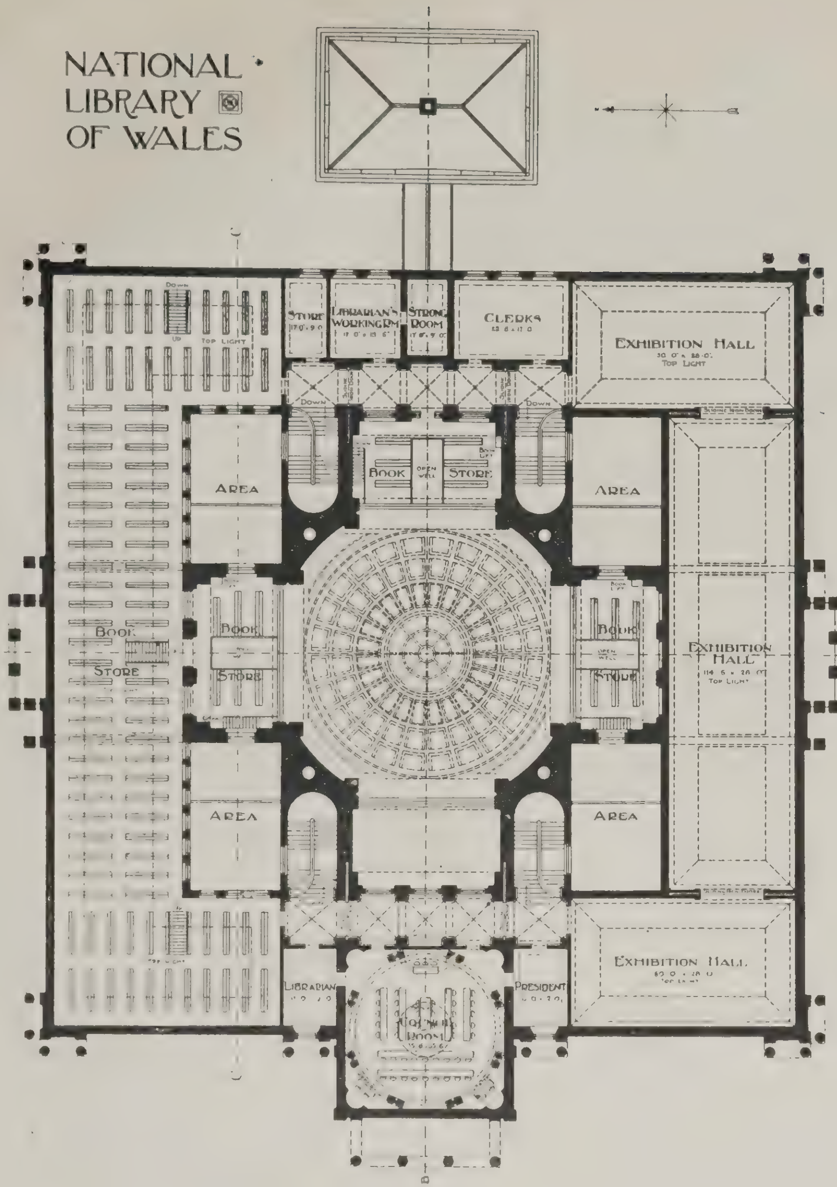
The necessary accommodation was to include, in the administrative department, a council room, of sufficient size for a meeting of 35, plus officers and reporters; librarian's private room, president's private room, strong room, and accommodation for assistant librarian, clerks, telephone, record, and catalogue, typewriting, and store-room for stationery and supplies; packing room, cloakroom for public and staff (both sexes); porter's room adjoining entrance hall. It was suggested that this department should form the centre of the main front, with a frontage of 75ft., and a height of 55ft. to the springing of the roof, divided into four floors, and that the private rooms for the president and librarian be on either side of the council room. In the department of printed books, a library hall of about 5,600 sq. ft., with seats for 50 readers, and book storage for 100,000 volumes, the height to range with the administrative department. The system of book-storage was to be arranged in multiples of 7ft. 6ins. from gallery to gallery, with entrances from the main floors of the administrative block to every second gallery. It was decided that this hall should be "of an impressive character, with books as the main feature," and that provision should be made for building rooms as required for special collections. In the department of manuscripts, a storage space for 25,000 volumes, capable of extension to store 50,000 volumes, special provision to be made for perusal of manuscripts in absolutely fireproof rooms, on the ground floor, 15ft. high, with arrangements for isolating this department by means of fireproof doors and rolling iron shutters for the windows. In the exhibition department, an exhibition hall, to be used by the public for inspection of rare books, fine bindings, etc., about 5,600 sq. feet, arranged in two or three continuous galleries 15ft. high.

In this portion of the building also provision was to be made for photographic rooms, patent print, and map rooms, room for Parliamentary papers and blue books, newspapers and periodical file rooms. In the book-storage department, provision was required to be made for the future storage of books on an unlimited scale, by means of a steel stack to be placed at the back of the site, where it could be expanded indefinitely,



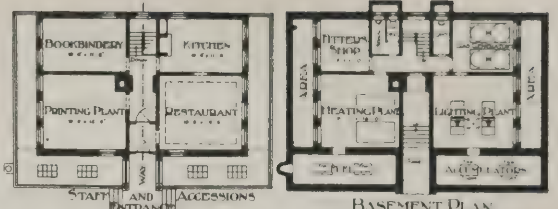
THE VICTORIA AND ALBERT MUSEUM. GROUND AND FIRST FLOOR PLANS. SIR ASTON WEBB, C.B., R.A., F.R.I.B.A., ARCHITECT.

NATIONAL LIBRARY OF WALES

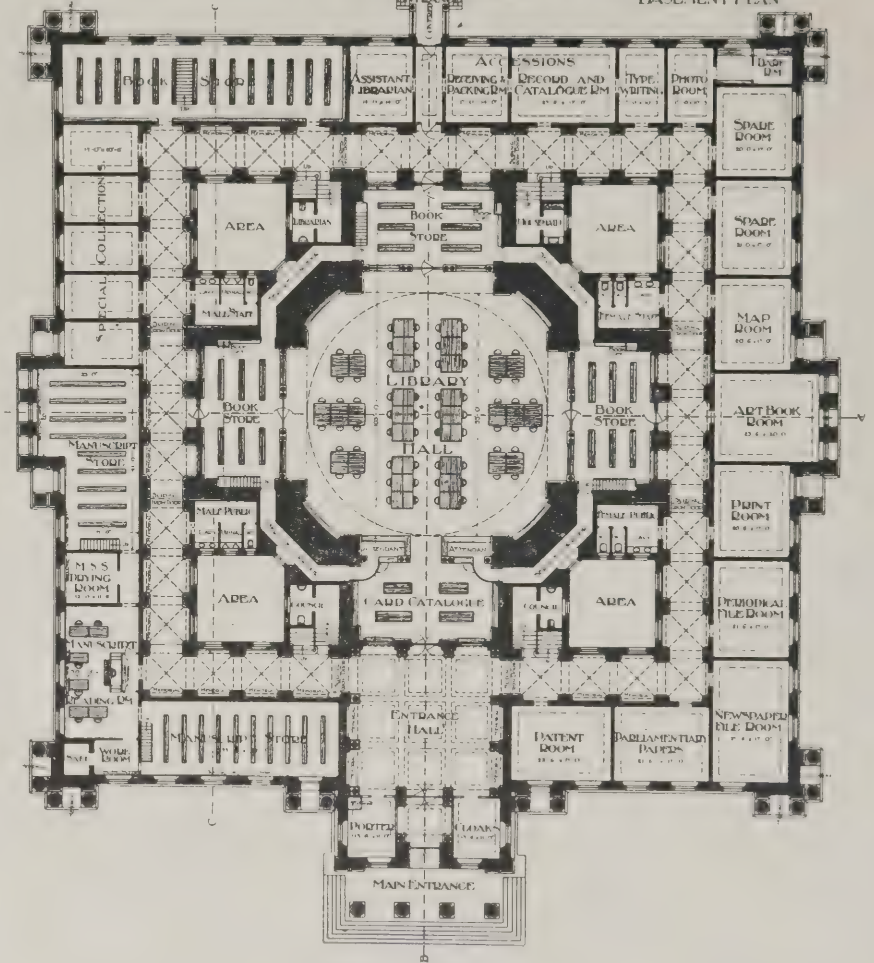


FIRST FLOOR PLAN

NATIONAL LIBRARY OF WALES



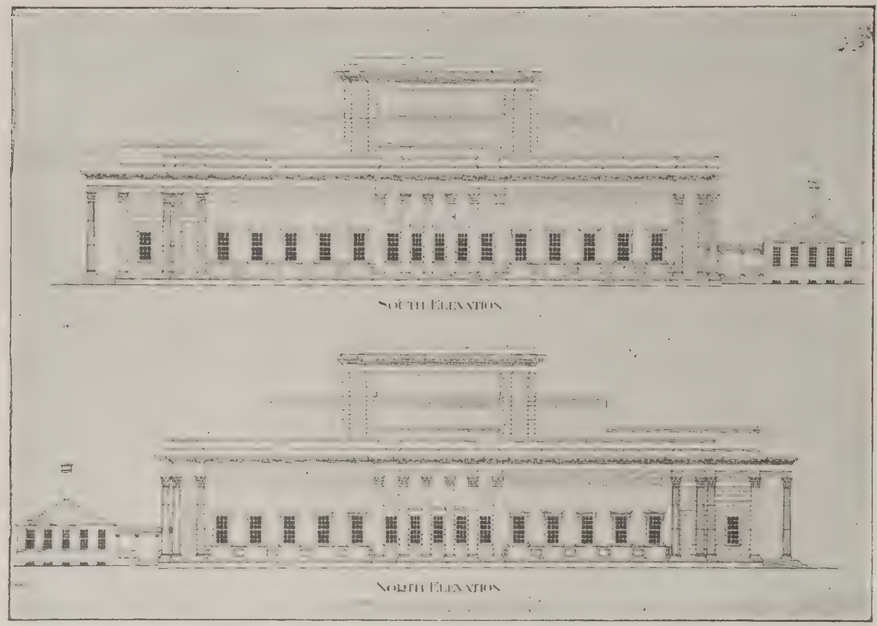
BASEMENT PLAN



GROUND FLOOR PLAN

NATIONAL LIBRARY OF WALES, ABERYSTWYTH. DESIGN SUBMITTED BY R. WYNN OWEN, A.R.I.B.A.

From the purely architectural point of view this design is wholly admirable. The fine spaciousness of the well-shaped Central Library, and the homogeneous character of the plan throughout, seem worthy of all praise. A pleasant feature is the corridor running on all four sides of the ground floor plan and lit by areas. This not only gives convenient access at all points, but in itself constitutes the required provision for the suitable introduction of memorial busts. The administrative block however is grouped at the back, whilst the Council Chamber, Librarian and Presidents' rooms—which would seem to come within the category of administrative rooms—are placed upon the main part.



THE WELSH NATIONAL LIBRARY, ABERYSTWYTH. DESIGN SUBMITTED BY R. WYNN OWEN, A.R.I.B.A.

The elevational exigencies apparently determine the disregard of the warning contained in the conditions with reference to the inadvisability of introducing skylights. By means of these, practically the whole of the upper floor is lighted. But the gain to the elevations is, we think it will be generally admitted, undeniable.

with ample provision for light to all parts, and easy access from the library, each book storey in the stack to be 7ft. 6ins. from floor to floor—a height required to govern the heights of all rooms (except the library hall and the top rooms of the administrative and exhibition blocks), so as to secure uniformity in the floors throughout. It was suggested that the steel stack should form the fourth side of a quadrangle, with provision for extension to the rear as required, the administrative department, library hall, and exhibition hall forming the other three sides.

A separate detached building was to be provided for the warming and generating plants, official residences being provided on another portion of the site, no domestic quarters were to be included in the main building, which was required to be thoroughly fireproof throughout. It was intended that the administrative, printed books, and manuscripts departments should be proceeded with immediately, the exhibition hall and book-stack to be added later.

As will be seen from a comparison of the different plans submitted, the framing of the conditions gave considerable scope for variety of treatment.

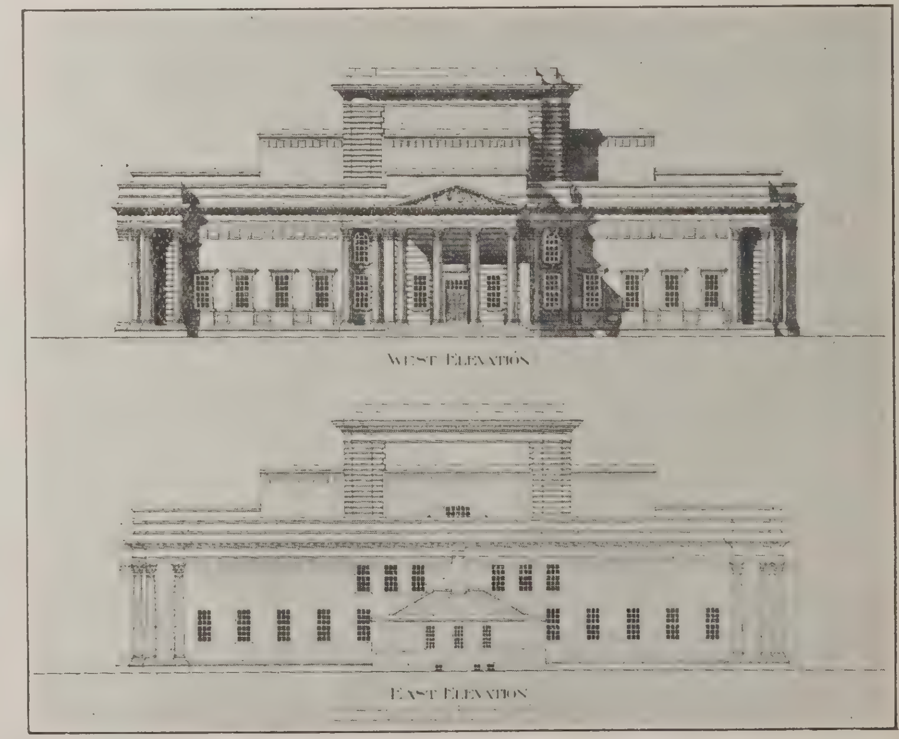
Without doubt, Mr. Greenslade's is the most logical and scientific solution of the problem. He has wisely fallen in with the suggestion embodied in the conditions regarding the disposition of the administration block, which forms in his design the outstanding feature of the main facade. In his placing of the book-stack on the fourth side of the quadrangle, he has also adopted another admirable suggestion. The access throughout appears to us to be all that could be desired, and the distribution of the books in the library hall very satisfactory. The working portion of the library is restricted for the most part to the ground floor, the first floor being treated as the main floor and the exhibition galleries placed above. This restriction of the working department to the lower part of the building would be a most satisfactory arrangement in actual practice, and we cannot but commend the ingenuity and thoroughness with which even the smallest details are worked out, and provision made for all possible requirements in a manner that reveals an intimate knowledge of the practical working of the department. The relation of the despatch and receiving rooms and the examining and repairing rooms with regard to the circulating library and future book-stacks, is exceedingly fortunate, and the lifts and service stairs for staff are conveniently placed. Perhaps the best feature of the whole scheme is the complete isolation of the manuscripts, which are to form the most valuable portion of the collection.

At the same time, we think it will be felt that this close attention to general convenience has been given rather at the expense of such architectural qualities as we should naturally expect in what is, after all, intended to be a great national monument. In the main elevation, the general composition is, we think, satisfactory, and the detail in parts shows a pleasing *neo-Grec* tendency. But we must confess that we do not find ourselves altogether in agreement with the rather Gothic perpendicular feeling of the individual features, and in more than one place—as, for example, in the cutting of the band, which forms the base of the main order, by over-tall windows—we could have wished for a closer adherence to that Classic spirit which the main outline of the design professes to embody.

With regard to the side elevations, which it will be seen are similar to each other in composition, the timid projection of the end and centre masses gives an appearance of indecision, in our opinion, which contrasts unfortunately with the bold modelling of the main part, and produces at the contiguous corners an appearance of somewhat crude inequality or treatment. And the elevation of the book-stack might have received more attractive handling.

From a purely architectural point of view, Mr. Wynn Owen's design is wholly admirable, both with regard to plan and elevations. The fine spaciousness of the well-shaped central library, and the homogenous character of the plan throughout, seem to us worthy of all praise. A pleasant feature to notice is the corridor running on all four sides of the ground floor plan, and lit by areas. This not only gives convenient access at all points, but in itself constitutes the required provision for the suitable introduction of memorial busts, etc.

The administrative block, however, is grouped at the back, whilst the council chambers, librarian and president's rooms—which would seem to come within the category of administrative rooms—are placed upon the main part. And we cannot but regret that elevational exigencies apparently determine the disregard of the warning contained in the conditions with reference to the inadvisability of introducing sky lights. By means of these, practically the whole of the upper floor is lighted. But the gain to the elevations is, we think, it will be generally admitted, undeniable. There is a restraint of modelling, a simplicity of style and keen realisation of the possibilities of the site that give evidence of exceptional ability. The placing of the centre mass higher than is apparently required for elevation effect will be found necessary.



THE WELSH NATIONAL LIBRARY, ABERYSTWYTH. DESIGN SUBMITTED BY R. WYNN OWEN, A.R.I.B.A.

The main facade in the general distribution of its mass is a remarkably fine piece of work. There is a restraint of modelling, a simplicity of style and keen realisation of the possibilities of the site that give evidence of exceptional ability. The placing of the centre mass higher than is apparently required for elevational effect will be necessary in view of the inevitable foreshortening which would take place in reality.

THE WELSH NATIONAL LIBRARY, ABERYSTWYTH. DESIGN SUBMITTED BY ARTHUR HARRISON. F.R.I.B.A.

This design adheres closely to the conditions. The exhibition halls are conveniently disposed with regard to the main entrance hall; the placing of the lavatories appears an admirable arrangement, whilst the provision for the future extension book-stack has been so made as to form a pleasant composition with the side wings. The elevations admittedly reveal skill in their picturesque grouping, but we regard the effect as being marred by the introduction of a tower in the central mass, and by the over-emphatic character of the main entrance.

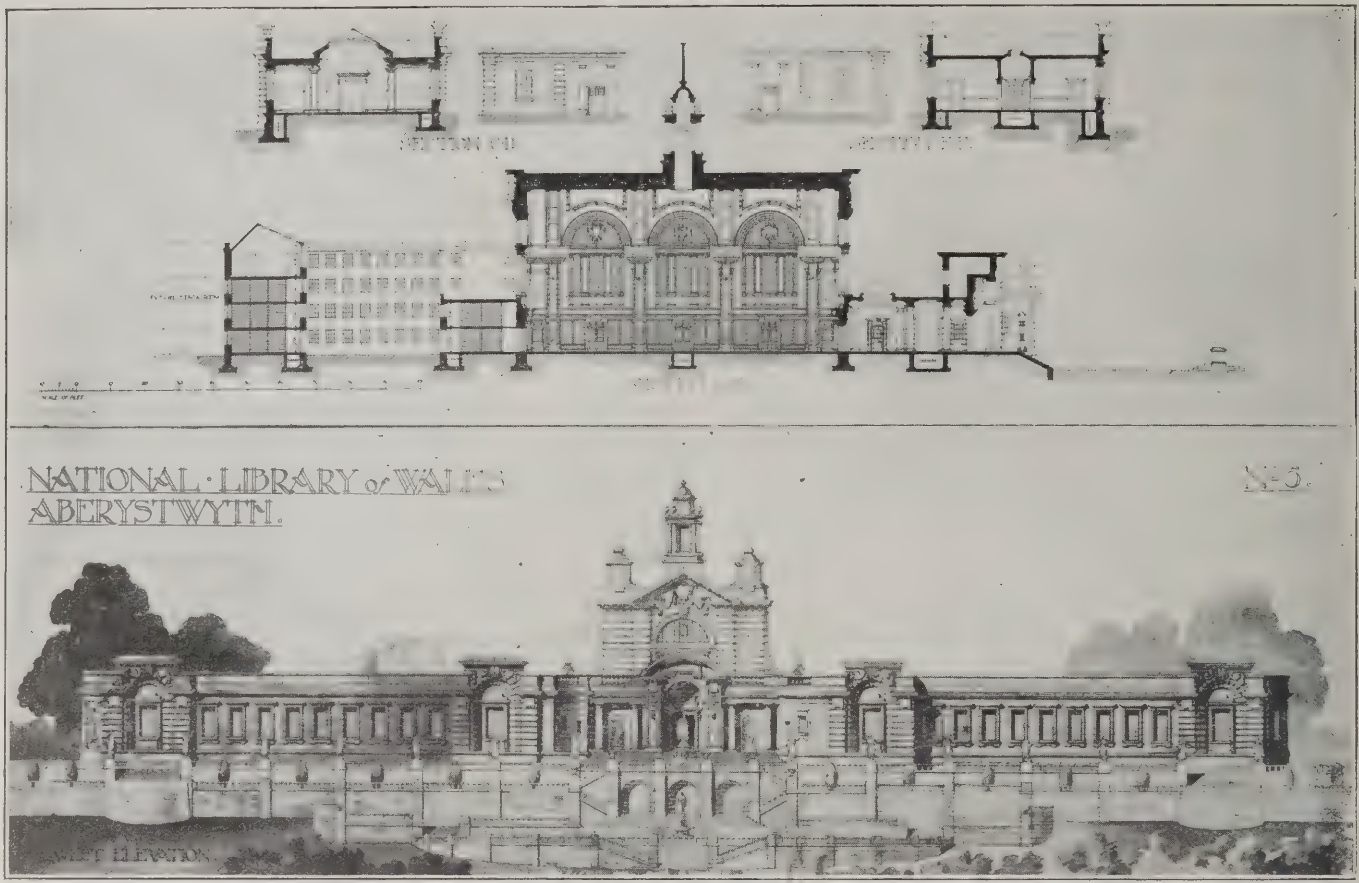
In the scheme submitted by Mr. Marshall Mackenzie, it will be seen that the exhibition block is made to balance with the square library; and though this arrangement produces a general effect of symmetry on plan, the actual sub-division of the exhibition block, and the consequent necessity for providing an area, detracts somewhat from its value. Another point which we regard as of doubtful convenience is the placing of the exhibition halls on the first floor, and the stock-rooms on the floor above. The latter are thus rendered difficult of ready access, and an adequate service of books to the reference department on the ground floor is practically precluded. Moreover the grouping of the lavatory accommodation on the ground floor, round the main vestibule would, we think, prove undesirable. The elevations do not charm us; but it must be allowed that in comparison to the run of modern library designs, they are distinguished by a certain unaffected directness.

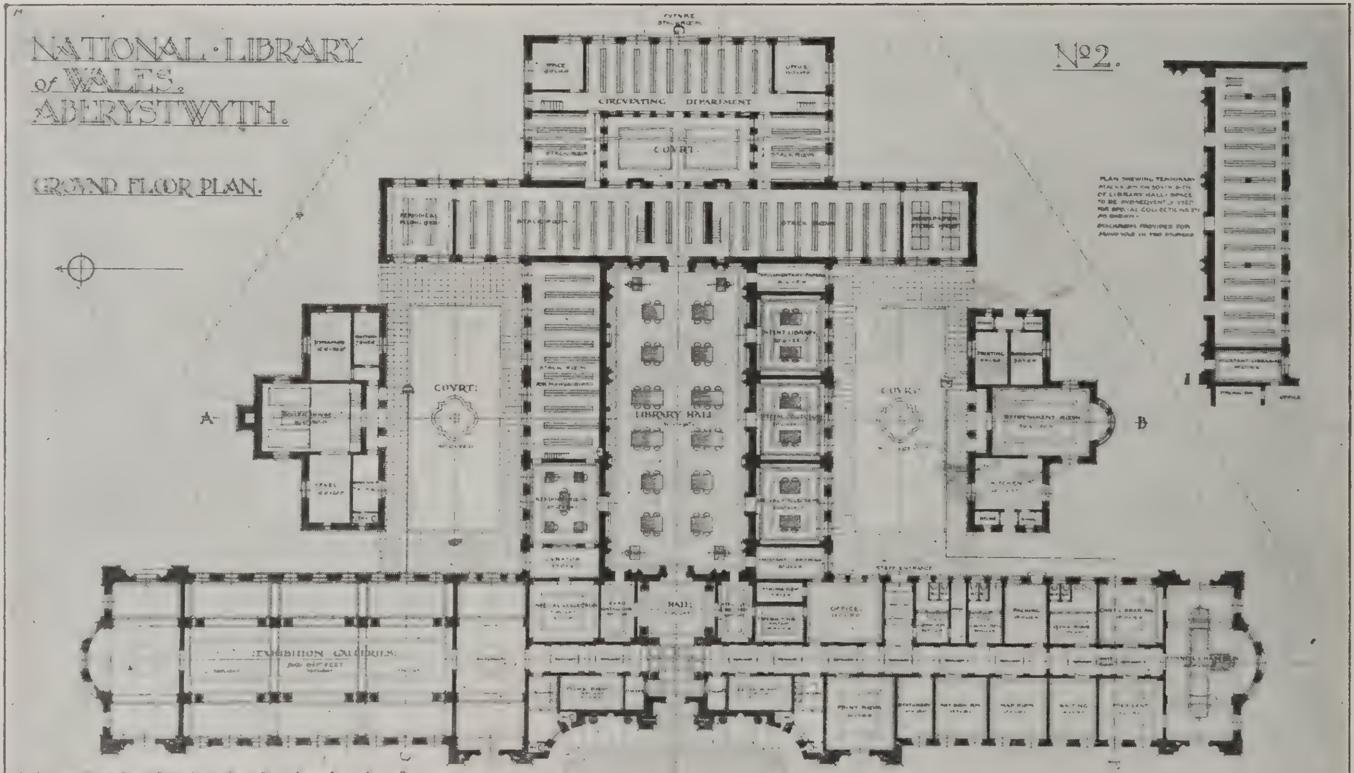
An examination of Mr. Hare's design will at once reveal its essential difference from the other arrangements submitted; the whole of the front block, containing the administration and exhibition halls, being only one storey high, and designed to compose with the central library hall, which rises above and dominates the front. A great convenience from the point of view of the public is undoubtedly the placing of the exhibition halls on the ground floor, and in such close proximity to the main entrance. But it appears to us that the general arrangement of the plan lacks cohesion; that it would compose in elevation from no point save on the centre line of the front facade. The various departments are so separated as to give a rambling appearance to the whole; and though this free disposition of the different parts has presumably been adopted to obtain practical advantages, we doubt whether the lighting of the main stack-room adjoining the library would be found to be adequate in reality. It will be observed that the elevations are conceived in the modern Renaissance manner, and that an elaborate system of terraces has been added to enhance their effect.

Studied adherence to the suggestions of the conditions seems to have been the foremost consideration in the evolution of the scheme submitted by Mr. Harrison. The exhibition halls are conveniently disposed with regard to the main entrance hall; and the placing of the lavatories throughout in a separate block projecting into the quadrangle, appears an admirable arrangement, whilst the provision for the future extension book-stack has been so made as to form a pleasant composition with the side wings. We must, however, confess ourselves somewhat out of sympathy with efforts to revive Gothic for secular purposes; and although these elevations admittedly reveal skill in their picturesque grouping, we regard the total effect as being marred by the asymmetric introduction of an unnecessary tower in the central mass, and by the over-emphatic character of the main entrance.

Messrs. Adams and Holden have produced an exceedingly skilful arrangement. The central position of the main hall, and its relation to the position of the special collections and book-stacks, seem to us highly satisfactory; and the treatment of the exhibition halls has resulted in the obtaining of very pleasant shapes, and an admirable system of circulation. The small courts on either side of the library hall are, perhaps, a little inadequate. We must congratulate the authors on the elevations, which are unusually fresh and pleasing. The colonnade *in antis* reminds us agreeably of a similar feature of Schinkel's "Altes Museum" at Berlin, and is treated in a commendably scholarly fashion.

Mr. Edward John Gregory, R.A., who has just died at Marlow, was born at Southampton in 1850, and came of a family of engineers, and was himself for a time in an engineers' office. His first contribution to the Royal Academy was a portrait in 1875. He had been president of the Royal Institute of Painters in Water Colours since 1898.





THE WELSH NATIONAL LIBRARY, ABERYSTWYTH. DESIGN SUBMITTED BY HENRY T. HARE, F.R.I.B.A.

Mr. Hare's design has essential differences from the other arrangements submitted. The whole of the front block contains the administration and exhibition halls, and is only one storey high, and designed to compose with the central library hall, which rises above and dominates the front. A great convenience from the point of view of the public is undoubtedly the placing of the exhibition halls on the ground floor, and in such close proximity to the main entrance. But it appears to us that the general arrangement of the plan lacks cohesion; that it would compose in elevation from no point save on the centre line of the front façade. The various departments are so separated as to give a rambling appearance to the whole; and though this free disposition of the different parts has presumably been adopted to obtain practical advantages, we doubt whether the lighting of the main stack-room adjoining the library would be found to be adequate in reality. It will be observed that the elevations are conceived in the modern Renaissance manner, and that an elaborate system of terraces has been added to enhance their effect.

FACTORY INSPECTION AND THE BUILDING TRADE.

In view of the general depression in home industries, it seems a somewhat surprising statement, made by the Chief Inspector of Factories in his annual report, that the numbers of factories and workshops under inspection continue to increase. It is noted that the number of such places now stands at 260,000, and this is apart from the warehouses, docks, wharves, quays, ships, buildings, and other premises which come under the Acts for certain purposes. Although this increase has occurred in the number of places, the general slackness of trade has caused a reduction in the volume of employment, and to this is modestly attributed the decline in the year's total of accidents. The chief inspector might reasonably have claimed that some credit was due to the vigilance of his staff. Their work has now been in progress for many years, and the efforts made should certainly sooner or later show a creditable result.

So far as the building trade, with its many allied crafts, is concerned, the statistics afford useful reading. Details of the accidents that have been notified to the certifying surgeons as occurring to persons engaged in these structural processes, show that 307 have been so reported; but this number does not include the accidents which are reportable to the inspectors only. Of these no details appear to be given. A sub-division of the total reveals much that is interesting. For instance, the young persons—that is, those under 18 years of age—who met with mishaps during the year, number 22, as compared with 285 adults, the deaths being in the proportion of 5 to 109. In considering these figures, it is to be remembered that the employment of youths on buildings is extremely limited.

The number of accidents mentioned, viz., 307, are sub-divided under five headings, as to causation:—Machinery moved by mechanical power, 178 (17 fatal); molten metal, hot liquid, 11; explosion, 20; escape of gas or steam, 1; other causes (fatal only), 97. This list points particularly to the dangers of machinery. Such risks could be reduced by the use of rough-and-ready, but quite serviceable, fencing, that can be arranged by any practical man with the odd timbers which can always be found on a building. The general foreman is often at a disadvantage when fixing his mechanical plant, lack of necessary space being one of the principal difficulties with which he has to contend. Imperfect light is another, which adds to dangers already existing; but both of these only render the requirements of adequate safeguarding more imperative. It is mentioned that no accidents were due to electricity, which, in view of the steady growth in the use of this power, speaks well for the care with which it is handled.

No complete tables are are given as to the incidence of lead poisoning amongst plumbers and painters. Amongst those engaged in plumbing and soldering, twenty-seven cases occurred, but no deaths ensued. The number is an increase of seven as compared with the previous year. The notification of these cases when they occur actually on a building (and the painting trade is included) is not enforceable, but nevertheless 239 were so reported, and 44 deaths are included in this number. It is apparent from this that the work performed away from the workshop must be considered the more dangerous, a fact which is probably due to the greater difficulty in giving effect to habits of personal cleanliness. It will be remembered that one of the suggestions made by the Building Accidents Committee which sat during 1907, was that for work of this description the employers should provide wash-basins, soap, towels, ets., and that the workmen should use them. The Building Operations Bill now before Parliament, also proposes that the notification of lead poisoning cases which occur on buildings shall be compulsory.

So far as the sanitation of workplaces is concerned, the superintending inspector for the south-eastern division says that, though much remains to be done, there is convincing evidence of progress. The evidence of inspectors in other parts of the country is less satisfactory. An inspector for the Midland division regrets the action of one important sanitary authority in permitting the erection of earthenware pedestal closets without the provision of a cistern to provide a proper water flush, the water having to be carried by hand. The same complaint is made of a more northerly district, with the addition that there the drains are frequently non-existent. Conferences have been held between the sanitary authorities and the oc-

These Architects have produced an exceedingly skilful arrangement. The central position of the main hall, and its relation to the position of the special collections and book-stacks, seem to us highly satisfactory; and the treatment of the exhibition halls has resulted in the obtaining of very pleasant shapes, and an admirable system of circulation. The small courts on either side of the library hall are, perhaps, a little inadequate. We must congratulate the authors on the elevations, which are unusually fresh and pleasing. The [illegible] colonnade *in antis*, reminds us agreeably of a similar feature of Schinkel's "Altes Museum" at Berlin, and is treated in a commendably scholarly fashion.

cupiers of premises concerned, but without immediate effect.

With regard to the Workmen's Compensation Act, an interesting point is made by Dr. Collis, a medical inspector. In dealing with lead poisoning from the smelting metals, an increase of cases is noted, and the cause of this is said to be the inclusion of this disease in the third schedule of the Compensation Act. There has been no decrease in the severity of the illnesses, and no ground for the view that malingering has played any part in the increase.

ANNUAL OUTING BATH MASTER BUILDERS' ASSOCIATION.

The Bath Master Builders' Association to the number of seventy, including the Mayor of Bath, held its annual outing at Torquay and Paignton. The visitors were welcomed by an ex-Mayor (Mr. Smerdon), and Corporation of Torquay, the Mayor and the Deputy Mayor being unable to be present. The President of the Association (Mr. F. B. Parsons) returned thanks for the cordiality of the welcome, after which the builders drove in chars-à-banc (provided by members of the Corporation) around Torquay and neighbourhood. The drive embraced Babbacombe Downs and St. Marychurch, after which the party returned to Torquay for dinner. Mr. F. B. Parsons presided, and he was supported by the Mayor of his town and several Torquay councillors and borough officials. The chairman submitted the toast, "Success to the Mayor and Corporation of Torquay." He said be had been struck very much with the fact that Torquay, like Bath, had a varied climate, so that those who desired it could obtain a mild climate. He was told that the empty houses in Torquay only averaged 2 per cent. That was very surprising, and was a testimony to the enterprise of the corporation. They were especially gratified at having among them Mr. Smerdon, because of his association with the building trade.

Mr. Smerdon, responding, said it was a disgrace to them in Torquay that they had no master builders' association, as such associations were of great value in enabling members of the trade to meet and talk over their difficulties.

The Town Clerk also replied.

The visitors motored to Paignton after dinner, where they were heartily welcomed, and games of cricket and bowls were played in Queen's Park, lent by the Urban District Council. At 5.30 high tea was served in the Cricket Pavilion, the president occupying the chair. Alderman Taylor expressed the thanks of the visitors to the Urban Council for their kindness and courtesy, and, speaking of the great growth of Paignton during the last 30 years, he said he thought the Council had consisted of men of great forethought and considerable taste.

Mr. Parnell, chairman of the Urban District Council, in acknowledging the compliment, said he was glad to see them present, because it was rumoured that the master builders of Bath had a large amount of money to invest, and there were numerous available building sites in Paignton on which it was desired to see houses erected. Paignton had been described as "the builders' paradise," and in proportion to its size he thought Paignton had done more for the building industry than any other town in the West of England. The whole of the hills in the neighbourhood could be supplied by gravitation with water of the best quality possible. The getting of this supply, however, had launched the governing body into an expenditure of no less than £150,000, and, when they considered than their rateable value was £62,000, and the population a little over 10,000, it would be seen what a large proportion of their expenditure had been in respect of water. It was not very remunerative at present, simply because it had been provided for the building sites on the hills. In this matter Paignton had launched out to help the building industry more than any other town he knew. He had no doubt that Paignton would become a second Bournemouth.

The visitors left for home about 7.30 p.m.

Buildings in Progress and Completed.

KELTY.—A new public hall is being built here at a cost of £4,500. Messrs. Andrew Scoble and Son, Dunfermline, are the architects for the hall, and the following are the tradesmen whose tenders have been accepted for the work:—Thomas Livingstone, builder, Cardenden; J. Armstrong, joiner, Kelty; A. Thomson and Co., plumbers, Dunfermline; A. E. Hutchison and Son, plasterers, Kinross; J. Paul and Son, slaters, Cowdenheath; D. Haxton and Co., glaziers, Kirkcaldy; W. Briggs, asphalte manufacturer, Dundee; Redpath, Brown and Co., Ltd., steel works, Edinburgh; James Adger, painter, Kelty; and James Combe and Son, heating engineers, Glasgow.

PINHOE.—A new Congregational Church has been erected here at a cost of £600. Messrs. Commin and Son, of Exeter, were the architects, and Mr. W. Harvey, also of Exeter, the contractor. The new building is of red brick with Bath stone dressings, and has a tiled roof.

PORTSMOUTH.—The Wesleyan Sailors' and Soldiers' Home was opened by the Duchess of Albany on the 11st inst. The building is a handsome structure in red brick and stone with a main hall to hold 500, and cubicle accommodation for 104 men. Messrs. Gordon and Gunton, of London, were the architects, and Messrs. West Bros., of Rochester, the contractors. The cost was about £20,000.

REDNAL.—A public reading room and library is being erected in Leach Green Lane from the designs of Mr. Bowers, the architect, of the King's Norton Libraries.

LIST OF COMPETITIONS OPEN.

Deposit for conditions given where known.

ATE OF LIVERY.	COMPETITION
July 9	PUBLIC BATHS, WOOD GREEN Architects desirous of competing are invited to send full particulars of any recent public baths designed by them, the erection of which they have supervised, stating general accommodation, cost, etc., to W. P. Harding, Clerk to the U.D. Council, Town Hall, Wood Green, not later than July 9th. From those thus applying a selection of not more than 15 Architects will be made, who will be invited to compete on certain conditions and particulars. Premiums of £52 10s., £26 5s., and £15 15s. will be awarded to the designs placed by the Assessor as first, second and third. Assessor: Mr. A. Hessell Tiltman, F.R.I.B.A. Cost not exceeding £8,000. The Council reserve to themselves the right of selecting from the premiated designs the one eventually to be erected.
July 9	STOKE-UPON TRENT. Additions to Town Hall including large hall to seat 3,000 people, police court, etc. Premiums of £100 and £50 for second and third designs respectively. Assessor nominated by Pres. R.I.B.A. Conditions and particulars from Jno. B. Ashwell, Town Clerk, Town Hall, Stoke-on-Trent,
uly 17	NEW PUBLIC BUILDINGS, BURSLEM. The Architect whose design is placed first by the Assessor will be appointed to carry out the work. Premiums of £100 and £75 to authors of second and third designs, respectively, Conditions and plan of site from F. Bettany, Borough Surveyor. Deposit, £2 2s., returnable on receipt of *bona fide* design.
uly 19	WHITLEY BAY PUBLIC ELEMENTARY SCHOOL for 600 scholars, for the County of Northumberland Education Committee. *Limited to Architects practising in the County and in the City and County of Newcastle-on-Tyne.* Particulars and plan of site from C. Williams, Secretary to the Education Committee, The Moothall, Newcastle-on-Tyne. Assessor: W.H. Knowles, F.R.I.B.A., F.S.A.
uly 30	GRIMSBY TOWN HALL EXTENSION. Estimated cost £26,000. Conditions of competition sent to any applicant on receipt of a stamped addressed foolscap envelope. Full particulars, schedule of requirements, plans of existing buildings, etc., on receipt of deposit £2 (cheques to be made payable to Frank Stephenson, Borough Treasurer), which deposit will be returned to those who send in designs, or if the whole of the particulars are sent back within ten days from the date of their receipt by the applicant. Premiums of £250, £150 and £100. An Architect of eminence will advise in conjunction with the Borough Engineer. Applications to be made to the latter, H. G. Whyatt, Assoc.M.Inst.C.E., Town Hall, Grimsby.
July 31	LAYING OUT ESTATE AT EASTWOOD, RENFREWSHIRE. The patrons of the Royal Incorporation of Hutcheson's Hospital, Glasgow, invite competitive designs for laying out for feuing and building their lands of Thornliebank, containing about 195 acres. Particulars, conditions, and skeleton plans from the Chamberlains to the Hospital, Hill and Hoggan, 194, Ingram Street, Glasgow, to whom designs are to be sent. Premiums, £100, £75, £50, and £25 for the first four designs, *which will become the property of the patrons, who will not be bound further to employ the authors.* Deposit, £3 3s.
Sept. 1	BRANCH LIBRARY, NEW CROSS, for Deptford Borough Council. Limited to Architects practising in the City or the County of London. Assessor: J. S. Gibson, Vice Pres. R.I.B.A. Premiums, £52 10s., £26 5s., and £10 10s., for three selected designs, and will be awarded in accordance with the conditions contained in the instructions to competitors. Site plan and copy of instruction from Vivian Orchard, Town Hall, New Cross Road, S.E. Deposit £1 1s., refunded on receipt of *bona fide* design or if instructions are returned within 21 days.

New School in Grove Street, Barnsley.

The award of the assessor, Mr. H. T. uckland, architect to the Birmingham Eduation Committee, was made known on Monday, the 21st instant, as follows:—1st, No. 28, £30, Mr. S. W. Dyson, Barnsley; 2nd, No. 37, £20, Messrs. Clarke and Moscrop, Darlington; 3rd, No. 21, £10, Messrs. Holtom and Fox, Dewsbury; 4th, No. 31, no prize, Mr. A. Brocklehurst, Manchester.

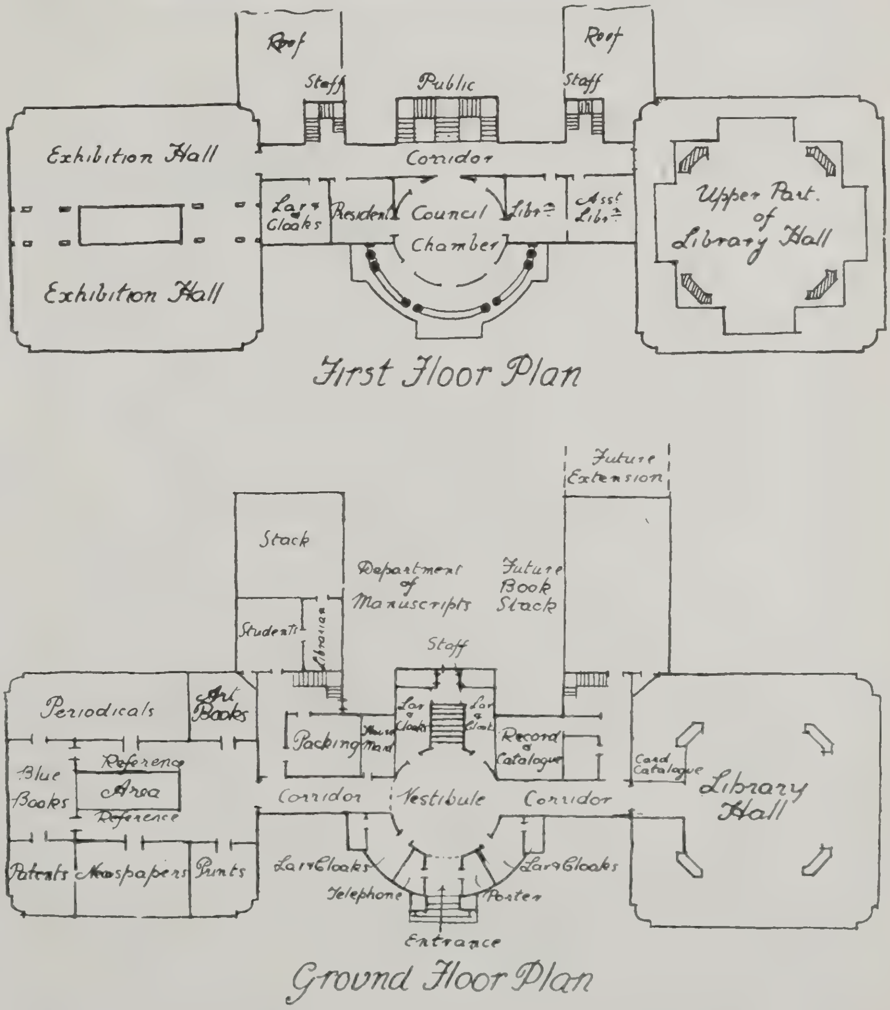
Public Baths, Wood Green.

The U.D. Council are promoting a competition for the above. Architects desirous of competing are to send in their names and particulars of their work in this class of building, by July 9th. From them a selection will be made for the competition proper. Mr. A. Hessell Tillman, F.R.I.B.A., is the assessor.

Builders' Notes.

The London Building By-laws. Part V. of the London County Council (General Powers) Bill was considered by the House of Commons Committee on Wednesday last. This part of the Bill is being opposed by the Institution of Civil Engineers, the Surveyors' Institution, and the Royal Institute of British Architects. It has for its object the amending of the London Building Acts with regard to buildings with skeleton steel framework and the use of reinforced concrete. The development of these forms of construction is hampered by the present by-laws (which the Council can in no way relax) as under these external walls must be provided of a specified thickness sufficient to carry weights on the basis of a brick and mortar construction, disregarding the essential features and advantages of both the newer forms of building, which require only thin enclosing walls to cloth the weight-carrying structure. The Bill provides for more rigid inspection by the Council's officers, including not only the external walls, as at present, but also the internal steel construction. The professional bodies mentioned are opposing some details of the proposed inspection, but their great objection is to the proposed arrangements for appeal in case of disagreement between the Council's district surveyor and the builders or architects. As the Bill is drawn, the Building Act Committee of the Council, advised by the Council's architect, is to be the final court of appeal. It is obvious that this is merely an appeal from the Council to the Council, or from one official to another, and it is not surprising that the professional bodies concerned should oppose such an arrangement. The Parliamentary Committee of the county council have now saved the situation—and probably the Bill—by proposing as an alternative that appeals should be made to the Tribunal of Appeal as constituted under the Building Acts. This tribunal consists of an architect, a lawyer, and one other, and can call in an engineer as an assessor. It has worked well in the past, and we doubt not that its adoption as the Court of Appeal in the provisions of the new Bill will be satisfactory to the opponents of that measure. The new procedure will be an expense to the council, who have to pay all cost of the tribunal; but the previously suggested arrangement was, on the face of it, inequitable.

Builders and the Budget. A deputation of the Bradford and District Master Builders' Association, consisting of Alderman Gadie, Councillor Dickinson, and Mr. Percy Fox, on the introduction of Sir G. Scott Robertson, M.P., laid before the Chancellor of the Exchequer on the 24th inst., the case of a



THE WELSH NATIONAL LIBRARY, ABERYSTWYTH. SKETCH PLANS OF DESIGN SUBMITTED BY A. MARSHALL MACKENZIE, A.R.S.A., AND SON.

In this scheme it will be seen that the exhibition block is made to balance with the square library; and though this arrangement produces a general effect of symmetry on plan, the actual sub-division of the exhibition block, and the consequent necessity for providing an area, detracts somewhat from its value. Another point which we regard as of doubtful convenience is the placing of the exhibition halls on the first floor, and the stack-rooms on the floor above.

builder buying land as in some sense a raw material of his business—possibly borrowing some part of the purchase money on mortgage—with no intention of holding the land up, but with a view to its development, and with every desire to get rid of it. Would the Chancellor of the Exchequer consider it employed or unemployed land if the builder developed it, say, to the extent of 20 per cent. of its possibilities? Again, would he take the actual purchase value and have that registered as the basis of taxation? The Chancellor of the Exchequer promised every consideration, and the delegates expressed their pleasure at the manner in which Mr. Lloyd-George had received them. Mr. Lloyd-George also expressed his satisfaction at the clear and forcible way in which the Yorkshiremen stated their case. The reports which reach us from architects and builders on the land taxation proposals are gloomy in the extreme. The Budget has had the effect of thoroughly frightening prospective building owners, and architects, already hard hit by trade depression, are deploring their losses on many schemes for houses which have been postponed or abandoned. Builders, too, report having submitted estimates which have been provisionally accepted and are now cancelled. One builder this week informs us that he lost three contracts last week in this way. It may be urged that this is needless panic, and not justified by anything in the proposals of the present Government; and that time will gradually see confidence restored. The trouble is that architects and builders have been suffering from depressed trade for several years and have all they can do to make a living at present. The particularly regrettable point about the land taxes is their tendency to militate against gardens, especially in or near towns. If garden areas, above one acre in extent, in the neighbourhood of towns, are to be taxed as building land, many fine gardens will disappear, and others will be prevented from ever appearing. It is hard enough to find suburban houses with decent gardens at the present day; and the possible restriction of gardens at a time when we are earnestly considering the question of town planning and of increasing rural conditions in our suburban districts, is a deplorable outlook. It must not be forgotten that though the man who lays out a garden and plants trees may derive an increment value for his land from the proximity of his fellow-men, he is also a public benefactor. Of course he may escape the tax by throwing open his grounds to the public; but those men who do, and they are not a few, know to their cost how ungrateful the public often is, and how much wanton damage is done to their grounds in consequence.

Employment in the Building Trade. Employment was, according to the "Labour Gazette," generally slack in May except among the painters, who were fairly well employed. It was better than a month ago, but showed little change on the whole compared with a year ago. Among trade union carpenters and joiners, the percentage of unemployed was 8.8, as compared with 11.0 a month ago, and 9.1 a year ago, and for plumbers at the same dates the percentages were 14.1, 14.0, and 14.3 respectively. With carpenters and joiners the percentage unemployed showed a decline in every district compared with the month previous, and in nearly every district compared with a year ago. For London the Trade Union returns show that 9.2 per cent. of carpenters and joiners were unemployed at the end of May, as compared with 10.3 a month ago, and 13.4 a year ago; the corresponding percentages for plumbers were 17.1, 11.7, and 16.2. Employment remained slack, except with painters, in nearly every large centre, but showed an improvement compared with a month ago. It was fair with bricklayers at Middlesbrough, Hartlepool, Stockport, Northwich, the Potteries, Wolverhampton, Ipswich, Plymouth, and Paisley, with masons at Dundee, Aberdeen, and Blackpool, and in South Wales, and with carpenters and

[Without doubt, Mr. Greenslade's is the most logical and scientific solution of the problem. He has wisely fallen in with the suggestion embodied in the conditions regarding the disposition of the administration block, which forms in his design the outstanding feature of the main façade. The access throughout appears to us to be all that could be desired, and the distribution of the books in the library hall very satisfactory.

joiners at Doncaster, Blackpool, Warrington, Chorley, Stockport, Derby, Mansfield, Newark, Lincoln, Cambridge, Ipswich, Swansea, Aberdeen, and Cork. With carpenters at Hull it was good. It declined with plumbers in the Northern Counties, with carpenters at Leicester, and with masons at Plymouth.

Enquiries Answered.

Correspondents are particularly requested to be as brief as possible. The querist's name and address must always be given, not necessarily for publication.

The Editor is willing to answer enquiries from readers who require information on architectural, constructional, or legal matters. Such information must be regarded as the gratuitous advice or information of a friend, and not as the professional opinion of one who holds himself out as possessing expert knowledge on the subject in question. The Editor will, however, avail himself of the assistance of a large staff of experts in the matters above mentioned, but enquiries sent must be on the express understanding that he is not to be held responsible for any delays, mistakes, inaccuracies, or negligences which may occur.

Enquirers whose questions involve possible legal proceedings are strongly urged to consult their solicitors before taking definite steps in regard thereto.

Answers by post will be sent if the enquiry is accompanied by a postal order for 1s. made payable to Technical Journals, Ltd., and crossed, and a stamped addressed envelope. Such enquiries must be marked "Answers by Post" on the outside cover.

This fee of 1s. required for answers by post is in no case to be regarded as payment for the answer given, but merely as a registration fee to meet the extra clerical and other expenses incurred in dealing with these special replies.

The Editor also reserves the right of refusing to reply to any question that he may deem to be unreasonable or unsuitable; and it must be understood that both question and reply will, as a rule, be published in these columns.

A Question of Extras.

LIVERPOOL.—X. Y. Z. writes: "In a specification for alterations there is this clause: 'All work reasonably to be inferred from the drawings is to be executed whether specified or not.' Can the builder, under the circumstances, claim for lath and plastering under new stairs, and other very small items as an extra? The builder examined the premises with plan and specification before tendering."

To a very large extent this depends on whether any special instructions were given for the execution of the particular work in question. If the employer left the builder to carry out his contract, merely inspecting and never giving orders or making alterations, there is no doubt whatever that this work is included in the contract, and that no extras are payable. If an architect has been employed, it will be for him to decide whether the extras charged for are reasonable or otherwise, and he will issue his final certificate accordingly.

F.S.I.

Footings and the Boundary Line.

WALES.—A. writes: "When building close up to a boundary between two pieces of unoccupied land, has the builder the right to project his footings on to the adjoining land in spite of the protest of the adjoining owner, or must he set the face of his wall back to allow the whole of the footings to rest on his own land?"

When building close up to his boundary, an owner must respect his neighbour's property in exactly the same way as he does so for all other purposes. The projection of the footings of a wall forms quite as clearly an encroachment as if the wall were entirely built on the adjoining owner's land—it is only a question of degree. You should so form your footings that on the outer side they are flush with your wall face, and you must also take care, at the top, that the coping, or other finish, is also within your boundary.

F.S.I.

Rights of Adjoining Owner.

In further reply to W. H. S. (see p. 497 of the issue for May 26th), this is purely a legal question, and can only be answered by a solicitor on the spot, who has all the documents before him. Unless B.'s "assignment" is of such a nature as to act as a conveyance of A.'s interest, I do not think that it can hold good as against the second mortgagee. But it must be remembered that the second mortgagee has no claim to handle any rents or profits unless his interest is in arrear, and he has exercised his powers of foreclosure under the mortgage deed.

F.S.I.

Insurance of Buildings in Course of Construction.

ESSEX.—ENQUIRER H. writes: "In whose name should a fire-insurance policy on a building in course of erection be taken out?"

The fire insurance policy upon a building which is in course of construction is usually issued in the joint names of the employer and of the contractor, the document itself being in the custody of the architect. The R.I.B.A. conditions of contract (sanctioned May 13th, 1895) incorporate a proviso to this same effect, (Clause 22).

F.S.I.

Meaning of Term "Flatting."

ESSEX.—ENQUIRER H. writes: "Please explain the meaning of the term 'flatting' as applied to painting."

"Flatting" consists in leaving the finishing coat of paint in a "flat" condition (not glossy). It is not considered to be sufficiently impervious for outside work, but is useful internally when finishing uneven surfaces, because it does not show up the inequalities as an oil or varnish coat will do.

F.S.I.

Trade and Craft.

Electric Lifts.

A useful catalogue, dealing specially and exclusively with lifts that are worked by electric power, has been issued by Messrs. R. Waygood and Co., Ltd., Falmouth Road, London, S.E., in which very full information is given as to methods of driving, methods of control, and the means adopted of ensuring perfect safety. Illustrations are given of various interesting installations of the firm's passenger or goods lifts, and the views include the new War Office, Whitehall; Baltic House, Leadenhall Street; the new Sessions House, Old Bailey; Buckingham Palace; Bournemouth and Ramsgate cliffs; and the liners "Mauretania" and "Amerika," etc.

Oak Panelling and Joinery.

Some excellent examples of interior woodwork are shown in a catalogue that has just been issued by Messrs. Hofler, Ltd., of 226a, Soho Square, W. Many specimens of plain and decorative panelling in Austrian oak are shown, as well as a number of designs of Austrian oak chimney-pieces. Not the least interesting nor the least numerous illustrations are those of work that has been executed by the firm. These include some very delicately and elaborately carved church work, as well as less ornate panelling, doors, and screens, in hotels and private houses. The designs of several eminent architects are represented.

Reconstructed Building Stones and Marble.

A distinction is drawn between what is known as ordinary artificial stone and that which is called reconstructed stone. The latter contains no cementing medium other than that found in the natural stone. The British Stone and Marble Co., Ltd., Ponders End, Middlesex, who lay stress on this distinction, state that in their process of manufacture quarry débris is calcined in closed retorts, the carbonic acid gas generated being collected and liquefied, and the lime so obtained is mixed with a certain proportion of the stone to be reconstructed, such stone being reduced by crushing and screening to its original grains. The material is then conveyed to a rotary drum, and after being thoroughly mixed is hydrated. The mass is pressed, when a density can be given to it equal to or higher than that of the best stone. Whilst it is in a plastic state, the product is fashioned to the required form. After being worked, it is placed in cylinder, where, a vacuum being created, the carbonic-acid gas previously extracted is fed to it, permeating the entire block, and making it crystalline throughout. The product is entirely free from lamination, the entire stone being homogeneous throughout, and containing no bedding planes, while any desired density can be secured, so that the lower courses of a building may be made of high weight-carrying capacity, while showing no difference in colour and formation from the upper courses. Mr. T. Allen Howe, curator of the Geological Survey and Museum, Jermyn Street, having examined microscopically the company's products, finds that it is by no means easy to distinguish between the natural and the reconstructed stone, but that the latter is superior in compactness, density, and crystallisation. Messrs. David Kirkaldy and Son have reported very favourably as to its resistance to crushing stress, etc.; and the firm are able to refer to important buildings in which their products are being used.

Meetings of the Journal Committee and Administrative Committee were held on June 22nd, and a meeting of the National Board of Conciliation on June 23rd.

Conditions of Contract and Conditions in Quantities.

The attention of the R.I.B.A. and of the Quantity Surveyors' Association has been drawn to what appears to be a growing practice of stating at the beginning of bills of quantities that the conditions of contract will be those agreed between the R.I.B.A. and the Builders' Institute, the while subsequent conditions are inserted in the quantities which vary the said agreed conditions of contract. As those subsequent conditions are probably repeated in the specification, there is danger that a confusion will arise which would make it extremely difficult to say what are the exact terms of the contract between the parties.

The Quantity Surveyors' Association, in reply, say they cannot understand how the inconsistency of which complaint is made can possibly arise when the quantities are prepared by a reliable surveyor. They express themselves quite in accord with us in deprecating such a practice, and will use their influence wherever practicable with a view to effecting its discontinuance.

The R.I.B.A. have published the communication in their journal for the information of their membership.

Home Office Departmental Committee on Lead Poisoning.

On May 17th, a communication was received from the Home Office saying that it was proposed to appoint a Departmental Committee to consider the question of lead poisoning in the painting and plumbing trades. The Federation was requested to communicate with the bodies concerned, and the London Association appointed their president, Mr. F. G. Rice, the National Painters' Association their secretary, Mr. W. G. Sutherland, of Manchester, and after consideration of the names suggested by our County Federations, the president selected Mr. J. W. Bellamy, of Birmingham, to represent this Federation. These names with addresses have been duly forwarded to the Home Office. As the operatives concerned will bring forward evidence tending to show the necessity for restrictions and regulations relating to the use of poisonous paints, the employers will have to be prepared with rebutting evidence or their case may suffer. It would be well, therefore, for the County Federations and local associations to be inquiring as to suitable witnesses in readiness.

Half-yearly Meetings.

The arrangements for the above meetings at Portsmouth are as follows:—

Tuesday, July 20th.—2.30 p.m., Council Meeting in Grand Jury Room, at the Town Hall.

Wednesday, July 21st.—10.30 p.m., General Meeting in Grand Jury Room at the Town Hall; after the meeting luncheon will be provided, for the members attending, in the Mayor's Banqueting Room, Town Hall. After lunch it is proposed to make up a party to visit the dockyard and be shown over the "Vernon" Torpedo Depot (by special permission of the Commander-in-chief).

The Queen's Hotel, Southsea, will be the headquarters, and a special tariff has been arranged. Rooms should be booked early.

The Annual Conference of Secretaries,

it is proposed, shall take place at Leeds, on Tuesday, October 19th, and a preliminary notice stating the fact and requesting suggestions for subjects and papers for the agenda has been issued.

The Proposed International Federation for the Building Trade.

In accordance with the instructions of the Committee, the secretary attended a meeting in Brussels of the Committee charged with drawing up a constitution for the proposed Federation. Delegates also attended from Belgium, Holland, Italy, Hungary, and France. The secretary secured the assent of the Committee on two points which appear to be of primary importance for the success of the contemplated Federation; one, that the annual subscription should be fixed for the present at 10 centimes (or approximately 1d.) per member; the second, that at future International Congresses other languages than French should also be recognised, and interpreters provided, so that delegates might address the congress in one of the four principal European languages. For the Executive Council, however, French would still be used.

Belgian Builders' League.

On April 24th and 25th, the above league celebrated the 25th anniversary of its foundation, and as the event coincided with the meeting of the Committee just referred to, its members were invited to assist at the festivities, which took the form of a theatre party, and a banquet attended by some 270 guests. The proceedings were highly successful in every way, and the foreign delegates were most hospitably entertained.

Organisation.

The Reading builders were invited to meet the president and secretary, to confer as to the advisability of forming a builders' association for that district. The response, however, was so unsatisfactory, that the meeting was reluctantly abandoned.

A similar attempt at Tunbridge Wells has met with hardly any better success. A small number of employers attended the first meeting, but the second meeting was a failure, only one attending, although about 10 promised to do so.

The secretary again visited Bournemouth and addressed a well-attended meeting of the local association, on the question of affiliation to the Federation. No decision was come to then, but a postal vote is being taken, and the result will be known very shortly.—A. G. WHITE, Secretary.

The Northern Centre.

The Yorkshire Federation.

The monthly meeting of the Executive Council of the Yorkshire Federation was held at the Liberal Club, Barnoldswick, on Thursday, June 17th, 1909. Mr. W. R. Thompson (president) occupied the chair, and was supported by 34 delegates from federated associations.

A letter was read from the secretary of the York Association stating that he had been requested at a general quarterly meeting to convey the thanks of the association to the Yorkshire Federation for the prompt and valued assistance given in the case of one of the members, which had been much appreciated and was gratefully acknowledged.

The treasurer reported receipt of sums amounting to £67 8s., including £30 transferred from insurance account. The Finance Committee reported that they had examined the accounts, and recommended payment.

On the motion of Mr. A. Moulson, seconded by Mr. H. Fallas, the travelling expenses of representatives of the Federation, having been examined and certified as correct, were approved for payment as follows :—

National Federation and Northern Centre		£14 12 4
National Conciliation Board	£12 3 4	
Northern Centre ,, ,,	5 14 11	
		17 18 3
Finance and Emergency Committee		1 4 10
		£33 15 5

Mr. Sinclair stated that he and the secretary while in London had made the final arrangement with Lloyds to continue the Federation scheme of insurance for another year, in accordance with the terms approved by the Federation.

A letter was read from the National secretary asking whether the Federation desired any action to be taken by the National Federation in regard to the Finance Bill. On the motion of Mr. A. Moulson, seconded by Mr. G. Rayner, a resolution was passed expressing the opinion that the land taxation clauses of the Finance Bill are likely to have a serious detrimental effect on building operations, and still further to accentuate the prevalent unemployment in the trade.

A letter was read from the Hull Association expressing the opinion that it is desirable that the Builders' Labourers' Federation should be admitted to the Conciliation Boards on the same conditions and with the same privileges as the other operative societies. The Federation secretary had written in reply pointing out that the National Federation had recommended that builders' labourers be admitted to the local Conciliation Boards in all towns where working rules had been mutually entered into between the labourers and the employers. The difficulty in admitting the labourers to the full benefit of the National scheme was that 20 or 30 societies claimed to represent the labourers, not one of which was sufficiently strong in numbers or in influence to be considered as representative. An effort to combine these societies for Conciliation purposes, and to appoint representatives on the National and Centre Boards, had not been successful. On the motion of Mr. W. T. Ledgard, seconded by Mr. T. E. Taylor, the reply of the Federation secretary was approved.

Mr. A. W. Sinclair gave a report of the proceedings of the annual meeting of the National Conciliation Board, including revision of rules, application of builders' labourers for admission to scheme, etc.

Mr. W. R. Thompson gave a report of the proceedings of the meetings of the Northern Centre Conciliation Board held on June 9th and 16th. Representatives and secretaries were requested to note the following appointments of the National Federation :—

National Administrative Committee [held last Tuesday, in London]. Executive Council, Portsmouth, July 20th, at 2.30 p.m. Half-yearly General Meeting, Portsmouth, July 21st, at 10.30 a.m.

Attention was drawn to the case of a builder who had been refused payment in full of a certificate granted by the architect. The matter is receiving careful consideration.

It was reported that Mr. Hope, solicitor, of Sunderland, had forwarded for the consideration of the Federation a copy of a form of sub-contract which had been drawn up by his firm, and approved and settled by Mr. A. A. Hudson, barrister-at-law, a leading authority on building contracts. On the motion of Mr. J. H. Tomlison, seconded by Mr. W. T. Ledgard, it was resolved to forward a copy of the suggested form of subcontract to the local associations and request them to favour the Federation with their observations thereon not later than July 7th if possible.

Mr. A. W. Sinclair opened a most interesting and instructive discussion on his recent visit to Germany under the auspices of the Housing Reform Council. His observations were supplemented by County Councillor J. Midgley and Councillor J. Dawson. Information was given, among other matters, as to the cost of sites under municipal town planning, the rent of tenement dwellings occupied by the working classes, and the effect of this system and consequent overcrowding on national physique and infantile mortality. A statement of the low rate of wages and long hours of labour prevailing both in Germany and Belgium compared most unfavourably with those obtaining in England. On the motion of the president, seconded by Mr. R. Raper, the best thanks of the Federation were tendered to Mr. Sinclair for the valuable general and trade information with which he had favoured the members.

It was resolved, on the motion of Mr. A. W. Sinclair, seconded by Councillor J. Dawson, to hold the next meeting of the Federation at Scarborough on Friday, July 16th.

The president and members of the Barnoldswick Association afterwards entertained the members to tea, and a hearty vote of thanks was accorded to them for their generous hospitality.—J. Davidson, Secretary, 14, Park Row, Leeds.

Northern Counties Federation.

SUNDERLAND AND DISTRICT ASSOCIATION.

Secretary: W. H. Hope, Solicitor.

At the annual meeting of the Sunderland and District Conciliation Board for the Building Trades, held in the Board Room, 14, Norfolk Street, Sunderland, on Thursday, June 10th, 1909,

Mr. F. W. Ranken proposed the re-election of Councillor Geo. Swan as chairman, and Mr. Geo. Johnson as vice-chairman, positions which they had now occupied for three years. This was seconded by Mr. Geo. Urwin, and carried unanimously. Councillor Geo. Swan, in returning thanks for his re-election, said that his duties in the past had been very light, and the meetings had been characterised by a feeling of good-fellowship, which he hoped would be continued. Mr. Johnson, in thanking the Board for his re-election, said that he quite agreed with Councillor Swan's remarks.

On the proposition of Mr. James Taylor, seconded by Mr. George Johnson, Mr. W. H. Hope and Mr. R. Baxter were unanimously re-elected secretaries of the respective parties, for which they both returned thanks.

The question of a fair wages clause in contracts for public authorities was considered, and the matter was left in the hands of the secretaries.

Mr. Geo. Johnson complained that, in spite of the promise of a certain firm to observe the local working rules, they were working until seven o'clock at nights, with the exception of Saturday, when they knocked off at one, and that they were unwilling to employ society men. After considerable discussion, it was resolved to make further inquiries, and, if it was found that the firm was not carrying out the rules of this district, to ask them to do so.

ROBERT HALL,
Building Surveyor,
52, Frederick Street, BURY.

With over 35 years practical experience of the Building Trade, and during the last 15 years a very varied experience in measuring up and adjusting contract and other accounts, is prepared to undertake and submit quotations for the following :—

The Measuring-up and Adjustment of Accounts,
Collection and Settlement of Accounts,
Assistance given in Estimating,
Annual or other Periodical Stocktakings,
Private Enquiries and Arbitrations undertaken,
or any other special work incidental to that of a Builder or Contractor.

A meeting of the Executive Council of the Sunderland and District Association was held in the Board Room on Thursday, June 17th, 1909, Mr. J. Morice Wright (vice-president) in the chair.

A complaint received from the operative bricklayers with respect to an alleged breach of the local working rules by a non-local federated builder was considered, and after hearing the contractor, the secretary was directed to see the secretary of the operatives and report.

The question of holding a picnic was discussed, and, on the proposition of Mr. J. McMillan, seconded by Mr. J. Emmerson, it was resolved to recommend that a visit be paid to the Dukeries, that the secretary obtain all the requisite information, that the date be either the 8th or the 15th of July, and that a circular be sent out to each of the members inviting them to take tickets.

The Federated Employers' Insurance Association, Ltd., Manchester, was adopted as the official company of this association.

It was mentioned that the Sunderland and South Shields Water Company was trying to enforce certain by-laws, as to which merely verbal instructions were being given, and it was resolved "That the secretary see the water company's engineer thereon, and also communicate with the Plumbers' Association to learn if they have any grievance in this direction."

The question of the alterations to the joiners' and bricklayers' working rules was discussed, and the secretary was directed to forward to the respective societies copies of the alterations, which appeared to be acceptable to all parties at the joint conference held on May 25th, 1909, asking them to give them their consideration, and notify the association of the decision arrived at.

Tyne and Blyth Federation.

A meeting of the Executive Council of the Tyne and Blyth District Building Trades Federation was held at the Hotel Metropole, Newcastle-upon-Tyne, on Thursday, June 17th, when there were present representatives from Newcastle-on-Tyne and South Shields, Blyth and North Shields being unrepresented. Mr. R. Heslop occupied the chair.

The question of workmen's compensation insurance was discussed, along with the recommendation passed by the Executive Council of the Northern Counties Federation of Building Trade Employers, recommending the Federated Employers' Insurance Association, Ltd., Manchester, and, on the proposition of Mr. R. Heslop, seconded by Mr. T. Anderson, it was unanimously resolved to adopt the company as the recognised insurers.

A circular letter issued by the different branches of the sub-trades appealing to architects for direct contracting for the subtraders was read. On the proposition of Mr. Foster, seconded by Mr. R. Heslop, it was resolved to take no action in the matter at present.

A resolution received from the Sunderland Incorporated Chamber of Commerce with reference to the non-payment of income-tax by corporate societies, and asking that they should be brought under assessment, was considered, and, on the proposition of Mr. J. T. Armstrong, seconded by Mr. T. Anderson, it was resolved: "That this Council approve of the proposal, and request the local associations to adopt it, and forward it to the Chancellor of the Exchequer."

The secretary reported that he had written to the local associations upon the proposals of the Chancellor of the Exchequer to increase the stamp duty upon the transfer of property from 10s. to 20s. per cent. The matter had been taken up strongly by the local associations, who had passed resolutions protesting against the tax, on the grounds that it would constitute an additional burden upon the sale of small properties, and discourage the building and acquisition of houses by small investors, and the resolutions had been forwarded to the Chancellor of the Exchequer, the Prime Minister, and the local members of Parliament. On the proposition of Mr. W. Foster, seconded by Mr. J. T. Armstrong, it was resolved: "That the action of the secretary be approved, and that the resolution be adopted."

The question of holding a picnic during the month of July was discussed, but the matter was dropped, as there was no strong desire to proceed.

The question of inviting the National Federation to hold their summer meeting in the Northern Counties area in 1911 was discussed, and the resolution thereon passed by the Executive Council of the Northern Counties Federation of Building Trade Employers read and adopted.

The present representatives upon the Conciliation Board, of which Mr. Weir (Newcastle), is chairman, were unanimously nominated for the ensuing year. — W. H. HOPE, solicitor, secretary, Post Office Chambers, 14, Norfolk Street, Sundreland.

Midland Centre.

NOTTINGHAM ASSOCIATION.

Secretary: W. J. Barton, F.C.I.S.

The Executive Committee of the Nottingham Association recently had a meeting with delegates of the Amalgamated Society of Carpenters and Joiners with reference to the technical instruction in joinery, which is being given by the Education Committee of the City. The joiners' delegates contended that this instruction should only be given to those who are engaged in the trade, as by giving it generally there was a waste of the ratepayers' money, and that giving this instruction to the general public was an injustice to their trade. The master builders generally agreed that the protest should be made, but thought it desirable to extend the scope of the protest by getting other trades to join, and that it should also be pointed out that great cost was being incurred for secondary education, which was in many cases being given to children of parents living outside the city, who escaped the cost of the heavy rates incurred in giving such education. The joiners' delegates agreeing with this view of the matter, it was unanimously resolved: "That this meeting of representatives of the Nottingham Master Builders' Association and the Amalgamated Society of Carpenters and Joiners invite the Nottingham and District Trades Council to join them in discussing the system of technical instruction as given by the educational authorities of the city, with a view to approaching them on the matter, as they are of the opinion that the present system is not conducive to the best interests of the trade concerned." This resolution was brought before the Nottingham and District Trades Council by the representative of the Amalgamated Society of Carpenters and Joiners, when the matter was referred to the Executive to deal with, and power given to call in others to assist them from the technical point of view.

The Council of the London Chamber of Commerce, at their meeting on June 10th, elected Mr. Henry Adams, M.Inst.C.E., F.S.I., etc. (Henry Adams and Son, 60, Queen Victoria Street, E.C.), a member of the Arbitration Committee of the Chamber, in addition to his membership of the Engineering Committee, which he has held for some years.

We regret to record the death of Mr. Thomas Barnsley, of Augustus Road, Edgbaston, at the age of seventy-seven. As a leading member of the firm of John Barnsley and Sons, builders, Mr. Barnsley executed some of the most important building work in Birmingham, including the Council House, the Art Gallery, the Union Club, and the General Hospital. Mr. Barnsley was appointed a city magistrate in 1896, and was a past-president of the Birmingham Master Builders' Association. He retired from business about ten years ago.

BUILDING TRADE LABOUR CONDITIONS, BRITISH AND FOREIGN.

Unemployment.

At a time when so much attention is being given to the question of unemployment in this country, and to the means whereby improved earnings may be secured to the working classes, a few notes of comparison between conditions at home and in foreign countries may prove of interest.

Admittedly we are passing through a period of bad trade which is especially pronounced in the building trade. The Board of Trade returns show that in 416 trade unions with a net membership of 700,867, the number of unemployed at the end of April last was 8.2 per cent. A year ago the percentage was 7.1.

The average maximum of unemployed between the years 1899 to 1908 was between 7 and 8 per cent. In the building trade the present rate of unemployment among carpenters and joiners is 11 per cent., and for plumbers 14 per cent.

Compare these figures with those of the State of New York, U.S.A. The trade union returns in that State for 1908 show that the number of unemployed varied in the summer months between 20 per cent. and 25.2 per cent., while in the winter months it rose to as high as 35.9 per cent. In other words a period of severe trade depression prevalent simultaneously in this country and in New York State caused in the latter an average amount of unemployment of from three to four times the average amount in this country.

In the State of Massachusetts the figures are a little more favourable, the number varying in the summer months between 8.99 and 16.4 per cent.—still much higher than has been the case here. The rate in the State of New York in 1906 was as low as 5.9 per cent., but generally the amount of unemployment there in recent years appears to have been about 12 per cent., which is much above the average rate in this country.

Wages in England, Germany and France.

From the Board of Trade statistics are taken the following average comparative figures for the three leading branches of the building trade.

ENGLAND.	
Bricklayers' average in eight cities, including London	41.0
Masons' average in eight large cities, including London	39.11
Carpenters' average in eight large cities, including London	39.8
	3)120.7
General average ...	40.2
GERMANY.	
Bricklayers' average in six large cities, including Berlin	32.6
Masons' average in seven large cities, including Berlin	31.0
Carpenters' average in six large cities, including Berlin	32.7
	3)96.1
General average ...	32.0
FRANCE.	
Bricklayers' average in eight large cities including Paris	24.1
Masons' average in eight large cities including Paris	27.8
Carpenters' average in eight large cities including Paris	29.1
	3)80.10
General average ...	26.11

The above comparison brings out in a remarkable manner the advantageous position occupied by operatives in the building trade in England as compared with those in France and Germany; and when the longer hours worked on the Continent are taken into account, and the admittedly higher cost of living there, together with inferior housing accommodation, higher rentals and consequent overcrowding, the comparison is vastly favourable to this country.

Trades Unions.

The "Report on Trade Unions in the United Kingdom in 1905-07," just issued by the Board of Trade, shows that in spite of trade depression the total membership at the end of 1907 was half-a-million more than at the end of 1904.

The unions connected with the building trades, however, show a decline of about 32,000.

Reverting to the total unions their accounts show a steady rise, the income of 1907 showing an increase of £400,000 over that of 1904, while the accumulated funds at the end of 1907 amounted to £5,600,000, an increase of nearly £1,000,000 since the end of 1904. During three years 1905-07 over £6,000,000 has been spent by the 100 principal unions. 8.2 per cent of this was for dispute pay, 23.2 per cent. for unemployed benefit and 46.1 per cent. on sick, accident, superannuation, funeral and similar benefits. Working and miscellaneous expenses accounted for the remaining 22.5 per cent.

The proportion spent in disputes was lower in these three years than the average for the period 1898 to 1907. The decrease in this expenditure was especially large in the case of the building trades in 1906-7 consequent on the increased use of methods of conciliation and arbitration in settling disputes.

It must be borne in mind that every saving effected by the unions in consequence of conciliation being substituted for strikes represents similar substantial savings to employers and the public, while it sets free a larger proportion of the union funds for those other beneficient purposes which figure so largely in their expenditure, and so lessens hardship and suffering in thousands of working class homes.

The following figures indicate this clearly. They apply to the building trade, being amounts paid under the heads given.

Year		Dispute benefit.		Unemployed benefit		Sick and accident benefit.
		£		£		£
1901	...	84,855	...	67,100	...	96,078
1905	...	57,479	...	142,987	...	111,808
1906	...	7,030	...	125,560	..	111,087
1907	...	6,594	...	115,951	...	108,733

The above figures are the more remarkable when it is taken into consideration that a decline in the numbers and membership of trades unions in the building trade has sychronised with the years of considerable depression through which the industry is and has been passing.

During the three years 1905-7, the Operative Bricklayers' Society lost 5,000 members, and the two principal unions of masons lost 10,000 members between them, while the Amalgamated Carpenters and Joiners shows a net decline of 2,000 in total membership, notwithstanding an exceptionally large increase (6,000) in the number of its members in branches outside the United Kingdom.

Trades Councils are local bodies. They have no power to direct the action of the unions represented, or to levy funds in aid of those on strike or for other purposes, but they frequently consider the cause or object of a trade dispute, and if satisfied, render financial and other assistance.

The number and membership of these Councils have steadily increased, and since 1898 the number shows a rise of nearly one-half and the membership of more than one-third.

The increase has been more marked in the South of England and in South Wales than in the other districts, the trades councils in this part of the Kingdom having doubled in membership and more than doubled in number. The increase is especially noticeable in the last five years, and seems to indicate that the workmen's organisation which has been hitherto somewhat slack and inactive in the south is changing in character and extent and will eventually exhibit similar signs of vigour to what it has long done in the northern parts.

The Acton Patent Concrete Partition Co. (1909), Ltd., contractors to H.M. Government, state that, owing to their offices on Cornhill being demolished for reconstruction, their address, as from June 24th, is 82, Victoria Street, and their telephone number Westminster 5474.

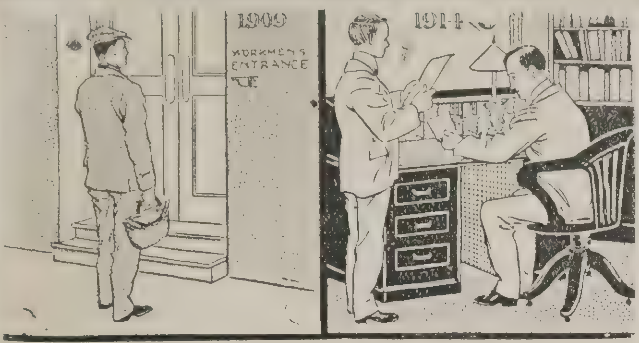
SS½=Sliding Scale with ½d. per hour increase. SS=Sliding Scale. A=About.



What YOU can accomplish in five years or a shorter time.

Isn't it an attractive possibility—to be able to leave poorly-paid, hum-drum, "do-as-you-are-told" employment for a high salaried, congenial position which gives scope for your personality? Thousands of workers in all parts of the world have realised this possibility through the International Correspondence Schools. YOU can realise it by the same means. The I.C.S. exist for the specific purpose of furnishing the training which qualifies for good positions, on terms within the reach of all, by means of home correspondence study. You can depend absolutely on the "salary-raising" efficiency of I.C.S. training. There is a solid 17 years record of good work behind the I.C.S. To-day the Schools have more students than any other educational institution in the world. Every month, students voluntarily report advancement as a direct result of I.C.S. training. One student writes:—

> "Paris, France.
>
> When I enrolled in your Electric Traction Course, I was engaged in a track construction gang, at a salary of £4 a month. After I enrolled I was successfully made boss of the track gang, and finally was appointed Traffic Manager of the same Company at a salary of £28 a month Your system of instruction by correspondence is most efficient and must be considered invaluable by everyone who wishes to perfect himself for technical work without interfering with his daily occupation.
>
> (Signed) A. B. SCHELL."

Remember, "What man has done man can do." In five years from now, or a much shorter time, YOU can occupy a high and responsible position in your chosen line, if you will only equip yourself with the necessary training NOW. Isn't it well worth your while to devote some of your leisure to interesting study when the reward is so great? Let us send you full particulars, not only of our courses, but also of our

"STUDENTS' AID DEPARTMENT"

which is in close touch with employers in every district, and devotes its entire attention to assisting our students in the matter of employment by introductions, recommendations, etc.

Mark the coupon, or write us about any special career—and thus

Take the first step towards success to-day.

103

Registrar, INTERNATIONAL CORRESPONDENCE SCHOOLS, Ltd.,
(Dept. B.), International Buildings, Kingsway, London, W.C.

I am interested in your system of Technical Training and desire to increase my earning power. Please send me, post paid, free of charge, the Book covering the subject before which I have marked **X** on the coupon, and full information showing how I can succeed in same.

The Renowned

Andrews-Hawksley

Patent Tread

Applied to Wood, Iron, Stone or Concrete Stairways, Floors, Landings, Platforms, Non-Conducting Floor Plates for Electric Light and Power Stations, Pavement Covers, etc., etc.

Pioneers of all Stair Treads.
The Tread that has lasted a lifetime.
There is nothing to equal it in the Market.

Architects and Engineers are invited to inspect our New Iron Staircase and Stair Tread made and laid by us at St. James's Park Station (District Railway).

Quotations given for Concrete Steps fitted complete with our Treads.

HAWKSLEY REVERSIBLE WOOD BLOCK TREAD
REGISTERED TRADE MARK.

Quotations given for Concrete Steps fitted complete with our Treads.

¶Used by Great Western Railway, London and North Western Railway, London Brighton and South Coast Railway, Great Northern Railway, Midland Railway, North Eastern Railway, North British Railway, Lancashire and Yorkshire Railway, H.M. Office of Works, War Office, Admiralty, etc.

Specialists in Light Constructional Work in Iron or Steel; Special Work in Wrought or Cast Iron; Staircases of every description; Concrete and Granolithic Work, etc.

Fire Escape Staircases with our Treads, a Speciality.

COMPLETE LIST OF CONTRACTS OPEN.

In this list are included, as a rule, only those contracts for which tenders are returnable about five days after the date of this issue.
Unless expressly stated to the contrary, all deposits required for bills of quantities, etc., are returned on receipt of *bona-fide* tenders.
The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair wages clause in the ontract, which requires them to pay the rates of wages current in the district.

BUILDING.

July 3. **MEXBOROUGH.**—Asphalting, building retaining wall, and improvements to urinals, at Mexborough Garden Street and Doncaster Road provided schools, for the West Riding C.C. Specifications of W. R. Hudson, Education Office, Mexborough, to whom tenders are to be sent.

July 3. **TREDEGAR.**—Erection of thirty or more workmen's cottages, for the Glyn Building Club. Plans and specifications may be seen at the offices of A. F. Webb, Architect and Surveyor, High Street, Blackwood, or Tredegar, to whom tenders are to be sent.

July 3. **GUILDFORD.**—Erection of a receiving home for children, for the Guardians of the Union. Plans, specifications, etc., on deposit of £3 3s. with Edward L. Lunn, Architect, 36, High Street, Guildford. Tenders must be delivered to W. S. V. Cullerne, Clerk to the Guardians, Union Offices, Commercial Road, Guildford.

July 3. **KING'S NORTON (near BIRMINGHAM).**—Erection of new Council Schools as follows, for the U.D.C. (a) Cotteridge infants' school for 400 children; architect, J. P. Osborne, 95, Colmore Row, Birmingham. (b) Stirchley Street infants' school for 400 children; architect, W. A. Harvey, 5, Bennett's Hill, Birmingham. Names, with deposit of £1 1s. for each school, to John F. Moore, Secretary, Education Offices, King's Norton.

July 5. **BELFAST.**—Plastering and renovating Doagh Masonic Hall. Plan, etc., may be obtained from W. C. Heron, Doagh.

"LIMPET" PATENT BOLTS & WASHERS
FOR CORRUGATED IRON SHEETS.

"There is no doubt in our mind that they ought to be regularly specified where iron sheeting is used."—*Vide* BUILDERS' JOURNAL.
PRICE'S PATENT
The latest and most approved Fixing for joining Corrugated Iron Sheeting together.
REGISTERED TRADE MARK
LIMPET
Their great feature is the way in which they adjust themselves to the corrugation and make an **absolutely watertight joint.** They also retard the corrosive action in Galvanized Sheets and combine other advantages.
EXCLUSIVELY ADOPTED BY THE INDIAN GOVERNMENT, THE LEADING RAILWAYS AND MANY OF THE LARGEST MANUFACTURING CONCERNS IN ENGLAND AND THE COLONIES.

Specifications and further particulars of Geo. Riley, Surveyor to the Council, 14, Walker Street, Wellington, Salop. Tenders must be sent to J. W. Littlewood, Clerk to the Council, Bank Chambers, Wellington, Salop.

(Continued on next page.)

FIBRO-CEMENT SHEETS

AND SLATES (Patented)

PANELLING OF A DINING-ROOM.

The ceiling and panelling of this room, as well as the door casing, mouldings and door panels are done with Fibrocement.

A panelling of this kind costs less with Fibrocement than if done with wood, as all glueing and assembling is replaced by a simple nailing and the superposition of sheets of various thicknesses.

Compared with wood panels, ours have the great advantage of never "playing" and never giving occasion to numerous joints of paint inevitable with wood panels.

Fibrocement never rots. Once fixed to the wall, it in no way loses its shape.

Write for further particulars to

C. ZERENNER & Co., *Original introducers of Asbestos Slate and Contractors to H.M. Government.*

Norfolk House, Laurence Pountney Hill, LONDON E.C.

Wholesale Distributing Agents Wanted,

Telegrams: "ZERENNERS, LONDON." Telephone: CENTRAL No. 11627 LONDON.
